The Chinese records carry the history of Tong-king as far back as the 22d century B.C., but, as the data are neither well authenticated nor particularly interesting, we need not dwell upon them. There is, however, one mention of Tong-king, or Yueh, as it was then called, in the 12th century B.C., which acquires importance from the fact that ambassadors from that country are said to have arrived at the Chinese court, bringing with them "south-pointing chariots." These are supposed by some to have been mariner's compasses, but it is difficult to pronounce any opinion on a statement so obscure. During the reign of Che Hwang-te (218 B.C.), the emperor who made himself famous by building the Great Wall of China and burning the books, a Chinese army invaded Tong-king and captured the town of Luliang, possibly the modern Hanoi. The occupation, however, was only temporary, and it was not until the rise to power of the Han dynasty that any serious attempt was made to subjugate the country. At that time a Chinese general Chaou T'o, who had established a principality consisting of the two modern provinces of Kwang-tung and Kwang-se, with his capital at Canton, invaded Tong-king, but was defeated and driven out of the country by the ruler, An-yang, whose victories were achieved mainly by the help of a foreign "divine mechanic." This man, whoever he may have been, seems to have been thrown aside after serving his immediate purpose; and, having thus deprived himself of his right hand, An-yang fell an easy victim when attacked by a second army sent by Chaou T'o. On the subjugation of the empire by the Han sovereign, Chaou T'o's principality was absorbed with the rest, and in 116 B.C. Tong-king became a dependency of China.

But this connection brought no peace to the country, and for centuries rebellion followed on rebellion. A particular uprising in the 1st century is noticeable from two sisters, Chêng-Tsêh and Chêng Urh, leading the rebel forces against the Chinese garrisons, with such success that the celebrated Ma Yuen had to be sent against the malcontents. After an arduous campaign Ma dispersed the rebels and captured and executed the two sisters, thus putting an end to the rebellion. The next fourteen centuries furnish a perpetual record of wars and rumors of wars, the disconnected narrative of which is generally uninteresting and sometimes unintelligible. In 1427 Li Loi acquired the throne, as so many of his predecessors had done, by violent means, but, unlike them, he established some degree of peace and order in the land. In the following century, however, the spirit of revolt broke out, and one of his successors owed the maintenance of his throne to the skill of his general Nguyen Dzo, on whom the title of hereditary viceroy was consequently conferred. This viceroy gradually assumed the supreme authority in the district under his control and virtually separated Tong-king from Annam, holding the first under his own sway and leaving the southern portion of the country to the *roi fainéant*. In this disunited condition the two countries remained during the 17th century and part of the 18th, till a successor of Nguyen invaded Annam, captured the imperial city of Hué, and dethroned the king, Gia Long, who fled to Siam. The Siamese sovereign entertained the fugitive with hospitality, but declined to help him to recover his throne. It happened, however, that at this time (1787) the Jesuit establishment of Bangkok was presided over by Bishop Pigneaux de Betaine, who thought he saw in the political condition of Annam a means of establishing the power of France in the eastern portion of Indo-China. With this object he proposed to Gia Long that he should accompany him to Paris to enlist the aid of Louis XVI. for the recovery of his throne. This the king declined to do, but as a compromise he sent his eldest son. The young prince was cordially received by Louis, before whom the bishop laid the following reasons for the interference of France on behalf of Gia Long: "The balance of political power in India appears at the present moment to be largely in favor of the English, and one may be justified in looking upon it as a matter of no little difficulty to restore the equilibrium. In my opinion the establishment of a French colony in Cochin-China will be the surest and most efficacious means to the end. . . . The most certain way of damaging the English in India is to ruin, or at any rate to weaken, her commerce in time of peace. Being situated nearer to China, we should undoubtedly absorb much of her trade. . . . In time of war it would be still more easy to stop all commerce between China and any hostile nation. . . . From such a coign of vantage it would be easy to interfere with the designs which the English evidently have of extending their frontier more to the east."

The embassy resulted in a treaty with Gia Long, by which the French king engaged to restore that monarch to his throne on condition that he accepted the virtual protectorship of France over Annam. But even before the initial steps towards the fulfilment of this contract could be carried out, the political uprising which finally brought the French king to the scaffold made all interference in the East impossible. In these circumstances the bishop determined to raise a sufficient force from the French and other adventurers who then frequented India and the neighboring countries, and, with an army so recruited, he landed in Annam. The Annamese resistance was of the feeblest kind; the usurper's power was broken at the first encounter, and Gia Long once again ascended his throne. As a reward for the services thus rendered to him, he extended a liberal protection to the Roman Catholic missionaries and their converts, and engaged French officers to fortify his towns and to drill his troops. He soon found, however, that his new allies had more ambitious designs than could be satisfied by doing him service. He therefore withdrew his countenance from them, and emphasized his displeasure by leaving his throne away from his eldest son, who had pleaded his cause in Paris, and by giving it to his youngest son. This change of policy told, as was natural, with greatest force on the missionaries and their converts in the interior of the country. From 1833 to 1839 eleven missionaries were put to death, and thousands, it is said, of the native Christians suffered martyrdom. Neither change of sovereign nor varying circumstances brought any relief to the persecuted Christians, until in 1859 the French Government determined to intervene on their behalf. In that year Admiral Rigault de Genouilly took Saigon by assault, and was attempting to open negotiations with the king of Annam, when the outbreak of the China war compelled him to satisfy himself with holding the captured town. So soon, however, as the Peking treaty was signed, the French resumed active operations in the neighborhood of Saigon and took possession of the provinces of Mitto and Bienhoa in Cochin-China. These victories led to the conclusion of a treaty with the king, Tu Duc, which, however, did not prevent the French from adding the provinces of Kinh-luong, Chaudoc, and Ha-tien to their acquired territory.

Having thus firmly established themselves in Annam, they began to turn their attention to Tong-king, attracted by the reported richness of its mineral wealth. They found a ready pretext for interfering in its affairs in the disturbances arising from the invasion of its northern provinces by the disbanded followers of the Tai-ping rebels. Acting on the protectorship which they professed to exercise over all the territories of Tu Duc, they proposed to him that a joint expedition composed of French and Annamese troops should be sent to quell the disturbances. On Tu Duc declining to accede, the French admiral was on the point of starting "to protect" Tong-king, when as before the outbreak of war put an end to the enterprise. The events of 1870 forbade any advance in the direction of Tong-king, but the return of peace in Europe was once more the signal for the renewal of hostilities in the East. The appearance of Garnier's work on his expedition up the Mekong aroused again an interest in Tong-king, and the reported wealth of the country added the powerful motive of self-interest to the yearnings of patriotism. Already M. Dupuis, a trader who in the pursuit of his calling had penetrated into Yunnan, and had thus discovered that the higher waters of the Song-koi were navigable, had visited Hanoi with a small force of desperadoes, and was attempting to negotiate for the passage up the river of himself and a cargo of military stores for the Chinese authorities in Yun-nan. Meanwhile Captain Senez appeared from Saigon, having received instructions to open the route to French commerce. But to neither the trader nor the naval officer would the Tongkingese lend a favorable ear, and in default of official permission Dupuis determined to force his way up the river. This he succeeded in doing, but arrived too late, for he found the rebellion crushed and the stores no longer wanted.

On his return to Hanoi, Dupuis found that the opposition of the authorities had gathered strength during his absence. His arrival served to restore the position of the French, and, not wishing to make an open attack upon them, the Tongkingese general wrote to the king, begging him to induce the governor of Saigon to remove the intruder. An order was thereupon issued calling upon Dupuis to leave the country. This he declined to do, and, after some negotiations, Garnier with a detachment was sent to Hanoi to do the best he could in the difficult circumstances. Garnier threw himself heart and soul into Dupuis's projects, and, when the Tong-kingese authorities refused to treat with him except on the subject of Dupuis's expulsion, he attacked the citadel on November 20, 1873, and carried it by assault. Having thus secured his position, he sent to Saigon for reinforcements, and meanwhile sent small detachments against the five other important fortresses in the delta (Hung-yen, Phu-ly, Hai-Dzuong, Ninh-Binh, and, Nam-Dinh), and captured them all. The Tong-kingese now called in the help of Liu Yung-fu, the leader of the "Black Flags," who at once marched with a large force to the scene of action. Within a few days he recaptured several villages near Hanoi, and so threatening did his attitude appear that Garnier, who had hurried back after capturing Nam-Dinh, made a sortie from the citadel. The movement proved a disastrous one, and resulted in the death of Garnier and of his second in command, Balny d'Avricourt.

Meanwhile the news of Garnier's hostilities had alarmed the governor of Saigon, who, having no desire to be plunged into a war, sent Philastre, an inspector of native affairs, to offer apologies to the king of Annam. When, however, on arriving in Tong-king Philastre heard of Garnier's death, he took command of the French forces, and at once ordered the evacuation of Nam-Dinh, Ninh-Binh, and Hai-Dzuong, —a measure which, however advantageous it may have been to the French at the moment, was most disastrous to the native Christian population, the withdrawal of the French being the signal for a general massacre of the converts. In pursuance of the same policy Philastre made a convention with the authorities (February 6, 1874), by which he bound his countrymen to withdraw from the occupation of the country, retaining only the right to trade at Hanoi and Hai-phong, and agreed to put an end to Dupuis's aggressive action. On the 15th of March a treaty was signed at Saigon.

For a time affairs remained *in statu quo*, but in 1882 Le Myre de Villers, the governor of Saigon, sent Rivière with a small force to open up the route to Yun-nan by the Song-koi. With a curious similiarity the events of Garnier's campaign were repeated. Finding the authorities intractable, Rivière stormed and carried the citadel of Hanoi, and then, with very slight loss, he captured Nam-Dinh, Hai-Dzuong, and other towns in the delta. And once again these victories brought Liu Yung-fu and his Black Flags into the neighborhood of Hanoi. As Garnier had done, so Rivière hurried back from Nam-Dinh on news of the threatened danger. Like Garnier also he headed a sortie against his enemies, and like Garnier he fell a victim to his own impetuosity.

In the meantime the Annamese court had been seeking to enlist the help of the Chinese in their contest with the French. The tie which bound the tributary nation to the sovereign state had been for many generations slackened or drawn closer as circumstances determined, but never had it been entirely dissevered, and from the Annamese point of view this was one of the occasions when it was of paramount importance that it should be acknowledged and acted upon. With much more than usual regularity, therefore, the king despatched presents and letters to the court of Peking, and in 1880 he sent a special embassy, loaded with unusually costly offerings, and with a letter in which his position of a tributary was emphatically asserted. Far from ignoring the responsibility thrust upon him, the emperor of China ordered the publication of the letter in the *Peking Gazette*. The death of Rivière and the defeat of his troops had meanwhile placed the French in a position of extreme difficulty. The outlying garrisons, with the exception of Nam-Dinh and Hai-phong, were at once withdrawn to Hanoi, and that citadel was made as secure as circumstances permitted. The Black Flags swarmed round its walls, and the reinforcements brought by Admiral Courbet and General Bouet were insufficient to do more than keep them at bay. So continued was the pressure on the garrison that Bouet determined to make an advance upon Sontay to relieve the blockade. After gaining some trifling successes, he attacked Vong, a fortified village, but he met with such resistance that, after suffering considerable loss, he was obliged to retreat to Hanoi. In the lower delta fortune sided with the French, and almost without a casualty Hai-Dzuong and Phu-Binh fell into their hands. These successes led to an ultimatum being sent to the king of Annam, in which were demanded the fulfilment of the treaty of 1874 and the acceptance of the protectorate of France over the whole of Annam, including Tong-king. This document met with no favorable reception, and, as at this moment a reinforcement of 7000 men arrived from France, Courbet, determining to supersede diplomacy by arms, appeared with his fleet before Huê. He found that, though Tu Duc was dead, his policy of resistance was maintained, and he therefore stormed the city. After a feeble defence it was taken, and the admiral concluded a treaty with the king (August 25, 1883), in which the French protectorate was fully recognized, the king further binding himself to recall the Annamese troops serving in Tong-king, and to construct a road from Saigon to Hanoi.

Though this treaty was exacted from the king under pressure, the French lost no time in carrying out that part of it which gave them the authority to protect the country, and on the 1st September Bouet again advanced in the direction of Sontay. But again the resistance he met with compelled him to retreat, after capturing the fortified post of Palan. The serious nature of the opposition experienced in these expeditions induced the French commanders to await reinforcements before again taking the field. Meanwhile, on the determination to attack Sontay becoming known in Paris, the Chinese ambassador warned the ministry that, since Chinese troops formed part of the garrison, he should consider it as tantamount to a declaration of war. But his protest met with no consideration. On the arrival of reinforcements an advance was again made; and on the 16th December, after some desperate fighting, Sontay fell.

The immediate object of the French commanders was at this time to make themselves secure in the delta, and to inflict such chastisement on the Black Flags and their allies as would prevent their disturbing the peace of the garrisons. This could not be attained so long as Bac-Ninh remained in the hands of the enemy. Generals Négrier, Brière de l'Isle, and Millot accordingly marched against the town, and began to shell it. But it was already deserted, and Millot entered the gates without striking a blow. Thus, while one part of the programme was fulfilled to the letter, the other part, which was to have sealed the fate of the garrison, failed conspicuously. In these circumstances it was thought advisable to push on along the great north-eastern road to China; and Négrier advanced about 30 miles towards Lang-son, captured a village there, and then returned to Bac-Ninh.

Meanwhile Brière de l'Isle followed up that portion of the Bac-Ninh garrison which had escaped along the northern road in the direction of Thai-Nguyen. He captured the fort of Yen-te, and marched on to Thai-Nguyen, where, as on so many occasions, there was a great display of martial ardor so long as the French were beyond firing distance, but the discharge of a few shells completely discomfited the defenders, who fled out of the north gate as the French marched in at the south. As Brière de l'Isle had positive orders not to hold the town, he burnt some of the buildings, and evacuated it. The Chinese troops immediately returned, and again were driven out a month later, only to return again on the withdrawal of the French. Once more, however, a column was sent against the city, which on this occasion was burnt to the ground.

The whole of the lower delta was thus made secure in the hands of the French. Hung-Hoa (a town about 15 miles northeast of Sontay) and Tuyen-Kwan (a fortified place about 40 miles farther north) both fell before the invaders, but from both the garrisons escaped practically unscathed.

In the meantime M. Fournier, the French consul at Tientsin, had been negotiating for peace, so far as China was concerned, with Li Hung-chang, and on May 17, 1884, had signed and sealed a memorandum by which the Chinese plenipotentiary agreed that the Chinese troops should evacuate the northern provinces of Tong king "*immédiatement.*" This expression was undeniably vague, and the French general in Tong-king, impatient of delay, in June dispatched Colonel Dugenne at the head of a strong force to occupy Lang-son. The expedition was badly arranged; the baggage train was far too unwieldy; and the pace at which the men were made to march was too quick for that scorching time of the year. They advanced, however, within 25 miles of Lang-son, when they suddenly came upon a Chinese camp. An irregular engagement commenced, and, in the pitched battle which ensued, the Chinese broke the French lines, and drove them away in headlong flight. This brought the military operations for the season to a close.

During the rainy season fevers of all kinds became alarmingly prevalent, and the number of deaths and of men invalided was very large. In the meantime, however, an expedition, led by Colonel Donnier, against the Chinese garrison at Chu, about 10 miles southeast from Lang-kep, was completely successful; and in a battle fought near Chu the Chinese were defeated, with a loss of 3000 killed, the French loss being only 20 killed and 90 wounded. In the skirmishes which followed the French were generally victorious, but not to such a degree as to warrant any enlargement of the campaign.

The arrival in January, 1885, of 10,000 men having brought up the force under Brière de l'Isle to 40,000 he ordered an advance towards Lang-son. The difficulties of transport greatly impeded his movements, still the expedition was successful. On the 6th February three forts at Dong-Song, with large supplies of stores and ammunition, fell into the hands of the French. Three days' heavy fighting made them masters of a defile on the road, and on the 13th Lang-son was taken, the garrison having evacuated the town just before the entrance of the conquerors. With his usual energy Négrier pressed on in pursuit to Ki-hea, and even captured the frontier town of Cua-ai. But Brière de l'Isle had now to hurry back to the relief of Tuyen-Kwan, which had been attacked by a Chinese force, and Négrier was left in command at Lang-son. The withdrawal of Brière de l'Isle's division gave the Chinese greater confidence, and, though for a time Négrier was able to hold his own, on the 22d and 23d of March he sustained a severe check between Lang-son and Thatke, which was finally converted into a complete rout, his troops being obliged to retreat precipitately through Lang-son to Than-moi and Dong-Song. Brière de l'Isle reached Tuyen-Kwan on the 3d of March, and found the Black Flags and Yun-nan braves strongly posted on the side of an almost inaccessible pass. After having sustained a succession of attacks for eighteen days, and seven actual assaults, the delight of the garrison at seeing Brière de l'Isle's relieving force may be imagined. It was while matters were in this position that Sir Robert Hart succeeded in negotiating peace between the two countries. By the terms agreed on (April 6, 1885), it was stipulated that France was to take Tong-king under its protection and to evacuate Formosa. The Chinese undertook at the same time to expend 80,000,000 francs [$15,440,000] on the construction of roads in South China.

The future fortunes of the colony must depend greatly on the administrative ability of the governors selected to rule over it. The death of Paul Bert was in this respect a great loss to Tong-king.

See *France and Tong-King*, by J. G. Scott, 1885; *Tonkin*, by C. B. Norman, 1884; *Tungking*, by W. Mesney, 1884. (R. K. D.)

TONGUE. See ANATOMY, vol. i. p. 786, and TASTE.

TONNAGE, REGISTER TONNAGE, or INTERNATIONAL REGISTER TONNAGE, is the unit on which the assessment of dues and charges on shipping is based. The system at present in force is known as the Moorsom system. A register ton is 100 cubic feet of internal volume. Thus a vessel of 100,000 cubic feet of internal space within the points of measurements prescribed by the law is 1000 tons register. Vessels are sometimes bought and sold under this unit. The tonnage rules, which are very full and elaborate, are contained in part ii. of the Merchant Shipping Act, 1854, sections 20 to 29 inclusive, and in section 9 of the Merchant Shipping Act, 1867, the latter being a special section in reference to a deduction from the gross tonnage in respect of crew space, which space must be fit for the proper accommodation of men who are to occupy it to entitle to such deduction. This enactment has led to great improvement in seamen's quarters.

Section 60 of the Merchant Shipping Act, 1862, provides on the point of international tonnage as follows: "Ships belonging to foreign countries which have adopted the British system of tonnage need not be remeasured in this country." The British system has been adopted by the following countries at the dates named: United States, 1865; Denmark, 1867; Austria-Hungary, 1871; Germany, 1873; France, 1873; Italy, 1873; Spain, 1874; Sweden, 1875; Netherlands, 1876; Norway, 1876; Greece, 1878; Russia, 1879; Finland, 1877; Hayti, 1882; Belgium, 1884; Japan, 1884. It is also under consideration by China.

There are slight differences in the rules for deduction for engine room in some of the countries, but owners or masters of foreign steamships, where this difference exists, may have the engine-rooms remeasured in the United Kingdom if they desire; in other words, their net tonnage may be reduced to exact English measure.

The British system was also mainly adopted by the International Tonnage Commission assembled at Constantinople in 1873, the rules of such commission forming the basis of dues levied on the ships of all countries passing through the Suez Canal. A special certificate is issued in the respective countries for this purpose. The main point of difference from the British system is with respect to the deduction for engine room.

There are three terms used in respect of the tonnage of ships,—namely, tonnage under decks, gross tonnage, and register tonnage.

In obtaining the gross measurement the space under the tonnage deck is first measured—sections 20 and 21 (1), (2), and (3); then the space or spaces, if any, between the tonnage deck (the tonnage deck is the second deck from below in all vessels of more than two decks and the upper deck in all other vessels) and the upper deck—section 21 (5) of Act; and finally the permanent closed-in spaces above the upper deck available for cargo, stores, passengers, or crew—section 21 (4) of Act.

Length 112.75 Feet ÷ 6 18.791 Feet, the Common Interval between Areas.

Depths ÷ 4, the Middle Depth being less than 16 Feet.

		Area 1	Area 2.		Area 3.		Area 4.		Area 5.		Area 6.		Area 7				

The allowance for engine room is governed by the percentage the net engine room—that is, the space exclusive of the coal bunkers—bears to the gross tonnage, and varies in paddle- and screw-steamers as laid down in section 23 of the Act.

In obtaining the tonnage under tonnage deck, ships are divided in respect of their length into five classes as follows:

Class 1.	Length 50 feet and under	..................into 4 equal parts.	
" 2.	" 50 " and not exceeding 120 feet,	6	"
" 3.	" 120 " " " 180 "	8	"
" 4.	" 180 " " " 225 "	10	"
" 5.	" 225 " and upwards	12	"

The following is an epitome of the rule for tonnage under the tonnage deck:

Length is taken inside on tonnage deck, from inside of plank at stern to inside of midship stern timber or plank; the length so taken, allowing for rake of bow and of stern in the thickness of the deck, and one-third of the round of beam, is to be divided into the prescribed number of equal parts (which determines the stations of the areas), according to the length of vessel, as above.

Area 1 is at the extreme limit of the bow. Area 2 is at the first point of division of the length. The rest are numbered in succession, the last being at the extreme limit of the stern.

Depths are taken at each point of division of the length, or station of each area, from the underside of the tonnage deck to ceiling at inner edge of timber strake, deducting therefrom one-third of the round of the beam. The depths so taken are to be divided into four equal parts, if midship depth should not exceed 16 feet; otherwise into six equal parts.

Breadths are taken at each point of division of the depths and also at the upper and lower points of the depths. The upper breadth of each area is to be set down in its respective column in a line with No. 1 (left-hand numerals), and the rest in succession.

The number of columns for areas will vary according to the length, as in the several classes, and will be equal to the number of parts into which the length is divided plus one.

The space or spaces between decks above the tonnage deck are dealt with by a similar formula. A mean horizontal area of the space, or each space if more than one, is found and multiplied by the mean height.

The permanent closed-in spaces above the upper deck available for cargo, stores, passengers, or crew are measured in the same manner, by finding a mean area and multiplying by a mean height.

The measurement of net engine room is governed by the arrangement of the space, and is measured as a whole or in parts as may be required by its particular form.

The above [table] is an example under class 2, depth under 16 feet, of tonnage under tonnage deck.

This formula is also applicable for finding displacement tonnage of ships, that is, the external displacement measured by taking transverse areas to the height of the load water-line to find the cubit content, which content divided by 35 gives the displacement in tons weight, the difference between the light and load displacement representing the carrying powers of a vessel in tons.

"The rule," says Mr. Moorsom, "is founded on the purest mathematical principles. It was first published in the *Philosophical Transactions* of the Royal Society of 1798 by Attwood, in his 'Disquisition on the stability of ships,' who there describes it as one of those formulæ invented by Sterling for measuring spaces bounded by irregular curves, founded on Sir Isaac Newton's discovery of a theorem—a discovery which the immortal author himself considered amongst his happiest inventions—by which the areas of all curvilinear spaces not geometrically quadrible nor discoverable by any known rules of direct investigation are so closely approximated as to amount to geometrical exactness."

Mr. Allan Gilmour at the middle of the present century expressed his opinion, after a careful consideration of the tonnage question, which was receiving much attention at that time owing to the law 8 and 9 Vict. cap. 89, which had been adopted in place of the old tonnage law 13 Geo. III. cap. 74, not giving satisfaction, that the "system framed by Mr. Moorsom will as it were compel every one to build strong, fast-sailing, and good seagoing ships, and that, in fact, it will stand as long as the world remains." It will be admitted that great progress has been made in every way in British shipping of late years, and for this due praise must be given to the influence of the present tonnage laws. (W. M*.)

TONNAGE AND POUNDAGE were customs duties anciently imposed upon exports and imports, the former being a duty upon all wines imported in addition to prisage and butlerage, the latter a duty imposed *ad valorem* at the rate of twelvepence in the pound [5 %] on all merchandise imported or exported. The duties were levied at first by agreement with merchants (poundage in 1302, tonnage in 1347), then granted by parliament in 1373, at first for a limited period only. They were considered to be imposed for the defence of the realm. From the reign of Henry VI. until that of James I. they were usually granted for life. They were not granted to Charles I., and in 1628 that king took the unconstitutional course of levying them on his own authority, a course denounced a few years later by 16 Car. I. c. 18, when the Long Parliament granted them for two months. After the Restoration they were granted to Charles II. and his two successors for life. By Acts of Anne and George I. the duties were made perpetual, and mortgaged for the public debt. In 1787 they were finally abolished, and other modes of obtaining revenue substituted, by 27 Geo. III. c. 13.

Poundage also signifies a fee paid to an officer of a court for his services, *e.g.*, to a sheriff's officer, who is entitled by 28 Eliz. c. 4 to a poundage of a shilling in the pound [5%] on an execution up to £100, and sixpence in the pound [2½%] above that sum.

TONQUA BEAN. The Tonqua, Tonka, or Tonquin bean, also called the coumara nut, is the seed of *Dipterix odorata*, a Leguminous tree growing to a height of 80 feet, native of tropical South America. The drupe-like pod contains a single seed possessed of a fine sweet "new-mown hay" odor, due to the presence of a crystallizable principle called coumarin, to which also the dried stalks of *Melilotus officinalis* and the vernal grass *Anthoxanthum odoratum* owe their odor. Tonqua beans are used principally for scenting snuff and as an ingredient in perfume sachets and in perfumers' "bouquets."

TONQUIN. See TONG-KING.

TONSILLITIS. See THROAT DISEASES.

TONSURE. The reception of the tonsure, in the Roman Catholic Church, is the initial ceremony which marks admission to orders and to the rights and privileges of clerical standing. It is administered by the bishop with an appropriate ritual. Candidates for the rite must have been confirmed, be adequately instructed in the elements of the Christian faith, and be able to read and write. Those who have received it are bound (unless in exceptional circumstances) to renew the mark, consisting of a bare circle on the crown of the head, at least once a month, otherwise they forfeit the privileges it carries. A very early origin has sometimes been claimed for the tonsure, but the earliest instance of an ecclesiastical precept on the subject occurs in can. 41 of the council of Toledo (633 A.D.): "omnes clerici, detonso superius capite toto, inferius solam circuli coronam relinquant." Can. 33 of the Quinisext council (692) requires even singers and readers to be tonsured. Since the 8th century three tonsures have been more or less in use, known respectively as the Roman, the Greek, and the Celtic. The first two are sometimes distinguished as the tonsure of Peter and the tonsure of Paul; in the latter the whole head was shaven, but when now practiced in the Eastern church this tonsure is held to be adequately shown when the hair is shorn close. In the Celtic tonsure (tonsure of St. John, or, in contempt, tonsure of Simon Magus) all the hair in front of a line drawn over the top of the head from ear to ear was shaven.

TONTINE. This system of life insurance owes its name to Lorenzo Tonti, an Italian banker, born at Naples early in the 17th century, who settled in France about 1650. In 1653 he proposed to Cardinal Mazarin a new scheme he had devised for promoting a public loan. His plan was to the following effect: A total of 1,025,000 livres [$197,825] was to be subscribed in ten portions of 102,500 livres each, by ten classes of subscribers, the first class consisting of persons under 7, the second of persons above 7 and under 14, and so on to the tenth, which consisted of persons between 63 and 70. The whole annual fund of each class was to be regularly divided among the survivors of that class, and on the death of the last individual the capital was to fall to the state. This plan of operations was authorized under the name of "tontine royale" by a royal edict, but this the parlement refused to register, and the idea remained in abeyance till 1689, when it was revived by Louis XIV., who established a tontine of 1,400,000 livres [$270,200] divided into fourteen classes of 100,000 livres each, the subscription being 300 livres [$57.90]. Although the classes were not quite filled, this tontine was carried on till 1726, when the last beneficiary died,—a widow who at the time of her decease was deriving from this source an annual income of 73,500 livres [$14,185.50]. Several other Government tontines were afterwards set on foot; but in 1763 restrictions were introduced, and in 1770 all tontines at the time in existence were wound up. Private tontines continued, however, to flourish in France for some years, the "tontine Lafarge" having been opened as late as 1791.

The tontine principle has often been applied in Great Britain, chiefly to the purchase of estates or the erection of buildings for which the necessary funds could not be procured by ordinary methods. The speculative element in the system has proved an attraction. The investor stakes his money on the chance of his own life or the life of his nominee enduring for a longer period than the other lives involved in the speculation, in which case he expects to win a large prize. The only thing which will serve to distinguish this from an ordinary lottery is the assumption that some may apply greater care or skill in the selection of lives than others of the players. The tontine principle is nearly the converse of ordinary life assurance, where it is the man who dies early who obtains an advantage for his heirs at the expense of the long liver. But it has been occasionally introduced into life assurance in the distribution of profits or surplus, and so far it tends to redress the inequalities of the original contract, the profits being assigned to the longest livers to a larger extent than in the common life assurance system. The tontine principle has been brought into considerable prominence by some American life offices (see INSURANCE, vol. xiii. p. 190). All that is wanted to make the system fair is that every one should understand that in order to secure a disproportionate share of profits in the event of his surviving and keeping up his policy he must make a corresponding sacrifice if he dies early or discontinues his insurance.

TOOKE, John Horne (1736–1812), an ardent politician and an erudite philologer, was the third son of John Horne, a poulterer in Newport Market, whose business the son, when a pupil at Eton with other boys of a more aristocratic position, in early life happily veiled under the title of a "Turkey merchant." He was born in Newport Street, Long Acre, Westminster, on 25th June, 1736. Some portion of his school days was passed, when he was about seven years old, in "an academy in Soho Square," and when three years older he went to a school in a Kentish village. For a time (1744–46) he was at Westminster School, but the greater part of his education was got at Eton, and then under private tuition, first at Sevenoaks in Kent (1753) and then at Ravenstone in Northamptonshire. In 1755 he was entered at St. John's College, Cambridge, and took his degree of B.A. in 1758, as last but one of the senior optimes, Beadon, his life-long friend, afterwards bishop of Bath and Wells, being among the wranglers in the same year. Strange to say, the object of all this care and expense found himself doomed to the drudgery of ushership at a boarding school at Blackheath, and the pleasures of his lot were not enhanced by his father's strongly expressed desire that he should take orders in the Church of England. A strange vacillation marked his career at this period, a vacillation probably due to a constant struggle between his own inclination and the wishes of his father. He was admitted to the diaconate of the church, and almost at the same time was entered at the Inner Temple. He studied for the bar for some time, mostly in the company of Dunning and Kenyon, and then was ordained as a priest of the national church by the bishop of Salisbury. After this event his father obtained for him the next presentation to the small vicarage of New Brentford, to which Horne was duly admitted, and he retained its scanty profits until 1773. During a part of this time he was absent on a tour in France, acting as the bear-leader of a son of the miser Elwes. To his credit be it said that while he resided at Brentford he discharged with exemplary regularity all the duties of his profession, and that, reviving a practice of the previous century, he studied medicine for the benefit of his poorer parishioners. Under the excitement created by the actions of Wilkes and the blunders of his ministerial opponents, Horne plunged into politics with consuming zeal. The newspapers abounded with his productions, but his chief effort was a scathing pamphlet on Lords Bute and Mansfield, setting out the "petition of an Englishman." In 1765 he again went abroad as tutor, and on this occasion he escorted to Italy the son of a Mr. Taylor, who lived near his Middlesex parish, a young man subject to fits of insanity. It was while passing through Paris on this tour that he made the personal acquaintance of Wilkes, and it was while at Montpellier, in January, 1766, that a letter addressed by Horne to Wilkes laid the seeds of that personal antipathy which afterwards grew so rapidly. In the summer of 1767 the travelled parson landed again on English soil, and, in spite of his latent distrust of the so-called "patriot," his exertions quickly obtained for Wilkes that seat for the county of Middlesex which ensured his fortune. Horne was deeply concerned in all the proceedings of the corporation of London in support of the popular cause, and he advised, if he did not actually draw up, the celebrated speech which Alderman Beckford addressed to his sovereign. As an incidental act in this struggle with the court and the majority of the House of Commons, Horne involved himself in a dispute with George Onslow, the member for Surrey, which culminated in a civil action, ultimately decided in Horne's favor, and in the loss by his opponent of his seat in parliament. An influential association, called "the Society for Supporting the Bill of Rights," was founded, mainly through the exertions of Horne, in 1769, but the members were soon divided into two opposite camps of the thick and thin partisans of Wilkes and of those who refused to be labelled by the name of any combatant, and in 1770 Horne and Wilkes broke out into open warfare. Into this controversy, carried on with that unflagging zeal which always springs from personal hatred, none will now care to enter; it benefited the fortunes of neither of the combatants, and it damaged the success of the cause for which they had both labored energetically. In 1771 Horne obtained at Cambridge, though not without some opposition from members of both the political parties, his degree of M.A., and in the same year he embarked on a more laborious and costly undertaking, that of vindicating the right of printing an account of the debates in parliament, in which, after a protracted struggle, between the ministerial majority and the civic authorities, the right was definitely established. The energies of the indefatigable parson knew no bounds. In the same year (1771) he crossed swords with Junius, and ended in disarming his masked antagonist. It is a curious corollary to this controversy that more than one speculator has identified him with Junius. Horne had now passed more than half the allotted span of life, and his only fixed income consisted of those scanty emoluments attached to a position which galled him daily. He resigned his benefice, and betook himself to the study of the law and to his studies in philology. An accidental circumstance, however, occurred at this moment which largely affected his future. His friend Mr. William Tooke had purchased a considerable estate south of the town of Croydon in Surrey, part of which seems to have consisted of Purley Lodge in Coulsdon. The possession of this property brought about frequent disputes with an adjoining landowner, and, after many actions in the law courts, the friends of Mr. Tooke's opponent endeavored to obtain, by a bill forced through the Houses of Parliament, the privileges which the law had not assigned to him. Horne thereupon, by a bold libel on the Speaker, drew public attention to the case, and, although he himself was placed for a time in the custody of the sergeant-at-arms, the clauses which were injurious to the interests of Mr. Tooke were eliminated from the bill through the publicity which his conduct had given to the matter. Mr. Tooke's gratitude knew no bounds; he declared his intention of making his friend the heir to his fortune, and, if the design was never carried into effect, Horne derived from the generous old man during his life-time large gifts of money. No sooner had this matter been happily settled than Horne found himself involved in a more serious trouble than any that had yet befallen him. For his conduct in signing the advertisement soliciting subscriptions for the relief of the relatives of the Americans murdered by the king's troops at Lexington and Concord, he was tried at the Guildhall in July, 1777, before Lord Mansfield, found guilty, and committed to the King's Bench prison in St. George's Fields, from which he only emerged after a year's durance, and after a loss in fine and costs, amounting to £1200 [$5832]. Soon after his deliverance, as he had thrown off, as he thought, his clerical gown, he applied to be called to the bar, but his application was negatived on the ground that his orders in the church were indelible. To return to the church was now impossible; and Horne tried his fortune, but without success, in farming some land in Huntingdonshire. Two tracts which were penned by him, one before and the other after his failure in practical life, exercised great influence in the country, one of them, criticising the measures of Lord North's ministry, passed through numerous editions; the other set out a scheme of reform which he afterwards withdrew in favor of that advocated by Pitt. On his return from his voluntary banishment in Huntingdonshire, he became once more a frequent guest at Mr. Tooke's house of Purley, and in 1782 assumed the name of Horne Tooke, which is now invariably assigned to him. In 1786 Horne Tooke conferred perpetual fame upon his benefactor's country house by adopting as a second title of his elaborate philological treatise of Ἔπεα Πτερόεντα, the more popular though misleading title of *The Diversions of Purley*. The treatise at once attracted attention in England and the Continent, was universally read by the vulgar as well as the learned, and, while its conclusions, if not always carrying conviction to the erudite, were deemed by them worthy of consideration as proceeding from a mind of extensive learning and singular acuteness, the fame given to Purley by the choice of the title gratified its owner. The first part was published in 1786, the second in 1805. The best edition is that which was published in 1829, under the editorship of Richard Taylor, with the additions written in the author's interleaved copy.

Between 1782 and 1790 Tooke gave his support to Pitt, and in the election for Westminster, a constituency in which Fox was vitally interested, he threw all his energies into the ministerial cause. With Fox he was never on terms of friendship, and Samuel Rogers, in his *Table Talk*, asserts that their antipathy was so pronounced that at a dinner party given by a prominent Whig not the slightest notice was taken by Fox of the presence of Horne Tooke. It was after the election of Westminster in 1788 that Tooke depicted the two rival statesmen in his celebrated pamphlet of *Two Pair of Portraits*. At the general election of 1790 he came forward as a candidate for that distinguished constituency in opposition to Fox and Lord Hood, but was defeated; and, though he again sought the suffrages of its voters in 1796, and his speeches at the hustings were never exceeded in ability, he was again at the bottom of the poll. Meantime the excesses of the French republicans had unhinged the minds of all sections of society in England, and the actions of the Tory ministry faithfully represented the feelings of the country. Horne Tooke was arrested early on the morning of 16th May, 1794, and conveyed to the Tower. His trial for high treason lasted for six days (October 17–23) and ended in his acquittal, the jury only requiring the short space of eight minutes to settle their verdict. The evidence which the crown could adduce in support of the charge proved to be of the slightest description, and the demeanor of the accused throughout the proceedings furnished abundant proofs of the resolution of his mind and the force of his abilities. His public life after this event was only distinguished by one act of importance. Through the influence of Lord Camelford, the fighting peer, he was returned to parliament in 1801 for the pocket borough of Old Sarum. No sooner was he returned to the House of Commons than Lord Temple endeavored to secure his exclusion on the ground that he had taken orders in the church, and one of Gillray's caricatures delineates the two politicians, Temple and Camelford, playing at battledore and shuttlecock, with Horne Tooke as the shuttlecock. The ministry of Addington would not support this suggestion, but a bill was at once introduced by them and carried into law, which rendered all persons in holy orders ineligible to sit in the House of Commons. The parliamentary life of the member for Old Sarum was preserved through one parliament, but at its expiration he was excluded for ever.

The last years of Tooke's life were spent in retirement in a house on the west side of Wimbledon Common, and there he was visited by the leading members of the party of progress. The traditions of his Sunday parties have lasted unimpaired to this day, and the most pleasant pages penned by his biographer describe the politicians and the men of letters who gathered round his hospitable board. His conversational powers rivalled those of Dr. Johnson; and, if more of his sayings have not been chronicled for the benefit of posterity, the defect is due to the absence of a Boswell. Through the liberality of his friends, his last days were freed from the pressure of poverty, and he was enabled to place his illegitimate son in a position which soon brought him wealth, and to leave a competency to his two illegitimate daughters. Illness seized him early in 1810, and for the next two years his sufferings were acute. He died in his house at Wimbledon on 18th March, 1812, and his body was buried with that of his mother at Ealing, the tomb which he had prepared in the garden attached to his house at Wimbledon being found unsuitable for the interment. An altar-tomb still stands to his memory in Ealing churchyard. A catalogue of his library was printed in 1813.

The *Life of Horne Tooke*, by Alexander Stephens, is written in an unattractive style, and was the work of an admirer only admitted to his acquaintance at the close of his days. Its main facts are reproduced with more brightness in an essay by Mr. J. E. Thorold Rogers in the second series of his *Historical Gleanings*. Many of Horne Tooke's wittiest sayings are preserved in the *Table Talk* of Samuel Rogers and S. T. Coleridge. (W. P. C.)

TOPAZ. It appears that the stone described by ancient writers under the name of τοπάζιος, in allusion to its occurrence on the island of Topazion in the Red Sea, was the mineral which we now know as the chrysolite or PERIDOTE (*q.v.*). The topaz of modern mineralogists was unknown to the ancients. Topaz occurs either crystallized, in association with granitic rocks, or in the form of rolled pebbles in the beds of streams. The crystals are orthorhombic prisms, with a perfect cleavage parallel to the base, or transverse to the long axis of the prism. This cleavage is recognized by the lapidary as the "grain" of the stone. It is notable that crystals of topaz are commonly hemimorphic; in other words, the prisms are terminated by dissimilar faces. This hemimorphism is associated with the property of pyroelectricity (see MINERALOGY, vol. xvi. p. 391). The chemical composition of the topaz has given rise to much discussion, but the mineral is now generally regarded as a silicate of aluminium associated with the fluorides of aluminium and silicon. When strongly heated it suffers considerable loss of weight. Brewster, examining the topaz microscopically, detected numerous fluid cavities, whence he concluded that it had been formed in the wet way. Two of the fluids obtained from these cavities have received the names of *brewsterlinite* and *cryptolinite*. Some of the finest topazes are almost colorless, and may be occasionally mistaken for diamonds. The topaz, however, is inferior in hardness; it lacks "fire;" and it becomes electric when heated—a property not possessed by the diamond. Colorless topazes are known to French jewellers as *gouttes d'eau*, and in Brazil as *pingas d'agoa*—names which refer to the limpidity of the stone—while in England they pass in trade under the curious name of *minas novas*. The beauty of the stone is best developed when in the form of a brilliant. The topaz is cut on a leaden wheel by means of emery, and is polished with tripoli. Colored topazes are usually either yellow or blue. The pleochroism of the stone is very marked: thus the color of the sherry-yellow crystals from Brazil is resolved by the dichroiscope into brownish-yellow and rose-pink. The color is unstable, the yellow topaz especially being liable to suffer bleaching by exposure to sunlight. Hence the fine series of crystals of Siberian topaz from the Kochscharow collection, now in the British Museum, is carefully protected from light by means of opaque pasteboard caps. In 1750 a Parisian jeweller named Dumelle discovered that the yellow topaz of Brazil, when exposed to a moderate heat, assumed a rose-pink color. It is generally believed that all the pink topaz occurring in jewellery owes its tint to artificial treatment. Formerly it was the practice to heat the stone in a sand-bath, but the change of color is now generally effected by wrapping the stone in German tinder, which is then ignited. This "burnt topaz" is sometimes known to jewellers as "Brazilian ruby." In like manner the blue topaz occasionally passes under the name of "Brazilian sapphire," and the pale green as "aquamarine"—a name which is strictly applicable only to the sea-green beryl. The largest known cut topaz is a fine brilliant, weighing 368 carats, and termed the "Maxwell Stuart topaz."

The topaz is occasionally found in Britain, but usually in small crystals unfit for jewellery. It occurs in granite at St. Michael's Mount in Cornwall, in Lundy Island, and in Arran, but the finest British specimens are obtained from the Highlands of Scotland. Ben-a-bourd, one of the Cairngorm group, yields good blue crystals. Topaz occurs in colorless and blue crystals in the granite of the Mourne Mountains in Ireland; and microscopic crystals are not uncommon in certain other granites. The famous topaz-rock of the Schneckenstein, in Saxony, yields pale yellow crystals of great beauty as mineralogical specimens, but not suited for cutting. The yellow Saxon topaz does not seem to change color on exposure to heat. Some of the finest topaz comes from near Odon Tchelon, in Siberia; while the well-known deep-yellow crystals of Brazil occur near Villa Rica (Ouro Preto). Fine topaz, pale blue and colorless, is found, as rolled crystals, in Tasmania and on Flinders Island in Bass's Strait. It also occurs in the tin-drifts of New South Wales; and beautifully-formed limpid crystals, of small size, accompany stream-tin at Durango, in Mexico. Fine topaz fit for jewellery has recently been worked at the Platte Mountain, near Pike's Peak, Colorado. One stone, weighing 125 carats, has been described as being "as fine a gem as America has produced of any kind" (Kunz, 1885). Topaz also occurs in cavities in rhyolite at Nathrop and Chalk Mountain, Colorado, and in trachyte near Sevier Lake, Utah. It is likewise found in Arizona, in New Mexico, and at Stoneham, Maine.

Oriental topaz is the name sometimes given to yellow corundum, a mineral which is readily distinguished from ordinary topaz by its superior hardness and density. The yellow and smoky varieties of quartz, or cairngorm, are often known in trade as *Scotch topaz*, but these are inferior to true topaz in hardness and in density. The chief differences between the three may be thus expressed:

	Scotch Topaz.	True Topaz.	Oriental Topaz.
Hardness..........	7	8	9
Specific gravity	2.6	3.5	4
Crystallization..	Hexagonal.	Orthorhombic.	Hexagonal.

TOPEKA, a city of the United States, the county seat of Shawnee county, and the capital of the State of Kansas, is situated (39° 3′ N. lat. and 95° 39′ W. long.) for the most part upon the south bank of the Kansas or Kaw river, upon a level prairie bench considerably elevated above the river. A small portion, known locally as North Topeka, lies upon the north side of the river. Besides the State capitol, which is an imposing building in the midst of an extensive park, the city contains the State insane asylum and the reform school. The Atchison, Topeka, and Santa Fé Railroad Company has its offices and workshops here, and the city is also intersected by a branch of the Union Pacific line. In 1860 Topeka had only 759 inhabitants; in 1870 the number had risen to 5790. In 1880 the population was 15,452 (8140 males and 7312 females); and in 1886 the number is returned at 25,005, making Topeka the second largest city in the State. The assessed valuation in 1886 was $6,547,079 and the debt of the corporation only $422,900.

TORCELLO, a small island 6 miles northeast of Venice, now almost deserted, but once a place of much importance. Torcello was one of the parent islands from which Venice was colonized, and possessed a cathedral church long before St. Mark's was founded. In the 11th century Torcello had already begun rapidly to decline. The existing cathedral of S. Maria is a building of the highest ecclesiological importance, unique in Europe as a perfect example of the arrangement of the choir in the 6th or 7th century, when the original cathedral was built, and, though most of the upper structure was rebuilt by Bishop Orseolo[1] about 1008, the plan of the church and the fittings of the choir still exist as they were originally designed. The church consists of a nave, with ten bays of arches on marble monoliths, and three aisles each terminated by an apse. Round the walls of the central apse are six tiers of seats for the officiating clergy, and in the centre, raised above the others, a marble throne for the bishop, approached by a flight of steps (see vol. iii. p. 361, Fig. 16). The high altar stood in front of the steps, and the celebrant stood with his back to the apse, looking over the altar towards the congregation. An exactly similar arrangement still exists in many of the early Coptic churches of Old Cairo: the church of Abu Sergeh is a specially perfect example.[2] When the church was reconstructed in 1008, Bishop Orseolo did not interfere with the older and then obsolete arrangements of the choir, but added a later choir, formed by marble screens, projecting three bays into the nave, with seats along three sides of the enclosure, —an arrangement like that which still exists in the church of S. Clemente in Rome (see ROME, vol. xx. p. 855). The present choir-stalls date from the 15th century. A fine marble ambo was at the same time placed outside the cancelli, and the position of the celebrant at the high altar was reversed. The vaults of the three apses are covered with fine glass mosaics, added probably in the 12th century: in the centre is a large figure of the Virgin, with the twelve apostles below; other mosaics cover the vaults of the aisle-apses and the whole entrance wall. The latter, much restored, has scenes of the Crucifixion, the Doom, and Heaven and Hell. The sculpture of the nave capitals and on the marble cancelli is very graceful work of Byzantine style, closely resembling similar panels at Ravenna. One remarkable peculiarity of this church is the marble shutter which closes each window on the right wall; these have pivots which revolve in projecting corbels—a very early method of closing windows of which very few examples still exist. Even when the shutters were closed some dim light passed through the semitranslucent marble slabs.[3] An octagonal baptistery, also built by Bishop Orseolo, stood outside the main entrance to the church, but has been rebuilt on a smaller scale. The crypt under the central apse of the cathedral is probably part of the original church, unaltered by any later changes.[4] The small church of S. Fosca, which is connected with the cathedral by a loggia, is also a building of exceptional interest, dating from the 10th century. It is purely Oriental in plan, and much resembles that of St. Mark's at Venice and S. Vitale at Ravenna, on a small scale. It has a cruciform nave, with a large dome supported on eight columns, and a projecting choir with three apses. Externally it is surrounded by a loggia, supported on marble columns with rich Byzantine capitals. S. Fosca was partially rebuilt in the 12th century, and has since been much modernized, but its original very interesting plan still remains but little changed.

TORGAU, a fortified town in the Prussian province of Saxony, is situated on the left bank of the Elbe, 30 miles northeast of Leipsic and 26 miles southeast of Wittenberg. Its most conspicuous building is the Schloss Hartenfels, on an island in the Elbe, begun in 1481 and completed in 1544 by the elector John Frederick the Magnanimous. This castle is one of the largest Renaissance buildings in Germany, and contains a chapel consecrated by Luther in 1544. The town-house is a quaint building of the middle of the 16th century, and there are several other large and fine buildings, chiefly modern. The parish church contains the tomb of Catherine von Bora, Luther's wife. The once flourishing weaving and brewing industries of Torgau have declined in modern times; but the town has manufactures of gloves and miscellaneous articles, and carries on trade in grain, etc., on the Elbe and by rail. The fortifications, begun in 1807 at Napoleon's command, are largely surrounded with water; they include a *tête-de-pont* at the end of the bridge across the Elbe. In 1885 the population was 10,988 (in 1783 4000), a large proportion of them soldiers.

---

[1] Son of the Venetian doge Pietro Orseolo I.

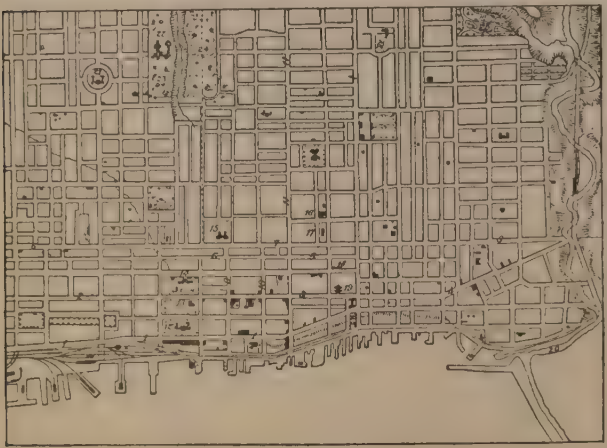
[2] See Middleton in *Archæologia*, vol. xlviii. p. 398.

[3] Similar marble slabs, not made to move, still exist in the apse windows of S Miniato, near Florence, and once existed in the basilica of S. Lorenzo fuori le Mura, Rome.

[4] The cathedral of Parenzo, in Istria, a work of the 6th century, much resembles the cathedral of Torcello (see vol. iii. p. 317, Fig. 17). Similar plans are also to be seen in many of the early churches of Syria (see De Vogüé, *Syrie Centrale*, Paris, 1865) as well as in the Coptic churches of Egypt.

Torgau is said to have existed as the capital of a distinct principality in the time of the emperor Henry I., but by 1305 it was in the possession of the margrave of Meissen. It was a frequent residence of the electors of Saxony. In Reformation times Torgau appears as the spot where John of Saxony and Philip of Hesse formed their league against the Roman Catholic imperial estates; and the Torgau Articles, drawn up here by Luther in 1530, were the basis of the Augsburg Confession. The Thirty Years' War inflicted great suffering on the town. In 1760 Frederick the Great defeated the Austrians in the neighborhood of Torgau. The town capitulated to Tauentzien on January 10, 1814, after a siege of three months.

TORONTO, the capital of the province of Ontario and the second largest city in the Dominion of Canada, is situated on a large and finely sheltered bay on the north shore of Lake Ontario, between the rivers Don and Humber. The magnetical and meteorological observatory, in the university grounds, stands at a height of 108 feet above the lake, and approximately 342 feet above the level of the sea, in lat. 43° 39′ 35″ N., long. 79° 23′ 39″ W. Toronto is 39 miles northeast of Hamilton, at the head of Lake Ontario, and 310 miles west-southwest of Montreal. The bay is formed by a peninsula or island about 6 miles long, enclosing a fine basin of 3.44 square miles, with a narrow entrance at the west end. This forms a safe and commodious harbor. The city stands on a thick deposit of boulder clay, overlying shaly sandstones of the Cincinnati or Hudson River group, practically equivalent in position to the Caradoc horizon of British geology. These thin-bedded sandstones crop out on the lake shore, and have been quarried for flagging and building purposes at the mouth of the Humber. In the northern part of the city the boulder clay is overlaid by stratified clays of the Post-Glacial age, largely used in the manufacture of bricks, of which many of the houses are built. The site slopes gradually from the margin of the bay for a distance of 3 miles to a terrace or ancient lake margin immediately outside the northern limits of the city, which occupies an area of 12.83 square miles, or of 17.99 square miles including the harbor and island. The streets cross each other at right angles. Yonge Street, the main thoroughfare running north and south, was constructed as a great military road in 1796, and extends under the same name, for upward of 30 miles, to Lake Simcoe. It constitutes the dividing line of the city, the streets being reckoned east or west according to their relation to it.



Plan of Toronto.

1. Front Street.
2. King Street (West).
3. King Street.
4 King Street (East).
5. Richmond Street.
6. Queen Street (West)
7. Queen Street.
8. Queen Street (East).
9. York Street.
10. Bay Street.
11. Yonge Street.
12. Parliament Buildings.
13. Governm't House.
14. Upper Canada College.
15. Osgoode Hall.
16. St. Michael's Cathedral.
17. Metropltn Church.

25. St. James Park.

The city is the seat of the provincial Government, with the official residence of the lieutenant-governor, the parliament buildings and Government offices, the courts of law, and the educational departmental buildings for Ontario. The provincial legislature occupies the old parliament buildings erected in 1849, when Toronto was the capital of Upper Canada; but they have long been recognized as inadequate for the purpose. Plans have accordingly been prepared, and the new buildings are now in process of erection. The site is in the centre of the Queen's Park, a finely wooded park of upwards of 30 acres, originally laid out for the provincial university, and on which the old buildings of King's College stood. The new university building occupies a fine site immediately to the west. It is an imposing structure, of great architectural beauty, in the Norman style, with a massive central tower. The buildings of the provincial school of practical science, and of the magnetical observatory, are also erected in the university grounds. The observatory is one of the meteorological stations established by the British Government, on the recommendation of the Royal Society, in 1840. It is now maintained by the Dominion Government.

The university, University College, and the school of practical science embrace in their conjoint teaching a comprehensive system of training in arts and science; and in them upwards of 500 students receive their training in arts, in the natural and applied sciences, and in engineering. There is also a medical faculty, reorganized under a recent Act, in conjunction with the department of science in the university. The university and college constitute unitedly the state institution maintained by public funds, and strictly secular. But it is surrounded with the theological and training colleges of different denominations in affiliation with it, the students of which pursue their undergraduate course in the university for a degree in arts. The affiliated colleges, some of which give degrees in divinity, include Knox College (Presbyterian), Wycliffe College (Church of England), St. Michael's College (Roman Catholic), Macmaster Hall (Baptist), and Victoria College (Methodist). Besides the provincial university and its affiliated colleges, Trinity College (Church of England) gives instruction in divinity and arts, and confers degrees in all the faculties. Toronto and Trinity medical schools occupy convenient buildings in the immediate vicinity of the general hospital, the Burnside lying-in hospital, and the Mercer eye and ear infirmary. The students in medicine number nearly 500, including a small number of lady students, for whom special instruction is provided. Upper Canada College, founded in 1829, is a provincial institution analogous to one of the great English public schools. It has about 300 students. The Collegiate Institute occupies a fine building immediately to the west of the horticultural gardens. It is the higher school, forming an important feature in the provincial system of education, and is maintained, along with the free public schools, from local taxes. Its students number 443, of whom 182 are females.

Osgoode Hall, the seat of the superior courts of law and equity, is an ornate Italian building, extended at various dates. The provincial asylum for the insane affords accommodation for upwards of 700 patients; it is surrounded with recreation grounds extending to 50 acres.

The city charities are numerous and well organized. The churches include some large and handsome buildings. Among the more important public buildings are those of the educational department, including a museum and gallery of art, normal and model schools; the custom-house, a fine Renaissance building, with extensive warehouses attached; and the post-office, also of tasteful architectural design. The free city library occupies a commodious building in Church Street, in addition to branch libraries in different parts of the city. It contains upwards of 47,000 vols. There are 35 city public schools, occupying large and commodious buildings, with 262 teachers and 20,213 children. The separate (Roman Catholic) schools number 13, with 60 teachers and 3792 children.

Toronto is the seat of many flourishing industries, including foundries, tanneries, furniture, stove, shoe, and other manufactories, flour-mills, breweries, etc. The site of the city is favorable to commerce. It is the centre of a rich agricultural district; and its harbor is of easy access to the largest vessels that navigate the lakes. It lies directly opposite the mouth of the Niagara river, distant 40 miles; and throughout the season of navigation well-appointed steamers maintain communication with the principal routes of travel in the United States and Canada. By means of the Grand Trunk, the Great Western, the Northern, the Canada Pacific, and other railways, it forms an important commercial centre for distribution; and it is the seat of the head offices of most of the banks and of the chief wholesale trade of western Canada. The direct route from the lower lakes to Lake Superior and the great Northwest is by the Northern Railroad to Georgian Bay, where lines of steamers maintain constant communication from Collingwood and Owen Sound to Prince Arthur's Landing and the railways to Manitoba and the Northwest.

In 1861 the population numbered 44,821; in 1871 it had increased to 56,092; in 1881 to 86,415; and in 1887 it is believed to amount to 140,000. The actual number on the assessment rolls is 111,800. The estimated value of real estate in Toronto is $105,000,000. The assessed value in 1886 was $83,556,811. The annual revenue of the city is estimated for 1887 at $1,812,941. The amount of customs duties for the fiscal year ending 30th June, 1887, was $4,273,038. The value of exports to the same date was $3,192,157, and of imports $21,020,528. The city returns three members to the Canadian House of Commons, and three to the provincial legislature of Ontario.

In the despatches of Canadian officials of Louis XIV. in the 17th century Toronto means the country of the Hurons, a region lying between Lake Simcoe and Lake Huron, about 40 miles north. The river Humber, which enters Lake Ontario immediately to the west of the Bay of Toronto, though navigable only for a short distance even by canoes, formed with its portages a line of communication between Lake Ontario and the Huron country. Hence the station near the mouth of the river became the common landing-place for trading and hunting parties bound for the region known of old as Toronto, and so received its name. A French trading post, built there in 1749, and originally named Fort Rouillé, after the French colonial minister Antoine Louis Rouillé, comte de Jouy, was familiarly known as Fort Toronto. The Northern Railway, the first one constructed in Upper Canada, followed the route of the old Indian trail, and established a direct line of communication, by means of steamers from Collingwood, with Lakes Huron, Michigan, and Superior. The railway passes through a fine agricultural country, and is now extended into the Muskoka and Nippitsing districts, bringing an extensive lumbering region into direct communication with Toronto.

The site for the town was surveyed in 1793 by Surveyor-General Bouchette, under the instruction of the lieutenant-governor, General Simcoe; and in his narrative of the original survey Bouchette describes the untamed aspect of the scene, with the group of wigwams of a little band of Mississaga Indians who constituted the sole occupants of the land; while the waters of the bay and the neighboring marshes were the haunts of innumerable coveys of wild-fowl. The first parliament of Upper Canada held its second session in May, 1793, at the town of Newark, at the mouth of the Niagara river; but in the following August the seat of government was transferred to Toronto, to which General Simcoe gave the name of York, in honor of the duke of York, the second son of George III. Under its new name the embryo metropolis slowly progressed as the surrounding country was cleared and settled. The entrance to the harbor was guarded by two block houses; provision was made for barracks and garrison stores; buildings were erected for the legislature; and there the members of parliament, summoned by royal proclamation to "meet us in our provincial parliament in our town of York," assembled on the 1st of June, 1797. Sixteen years later the population numbered only 456. The town was twice sacked in the war of 1812. General Dearborn captured it at the head of a force of upwards of 2000 drawn from the neighboring States. On their advance to the outworks of the garrison, the magazine of the fort exploded, whether by accident or design, killing many of the invaders. The halls of legislature and other buildings were burnt, and the town pillaged. On the restoration of peace the work of creating a capital for Upper Canada had well nigh to begin anew. But the city advanced with the general progress of the country. Trade centred in the little capital; the population increased; and needful manufactures were established. The organization of Upper Canada College in 1830, with a staff of teachers nearly all graduates of Cambridge, gave a great impetus to the city and province. In 1834 the population of York numbered fully 10,000; and an Act of the provincial legislature conferred on it a charter of incorporation, giving it for the first time an efficient system of municipal government, with a mayor, aldermen, and councilmen, entrusted with the administration of its affairs. Under this charter it was constituted a city, with the name of Toronto. (D. W.)

TORPEDO. Torpedoes may be briefly described as charges of some explosive agent, inclosed in water-tight cases, and moored or propelled under water at such depths that by their explosion they may sink or seriously damage a vessel in their vicinity. The use of torpedoes in naval warfare was proposed and even attempted in the end of the last and beginning of the present century, but no successful application of them was made until the American Civil War of 1861–64. The word "submarine mine" is generally substituted for "torpedo" when speaking of defensive or stationary mines, the latter term being reserved for locomotive torpedoes, or others used in offensive operations.

1. *Submarine Mines.*—Submarine mines are divided into three classes: (1) observation mines, fired by an electric current when the enemy is observed to be within the destructive area of the mine; (2) electro-contact mines, which, when struck, fire by automatically completing the electric circuit from the battery ashore; (3) mechanical mines, which, when struck, fire through the action of some contrivance within themselves, and are not connected with the shore. Mines of the first class are used in places where a channel has to be kept clear for screw steamers to pass, the second class in those parts of the channel where there is little traffic, and the third class in channels which it is intended to bar equally against friend or foe.

Electrical mines have the advantage over mechanical that by the removal of the firing battery the passage of a ship is rendered perfectly safe, and that the condition of the mine can be ascertained by electrical tests, but the electric cables are liable to damage, and add greatly to the expense of the defence.

Gun-cotton and dynamite are the explosives generally used in mines, the charges varying from 30 ℔ to 500 ℔, according to the description of mine. In all mines the charge is exploded by means of a detonator containing fulminate of mercury. In mines loaded with gun-cotton the detonator is inserted in a priming charge of dry gun-cotton, this priming charge being in a metal case, closely surrounded by the wet gun-cotton comprising the remainder of the charge. Where dynamite is employed the priming charge is not necessary. Experiments made to determine the horizontal distance at which an ironclad will be vitally injured by different charges have yielded the following general results:

Charge.	Submergence.	Distance.
150 ℔ mine	10 to 15 ft.	4 ft.
250 ℔ ground mine	30 ft.	10 ft.
500 ℔ ground mine	60 ft.	15 ft.

The explosion of 500 ℔ of gun-cotton at a horizontal distance of 30 feet would seriously injure a vessel, and 30 ℔ in contact with the bottom below the armor would probably blow a hole through the outer and inner skin. The depths given above are approximately the best depths to get the fullest effect out of the charges mentioned. When the water is so deep that if the mine were placed on the bottom it could not exert its full destructive effect on the bottom of a ship, it is given enough buoyancy to allow it to float above its moorings,—a mine on the bottom being termed a "ground mine," and a mine floating above its moorings a "buoyant mine."

If mines are placed too close together the explosion of one will damage those near it, the interval which must be left between them being—for a 100 ℔ mine, 100 feet; for a 250 ℔ mine, 250 feet; and for a 500 ℔ mine, 300 feet. There is therefore always a possibility of a ship passing through a single line of mines without coming within the destructive area of any. Mines are therefore generally arranged in two or more lines, the mines of one line covering the spaces left between the mines of the next, or several mines may be laid close together, and the whole exploded simultaneously.

The electric circuit of all electrical mines is very similar. A voltaic battery ashore has one pole put permanently to earth and the other pole joined to the electric cable leading to the mine. This cable passes into the mine case through a water-tight joint, and is connected up to one pole of the electric detonator, the other pole of the detonator being connected to the mouth-piece of the mine and consequently to earth. To prevent the mine being fired until the proper moment has arrived, this circuit must be broken somewhere, and means provided for completing it when the mine is to be fired. In the case of observation mines this is done by inserting a firing key in the electric cable near the battery, and in electro-contact mines by a circuit closer in the mine.

Observation mines.

The right moment to fire an observation mine is determined by two observers ashore, who have each adjusted two sights in line with the mine, as it was lowered into position,—the stations for these observers being chosen so that their lines of sight may be as nearly as possible at right angles to each other. The electric cable from the mine is led past both observers and connected to a firing battery, one pole of which is put permanently to earth. A firing key inserted in the circuit at the station of each observer renders the simultaneous pressure of both keys necessary to explode the mine. If each observer depresses his firing key as the centre of the enemy crosses his own line of sight, both keys can only be pressed simultaneously if the enemy arrives at the intersection of the two lines of sight, and consequently over the mine. When many mines are placed in one channel, it is usual to moor them in three lines, the prolongation of each line converging to an observing station, where the direction of each line is marked by sights. The electric cables from all the mines come to another observing station, and are there connected to separate firing keys, each of which has one pole joined up to a firing battery. The observer at this station is also provided with a separate sight marking the direction of each mine in all the lines. The former station is termed the "converging" and the latter the "firing" station. The observer at the converging station telegraphs to the firing station the instant at which the centre of the enemy is on one of the lines of mines, the observer at the firing station determining by means of his sights which individual mine the enemy is over, and he can fire it by pressing the corresponding key.

Instead of separate sights for each mine, observing arcs may be used. These instruments are furnished with a telescope, which can be constantly directed on the enemy, a bar attachment automatically closing the circuit when the direction of the enemy corresponds to a mine. The camera obscura has also been used for determining the position of an enemy in the mine field.

Electro-contact mines.

Electro-contact mines are buoyant mines moored about 10 feet below the surface, and are in connection with an electric battery ashore. They are arranged to explode on being struck by a passing ship, by means of an apparatus contained in the mine itself, called a circuit closer. Many different kinds of circuit closers are in use, but they all depend upon there being a break in the electric circuit while the circuit closer is at rest, the circuit closer completing the circuit when the mine receives a blow. That most commonly used (Fig. 1) consists of a steel spindle *a* carrying a weight *b* on its upper end. This steel spindle carries an insulated brass ring *c*, to which the wire from the detonator *d* is attached, the other pole of the detonator being connected to the cable *e* leading to the electric battery. On the mine being struck the inertia of the weight causes the steel rod to vibrate sufficiently to bring the insulated ring in contact with brass springs in connection with the earth, thus completing the circuit of the electric battery through the detonators. Another form of circuit closer is a tube of mercury, which by splashing up when the mine is struck completes the electric circuit between two previously insulated points.

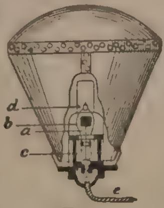

FIG. 1.

A single main cable from the battery may have several electro-contact mines attached to it; the expense of leading a separate wire from each mine to the battery is therefore avoided. If one mine was fired the broken end of its branch wire from the main cable would be left in the water, and on another mine being struck it would only receive a portion of the current, as the battery would be connected to earth through the broken branch. Each branch wire must therefore have a disconnector in circuit, clear of the explosion. The disconnector consists of a platinum wire fuse contained in a strong iron case, and the same current which fires the detonator in the mine fuses the platinum wire bridge of the disconnector, and the circuit to the broken branch remains insulated.

Mechanical mines.

Mechanical mines, of which there are many different patterns contain the means of ignition within themselves, and are unconnected with any apparatus ashore. They may be ignited by percussion, friction, chemical action, and electricity.

A simple form of mechanical mine has a heavy top, which, on being pushed off by a passing ship, either pulls out a pin and releases a plunger, which is then forced by a powerful spring into a detonator, or a friction tube is fired when the weight falls on a line attached to it. Another form, known as Abel's mechanical exploder, consists of a glass tube containing sulphuric acid, and surrounded by chlorate of potash and sugar. The whole is contained in an india-rubber tube, which projects from the top of the mine, the lower end being in communication with the charge. When struck, the india-rubber bends, and, the glass tube breaking, the sulphuric acid mixes with the chlorate of potash and sugar and inflames the charge.

Electro-mechanical mines.

Electro-mechanical mines can be made by placing a voltaic battery inside the mine itself and joining it up to a fuse and circuit closer, the circuit closer completing the circuit when the mine is struck. Another form of electro-mechanical mine (Fig. 2) has several projecting horns (*a*, *a*, *a*) of lead tubing. Inside each horn is a glass tube containing bichromate of potash, and immediately under it a row of small zinc and carbon plates, *b*, in a containing cell. On any one of the lead horns being bent, the glass tube is broken, and the bichromate of potash drops into the

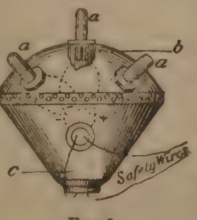

FIG. 2.

cell, converting the arrangement into a voltaic battery, which, being already connected to the electric fuse, *c*, fires the mine.

All mechanical and electro-mechanical mines are provided with some contrivance to guard against accidental explosion during the process of laying. In mechanical mines a safety-pin can be withdrawn after the mine is in position, or, in the case of Abel's exploder, the projecting tube is surrounded by iron segments which fall off when the mine is in position. In electro-mechanical mines two of the wires forming part of the circuit inside the mine may be brought through to the outside and kept apart till the mine is in position, these wires being long enough to allow of the operator retiring clear of the explosion before joining them up and rendering the mine dangerous.

Mechanical mines have the advantage over electrical that they require fewer trained men for their manipulation, are cheaper, and can be placed in position very rapidly. But no really efficient method has yet been devised that will ensure a mechanical mine, after it has been placed in position, being safely taken up again for examination or removal, nor can any tests be applied to as certain if it remains in an efficient condition.

Counter-mining.

All mines, especially those with electric cables attached, must be protected by gun fire or guard boats, as, if the mine field is unprotected, they can be easily destroyed by countermining or creeping. Countermining is carried out by exploding a succession of charges in an enemy's mine field. Mines containing heavy charges would be used for the purpose, several of these mines being dropped in succession from a boat towed by a fast steamer, the whole line being exploded together as soon as the last mine had been dropped. Numerous experiments have proved that the explosion of a 500 ℔ mine will effectually destroy any mine within a radius of 100 feet; the countermines would therefore be dropped at double this distance apart, and the channel so cleared marked by buoys. Electric cables can also be caught and raised to the surface by grapnels or the grapnel may have a case of explosive between its arms, so that, instead of raising the wire, it may be cut by firing the charge.

2. *Locomotive Torpedoes.*—Locomotive torpedoes are a numerous class, the principal being the Whitehead, Lay, Sims, Brennan, and Ericsson. The Whitehead is the only one which can be considered a well-developed naval weapon.

Whitehead torpedo.

This torpedo (Fig. 3) is made in different sizes, varying from 12 feet to 19 feet in length and from 12 to 15 inches in diameter; the cross section is circular, tapering to a point at each end. It is capable of being so adjusted that on being discharged it will travel at any depth between 5 and 15 feet below the surface, and it will maintain this depth for its entire run. The torpedo travels at a uniform speed for the whole of its range, the speed and range varying for different patterns; the latest type has a speed of 24 knots for 600 yards. The torpedo can be set so that, in the event of its not striking the ship aimed at, it will stop at the end of its range and sink. For exercise it can be set to stop at any distance within the limits of its range, rise to the surface, and float. The torpedo is divided into several compartments. The foremost, A, contains a charge of from 30 to 100 ℔ of gun-cotton, according to the size of the torpedo. This charge is fired on the torpedo striking a ship by a pistol which screws into the nose of the torpedo. On impact the point of the pistol is driven inwards and forces the point of a steel striker into a detonator. By means of powerful air-pumps air is compressed into the air-chamber B to a pressure of 1000 ℔ on the square inch, and actuates a three-cylinder engine, which drives two propellers revolving in opposite directions in the tail. The mechanism in the balance chamber C works two exterior rudders on each side of the tail, which keep the torpedo at a uniform depth during its run. This device has never been patented, but is a secret; the details of it, however, have been purchased by all prominent maritime nations.

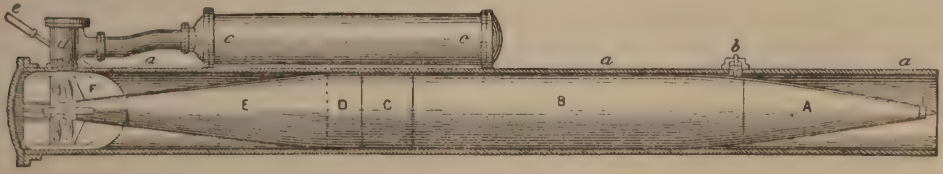

Fig. 3.—Whitehead Torpedo.

The tail F is fitted with four broad fins, which tend to keep the torpedo on a straight course and prevent it rolling. The horizontal tail fins carry four rudders, two horizontal and two vertical. The horizontal rudders worked from the balance-chamber keep the torpedo at its set depth; the vertical rudders are permanently adjusted so as to cause the torpedo to travel in a straight line.

The air-chamber of a torpedo is usually made of fluid compressed steel, the remaining compartments of thin steel plate, and the interior mechanism of phosphor-bronze. In Germany torpedoes are now made entirely of phosphor-bronze.

The torpedo can be discharged from above or below water. From above water it is shot out of an air-gun (Fig. 3) mounted on the deck of a ship and pointing through the side. The air-gun consists of a metal tube *a*, *a*, *a*, of the same length as the torpedo, the rear end being closed by an air-tight door. The gun carries a reservoir *c* of compressed air, the contents of which, by means of a suitable firing valve *d*, can be instantaneously admitted into the gun. When the torpedo is to be discharged this firing valve is opened, and the compressed air in the reservoir forces the torpedo out at a high velocity, a tripper *b* projecting through the top of the gun throwing back the starting lever of the torpedo on its way out. From below water the torpedo is discharged through a tube, the muzzle of which forms part of the stem of the ship, the tube being fitted with an outside valve which prevents the water from entering while the torpedo is placed in the tube. Latterly powder has been used instead of compressed air for the ejecting force.

Lay torpedo.

The Lay torpedo is a boat of cylindrical form, the fore part being charged with an explosive. The motive power is carbonic acid gas generated in the usual way. As only a very small portion of the boat is visible on the surface, two guide rods, one on each end of the vessel, mark its position at any part of its run. The boat can be started, stopped, and steered by means of electric cable, containing several insulated wires, which is paid out from the boat as it travels.

Sims torpedo.

The Sims torpedo is cigar-shaped, and is suspended to a boat-shaped float. The torpedo is propelled by screws driven by an electric motor situated in the body, the current for which is supplied from a dynamo ashore. The electric cable is coiled on a drum in the torpedo, and pays out as the torpedo advances. The torpedo is also steered from the shore by an electric current. Its speed is about 12 knots.

Brennan torpedo.

The principle of the Brennan torpedo is as follows. The torpedo contains two drums upon which a large amount of pianoforte wire is wound. One end of the wire from each drum is taken to large drums ashore, which are revolved by a steam-engine. By winding up on the large drums ashore a rotary motion is imparted to the drums in the torpedo, which by means of gearing revolve two screw propellers, and these drive the torpedo through the water. The torpedo can be steered from the shore in any direction, by winding on one drum faster than the other, whjch alteration in motion moves a vertical rudder on the torpedo.

Ericsson torpedo.

The Ericsson torpedo is a long fish-shaped weapon, made of wood, and weighted so as to have little or no buoyancy. The charge is contained in a metal case at the fore end. It is propelled by a charge of gunpowder, out of a submarine gun fixed in the bows of a ship. Its range is about 300 feet, and it fires on impact.

Outrigger, drifting, and towing torpedoes.

Outrigger, Drifting, and Towing Torpedoes.—Before the introduction of the Whitehead, vessels armed with torpedoes were principally supplied with the outrigger torpedo. The explosive is contained in a metal case secured to the end of a steel or wooden pole, which lies fore and aft in the vessel carrying it. The pole can be rigged out until the torpedo is submerged a short distance ahead of the vessel, and is fired on contact with the enemy's side, either by an operator in the boat completing the electric circuit, or by the circuit being completed by a circuit closer in the torpedo. In rivers, or places with a current, drifting torpedoes can be used. They should be suspended from floats, and arranged in groups or pairs connected together by a rope, so that they may catch across the bows of a vessel at anchor. They can be fired after a given lapse of time by clockwork and other devices, or can be so arranged that the firing arrangement is released on a catch being withdrawn by the action of a propeller wheel, which remains stationary as long as the torpedo drifts with the current, but is revolved by the force of the current when the torpedo is stopped. Towing torpedoes are constructed to diverge from either side of the ship, when towed, which is effected by shaping the torpedo like an otter. The torpedo tows on the surface, and, on striking a ship's side, the head containing the charge drops off, and fires as its weight tautens a line connecting it to the body.

Torpedo boats.

Torpedo Boats.—The great improvements made of late years in machine guns have rendered the outrigger and towing torpedo of little value for torpedo boats as it would be almost impossible to approach a vessel near enough to use them before the boat would be destroyed by the storm of missiles which would be fired at her. All torpedo boats under construction, and most of those already completed, are therefore armed with the Whitehead torpedo. A modern torpedo boat is built entirely of steel, the plates often not exceeding $\frac{1}{8}$ inch in thickness, as, in order to get the necessary high speed, the minimum of weight consistent with the necessary strength is of the first importance. There are three classes of boats, known as first, second, and third. The first are capable of keeping the sea on their own account; the second are for harbor defence; and the third can be carried on board a ship.

The following table gives the dimensions and other details of a boat of each type:

Type of Boat	Length.	Beam.		Displacement.	Full Speed in Knots.	Indicated Horse-Power at Full Speed.	Boiler Pressure, ℔ per Square Inch.	Distance Boat can steam with Coal carried at	
								Full Speed.	Half Speed.
	Ft.	Ft.	in.	Tons.				Knots.	Knots.
1st class............	135	13	0	88	23	1150	140	400	2000
2d class............	86	11	0	30	20	450	125	150	400
3d class............	64	7	6	12.5	16.5	150	120	100	250

The boilers and machinery are protected by coal, and an armored tower protects the steering gear and telegraphs for controlling the engines.

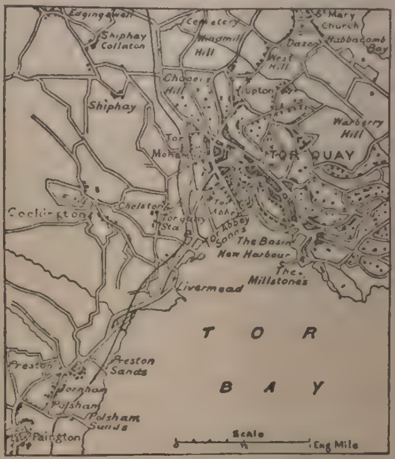
Torpedo nets.

Torpedo Nets.—The introduction of the modern torpedo boat has caused great attention to be paid to any means which will protect a ship from the torpedo. Most nations are adopting steel-wire netting, suspended from booms attached to the ship's side, the booms keeping the nets sufficiently far off to prevent any damage being done to the bottom by the explosion of the largest charge carried by a Whitehead. This netting, besides being cumbersome and heavy, cannot be used unless the ship is stationary or nearly so, so that in many cases it would be useless, but for ships at anchor it is of great value. Increased cellular subdivision is also being given to ships under construction, and special vessels, called "torpedo catchers," are being built by most nations. A torpedo catcher is a vessel of superior size and strength, but with the same high speed as a torpedo boat, the principal arm of the torpedo catcher being machine guns.

(E. P. G.)

TORQUATUS. See MANLIUS.

TORQUAY, a watering-place of England, is finely situated on the northern recess of Tor Bay, Devonshire, and on the Dartmouth and Torbay branch of the Great Western Railway, 12 miles north of Dartmouth, 23 south of Exeter, and 220 west-southwest of London. Owing to the beauty of its site and the equability of its climate, it is the favorite watering-place of Devon, and, being screened by lofty hills on the north, east, and west, and open to the sea breezes of the south, it has a high reputation as a winter residence. The temperature seldom rises as high as 70° in summer or falls below freezing point in winter. The lower ground is occupied by shops, hotels, and the plainer class of houses, while mansions and villas occupy the picturesque acclivities of the well-wooded limestone cliffs, commanding a great variety of fine views. There are still some remains of the original Torre abbey, founded for Præmonstratensians by William, Lord Brewer, in 1196. They stand to the north of the modern mansion, but, with the exception of a beautiful pointed-arch portal, are of comparatively small importance. On the south of the gateway is an old 13th-century building, known as the Spanish barn. On Chapel Hill are the remains of a chapel of the 12th century, dedicated to St. Michael, supposed to have formerly belonged to the abbey. St. Saviour's parish church of Tor-Mohun, or Tormoham, an ancient stone structure, was restored in 1874. The old church at St. Mary Church, to the north of Torquay, has been rebuilt in the Early Decorated style; and in 1871 a new tower was also erected as a memorial to Dr. Phillpotts, bishop of Exeter, who with his wife is buried in the churchyard. St. John's church, by Street, is a very fine example of modern Gothic. Among the principal secular buildings are the town-hall with square tower (1852), the post-office (1865), the museum of the natural history society (1874), the theatre and opera-house (1880), the county police court, the market, and the schools of art and science (extended in 1887). There are a number of benevolent institutions, including the Torbay infirmary and dispensary (1843), the homœopathic dispensary (1848), the Western hospital for consumption (1852), Crypt House institution for invalid ladies (1854), and the Mildmay home for incurable consumptives (1886). In 1886 the local board purchased from the lord of the manor, at a cost of £85,000 [$413,100], the harbors, piers, baths, assembly rooms, etc., including 60 acres of pleasure grounds and open spaces. The town is supplied with water from the Dartmoor hills, 16 miles distant, at a cost of £120,000 [$583,200]. There is a convenient harbor, extended in 1870 at a cost of £70,000 [$340,200], and having a depth of over 20 feet



Environs of Torquay.

at low water. The principal imports are coals, timber, and slates, and the principal exports are stones of the Transition limestone or Devonshire marble, which is much valued for building purposes. In the town are a number of marble-polishing works. Terra-cotta ware of very fine quality is also manufactured from a deposit of clay at Watcombe and at Hele. The population of the urban sanitary district (Tormoham with Torquay, area 1465 acres) in 1871 was 21,657, and in 1881 it was 24,767.

There was a village at Torre even before the foundation of the abbey, and in the neighborhood of Torre are remains of Roman occupation. The manor was granted by William the Conqueror to Richard de Bruvere or de Brewere, and was subsequently known as Tor Brewer. After the defeat of the Spanish Armada, Don Pedro's galley was brought into Torbay; and William, prince of Orange, landed at Torbay 5th November, 1688. The bay was a rendezvous for the British fleet during the war with France, and the first good houses at Torquay were built for the officers. Until half a century ago it was an insignificant fishing village.

See Blewitt's *Panorama of Torquay*, 1832, and White's *History of Torquay*, 1878.

TORQUEMADA, Juan de (1388–1468), or rather Johannes de Turrecremata, cardinal, was born at Valladolid in 1388, and at an early age joined the Dominican order, early distinguishing himself for learning and devotion. In 1415 he accompanied the general of his order to the council of Constance, whence he proceeded to Paris for study, and took his doctor's degree in 1423. After teaching for some time in Paris, he became prior of the Dominican house first in Valladolid and then in Toledo. In 1431 Pope Eugenius IV. called him to Rome and made him "magister sancti palatii." At the council of Basel he was one of the ablest and most prominent supporters of the view of the Roman curia, and he was rewarded with a cardinal's hat in 1439. He died in 1468.

His principal works are *In Gratiani Decretum Commentarii*, 4 vols., Venice, 1578; *Expositio Brevis et Utilis super Toto Psalterio*, Mainz, 1474; *Quæstiones Spirituales super Evangelia Totius Anni*, Brixen, 1498; *Summa Ecclesiastica*, Salamanca, 1550. The last-named work has the following topics: (1) De Universa Ecclesia; (2) De Ecclesia Romana et Pontificis Primatu; (3) De Universalibus Conciliis; (4) De Schismaticis et Hæreticis.

TORQUEMADA, Tomas de, inquisitor-general for Castile and Leon, was born early in the 15th century, and died in 1498. When called to the work with which his name is so unenviably associated he was prior of the Dominican house in Segovia. See Inquisition.

TORRE ANNUNZIATA, a town of Italy, in the province of Naples, 12½ miles southeast from that city, on the Bay of Naples, at the southern base of Vesuvius. The inhabitants are mainly occupied in fishing and in a brisk coasting trade; there are also manufactures of arms, paper, and macaroni. The population in 1881 was 20,060.

TORRE DEL GRECO, a town of Italy, in the province of Naples, 7½ miles to the southeast of that city, lies at the southwest foot of Vesuvius, on the shore of the Bay of Naples. It is built chiefly of lava, and stands on the lava stream of 1631, which destroyed two-thirds of the older town. Great damage was done by the eruptions of 1737 and 1794, when immense streams of lava flowed through the town into the sea; the earthquake of 1857 and the eruption of December 8, 1861, were even more destructive. After each disaster the people have returned and repaired the ruin, the advantage derived from the rich land on the flanks of the volcano and the proximity to the sea and to Naples being more than enough to overcome apprehensions of danger. In the outskirts are many beautiful villas and gardens. The inhabitants are largely employed in fishing (tunny, oyster, sardine, and especially coral), and the neighborhood is famed for its fruit and wine. The population in 1881 was 21,588.

TORREY, John (1796–1873), a distinguished American botanist, was a member of an old New England family which contributed several officers to the War of Independence. He was born at New York [15th August], and spent his school days there, save for the concluding year at Boston. When he was 15 or 16 years of age his father received a prison appointment at Greenwich, and there he made the acquaintance of Amos Eaton, one of the foremost pioneers of natural history studies and popular science teaching in America. He thus learned the elements of botany, as well as something of mineralogy and chemistry, so determining the studies of his life. In 1815, he commenced the study of medicine, meanwhile finding time to prepare his first catalogue of plants, and to establish a correspondence with American and foreign botanists, and in 1818 he commenced practice.[1] Stimulated by Elliott's account of the flora of South Carolina and Georgia, Torrey commenced a systematic account of the botany of the Northern States, of which the first and only volume appeared in 1824. In the same year he obtained the chair of chemistry and geology at West Point Military Academy, whence he was translated three years later to the chemical professorship in the College of Physicians, New York. He next described the collections of the first exploration of the Colorado Territory, so laying the foundation of all subsequent work upon the flora of the Rocky Mountains. In these years he also monographed the sedges, and did good service in substituting the natural for the Linnæan system. In 1836 he was appointed botanist to the State of New York, producing his *Flora* of the State in 1843; while from 1838–43 he carried on the publication of the earlier portions of *Flora of North America*, with the assistance of his pupil Asa Gray. Becoming more and more immersed in chemical labors, which from 1857 passed partly and soon completely into those of U. S. assayer, he notwithstanding continued to accumulate and work up masses of material for this vast undertaking, which still awaits completion at the hands of his colleague and successor, Prof. Gray. He evinced a continued interest in botanical teaching, and made over his valuable herbarium and library to Columbia College two or three years before his death. He will be remembered not only as the father of American systematic botany, and an accurate and faithful, if somewhat excessively cautious, investigator, but also as an eminent teacher, and for an excellence of personal character and simplicity of beliefs much resembling Faraday's. His memory is literally kept green by the beautiful Coniferous genus *Torreya*, and his labors commemorated and continued in the valuable memoirs of the Torrey Botanical Club.

See Gray, in *Sillimian's Journal*, 1873.

TORRICELLI, Evangelista (1608–1647), physicist and mathematician, was born at Faenza, October 15, 1608. Left fatherless at an early age, he was carefully educated under the care of his uncle, a Camaldolese monk, who in 1627 sent him to Rome to profit by the scientific teachings of Benedetto Castelli. The perusal of Galileo's *Dialoghi delle Nuove Scienze* (1638) inspired his fertile mind with many fresh developments of the new mechanical principles there set forth, which he embodied in a treatise *De Motu* (printed amongst his *Opera Geometrica*, 1644). Its communication by Castelli to Galileo in 1641 led to the adoption as a disciple by the Florentine sage of one who seemed not unworthy to become his successor. Torricelli accordingly, repairing to Florence, October 10, 1641, resided with Galileo, and acted as his amanuensis during the three remaining months of his life. On its close his contemplated return to Rome was anticipated by his nomination as grand-ducal mathematician and professor of mathematics in the Florentine academy. The discovery which has perpetuated his fame was made in 1643. Galileo had failed to perceive why water refuses to rise above 33 feet in a closed tube. It occurred to Torricelli to try the experiment in a more compendious form. The anticipated result ensued that the suspended column of mercury was shorter than that of water in the proportion of its greater specific gravity. He immediately concluded both to be sustained by atmospheric pressure, and constructed the "siphon-barometer" expressly for the purpose of measuring its fluctuations. By this momentous discovery the obscure notion of a *fuga vacui* was banished from physical science, and its progress most notably quickened. The mercurial barometer was long known as the "Torricellian tube," and the vacuum it includes is still designated the "Torricellian vacuum."

---

[1] [While yet a student at the College of Physicians and Surgeons (N. Y.), he helped to found the N. Y. Lyceum of Natural History, of which he was long president.—Am. Ed.]

The publication amongst Torricelli's *Opera Geometrica* (Florence, 1644) of a tract on the properties of the cycloid involved him in a controversy with Roberval, who accused him of plagiarizing his earlier solution of the problem of its quadrature. There seems, however, no room for doubt that Torricelli's was arrived at independently. The matter was still in debate when he was seized with fever and pleurisy, and died at Florence, after twenty days' illness, October 25, 1647, at the age of 39. He was buried in San Lorenzo, and a commemorative statue of him erected at Faenza in 1864. He was of a singularly amiable disposition, and possessed qualities the most felicitous for the investigation of nature. Among the new truths detected by him was the valuable mechanical principle that if any number of bodies be so connected that, by their motion, their centre of gravity can neither ascend nor descend, then those bodies are in equilibrium. He also discovered the remarkable fact that the parabolas described (in a vacuum) by indefinitely numerous projectiles discharged from the same point with equal velocities, but in all directions, are situated within a paraboloid which is a tangent to all of them. His theorem that a fluid issues from a small orifice with the same velocity (friction and atmospheric resistance apart) which it would have acquired in falling through the depth from its surface is of fundamental importance in hydraulics. He greatly improved both the telescope and microscope, and invented the simple microscope composed of a globule of melted glass. · Several large object lenses, engraven with his name, are preserved at Florence. He used and developed Cavalieri's method of indivisibles.

A selection from Torricelli's manuscripts was published by Tommaso Bonaventura in 1715, with the title *Lezioni Accademiche* (Florence). They include an address of acknowledgment on his admission to the Accademia della Crusca. His essay on the inundations of the Val di Chiana was printed in *Raccolta d'Autori che trattano del Moto dell' Acque* (vol. iv. p. 115, Florence, 1768) and amongst *Opuscoli Idraulici* (vol. iii, p. 347, Bologna, 1822). For his life, see Fabroni, *Vitæ Italorum*, vol. i. p. 345; Ghinassi, *Lettere fin qui Inedite di Evangelista Torricelli* (Faenza, 1864); Tiraboschi, *Storia della Lett. It.*, vol, viii. p. 302 (ed. 1824); Montucla, *Hist. des Math.*, vol. ii.; Marie, *Hist. des Sciences*, vol. iv. p. 133.

TORRIGIANO, Pietro (*c.* 1470–1522), a Florentine sculptor, was, acccording to Vasari, one of the group of talented youths who studied art under the patronage of Lorenzo the Magnificent in Florence. Ben. Cellini, reporting a conversation with Torrigiano, relates that he and Michelangelo, while both young, were copying the frescos in the Carmine chapel, when some slighting remark made by Michelangelo so enraged the violent temper of Torrigiano that he struck him on the nose, and thus caused that disfigurement which is so conspicuous in all the portraits of Michelangelo. Soon after this Torrigiano visited Rome, and helped Pinturicchio in modelling the elaborate stucco decorations in the Appartamenti Borgia for Alexander VI. After some time spent as a hired soldier in the service of different states, Torrigiano was invited to England to execute the magnificent tomb for Henry VII. and his queen which still exists in the lady chapel of Westminster Abbey. This appears to have been begun before the death of Henry VII. in 1509, but was not finished till 1517. It consists of two colossal recumbent effigies in gilt bronze on an altar-tomb of black marble, decorated with very graceful medallions of the patron saints of Henry and his wife, and other enrichments in bronze. The two effigies are well modelled, and have life-like but not too realistic portraits. After this Torrigiano received the commission for the altar, retable, and baldacchino which stood at the west, outside the screen of Henry VII.'s tomb. The altar had marble pilasters at the angles, two of which still exist, and below the *mensa* was a life-sized figure of the dead Christ in painted terra-cotta. The retable consisted of a large relief of the Resurrection. The baldacchino was of marble, with enrichments of gilt bronze; part of its frieze still exists, as do also a large number of fragments of the terra-cotta angels which surmounted the baldacchino and parts of the large figure of Christ. The whole of this work was destroyed by the Puritans in the 17th century.[1] Henry VIII. also commissioned Torrigiano to make him a magnificent tomb, somewhat similar to that of Henry VII., but one-fourth larger, to be placed in a chapel at Windsor (*q.v.*); it was, however, never completed, and its rich bronze was melted by the Commonwealth, together with that of Wolsey's tomb. The indentures for these various works still exist, and are printed by Neale, *Westminster Abbey*, London, 1818, vol. i. p. 54–59. These interesting documents are written in English, and in them the Florentine is called "Peter Torrysany." For Henry VII.'s tomb he contracted to receive £1500 [$7290], for the altar and its fittings £1000 [$4860], and £2000 [$9720] for Henry VIII.'s tomb. Other works attributed from internal evidence to Torrigiano are the tomb of Margaret of Richmond, mother of Henry VII., in the south aisle of his chapel, and a terra-cotta effigy in the chapel of the Rolls.

While these royal works were going on, Torrigiano visited Florence in order to get skilled assistants. He tried to induce Ben. Cellini to come to England to help him, but Cellini refused, partly from his dislike to the brutal and swaggering manners of Torrigiano, and also because he did not wish to live among "such beasts as the English." The latter part of Torrigiano's life was spent in Spain, especially at Seville, where some terra-cotta sculpture by him still exists. His violent temper got him into difficulties with the authorities, and he ended his life in 1522 in the prisons of the Inquisition.

TORSHOK [or Torjok], a district town of Russia, in the government of Tver, on the river Tvertsa, 38 miles by rail to the southwest of the Ostashkovo station of the St. Petersburg and Moscow railway. It dates from the 11th century, and the very name ("market-place") shows that this dependency of Novgorod was a commercial centre. It was strongly fortified with a stone wall, which, however, only partially protected it from the attacks of Mongols, Lithuanians, and Poles. Torshok is now celebrated in Russia for its embroidered leather-work and manufacture of travelling bags, and for its trade in corn and flour. The population in 1884 was 12,900.

TORT, as a word of art in the law of England and the United States, is the name of civil wrongs (not being merely breaches of contract) for which there is a remedy by action in courts of common law jurisdiction. It may be said to correspond approximately to the term "delict" in Roman law and the systems derived from it. But this is only a rough approximation. For in English usage tort includes, not only those matters which in Roman law are classed under obligations *quasi ex delicto*, but various others which Roman or modern Continental lawyers would refer to the law of ownership or real rights, and not to any such head as "delict." The truth is that the actual development of tort as a legal genus has been purely historical and to no small extent accidental. Nothing can be learnt, of course, from the word itself. It is merely the French word for "wrong," specialized into a technical meaning by a process which was completed only in the latter years of the 17th century and the earlier of the 18th.

---

[1] An old drawing still exists showing this elaborate work: it is engraved in the *Hierurgia Anglicana*, London, 1848, p 267. Many hundreds of fragments of this terra-cotta sculpture were found a few years ago hidden under the floor of the triforium in the abbey; they are unfortunately too much broken and imperfect to be fitted together.

The early common law had no theory of obligations in the Roman sense, and hardly any theory of contract. Its remedies were directed either to the restitution of something which the defendant unjustly detained from the plaintiff—were it land, goods, or money—or to the repression of violent wrongdoing. Only the former class of remedies was purely civil; the latter included a penal element of which formal traces remained long after the substance had vanished. A man who trespassed on his neighbor with force and arms offended the king as well as his neighbor, and was liable not only to pay damages to his neighbor but to make a fine to the king. Gradually the category of "force and arms" was held to include all manner of direct injuries to person, land, or goods, though the force might consist in nothing more than the bare setting foot without lawful cause on the soil possessed by one's neighbor. But this was still a long way from making room for the modern growth of the law of torts. The decisive opening was given by the Statute of Westminster, which enabled actions to be framed "on the case"—*in consimili casu*,—that is, allowed legal remedies to be extended by analogy to the forms of action already recognized. Now those forms and their incidents were archaic and inelastic: the procedure was cumbrous, and plaintiffs were liable in many ways to irrational and irreparable discomfiture. The more modern action on the case was free from these drawbacks. Hence it was the aim of ingenious pleaders to extend the action on the case as much as possible; and so successful was this movement that in the 16th century a special form of "trespass on the case" became, under the name of *assumpsit*, the common and normal method of enforcing contracts not made by deed, and remained so till the middle of the present century. It still holds its place in those American States where the old forms of action have not been abolished. Note that "assumpsit" had become a substantive title of the law, and was consciously referred to its proper genus of contract, before the genus or order of torts was formed. Meanwhile other actions on the case, framed mostly on the analogy of trespass, but partly on that of other generically similar remedies of the old law, were applied to the redress of miscellaneous injuries to person or property which for one and another reason could not be touched, or could not be conveniently dealt with, by the old action of trespass itself. Some of these actions on the case acquired fixed forms of their own and became distinct species; others did not; there remained (and there still remains in theory) an undefined region of possible new actions applying the principles of legal right and duty to new exigencies of fact.

The extension of forms of remedy grounded on trespass caused those forms which were grounded on restitution to fall into the background, with the curious result that in the modern common law nothing is left answering to the *vindicatio* of the Roman law. We have an elaborate law of property, but when it comes to the practical protection of our rights we find that we can recover our property only by complaining of a wrong done to our possession or right to possession. The law puts the actual possessor in the first line, and allows an owner definitely out of possession to sue only for "injury to the reversion," though an owner who can resume possession at will is indeed more favorably treated. Its remedies are made efficient, but at the cost of straining the theory at various points. Hence many difficulties of detail and much obscurity of principle. The distinction between *dominium* and *obligatio* exists, of course, in English law, but it is peculiarly hard for an English lawyer, with the usual unsystematic training, to grasp it with certainty or trace it with accuracy.

There is also a region of considerable obscurity about the points of contact between contract and tort. The questions thus raised are too technical for discussion here. Since pleadings have ceased to be formal they are much less likely to arise; on the other hand, they are more likely, in the exceptional cases where they may still arise, to be unexpected and baffling.

For the practical purposes of modern law we may divide torts into three groups,—wrongs of a personal character, wrongs affecting property, and wrongs affecting person and property, either or both. Under the first group come the wrongs of physical violence and restraint, namely, assault and false imprisonment; then the wrong done to men's good name by libel and slander, in which kind there are sundry curious and not wholly rational distinctions; and we must here rather than elsewhere count deceit, and a somewhat ill-defined class of wrongs of a like nature, of which the generic mark is the necessary presence of a fraudulent intention, or at least reckless disregard of good faith. In one case, that of malicious prosecution, evil motive must be shown; in fact, the much-tormented word "malice" has very nearly its natural and ordinary meaning. So-called slander of title belongs to this class, being in truth a special form of deceit. Wilful interference with the exercise of public or private rights may be an actionable wrong, though the competitive exercise of like rights is none; and it is held, though not without doubt, that procuring a person to break his contract for one's own advantage (for example, a singer engaged by a rival opera manager, or a specially skilled workman in a rival factory) is on this principle a wrong to the other contracting party.

With regard to property the broad rule of the common law is that a man meddles with whatever belongs to others at his peril. This has been established and worked out only through a series of intricate formal distinctions. But the result is that, special exceptions excepted, even the most innocent assumption of dominion without a real title makes one liable to the true owner.

Wrongs of the mixed kind affecting both person and property arise from the use of one's own property, or the doing of acts lawful in themselves, in a manner inconsistent with the safety and convenience of others. The accustomed heads of such wrongs are nuisance and negligence. Generally some failure in due diligence is involved; but in some cases the law has, on grounds of general policy, imposed an absolute or all but absolute duty of avoiding harmful results. One must do certain things at one's peril, if at all, though the doing of them is not in itself unlawful; others are done not at one's peril, and yet under a wider responsibility than the common run of lawful acts. It is not wrong to make an artificial reservoir of water on one's own land; but the landowner who does so must answer for all damage, though no failure in due diligence be shown, if the water escapes by any cause which reasonable human care could possibly have provided against. Again, the occupier of a place of business must keep it in safe repair, for the benefit of customers and others lawfully coming there; and, if harm is done through the want of repair, it is no excuse for him to say that he had engaged an apparently competent person to keep things in order. These are modern principles in the law, and seem to have hardly yet reached their full development. The doctrine of negligence is also mostly modern. Questions of much interest and difficulty are raised by "contributory negligence," *i.e.*, when it is alleged by way of defence that the party complaining suffered wholly or mainly by his own want of care. The true principle appears to be that, if under the circumstances the harm suffered by the plaintiff was the natural and probable consequence of the defendant's want of care, the defendant is liable,—and this whether the plaintiff, or some third person, has or has not in any degree contributed to the final result by want of care on his own part, or even by a voluntary act, provided that the act be such as might have been foreseen and expected. But if the plaintiff has done something which, though induced by the defendant's default, was not a natural and probable consequence of it, or if the harm suffered is due to some act of a third person which could not have been reasonably foreseen or expected, then the defendant will not be liable.

A great number of special duties have been imposed on different classes of persons—public officers, undertakers of public occupations, and so forth—by modern Acts of Parliament, and are enforcible by penalties. In some cases the breach of such a duty confers a separate right of action upon a person who thereby suffers damage, in others not, according to what appears to be the intention of the enactment. No general rule can be laid down.

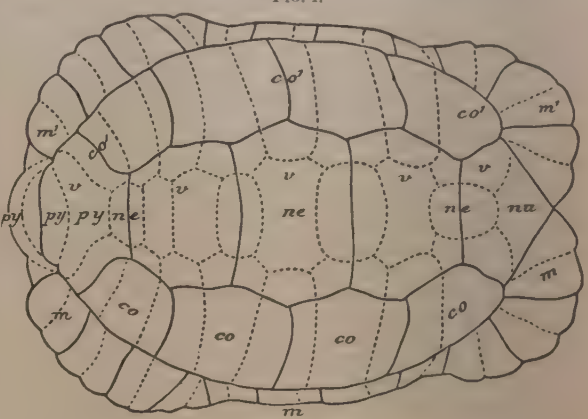
In practice, a large proportion of actionable injuries, especially injuries by negligence, are due to the acts or defaults of servants or workmen, from whom no substantial redress could be obtained or expected. It is held in the common law, and appears to be held in all modern systems, that a master is liable for the acts and defaults of the servants employed by him, provided those acts or defaults occur in the course of the servant's employment, that is, while the servant is about the master's business, and acting with a view to the master's interest, and not for some different private purpose of his own. But a man is not generally liable for the conduct of an "independent contractor"—a person who undertakes to do or get done certain work, but not to be under the employer's control as to the manner of doing it. One may be so liable, however, in virtue of special duties attached to particular situations by positive rules of law. When a servant is injured by the act or default of another servant working under the same employer, the general rule of liability has been largely modified in the employer's favor, on grounds which have neither been consistently expounded nor generally received as satisfactory. The Employers' Liability Act of 1880 has remedied the most obvious hardships consequent on the decisions, but only by way of particular exceptions, so that the law as a whole, if more just than it was, is much more intricate, and does not appear to rest on any intelligible principle. The Scottish courts were in a way to develop a more rational doctrine, but the House of Lords, instead of adopting it, forced the law of Scotland into conformity with judgments which were still of only recent authority in England. The subject, however, has given trouble everywhere, and legislative experiments have been tried in many Continental countries. See *Parliamentary Papers, Commercial*, No. 21, 1886.

Literature.—There are several modern English and American text-books on the law of torts: C. G. Addison, *Wrongs and their Remedies, being a Treatise on the Law of Torts*, 6th ed., by Horace Smith, London, 1887, la. 8vo.; M. M. Bigelow, *Leading Cases on the Law of Torts*, Boston, Mass., 1875, la. 8vo.; Id., *Elements of the Law of Torts*, 3d ed., Boston, Mass., 1886, sm. 8vo.; C. Collett, *Manual of the Law of Torts and of the Measure of Damages*, 6th ed., Madras, 1886, 8vo.; T. M. Cooley, *A Treatise on the Law of Torts*, Chicago, 1880, 8vo.; S. Hastings, *A Treatise on Torts*, London, 1885, la. 8vo.; F. Hilliard, *The Law of Torts or Private Wrongs*, 4th ed., Boston, Mass., 1874, la. 8vo., 2 vols.; F. T. Piggott, *Principles of the Law of Torts*, London, 1885, 8vo.; F. Pollock, *The Law of Torts*, London, 1887, 8vo.; A. Underhill, *A Summary of the Law of Torts*, 3d ed., London, 1881, 8vo. There are also well-known works of a wider scope which touch on many parts of the subject, such as that of Mayne on Damages; and monographs on special parts, such as those on Negligence by Campbell, Horace Smith, Shearman and Redfield, and Wharton, and those on Libel and Slander by Starkie (recent ed. by Folkard) and Blake Odgers. The Government of India has taken steps to codify the law of civil wrongs (Whitley Stokes, *The Anglo-Indian Codes*). The general institutional books (Blackstone and Kent, and the later adaptations of Blackstone in England) are of little use, as in almost every branch the law has been largely developed and modified by the decisions of the last fifty years.

(F. PO.)

TORTOISE. Of the three names generally used for this order of reptiles, viz., Tortoise, Turtle, and Terrapin, the first is derived from the old French word *tortis*, *i.e.*, twisted, and was probably applied first to the common European species on account of its curiously bent forelegs. Turtle is believed to be a corruption of the same word, but the origin of the name terrapin is unknown:[1] since the time of the navigators of the 16th century it has been in general use for freshwater species of the tropics, and especially for those of the New World. The name tortoise is now generally applied to the terrestrial members of this group of animals, and that of turtle to those which live in the sea or pass a great part of their existence in fresh water.

FIG. 1.



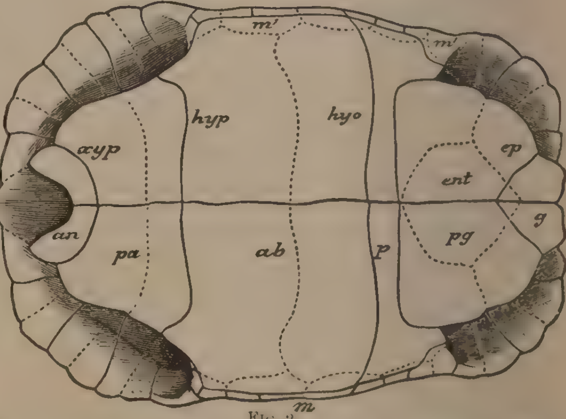


FIG. 2.

FIGS. 1, 2.—Shell of *Testudo pardalis*, to show the divisions of the integument, which are marked by entire lines, and of the osseous carapace, these being marked by dotted lines. Fig. 1, Upper or dorsal aspect. Fig. 2, Lower or ventral aspect.

Dermal Scutes: *co*, costals; *v*, vertebrals; *m*, marginals; *g*, gulars; *pg*, post-gulars; *p*, pectorals; *ab*, abdominals; *pa*, præanals; *an*, anals.

Bones of the Carapace; *co'*, costals; *ne*, neurals; *nu*, nuchal; *py*, pygal; *m'*, marginals; *ent*, entoplastron; *ep*, epiplastron; *hyo*, hyoplastron; *hyp*, hypoplastron; *xyp*, xyphiplastron.

Tortoises and turtles constitute one of the orders of Reptiles, the *Chelonia*. They are characterized by having the trunk of the body incased in a more or less ossified carapace, which consists of a dorsal more or less convex portion, and of a flat ventral one, the so-called plastron. These portions are generally more or less firmly united on the side, but leave a wide opening in front through which the head and neck and the fore-limbs protrude, and one behind for the tail and hind-limbs. The dorsal carapace is (with the exception of *Sphargis*) formed by the dorsal vertebræ, by the ribs which are so much expanded as to form sutures with each other, and by a number of lateral dermal ossifications (marginals). The plastron consists of from eight to eleven more or less dilated dermal bones, the sternal elements of higher *Vertebrata* being absent. This osseous case or shell receives in its interior the organs of the chest and abdomen, the humeral and pelvic bones, and the muscles for the humerus and femur. In many species, especially those of the family *Testudinidæ*, or tortoises proper, the neck and head and the limbs can be withdrawn within the shell, the cervical and the proximal caudal vertebræ retaining their mobility. In the majority of Chelonians the osseous shell is covered with a hard epidermoid coat, which is divided into large symmetrical plates (commonly called "tortoise-shell" in those species from which the article of commerce is obtained), which can be detached from the underlying bones. These epidermoid plates do not correspond in arrangement or extent with the bones of the carapace; they vary considerably in form, and are therefore generally noticed in the descriptions of species. Their arrangement and terminology may be learned from the accompanying illustrations (Figs. 1, 2).

---

[1] [The word is probably an assimilation of an Algonkin name for the animal. See Bartlett's *Americanisms*. The usual derivation from the French terrapéne is only an ingenious conjecture.—AM. ED.]

The integuments of the head, neck, tail, and limbs are either soft and smooth or tubercular or scaly, the tubercles and scales having frequently an osseous nucleus.

Other parts also of the skeleton show remarkable peculiarities, so that the sometimes very fragmentary remains of Chelonians can almost always be recognized as such. All the bones of the skull are suturally united, with the exception of the mandible and hyoid bone; the dentary portion of the mandible consists of one bone only. The pectoral arch is composed of the scapula, with which the precoracoid is united, and the coracoid. Clavicles (epiplastra) are represented by the anterior elements of the plastron. Two pairs of limbs are invariably present.

All Chelonians possess a tail, which is generally short, but sometimes elongate, and always provided with strong muscles at the base. No Chelonian possesses teeth; but their jaws are provided with horny sheaths, with hard and sharp edges, forming a beak like that of a parrot.

The number of Chelonians known at present may be estimated at about 220, the freshwater species being far the most numerous, and abundant in well-watered districts of the tropical and subtropical zones. Their number and variety decrease beyond the tropics, and in the north they disappear entirely about the 50th parallel in the western and about the 56th in the eastern hemisphere, whilst in the southern hemisphere the terrestrial forms seem to advance to 36° S. lat. only. The marine turtles, which are spread over the whole of the equatorial and subtropical seas, sometimes stray beyond those limits. As in other orders of Reptiles, the most specialized and the largest forms are restricted to the tropics (with the exception of *Macroclemmys*); but unlike lizards or snakes, Chelonians are unable to exist in sterile districts or at great altitudes. Chelonians are strictly animals of plains, or at least of low country.

Chelonians show a great divergence in their mode of life,—some living constantly on land, others having partly terrestrial partly aquatic habits, others again rarely leaving the water or the sea. The first mentioned, the land tortoises proper, have short club-shaped feet with blunt claws, and a very convex, heavy, completely ossified shell. In the freshwater forms the joints of the limb bones are much more mobile, the digits distinct, armed with sharp claws, and united by a membrane or web; their shell is less convex and is flattened, and more or less extensive areas may remain cartilaginous to lessen its specific gravity. As a rule, the degree of development of the interdigital web and of convexity of the shell indicates the prevalence of aquatic or terrestrial habits of a species of terrapin. Finally, the marine turtles have paddle-shaped limbs resembling those of Cetaceans.

Land tortoises are sufficiently protected by their carapace, and therefore have no need of any special modification of structure by means of which their appearance would be assimilated to the surroundings, and thus give them additional security from their enemies. These, however, are but few in number: the large cats of South America are said to be able to tear them out of the shell with their claws; and the ancient tale of Æschylus having been killed by a tortoise carried aloft by an eagle and dropped on the head of the unfortunate poet seems to be founded on the fact that tortoises are a favorite prey of the Lämmergeyer (*Gypaetus*), which has the habit of dropping them from a height on rocks in order to break the shell. On the other hand, among the carnivorous terrapins and freshwater turtles instances of protective resemblance are not scarce, and may even attain to a high degree of specialization, as in *Chelys*; their shells offer them less protection, and their enemies (crocodiles and alligators) are more numerous; they also require this special provision to enable them to approach or seize their prey with greater ease. The colors of land tortoises are generally plain or in simple patterns, whilst those of many terrapins are singularly varied, bright, and beautiful.

Chelonians are diurnal animals; only a few are active during the night, habitually or on special occasions, as, for instance, during oviposition. Land tortoises are slow in all their movements, but all kinds living in water can execute extremely rapid motions, either to seize their prey or to escape from danger. All Chelonians are stationary, residing throughout the year in the same locality, with the exception of the marine turtles, which periodically migrate to their breeding-stations. Species inhabiting temperate regions hibernate.

Chelonians possess great tenacity of life, surviving injuries to which other Reptiles would succumb in a short time. The heart of a decapitated tortoise continues to beat for many hours after every drop of blood has been drained from the body, and the muscles of the trunk and head show signs of reflex action twenty-four hours after the severance of the spinal cord. The longevity of tortoises is likewise a well-known fact, to which reference will again be made.

Land tortoises, a few terrapins, and some of the marine turtles are herbivorous, the others carnivorous, their prey consisting chiefly of fish, frogs, and other small aquatic animals.

All Chelonians are oviparous, and the eggs are generally covered with a hard shell.

In the system[1] proposed by Duméril and Bibron, and afterwards modified by Gray and Strauch, the Chelonians are arranged according to their mode of life, and divided into terrestrial, paludine, fluviatile, and marine forms. However natural such an arrangement may appear at first, a more careful examination proves it to be (as all arrangements based solely upon the mode of life) at variance with the structural affinities, whether the recent forms alone be considered or the fossil as well. The division of the bulk of the order into *Cryptodira* and *Pleurodira*, as suggested by Agassiz, Cope, and Rütimeyer, was a decided progress, as is also the elimination of the suborders *Atheca* and *Trionychoidea* recently proposed by Cope and Baur.

The order of Chelonians may then be divided into the following suborders and families:[2]

SUBORDER I. ATHECÆ.

Vertebræ and ribs free, separated from a bony exoskeleton.

Family 1. SPHARGIDÆ.

Limbs paddle-shaped, clawless; phalanges without condyles. Plastron reduced to an annular series of eight small bones. Exoskeleton consisting of numerous small bony plates arranged like mosaic. Pelagic.

Genus: *Dermatochelys* (*Sphargis*).
Fossil genera: *Psephophorus* (Pliocene), *Protosphargis* (Cretaceous), *Protostega* (Cretaceous), *Psephoderma*? (Triassic).

SUBORDER II. TESTUDINATA.

Dorsal vertebræ and ribs immovably united and expanded into bony plates forming a carapace, which is bordered by a complete series of marginal bones. Epiplastra (clavicles) in contact with hyoplastra; entoplastron (interclavicle), if present, oval, rhomboidal, or T-shaped. Sacral and caudal ribs articulating with the centrum and the neural arch. Digits with not more than three phalanges.

---

[1] The more important works on this order of Reptiles have been enumerated in the article REPTILES, vol. xx. p. 453.

[2] Only the more important and best known of the extinct genera are admitted into this synopsis.

SERIES A. CRYPTODIRA.

Neck retractile by a sigmoid curve in a vertical plane. Pelvis not anchylosed to the carapace and plastron. Rarely one or two epidermic scutes (intergular) in addition to the normal six pairs.

GROUP A. Digitata.

Digits short or moderately elongate; phalanges with condyles; claws four or five. Neck completely retractile.

Family 1. TESTUDINIDÆ.

Plastral bones nine. Nuchal bone without costiform processes. Carapace with epidermic scutes. Caudal vertebræ procœlous. Tropical and temperate zones, with the exception of Australia.

Recent genera: *Dermatemys, Batagur, Clemmys, Pangshura, Geoemyda, Cyclemys, Emys, Cistudo, Manouria, Testudo, Homopus, Cinyxis, Pyxis.*

Fossil genera: *Eurysternum* (Jurassic), *Chitracephalus* (Cretaceous), *Adocus* (Cretaceous), *Palæochelys* (Miocene), *Ptychogaster* (Miocene), *Colossochelys* (Pliocene).

Family 2. PLATYSTERNIDÆ.

Plastral bones nine. Nuchal bone without costiform processes. Carapace with epidermic scutes. Caudal vertebræ mostly opisthocœlous. Indian region.

Genus: *Platysternum.*

Family 3. BAENIDÆ.

Plastral bones eleven, mesoplastra being present. Nuchal bone without costiform processes. Carapace with epidermic scutes. Caudal vertebræ opisthocœlous.

Fossil genera: *Platychelys* (Jurassic); *Baena* (Eocene).

Family 4. CHELYDRIDÆ.

Plastral bones nine. Nuchal bone with long costiform processes, extending below the marginals. Carapace with epidermic scutes. Caudal vertebræ mostly opisthocœlous. Northern and tropical American regions.

Recent genera: *Chelydra, Macroclemmys.*
Fossil genus: *Tretosternum* (Cretaceous).

Family 5. STAUROTYPIDÆ (Boulenger).

Plastral bones nine. Nuchal bone with short costiform processes, extending below the marginals. Carapace with epidermic scutes. Caudal vertebræ procœlous. Central-American district.

Genera: *Staurotypus, Claudius.*

Family 6. CINOSTERNIDÆ.

Plastral bones eight, the entoplastron being absent. Nuchal bone with short costiform processes, extending below the marginals. Carapace with epidermic scutes. Caudal vertebræ procœlous. Northern and tropical American regions.

Genera: *Aromochelys, Cinosternum.*

Family 7. PSEUDOTRIÓNYCHIDÆ (Boulenger).

Shell without epidermic scutes.

Fossil genera: *Pseudotrionyx* and *Anostira* (Eocene).

GROUP B. Pinnata

Limbs paddle-shaped; phalanges without condyles; claws one or two. Neck imperfectly retractile; cervical vertebræ short, mostly articulated by amphiarthrosis.

Family 8. CHELONIDÆ.

Plastral bones nine. Nuchal without costiform processes. Carapace with epidermic scutes. Hyo- and hypoplastra not meeting mesially. Pelagic.

Recent genera: *Chelone, Caouana, Caretta.*
Fossil genus: *Puppigerus* (Miocene and Eocene).

SERIES B. PLEURODIRA.

Neck not retractile, bending laterally. Pelvis anchylosed to the carapace and plastron. When epidermic scutes are present, one or two intergulars in addition to the normal plastral scutes.

Family 1. CHELYDIDÆ.

Plastral bones nine. Carapace with epidermic scutes. Limbs with four or five claws. Australian and tropical American regions.

Recent genera: *Platemys, Chelymys, Elseya, Chelodina, Hydraspis, Hydromedusa, Chelys.*
Fossil genera: *Plesiochelys* (Jurassic), *Craspedochelys* (Jurassic), *Idiochelys* (Jurassic), *Notomorpha* (Eocene).

Family 2. PELOMEDUSIDÆ.

Plastral bones eleven, mesoplastra being present. Carapace with epidermic scutes. Limbs with four or five claws. African and tropical American regions.

Recent genera: *Pelomedusa, Sternothærus, Dumerilia, Podocnemis, Peltocephalus.*
Fossil genera: *Pleurosternum* (Cretaceous, Eocene), *Bothremys* (Cretaceous), *Taphrosphys* (Cretaceous).

Family 3. CARETTOCHELYDIDÆ.

Plastral bones nine. No epidermic scutes on the shell. Limbs paddle-shaped, with only two claws. New Guinea.

Genus: *Carettochelys.*

Family 4. MIOLANIIDÆ (Boulenger).

Caudal vertebræ opisthocœlous; tail long and encased in a bony sheath. Australia.

Fossil genus: *Miolania* (Pleistocene).

SUBORDER III. TRIONYCHOIDEA.

Dorsal vertebræ and ribs immovably united, forming a carapace; no pygal plate; marginal plates absent or forming an incomplete series. Plastron formed of nine bones, epiplastra separated from the hyoplastra by the entoplastron, which is Λ-shaped, without longitudinal process. Sacral and caudal ribs attached to transverse processes of the neural arch. Fourth digit with four or five phalanges.

Family 1. TRIONYCHIDÆ.

No epidermic scutes. Limbs with three claws. Indian, African, and American regions.

Genera: *Chitra, Heptathyra, Trionyx, Cyclanosteus, Emyda.*

We add a few notes on such of the genera enumerated in this synopsis as have some special interest attached to them, either from a scientific or an economic point of view.

The family *Sphargidæ* is represented in the recent fauna by a single species, *Dermatochelys* or *Sphargis coriacea*, the Leathery Turtle, the range of which extends over the tropical and subtropical seas of both hemispheres, and which occasionally strays into the northern parts of the Atlantic, its occurrence on the British coast having been recorded three or four times within the last century. It differs from all other Chelonians by its carapace being formed by ossifications of the skin only. Neither the vertebræ nor the ribs enter into its formation; the latter remain free, and are not particularly dilated. During the life of the animal the carapace is flexible like thick leather, the bony deposits being arranged like mosaic, with several longitudinal ridges of larger osseous tubercles. The limbs are, as in other marine turtles, paddle- or fin-shaped, the anterior much longer than the posterior, and all destitute of claws. This turtle is probably the largest living Chelonian, exceeding 6 feet in length. The names *Testudo lyra*, *Sphargis mercurialis*, etc., have reference to the myth that the shell of this or some other turtle was used by Mercury in his construction of the lyre.

The family *Testudinidæ* is composed of an unbroken series, from thoroughly aquatic freshwater tortoises like *Dermatemys* and *Batagur* to the tortoises which live exclusively on land and are perfectly helpless in water. In the Central-American genus *Dermatemys* the digits are very broadly webbed, the epidermic scutes are thin, and the nose is much produced,—characters which, together with the strong depression of the shell, give these terrapins somewhat the aspect of the freshwater turtles or *Trionychidæ*. They feed exclusively upon leaves, grass, and especially fruit, and are eaten by the natives. Of the freshwater tortoises of the Old World the most thoroughly aquatic are the Batagurs, which inhabit the East Indies, and attain to a length of 2 feet. Like their American representative, *Dermatemys*, they are essentially herbivorous, and their flesh is eaten. The genus *Clemmys* is extremely abundant in species, most of which are of small size, and elegantly ornamented with symmetrical markings of bright color. The majority of the species occur in North America and Mexico, and are of amphibious habits. Only one species, *C. leprosa*, inhabits southern Europe. A second European species belongs to the genus *Emys*, *E. orbicularis*, which, towards the end of the Quaternary period appears to have been distributed over a great part of northern Europe, remains having been found in peat in England, Belgium, Denmark, and Sweden. Its habitat is now restricted to southern Europe, southwestern Asia, and northwestern Africa; but singularly it has survived in a few isolated northern stations, for instance, in the neighborhood of Berlin and Königsberg, although it is there on the verge of extinction. The mobility of the lobes of the plastron, which distinguishes *Emys* from *Clemmys*, is carried a degree further in the North-American genus *Cistudo*, the Box Tortoise; this terrapin possesses a hinge in the plastron, rendering its anterior and posterior portions movable, and converting them into lids by which the openings of the shell can be completely closed when the head and limbs are retracted. A similar protective apparatus exists in the tortoises of the genus *Cinosternum*. In the African terrestrial genus *Cinyxis* it is the posterior portion of the carapace that is movable, and separated from the anterior by a hinge. True land tortoises, *Testudo*, occur in Africa, southern Europe, southern Asia, South America, and the southern parts of North America. Those best known in Europe are *Testudo græca* and the Moorish Tortoise, *Testudo mauritanica*, large numbers of which are imported into the United Kingdom, chiefly from Morocco. But the most interesting are the gigantic tortoises which formerly inhabited in extreme abundance the Mascarene and Galapagos Islands, and are now on the verge of extinction, or have actually become extinct. At the time of their discovery those islands were uninhabited by man or any large mammal; the tortoises, therefore, enjoyed perfect security; and this, as well as their extraordinary degree of longevity, accounts for their enormous size and their large numbers. They could be captured in any quantity with the greatest ease within a few days, and proved to the ships' companies who during their long voyages had to subsist mainly on salt provisions a most welcome addition to their table. They could be carried in the hold of a ship, without food, for months, and were slaughtered as occasion required, each tortoise yielding, according to size, from 80 to 300 pounds of excellent and wholesome meat. Under these circumstances the numbers of these helpless creatures decreased so rapidly that in the beginning of this century their extermination was accomplished in the Mascarenes, and now only a few remain in a wild state in Aldabra and in some of the islands of the Galapagos group. Singularly, the majority of these islands were inhabited each by one or more peculiar forms, specifically distinct from those of the other islands. A large male specimen from Aldabra, which was imported into London some years ago, weighed 870 ℔, and, although known to have been more than eighty years old, was still growing at the time of its death. There is no evidence to show that any of these tortoises were indigenous in the Seychelles; the specimens kept there in a semi-domesticated state have been either directly imported from Aldabra or are the descendants of imported individuals.

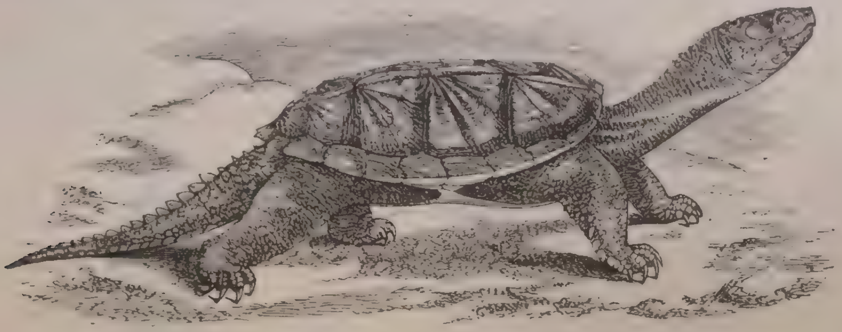

FIG. 3.—Alligator Terrapin (*Chelydra serpentina*).

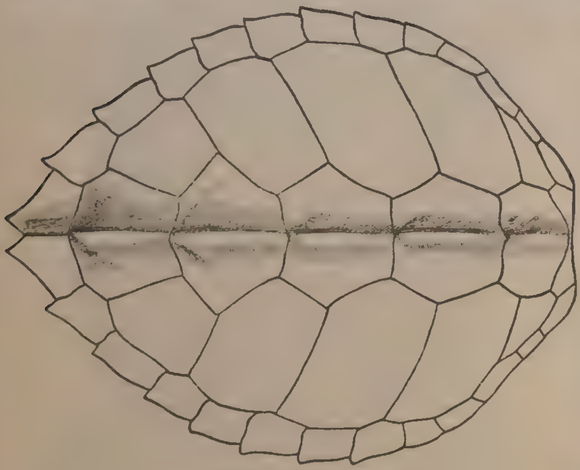

FIG. 4.—Loggerhead (*Caouana caretta*).

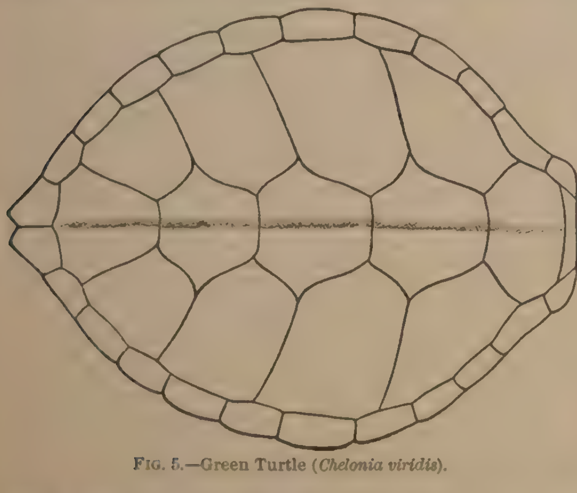

FIG. 5.—Green Turtle (*Chelonia viridis*).

The family of *Chelydridæ* includes freshwater tortoises, which are known under the names of Snappers or Alligator Terrapins (Fig. 3), on account of their ferocity and long compressed crested tail. They are now confined to North America east of the Rocky Mountains, Central America, and northwest South America, but remains of two species of *Chelydra*, closely related to their recent representative, have been found in the Oligocene and Miocene of central Europe. A second genus, closely allied to *Chelydra*, *Macroclemmys temminckii*, the shell of which attains to a length of 3 feet, and which is the largest known freshwater Chelonian, is restricted to the river-systems tributary to the Gulf of Mexico.

The family of *Cinosternidæ* contains a rather large number of small-sized species, distributed from the northern parts of the United States to the northern parts of Brazil. They are of amphibious habits. The front and hind lobes of the plastron are movable, and in certain species of *Cinosternum* the animal can completely shut itself up in its shell.

The *Chelonidæ*, or marine turtles, contain but few species, which are referred to three genera,—*Caouana*, *Chelone*, and *Caretta*. Their limbs are wholly modified into paddles, by means of which they can propel themselves with extraordinary rapidity through the water, but which are entirely unfit for locomotion on land, where the progress of these animals is as awkward as that of a seal. The toes are enclosed in a common skin, out of which only one or two claws project. The carapace is broad and much depressed, so that when the turtles are surprised on shore and turned over on their back, they cannot regain their natural position. Their capture forms a regular pursuit wherever they occur in any numbers. Comparatively few are caught in the open sea, others in stake nets, but the majority are intercepted at well-known periods and localities where they go ashore to deposit their eggs. These are very numerous, from 100 to 250 being produced by one female,

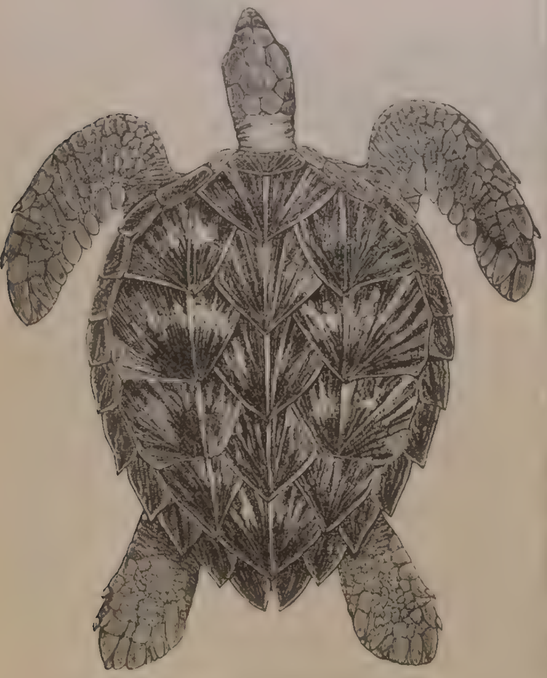

Fig. 6.—Hawksbill Turtle (*Caretta imbricata*).

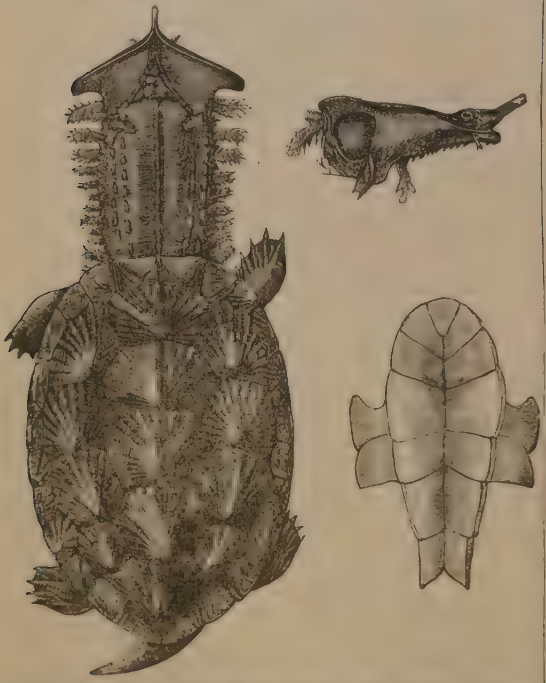

Fig. 7.—The Matamata (*Chelys fimbriata*), with side view of head, and separate view of plastron.

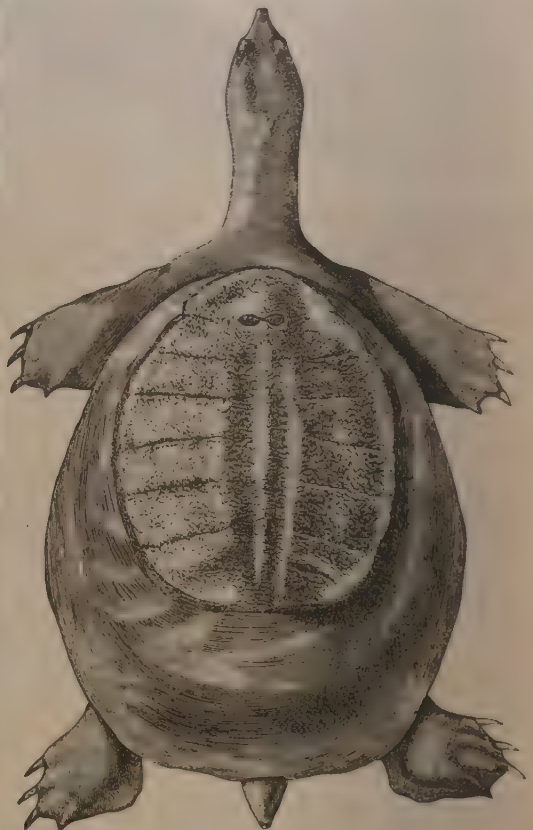

Fig. 8.—Upper View of the Turtle of the Euphrates (*Trionyx euphratica*).

and buried by her in the sand; they are eagerly searched for and eaten. Some of the marine turtles are highly esteemed for the delicacy of their meat and of the gelatinous skinny parts of their neck and fins; others yield oil, and others again the tortoise-shell of commerce. Probably the largest of these marine turtles is the Loggerhead (*Caouana*), which possesses fifteen vertebral and costal shields, and occurs in the Atlantic as well as in the Indian Ocean (Fig. 4). It is carnivorous, feeding on fish, molluscs, and crustaceans, and not esteemed as food, although it is eaten by the native fishermen. A great part of the turtle-oil which finds its way into the market is obtained from the Atlantic species of this genus; also tortoise-shell of an inferior quality is obtained from it. The Green Turtle (Fig. 5), which yields the materials for the celebrated soup, belongs to the genus *Chelone;* it is distinguished from *Caouana* by having thirteen vertebral and costal shields only, which are not imbricate. These animals are herbivorous, feeding on marine *Algæ* only; they occur in the Indo-Pacific and Atlantic; and, although several species have been distinguished, they all may possibly be referable to one only. The turtle imported into Europe comes chiefly from the West Indies. Instances are recorded of the flesh of this species having acquired poisonous qualities. The Hawksbill Turtle, *Caretta* (Fig. 6), so named from its rather elongate and compressed curved upper jaw, does not reach the same size as the other turtles, and is readily recognized by the thirteen imbricate scutes of its carapace. It seems to be more abundant in the Indian than in the Atlantic Ocean, but is plentiful only in certain localities. As, however, these turtles always resort to the locality where they were born, or where they have been wont to propagate their kind, and as their capture is very profitable, they become scarcer and scarcer at places where they are known to have been abundant formerly. If the plates of tortoise-shell are detached from the animal when decomposition has set in, their color becomes clouded and milky, and hence the cruel expedient is resorted to of suspending the turtle over fire till heat makes the shields start from the bony part of the carapace, after which the creature is permitted to escape to the water. There is no doubt that turtles thus allowed to escape to the water after such an operation may survive; but it is very improbable that the epidermal shields are ever sufficiently regenerated to be fit for use. At Celebes, whence the finest tortoise-shell is exported to China, the natives kill the turtle by blows on the head, and immerse the shell in boiling water to detach the plates; dry heat is only resorted to by the unskilful. The natives eat the flesh of this turtle, but it is unpalatable to Europeans; the eggs, however, are regarded as equal to those of the other turtles.

Of the family *Chelydidæ* the most remarkable type is the Matamata, *Chelys fimbriata*, a native of the Guianas and northern Brazil (Fig. 7). In its strongly depressed and flat head, long tube-like snout, weak jaws, minute eyes, skinny tentacles, it bears a striking similarity to the Surinam toad, *Pipa americana*, which inhabits the same countries. The neck is very broad and depressed, and fringed with foliated tentacles, floating in the water like some vegetable growth, whilst the rough bossed carapace resembles a stone,—an appearance which evidently is of as great use to this creature in escaping the observation of its enemies as in alluring to it unsuspicious animals on which it feeds.

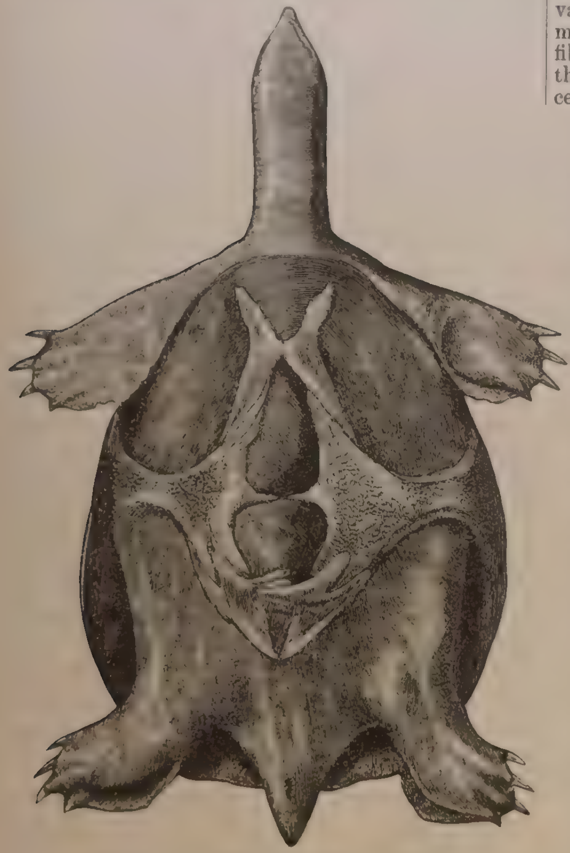

FIG. 9.—Lower View of *Trionyx euphratica*.

The family of *Carettochelydidæ* contains a single genus, *Carettochelys*, quite recently discovered in the Fly river, New Guinea, and exhibiting a remarkable combination of characters. Its limbs are formed very much like those of the marine turtles, whilst the shell lacks epidermic scutes, as in the *Trionychidæ*.

In the freshwater turtles, or *Trionychidæ* (Figs. 8 and 9), the carapace is reduced to a flat disk, which is covered with soft skin. The neck and limbs can be lodged under the broad skinny borders of the carapace; also the plastron is very imperfectly ossified, and sometimes dilated into large flexible lobes which may cover the limbs. The latter are much flattened and broadly webbed, and only the three inner toes armed with claws. The jaws are concealed under broad, fleshy lips, the nose projecting like a short proboscis. These turtles are carnivorous, and very ferocious; when they want to bite or seize their prey they project their neck and head with lightning rapidity. They are well known on the upper Nile, Euphrates, Ganges, Yangtse-kiang, and Mississippi, and, indeed, distributed over all the large fresh waters of the geographical regions to which these rivers belong. Some of the species exceed a length of three feet. In the United States, where two species, *Trionyx muticus* and *Trionyx ferox*, occur, the flesh of the latter is said to be most delicate to eat, far surpassing in flavor that of the green turtle. (A. C. G.)

TORTOISE-SHELL. The tortoise-shell of commerce consists of the epidermic plates of the hawksbill turtle, *Caretta imbricata*. The plates of the back or carapace, technically called the head, are 13 in number, 5 occupying the centre, flanked by four on each side. These overlap each other to the extent of one-third of their whole size, and hence they attain a large size, reaching in the largest to 8 inches by 13 inches, and weighing as much as 9 ounces. The carapace has also 24 marginal pieces, called hoofs or claws, forming a serrated edge round it; but these, with the plates of the plastron, or belly, are of inferior value. The plates of tortoise-shell consist of horny matter, but they are harder, more brittle, and less fibrous than ordinary horn. Their value depends on the rich mottled colors they display—a warm translucent yellow, dashed and spotted with rich brown tints—and on the high polish they take and retain. The finest tortoise-shell is obtained from the Eastern Archipelago, particularly from the east coast of Celebes to New Guinea; but the creature is found and tortoise-shell obtained from all tropical coasts, large supplies coming from the West Indian Islands and Brazil.

Tortoise-shell is worked precisely as horn; but, owing to the high value of the material, care is taken to prevent any waste in its working. The plates, as separated by heat from the bony skeleton, are keeled, curved, and irregular in form. They are first flattened by heat and pressure, and superficial inequalities are rasped away. Being harder and more brittle than horn, tortoise-shell requires careful treatment in moulding it into any form, and as high heat tends to darken and obscure the material it is treated at as low a heat as practicable. For many purposes it is necessary to increase the thickness or to add to the superficial size of tortoise-shell, and this is readily done by careful cleaning and rasping of the surfaces to be united, softening the plates in boiling water or sometimes by dry heat, and then pressing them tightly together by means of heated pincers or a vice. The heat softens and liquefies a superficial film of the horny material, and that with the pressure effects a perfect union of the surfaces brought together. Heat and pressure are also employed to mould the substance into boxes and the numerous artificial forms into which it is made up.

Tortoise-shell has been a prized ornamental material from very early times. It was one of the highly esteemed treasures of the far East brought to ancient Rome by way of Egypt, and it was eagerly sought by wealthy Romans as a veneer for their rich furniture. In modern times it is most characteristically used in the elaborate inlaying of cabinet work known as buhl furniture. It is also employed as a veneer for small boxes and frames. It is cut into combs, moulded into snuff-boxes and other small boxes, formed into knife-handles, and worked up into many other similar minor articles. The plates from certain other tortoises, known commercially as turtle-shell, possess a certain industrial value, but they are either opaque or soft and leathery, and cannot be mistaken for tortoise-shell. A close imitation of tortoise-shell can be made by staining translucent horn. See COMB, vol. vi. p. 160.

TORTOLA. See VIRGIN ISLANDS.

TORTONA, a town of Italy, in the province of Alessandria, on the right bank of the Scrivia, at the northern foot of the Apennines, 13 miles to the east of Alessandria, was formerly a place of strength until its fortifications were destroyed by the French after Marengo (1799); the ramparts are now turned into shady promenades. The cathedral, erected by Philip II., is architecturally uninteresting, but contains a remarkably fine Roman sarcophagus. Silk-weaving, tanning, and hat-making are the chief industries; and there is some trade in wine and grain. The population in 1881 was 9023 (commune 14,442).

Dertona is spoken of by Strabo as one of the most important towns of Liguria, and is alluded to by Pliny as a Roman colony. In the Middle Ages it was zealously attached to the Guelphic cause, on which account it was twice laid waste by Frederick Barbarossa (in 1155 and 1163.)

TORTOSA, a fortified city of Spain, in the province of Tarragona, and 40 miles by rail to the southwest of that town, is picturesquely situated on the left bank of the Ebro (here crossed by a bridge of boats), 22 miles above its mouth. It is for the most part an old walled town, with narrow, crooked, and ill-paved streets; the houses are lofty, and massively built of granite. The slope on which it stands is crowned with an old ruined castle, commanding a splendid view. The cathedral is a conspicuous building near the river; it occupies the site of a mosque built in 914 by 'Abd al-Raḥmán; the present structure, which dates from 1347, has its Gothic character disguised by a classical façade with Ionic pillars and much tasteless modernization. The stalls in the choir, carved by Cristobal de Salamanca in 1588–93, and the sculpture of the pulpits, as well as the ironwork of the choir-railing and some of the precious marbles with which the chapels are adorned, deserve notice. None of the other public buildings, which include an episcopal palace, a town-hall, and numerous churches, require special mention. The manufactures of Tortosa include paper, hats, leather, porcelain, majolica, soap, and spirits. There is an important fishery in the river, and an active trade is carried on through the harbor, which is accessible to vessels of 100 tons burden, corn, wine, oil, wool, silk, fruits, and liquorice (a specialty of the district) being among the leading articles of export. Near Tortosa are rich quarries of marble and alabaster, and the whole surrounding country is very fertile and beautiful. The population within the municipal boundaries in 1878 was 24,057.

Tortosa, the *Dertosa* of Strabo and the *Colonia Julia Augusta Dertosa* of numerous coins, was a city of the Ilercaones in Hispania Tarraconensis. Under the Moors it became a place of great importance as the key of the Ebro valley. It was taken by Louis the Pious in 811 (after an unsuccessful siege of two years before), but was soon recaptured. Having become a haunt of pirates, and exceedingly injurious to Italian commerce, it was made the object of a crusade proclaimed by Pope Eugenius III. in 1148, and was accordingly captured by Raymond Berengar, assisted by Templars, Pisans, and Genoese. Tortosa fell into the hands of the duke of Orleans in 1708, and was again surrendered in the War of Independence in 1811 to the French under Suchet, who held it till 1814.

TORTURE. It is proposed to treat in this place not so much the innumerable modes of inflicting pain which have been from time to time devised by the perverted ingenuity of man as the subject of legal torture as it existed in the civilized nations of antiquity and of modern Europe, that is to say, torture inflicted with more or less appearance of legality by a responsible executive or judicial authority. From this point of view torture was always inflicted for one of two purposes—(1) as a means of eliciting evidence from a witness or from an accused person either before or after condemnation, (2) as a part of the punishment. Torture, as a part of the punishment, may be regarded as including every kind of bodily or mental pain beyond what is necessary for the safe custody of the offender, (with or without enforced labor) or the destruction of his life,—in the language of Bentham, an *afflictive* as opposed to a *simple* punishment. Thus the unnecessary sufferings endured in English prisons before the reforms of Howard (see HOWARD and PRISON DISCIPLINE) and the drawing and quartering in the old executions for treason fall without any straining of terms under the category of torture. The whole subject is now one of only historical interest as far as Europe is concerned. It was, however, up to a comparatively recent date an integral part of the law of most countries (to which England, Aragon, and Sweden[1] formed honorable exceptions), as much a commonplace of law as trial by jury in England. One reason for its long continuance was no doubt the view taken in an age of judicial perjury[2] that truth was only to be attained by violent means, if not by torture then by ordeal or trial by battle. Speaking generally, torture may be said to have succeeded the ordeal and trial by battle (compare ORDEAL). Where these are found in full vigor, as in the capitularies of Charlemagne, there is no provision for torture. It was no doubt accepted reluctantly, but tolerated in the absence of any better means of eliciting truth, especially in cases of great gravity, on the illogical assumption that extraordinary offences must be met by extraordinary remedies.

The opinions of the best authorities have been in theory almost unanimously against the use of torture, even in a system where it was as completely established as it was in Roman law. "Tormenta," says Cicero,[3] in words which it is almost impossible to translate satisfactorily, "gubernat dolor, regit quæsitor, flectit libido, corrumpit spes, infirmat metus, ut in tot rerum angustiis nihil veritati loci relinquatur." Seneca says bitterly, "it forces even the innocent to lie." St. Augustine[4] recognizes the fallacy of torture. "If," says he, "the accused be innocent, he will undergo for an uncertain crime a certain punishment, and that not for having committed a crime, but because it is unknown whether he committed it." At the same time he regards it as excused by its necessity. The words of Ulpian, in the *Digest* of Justinian,[5] are no less impressive. "The torture (*quæstio*) is not to be regarded as wholly deserving or wholly undeserving of confidence; indeed, it is untrustworthy, perilous, and deceptive. For most men, by patience or the severity of the torture, come so to despise the torture that the truth cannot be elicited from them; others are so impatient that they will lie in any direction rather than suffer the torture; so it happens that they depose to contradictions and accuse not only themselves but others." Montaigne's[6] view of torture as a part of the punishment is a most just one: "All that exceeds a simple death appears to me absolute cruelty; neither can our justice expect that he whom the fear of being executed by being beheaded or hanged will not restrain should be any more awed by the imagination of a languishing fire, burning pincers, or the wheel." Montesquieu[7] speaks of torture in a most guarded manner, condemning it, but without giving reasons, and eulogizing England for doing without it. The system was condemned by Bayle and Voltaire with less reserve. Among the Italians, Beccaria,[8] Verri,[9] and Manzoni[10] will be found to contain most that can be said on the subject. The influence of Beccaria in rendering the use of torture obsolete was undoubtedly greater than that of any other legal reformer. The great point that he makes is the unfair incidence of torture, as persons' minds and bodies differ in strength. Moreover, it is, says he, to confound all relations to expect that a man should be both accuser and accused, and that pain should be the test of truth, as though truth resided in the muscles and fibres of a wretch under torture. The result of the torture is simply a matter of calculation. Given the force of the muscles and the sensibility of the nerves of an innocent person, it is required to find the degree of pain necessary to make him confess himself guilty of a given crime. Bentham's[11] objection to torture is that the effect is exactly the reverse of the intention. "Upon the face of it, and probably enough in the intention of the framers, the object of this institution was the protection of innocence; the protection of guilt and the aggravation of the pressure upon innocence was the real fruit of it." The apologists of torture, even among jurists, are not numerous. In fact, theoretical objections to it are often urged by the authors of books of practice, as by Damhouder, Von Rosbach, Von Boden, and Voet. It is worthy of note, however, as illustrative of the feeling of the time, that even Bacon[1] compares experiment in nature to torture in civil matters as the best means of eliciting truth. Muyart de Vouglans[2] derives the origin of torture from the law of God. Other apologists are Simancas, bishop of Badajos,[3] Engel,[4] and in England Sir R. Wiseman.[5]

---

[1] But even in these countries, whatever the law was, torture certainly existed in fact.

Greece.—The opinion of Aristotle was in favor of torture as a mode of proof. It is, he says, a kind of evidence, and appears to carry with it absolute credibility because a kind of constraint is applied. It is classed as one of the "artless persuasions" (ἄτεχναι πίστεις).[6] At Athens slaves, and probably at times resident aliens, were tortured, but it was never applied to free citizens,[7] such application being forbidden by a psephism passed in the archonship of Scamandrius. After the mutilation of the Hermæ in 415 B.C. a proposition was made, but not carried, that it should be applied to two senators named by an informer. In this particular case Andocides gave up all his slaves to be tortured.[8] Torture was sometimes inflicted in open court. The rack was used as a punishment even for free citizens. Antiphon was put to death by this means.[9] The torture of Nicias by the Syracusans is alluded to by Thucydides[10] as an event likely to happen, and it was only in order to avoid the possibility of inconvenient disclosures that he was put to death without torture. Isocrates and Lysias refer to torture under the generic name of στρέβλωσις. As might be expected, torture was frequently inflicted by the Greek despots, and both Zeno and Anaxarchus are said to have been put to it by such irresponsible authorities. At Sparta the despot Nabis was accustomed, as we learn from Polybius,[11] to put persons to death by an instrument of torture in the form of his wife Apega, a mode of torture no doubt resembling the *Jungfernkuss* once in use in Germany.

Rome.—The Roman system was the basis of all subsequent European systems which recognized torture as a part of their procedure. The law of torture was said by Cicero to rest originally on custom (*mores majorum*). There are frequent allusions to it in the classical writers[12] both of the republic and the empire. The law, as it existed under the later empire, is contained mainly in the titles *De Quæstionibus*[13] of the *Digest* and the *Code*,[14]—the former consisting largely of opinions from the *Sententiæ Receptæ* of Paulus,[15] the latter being for the most part merely a repetition of constitutions contained in the Theodosian Code.[16] Both substantive law and procedure were dealt with by these texts of Roman law, the latter, however, not as fully as in mediæval codes, a large discretion being left to the judges. Torture was used both in civil and criminal trials, but in the former only upon slaves and freedmen or infamous persons—such as gladiators—and where the truth could not be otherwise elicited, as in cases affecting the inheritance (*res hereditariæ*). Its place in the case of free citizens was taken by the reference to the oath of the party (see OATH). During the republic torture appears to have been confined to slaves in all cases, but with the empire (according to Dion Cassius under Tiberius) a free man became liable to it if accused of a crime, though not as a witness. If a Christian, of however high a condition, he was subject to torture during the period between the edict of Diocletian in 303 and the edict of toleration of Galerius in 311. This short period excepted, the liability of a free man depended upon two conditions, the nature of the accusation and the rank of the accused. On an accusation of treason every one, whatever his rank, was liable to torture, for in treason the condition of all was equal.[17] The same was the case of those accused of sorcery (*magi*), who were regarded as *humani generis inimici*.[18] A wife might be tortured (but only after her slaves had been put to the torture) if accused of poisoning her husband. In accusations of crimes other than treason or sorcery, certain persons were protected by the dignity of their position or their tender age. The main exemptions were contained in a constitution of Diocletian and Maximian, and included soldiers, nobles of a particular rank, *i.e.*, *eminentissimi* and *perfectissimi*, and their descendants to the third generation, and *decuriones* and their children to a limited extent—that is to say, they were subject to the torture of the *plumbatæ* in certain cases, such as fraud on the revenue and extortion. In addition to these, priests (but not clergy of a lower rank), children under fourteen, and pregnant women were exempt. A free man could be tortured only where he had been inconsistent in his depositions. No one was to be chained in prison before trial, nor could a prisoner be tortured while awaiting trial. The rules as to the torture of slaves were numerous and precise. It was a maxim of Roman law that torture of slaves was the most efficacious means of obtaining truth.[19] They could be tortured either as accused or as witnesses, but against their masters only in accusations of treason, adultery, frauds on the revenue, coining, and similar offences (which were regarded as a species of treason), attempts by a husband or wife on the life of the other, and in cases where a master had bought a slave for the special reason that he should not give evidence against him. The privilege from accusations by the slave extended to the master's father, mother, wife, or tutor, and also to a former master. On the same principle a freedman could not be tortured against his patron. The privilege did not apply where the slave was joint property, and one of his masters had been murdered by the other, or where he was the property of a corporation, for in such a case he could be tortured in a charge against a member of the corporation. Slaves belonging to the inheritance could be tortured in actions concerning the inheritance. The adult slaves of a deceased person could be tortured where the deceased had been murdered. In a charge of adultery against a wife, her husband's, her own, and her father's slaves could be put to the torture. A slave manumitted for the express purpose of escaping torture was regarded as still liable to it. Before putting a slave to torture without the consent of his master, security must be given to the master for his value. The master of a slave tortured on a false accusation could recover double his value from the accuser. The undergoing of torture had at one time a serious effect upon the after-life of the slave, for in the time of Gaius a slave who had been tortured could on manumission obtain no higher civil rights than those of a *dediticius*.[20] The rules of procedure were conceived in a spirit of as much fairness as such rules could be. Some of the most important were these. The amount of torture was at the discretion of the judge, but it was to be so applied as not to injure life or limb. The examination was not to begin by torture; other proofs must be exhausted first. The evidence[1] must have advanced so far that nothing but the confession of the slave was wanting to complete it. Those of weakest frame and tenderest age were to be tortured first. Except in treason, the unsupported testimony of a single witness was not a sufficient ground for torture. The voice and manner of the accused were to be carefully observed. A spontaneous confession, or the evidence of a personal enemy, was to be received with caution. Repetition of the torture could only be ordered in case of inconsistent depositions or denial in the face of strong evidence. There was no rule limiting the number of repetitions. Leading questions were not to be asked. A judge was not liable to an action for anything done during the course of the examination. An appeal from an order to torture was competent to the accused, except in the case of slaves, when an appeal could be made only by the master.[2] The appellant was not to be tortured pending the appeal, but was to remain in prison.[3] The principal forms of torture in use were the *equuleus*, or rack (mentioned as far back as Cicero), the *plumbatæ*, or leaden balls, the *ungulæ*, or barbed hooks, and the *fidiculæ*, or cord compressing the arm. Other allusions in the *Digest* and *Code*, in addition to those already cited, may be shortly noticed. The testimony of a gladiator or infamous person (such as an accomplice) was not valid without torture.[4] This was no doubt the origin of the mediæval maxims (which were, however, by no means universally recognized),—*Vilitas personæ est justa causa torquendi testem*, and *Tortura purgatur infamia*. Torture could not be inflicted during the forty days of Lent.[5] Robbers and pirates might be tortured even on Easter Day, the Divine pardon being hoped for where the safety of society was thus assured.[6] Capital punishment was not to be suffered until after conviction or confession under torture.[7] Withdrawal from prosecution (*abolitio*) was not to be allowed as a rule after the accused had undergone the torture.[8] In charges of treason the accuser was liable to torture if he did not prove his case.[9] The infliction of torture, not judicial, but at the same time countenanced by law, was at one time allowed to creditors. They were allowed to keep their debtors in private prisons, and most cruelly ill-use them, in order to extort payment.[10] Under the empire private prisons were forbidden.[11] In the time of Juvenal, if his sixth satire may be believed, the Roman ladies actually hired the public torturers to torture their domestic slaves. As a part of the punishment torture was in frequent use. Crucifixion, mutilation, exposure to wild beasts in the arena, and other cruel modes of destroying life were common, especially in the time of the persecution of the Christians under Nero.[12] Crucifixion as a punishment was abolished by Constantine in 315, in veneration of the memory of Him who was crucified for mankind. The punishment of mutilation was moderated by Justinian, who forbade amputation of both hands or feet or of any limb, and confined it in future to amputation of one hand.[13] Scourging was inflicted only on slaves; free men were exempt by the *Lex Porcia* and *Lex Valeria*, except in a few cases, such as that of adultery, the penalty for which was scourging and cutting off the nose.[14] On the other hand, where the interests of the church were concerned, the tendency was in favor of greater severity. Thus, by the Theodosian Code, a heretic was to be flogged with lead (*contusus plumbo*) before banishment,[15] and Justinian made liable to torture and exile any one insulting a bishop or priest in a church.[16]

[12] An interesting one, illustrating the uselessness of torture in the face of courage and resolution, is the abortive result of the torture of a Spanish peasant in 25 A.D. on the charge of being the murderer of Lucius Piso (Tac., *Ann.*, iv. 45). A somewhat similar case, occurring in Sicily, is given by Valerius Maximus, bk. iii. c. iii. The horrible torture of Epicharis, a freed woman, is described by Tacitus, *Ann.*, xv. 57. In Pliny's letter to Trajan (*Epist.*, x. 97), he mentions having put to the torture two Christian deaconesses (*ministræ*).

[13] *Quæstio* included the whole process of which torture was a part. In the words of Cujacius, "quæstio est interrogatio quæ fit per tormenta, vel de reis, vel de testibus qui facto intervenisse dicuntur."

The Church.—As far as it could the church adopted the Roman law, with the important and characteristic difference (dating from the severe edicts of Theodosius the Great in 381) that heresy took the place of treason, it being regarded as a kind of treason against God ("crimen læsæ majestatis divinæ").[17] The doctrine of confiscation for treason was so convenient and profitable that it was rapidly adopted by the church.[18] As most instances in which torture was inflicted by ecclesiastical tribunals would be accusations of heresy or Judaism—a specially revolting form of heresy to mediæval Christians—this theory practically equalized all persons for the purpose of torture, in accordance with the doctrine that in treason all were equal. The church generally secured the almost entire immunity of its clergy, at any rate of the higher ranks, from torture by civil tribunals.[19] In many instances councils of the church pronounced against torture, *e.g.*, in a synod at Rome in 384.[20] Torture even of heretics seems to have been originally left to the ordinary tribunals. Thus a bull of Innocent IV., in 1252, directed the torture of heretics by the civil power as being robbers and murderers of souls, and thieves of the sacraments of God.[21] The church also enjoined torture for usury.[22] A characteristic division of torture, accepted by the church but not generally acknowledged by lay authorities, was into spiritual and corporal, the latter being simply the imposition of the oath of purgation, the only form originally in use in the ecclesiastical courts. The canon law contains little on the subject of torture, and that little of a comparatively humane nature. It laid down that it was no sin in the faithful to inflict torture,[23] but a priest might not do so with his own hands,[24] and charity was to be used in all punishments.[25] No confession was to be extracted by torture.[26] The principal ecclesiastical tribunal by which torture was inflicted in more recent times was of course the INQUISITION (*q.v.*). The code of instructions issued by Torquemada in Spain in 1484 provided that an accused person might be put to the torture if *semiplena probatio* existed against the accused,—that is, so much evidence as to raise a grave and not merely a light presumption of guilt, often used for the evidence of one eye or ear witness of a fact. If the accused confessed during torture, and afterwards confirmed the confession, he was punished as convicted; if he retracted, he was tortured again, or subjected to extraordinary punishment. One or two inquisitors, or a commissioner of the Holy Office, were bound to be present at every examination. Owing to the occurrence of certain cases of abuse of torture, a decree of Philip II. was issued, in 1558, forbidding the administration of torture without an order from the council. But this decree does not appear to have been fully observed. By the edict of the inquisitor-general Valdés, in 1561, torture was to be left to the prudence and equity of the judges. They must consider motives and circumstances before decreeing torture, and must declare whether it is to be employed *in caput proprium*, *i.e.*, to extort a confession, or *in caput alienum*, *i.e.*, to incriminate an accomplice. The accused was not to be informed of the grounds of torture. He was not to be questioned on a particular fact, but was to be allowed to say what he pleased. Torture was not to be decreed until the termination of the process, and after defence heard, and the decree was subject to appeal, but only in doubtful cases, to the Council of the Supreme. It was also only in doubtful cases that the inquisitors were bound to consult the council; where the law was clear (and of this they were the judges) there need be no consultation, and no appeal was allowed. The judges, the registrar, and the executioners were the only persons allowed to be present at the torture. They were to be careful that the jailer suggested nothing to the accused during the torture. On ratification twenty-four hours afterwards of a confession made under torture, the accused might be reconciled, if the inquisitors believed him to be sincerely repentant. If convicted of bad faith, he might be relaxed, *i.e.*, delivered to the secular power to be burned. The inquisitors had a discretion to allow the accused to make the canonical purgation by oath instead of undergoing corporal torture, but the rule which allows this to be done at the same time discountenances it as fallacious. It is remarkable that the rules do not allow much greater efficacy to torture. They speak of it almost in the terms of Roman law as dangerous and uncertain, and depending for its effects on physical strength.[1] Torture had ceased to be inflicted before the suppression of the Inquisition, and in 1816 a papal bull decreed that torture should cease, that proceedings should be public, and that the accuser should be confronted with the accused.[2] It was still, however, customary for the fiscal, even in the latest times, to end the requisition by demanding torture as a matter of form. The rules in themselves were not so cruel as the construction put upon them by the inquisitors. For instance, by Torquemada's instructions torture could not be repeated unless in case of retractation. This led to the subtlety of calling a renewed torture a continuation, and not a repetition.[3] The rules of Torquemada and of Valdés are those of the greatest historical importance, the latter forming the code of the Holy Office until its suppression, not only in Spain, but in other countries where the Inquisition was established. But several other codes of procedure existed before the final perfection of the system by Valdés. The earliest is perhaps the instructions for inquisitors (*Directorium Inquisitorum*) compiled a century earlier than Torquemada by Nicholas Eymerico, grand inquisitor of Aragon about 1368.[4] Rules of practice were also framed two centuries later by Simancas, whose position as an apologist has been already stated. The text-book of procedure of the Italian Inquisition was the *Sacro Arsenale*.[5] In the Netherlands, Francis Van der Helst was appointed inquisitor-general in 1521, with authority to torture heretics without observing the ordinary forms of law, and without appeal.[6] In 1545 and 1550 instructions for the guidance of inquisitors were issued by Charles V.[7] The liability of a judge for exceeding the law was not always recognized by the Inquisition to the same extent as by the lay tribunals. Llorente gives an instance of a warrant by an inquisitor to a licentiate ordering the torture of an accused person, and protesting that, in case of death or fracture of limbs, the fact is not to be imputed to the licentiate.[8]

---

[1] The evidence on which the accused might be tortured was expressed in Roman law by the terms *argumentum* and *indicium*. The latter term, as will be seen, afterwards became one of the most important in the law of torture, but the analysis of *indicium* is later than Roman law. *Indicium* was not quite the same thing as *semiplena probatio*, though the terms appear to be occasionally used as synonyms. *Indicium* was rather the foundation or cause of *probatio*, whether *plena* or *semiplena*. An *indicium* or a concurrence of *indicia* might, according to circumstances, constitute a *plena* or *semiplena probatio*. The difference between the words may be illustrated by a passage from Justin, "Ad cujus rei probationem immittit indices," xxxii. 2.

Thus far of the law. In practice all the ingenuity of cruelty was exercised to find new modes of torment.[9] These cruelties led at times to remonstrance from the civil power. One example is the edict of Philip II. just mentioned. Another and an earlier one is an *ordonnance* of Philip the Fair, in 1302, bidding the Inquisition confine itself within the limits of the law.[10] At Venice the senate decreed that three senators should be present as inquisitors. Further details of the varieties of torture will be found, by those curious in such matters, in the works of Llorente, Herculano (*History of the Inquisition in Portugal*), Motley, Garrido and Cayley, and Picart, to which may be added works giving accounts of the sufferings of individuals under the Inquisition, such as the narrative of the sufferings of William Lithgow at Malaga in 1622 and of Van Halen in 1817, and (in the Spanish and Portuguese colonies) the cases of Francisco Moyen in Chili, and of Dellon at Goa in 1673.[11] Mental torture may be exemplified by EXCOMMUNICATION (*q.v.*), and by the secrecy and uncertainty of the proceedings of the inquisitors.

As the practice of torture, both by the civil and ecclesiastical power, became more systematized, it grew to be the subject of casuistical inquiry by churchmen, to an extent far exceeding the scanty discussion of the question in the text of the canon law. It will be sufficient here to cite as an example the treatment of it by Liguori, who incorporates the opinions of many of the Spanish casuists. On the whole, his views appear to be more humane than the prevailing practice. The object of torture he defines very neatly as being to turn *semiplena* into *plena probatio*. For this proper *indicia* are necessary. He then proceeds to decide certain questions which had arisen, the most interesting of which deal with the nature of the sin of which the accused and the judge are guilty in particular instances. A judge sins gravely if he does not attempt all milder means of discovering truth before resorting to torture. He sins in a criminal cause, or in one of notable infamy, if he binds the accused by oath to tell the truth before there is proof against him. It is the same if without oath he uses threats, terror, or exhibition of torments to confound the witness.[12] If any one, to avoid grave torments, charges himself with a capital crime, he does not sin mortally.[13] It was a doubtful question whether he sinned gravely in such case.

England.—It is the boast of the common law of England that it never recognized torture as legal. One, perhaps the chief, reason for this position taken by the law is the difference of the nature of the procedure in criminal cases from that in general use in Continental countries. To use words more familar in foreign jurisprudence, the English system is *accusatorial* as distinguished from *inquisitorial*. The common law of England has always shown itself averse to the inquisitorial system, and so (at least in theory) to the torture which may be regarded as an outcome of the system whose one end was to obtain a confession from the accused. The tendency of the small amount of statute law bearing on the subject is in the same direction. It was provided by Magna Charta, § 29, "that no free man . . . . . should be destroyed in any way unless by legal judgment of his equals or by the law of the land." On this Sir E. Coke comments, "No man destroyed, etc., that is, forejudged of life or limb, disenherited, or put to torture or death."[1] The Act of 27 Hen. VIII. c. 4 enacted that, owing to the frequent escape of pirates, in trials by the civil law, "the nature whereof is that before any judgment of death can be given against the offenders they must plainly confess their offence (which they will never do without torture or pains)," such persons should be tried by jury before commissioners under the Great Seal. Finally, the Bill of Rights provided that cruel and unusual punishments ought not to be inflicted. The opinions of the judges have been invariably against torture in theory, however much some of them may have been led to countenance it in practice. The strongest authority is the resolution of the judges in Felton's case (1628), "that he ought not by the law to be tortured by the rack, for no such punishment is known or allowed by our law."[2] In accordance with this are the opinions of Sir John Fortescue,[3] Sir Thomas Smith,[4] and Sir E. Coke. The latter says,—"As there is no law to warrant tortures in this land, nor can they be justified by any prescription, being so lately brought in."[5] In spite of all this torture in criminal proceedings was inflicted in England with more or less frequency for some centuries, both as a means of obtaining evidence and as a part of the punishment. But it should be remarked that torture of the former kind was invariably ordered by the crown or council, or by some tribunal of extraordinary authority, such as the Star Chamber, not professing to be bound by the rules of the common law. In only two instances was a warrant to torture issued to a common law judge.[6]

---

[1] The rules will be found in Llorente's *Hist. of the Inquisition*, cc. vi., xxii.

[2] A case of actual torture occurred in Spain in the case of Van Halen, in 1817, in spite of the papal bull. In South America, as late as 1809, power to torture was conferred on inquisitors by the dean and chapter of Santiago. See *Francisco Moyen, or the Inquisition in South America*, by B. V. Mackenna (transl. by J. W. Duffy, 1869), p. 217.

[3] Prescott, *Ferdinand and Isabella*, vol. i. p. 327.

[4] An edition was published at Rome in 1558, and a compendium at Lisbon in 1762, and by Marchena at Montpellier in 1821.

[5] The only edition which the writer has seen is dated Genoa and Perugia, 1653.

[7] Id., p. 329.

[8] Llorente, c. xiv.

[9] Among others were the gradual pouring of water drop by drop on a particular spot of the body, the *tormento de toca*, or pouring of water into a gauze bag in the throat, which gradually forced the gauze into the stomach, and the *péndola*, or swinging pendulum, so graphically described in one of Edgar Poe's tales.

[10] *Ordonnances des Rois*, vol. i. p. 346.

[11] The history of Dellon's narrative of his experiences in the prison of the Inquisition is remarkable. It was translated into English in 1688 by the Rev. R. Wharton, a chaplain of Archbishop Sancroft, but was refused a license, as being contrary to the king's religion, and the publisher was imprisoned.

[12] *Theol. Mor.*, bk. ix § 202.

[13] § 274.

A license to torture is found as early as the Pipe Roll of 34 Hen. II.[7] The Templars (see TEMPLARS) were tortured in 1310 by royal warrant addressed to the mayor and sheriffs of London.[8] In this case it is recorded that torture was unknown in England, and that no torturer was to be found in the realm.[9] A commission was issued concerning the tortures at Newgate in 1334.[10] The rack in the Tower is said to have been introduced by the duke of Exeter in the reign of Henry VI., and to have been thence called "the duke of Exeter's daughter."[11] In this reign torture seems to have taken its place as a part of what may be called extraordinary criminal procedure, claimed, and it may be said tacitly recognized, as exercisable by virtue of the prerogative, and continued in use down to 1640.[12] The infliction of torture gradually became more common under the Tudor monarchs. Under Henry VIII. it appears to have been in frequent use. Only two cases are recorded under Edward VI., and eight under Mary.[13] The reign of Elizabeth was its culminating point. In the words of Hallam, "the rack seldom stood idle in the Tower for all the latter part of Elizabeth's reign."[14] The varieties of torture used at this period are fully described by Dr. Lingard,[15] and consisted of the rack, the scavenger's daughter,[16] the iron gauntlets or bilboes, and the cell called "Little Ease." The registers of the council during the Tudor and early Stuart reigns are full of entries as to the use of torture, both for state and for ordinary offences.[17] Among notable prisoners put to the torture were Anne Ascue, the Jesuit Campion, Guy Fawkes,[18] and Peacham (who was examined by Bacon "before torture, in torture, and after torture").[19] The prevalence of torture in Elizabeth's reign led to the well-known defence attributed to Lord Burghley, "A declaration of the favorable dealing of Her Majesty's commissioners appointed for the examination of certain traitors, and of tortures unjustly reported to be done upon them for matter of religion," 1583.[20] The use of torture in England being always of an extraordinary and extra-judicial nature, it is comparatively certain that it could hardly have been applied with that observation of forms which existed in countries where it was regulated by law. There were no rules and no responsibility beyond the will of the crown or council. This irresponsibility is urged by Selden[21] as a strong objection to the use of torture.

So far of what may be called torture proper, to which the common law professed itself a stranger. There were, however, cases fully recognized by the common law which differed from torture only in name. The *peine forte et dure* was a notable example of this. If a prisoner stood mute of malice instead of pleading, he was condemned to the *peine*, that is, to be stretched upon his back and to have iron laid upon him as much as he could bear, and more, and so to continue, fed upon bad bread and stagnant water through alternate days until he pleaded or died.[22] It was abolished by 12 Geo. III. c. 20. 7 and 8 Geo. IV. c. 28 enacted that a plea of "not guilty" should be entered for a prisoner so standing mute. A case of *peine* occurred as lately as 1726. At times tying the thumbs with whip-cord was used instead of the *peine*. This was said to be a common practice at the Old Bailey up to the last century.[23] In trials for witchcraft the legal proceedings often partook of the nature of torture, as in the throwing of the reputed witch into a pond to see whether she would sink or swim, in drawing her blood,[24] and in thrusting pins into the body to try to find the insensible spot. Confessions, too, appear to have been often extorted by actual torture, and torture of an unusual nature, as the devil was supposed to protect his votaries from the effects of ordinary torture.

Torture as a part of the punishment existed in fact, if not in name, down to a very recent period. Mutilation as a punishment appears in some of the pre-Conquest codes, such as those of Alfred, Athelstan, and Canute. Bracton, who does not notice torture as a means of obtaining evidence, divides corporal punishment into that inflicted with and without torture.[1] Later instances are the punishment of burning to death inflicted on heretics under the Six Articles (31 Hen. VIII. c. 14) and other Acts, and on women for petit treason (abolished by 30 Geo. III. c. 48), the mutilation inflicted for violence in a royal palace by 33 Hen. VIII. c. 12, the punishment for high treason, which existed nominally until 1870 (see TREASON), the pillory (abolished by 7 Will. IV. and 1 Vict. c. 23), the stocks, and the burning in the hand for felony (abolished by 19 Geo. III. c. 74). Corporal punishment now exists only in the case of juvenile offenders (see SUMMARY JURISDICTION) and of robbery with violence (see THEFT). It was abolished in the army by the Army Act, 1881.[2]

[24] The superstition was that any one drawing a witch's blood was free from her power. This is alluded to in *Henry VI.*, pt. i. act i. sc. 5; "Blood will I draw on thee; thou art a witch."

Scotland.—Torture was long a recognized part of Scottish criminal procedure, and was acknowledged as such by many Acts and warrants of the Scottish parliament, and warrants of the crown and the privy council. Some of the more important instances are the following. In 1542 the forfeiture of John, Lord Glammis, was reduced by the parliament as having proceeded on a confession extorted by threats of the "pynebankis." In 1567 four persons were ordered by the Privy Council to be tortured for complicity in Darnley's murder.[3] In 1591 a commission issued to torture certain persons accused of witchcraft.[4] James VI., in 1596, empowered the provost and bailies of Edinburgh to try rioters by torture. The torture was applied to Rhynd in 1600, on a charge of being privy to the Gowrie House conspiracy.[5] Two Acts in 1649 dealt with torture: one took the form of a warrant to examine witnesses against William Barton by any form of probation,[6] the other of a warrant to a committee to inquire as to the use of torture against persons suspected of witchcraft.[7] In 1650 the parliament ordained the committee appointed for the examination of prisoners to intimate to Colonel Sibbald that if his examination were not satisfactory the parliament would ordain him to be tortured. The judges, in 1689, were empowered by the estates to torture Chiesly of Dalrye, charged with the murder of the Lord President Lockhart, in order to discover accomplices. In the same year the use of torture without evidence or in ordinary cases was declared illegal in the Claim of Right. The careful wording of this will be noticed: it does not object to torture altogether, but reserves it for cases where a basis of evidence had already been laid, and for crimes of great gravity, thus admitting the dangerous principle, founded on Roman law, that the importance of the crime is a reason for departing from the ordinary rules of justice. However great the crime, it is no more certain than in the case of a crime of less gravity that the person accused was the person who committed it. A warrant issued in the same year to put to the torture certain persons accused of conspiring against the Government, and also certain dragoons suspected of corresponding with Lord Dundee. In 1690 an Act passed reciting the torture of William Carstares, a minister, in 1683, and re-establishing his competency as a witness.[8] The last warrant appears to be one in 1690 for torturing a man accused of rape and murder. In 1708 torture in Scotland was finally abolished by 7 Anne c. 21, § 5. Many details of the tortures inflicted will be found in Pitcairn's *Criminal Trials* and the introduction to Maclaurin's *Criminal Cases*. Among other varieties—the nature of some of them can only be guessed—were the rack, the piluiewinkis, the boot,[9] the caschie-laws, the lang irnis, the narrow-bore, and, worst of all, the waking, or artificial prevention of sleep.[10] The ingenuity of torture was exercised in a special degree on charges of witchcraft, notably in the reign of James VI., an expert both in witchcraft and in torture. The Act of 1649, already cited, shows that the principle survived him. Under the government of the dukes of Lauderdale and York torture as a practice in charges of religious and political offences reached its height. "The privy council was accustomed to extort confessions by torture; that grim divan of bishops, lawyers, and peers sucking in the groans of each undaunted enthusiast, in hope that some imperfect avowal might lead to the sacrifice of other victims, or at least warrant the execution of the present."[11] With such examples before them in the law, it is scarcely to be wondered at that persons in positions of authority, especially the nobility, sometimes exceeded the law and inflicted torture at their own will and for their own purposes. There are several instances in the register of the privy council of suits against such persons, *e.g.*, against the earl of Orkney, in 1605, for putting a son of Sir Patrick Bellenden in the boots.

Ireland seems to have enjoyed a comparative immunity from torture. It was not recognized by the common or statute law, and the cases of its infliction do not appear to be numerous. In 1566 the president and council of Munster, or any three of them, were empowered to inflict torture, "in cases necessary, upon vehement presumption of any great offence in any party committed against the Queen's Majesty."[12] In 1583 Hurley, an Irish priest, was tortured in Dublin, by "toasting his feet against the fire with hot boots."[13] In the case of Myagh, in 1581, the accused was brought over from Ireland by command of the lord deputy to be tortured in the Tower.[14] In 1615 one O'Kennan was put to the rack in Dublin by virtue of the lord deputy's commission.[15] In 1627 the lord deputy doubted whether he had authority to put a priest named O'Cullenan to the rack. An answer was returned by Lord Killultagh to the effect that "you ought to rack him if you saw cause and hang him if you found reason."[16]

British Colonies and Dependencies.—The infliction of torture in any British colony or dependency has usually been regarded as contrary to law, and ordered only by arbitrary authority. It is true that in the trial of Sir Thomas Picton in 1806, for subjecting, while governor of Trinidad, a woman named Luisa Calderon to the torture of the picquet,[17] one of the grounds of defence was that such torture was authorized by the Spanish law of the island, but the accused was convicted in spite of this defence, and the final decision of the Court of King's Bench, in 1812, decreeing a respite of the defendant's recognizances till further order, was perhaps not so much an affirmation of the legality in the particular instance as the practical expression of a wish to spare an eminent public servant.[18] As to India, the second charge against Warren Hastings was extortion from the begums of Oude by means of the torture of their servants.[19] In the present Indian Penal Code and Evidence Act there are provisions intended, as Sir James Stephen says,[20] to prevent the practice of torture by the police for the purpose of extracting confessions from persons in their custody.[21] In Ceylon torture, which had been allowed under the Dutch government, was expressly abolished by royal proclamation in 1799.

United States.—One instance of the *peine forte et dure* is known. It was inflicted in 1692 on Giles Cory of Salem, who refused to plead when arraigned for witchcraft.[22] The constitution of the United States provides, in the words of the Bill of Rights, that cruel and unusual punishments are not to be inflicted.[23] This is repeated in the constitutions of most States. The infliction of cruel and unusual punishment by the master or officer of an American vessel on the high seas, or within the maritime jurisdiction of the United States, is punishable with fine or imprisonment, or both.[24]

Continental States.—The principles of Roman law were generally adopted. Want of space unfortunately prevents a detailed examination of the law of other countries, but that of Italy may fairly be taken as the type of a system which reached at its maturity a certain revolting completeness of which it is difficult to speak with patience. The law as it existed in Italy is contained in a long line of authorities, chiefly supplied by the school of Bologna, beginning with the *glossatores* and coming down through the *post-glossatores*, until the system attained its perfection in the vast work of Farinaccius, written early in the 17th century, where every possible question that could arise is treated with elaborate minuteness. The writings of jurists were supplemented by a large body of legislative enactments in most of the Italian states, extending from the constitutions of the emperor Frederick II. down to the last century.

[24] *Revised Stat.*, § 5347.

It is not until Bartolus (1314–1357) that the law begins to assume a definite and complete form. In his commentary on book xlviii. of the *Digest* he follows Roman law closely, but introduces some further refinements: *e.g.*, though leading questions may not be asked in the main inquiry they are admissible as subsidiary. There is a beginning of classification of *indicia*. A very full discussion of the law is contained in the work on practice of Hippolytus de Marsiliis,[1] a jurist of Bologna, notorious, on his own admission, as the inventor of the torture of keeping without sleep. He defines the question as *inquisitio veritatis per tormenta et cordis dolorem*, thus recognizing the mental as well as the physical elements in torture. It was to be used only in capital cases and atrocious crimes. The works of Farinaccius and of Julius Clarus nearly a century later were of great authority from the high official positions filled by the writers. Farinaccius was procurator-general to Pope Paul V., and his discussion of torture is one of the most complete of any.[2] It occupies 251 closely printed folio pages with double columns. The length at which the subject is treated is one of the best proofs of the science to which it had been reduced. The chief feature of the work is the minute and skilful analysis of *indicia*, *fama*, *præsumptio*, and other technical terms. Many definitions of *indicium* are suggested, the best perhaps being *conjectura ex probabilibus et non necessariis orta, a quibus potest abesse veritas sed non verisimilitudo*. For every infliction of torture a distinct *indicium* is required. But this rule does not apply where it is inflicted for discovering accomplices or for discovering a crime other than that for which it was originally inflicted. Torture may be ordered in all criminal cases, except small offences, and in certain civil cases, such as denial of a *depositum*, bankruptcy, usury, treasure trove, and fiscal cases. It may be inflicted on all persons, unless specially exempted (clergy, minors, etc.), and even those exempted may be tortured by command of the sovereign. There are three kinds of torture, *levis*, *gravis*, and *gravissima*, the first and second corresponding to the ordinary torture of French writers, the last to the extraordinary. The extraordinary or *gravissima* was as much as could possibly be borne without destroying life. An immense variety of tortures is mentioned, the most usual being the tying of one hand only with the cord. The judge could not begin with torture; it was only a *subsidium*. If inflicted without due course of law, it was void as a proof. The judge was liable to penalties if he tortured without proper *indicia*, if a privileged person, or if to the extent that death or permanent illness was the result. An immense variety of tortures is mentioned, and the list tended to grow, for, as Farinaccius says, judges continually invented new modes of torture to please themselves. Numerous casuistical questions are treated at length. Could a priest reveal an acknowledgment of an intended crime made to him in confession? What kinds of reports or how much hearsay evidence constituted fame? How far was a confession allowed to be extorted by blandishments or false promises on the part of the judge? Were there three or five grades in torture? Julius Clarus of Alessandria was a member of the council of Philip II.[3] To a great extent he follows Farinaccius. He puts the questions for the consideration of the judge with great clearness. They are—whether (1) a crime has been committed, (2) the charge is one in which torture is admissible, (3) the fact can be proved otherwise, (4) the crime was secret or open, (5) the object of the torture is to elicit confession of crime or discovery of accomplices. He admits the tremendous power given to a judge of torturing a witness should he suspect that the latter knows the truth and is concealing it. An accuser may not be racked with the accused in order to test his sincerity. The clergy can be tortured only in charges of treason, poisoning, and violation of tombs. On the great question whether there are three or five grades, he decides in favor of five, viz., threats, taking to the place of torment, stripping and binding, lifting on the rack, racking. Other Italian writers of less eminence have been referred to for the purposes of this article. The burden of their writings is practically the same, but they have not attained the systematic perfection of Farinaccius. Citations from many of them are made by Manzoni (see below). Among others are Guido de Suzara, Paris de Puteo, Ægidius Bossius of Milan, Casonus of Venice, Decianus, Follerius, and Tranquillus Ambrosianus, whose works cover the period from the 13th to the end of the 17th century. The law depended mainly on the writings of the jurists as interpreters of custom. At the same time in all or nearly all the Italian states the customary law was limited, supplemented, or amended by legislation. That a check by legislative authority was necessary appears from the glimpses afforded by the writings of the jurists that the letter of the law was by no means always followed.[4] The earliest legislation after the Roman law seems to be the constitutions of the emperor Frederick II. for Sicily promulgated in 1231.

Several instances of the torture of eminent persons occur in Italian history. The historical case of the greatest literary interest is that of the persons accused of bringing the plague into Milan in 1630 by smearing the walls of houses with poison. An analysis of the case was undertaken by Verri[5] and Manzoni,[6] and puts in a clear light some of the abuses to which the system led in times of popular panic. Convincing arguments are urged by Manzoni, after an exhaustive review of the authorities, to prove the groundlessness of the charge on which two innocent persons underwent the torture of the *canape*, or hempen cord (the effect of which was partial or complete dislocation of the wrist), and afterwards suffered death by breaking on the wheel. The main arguments shortly stated, are these, all based upon the evidence as recorded, and the law as laid down by jurists. (1) The unsupported evidence of an accomplice was treated as an *indicium* in a case not one of those exceptional ones in which such an *indicium* was sufficient. The evidence of two witnesses or a confession by the accused was necessary to establish a remote *indicium*, such as lying. (2) Hearsay evidence was received when primary evidence was obtainable. (3) The confession made under torture was not ratified afterwards. (4) It was made in consequence of a promise of impunity. (5) It was of an impossible crime.

Much general information on the subject will be found in the works of Mr. Lea and Mr. Lecky, to which reference has already been made, in the *Penny Cyclopædia*, s.v. "Torture," in Zedler's *Universal Lexicon*, s.v. "Tortur," and in Meyer's *Esprit des Institutions Judiciaires*. For England, Jardine's work is the standard authority. Thirty-six kinds of torture are described in Meyer's *Konversations-Lexikon*, s.v. "Tortur." Instruments of torture are still preserved in the Tower of London and in the museums of Munich, Ratisbon, Nuremberg, The Hague, and other places. Those at the Tower are the iron collar, the bilboes, the thumbscrew, and the scavenger's daughter. There is also a model of one of the forms of the rack. (J. W†.)

TORY. See WHIG AND TORY.

TOTEMISM. A totem is a class of material objects which a savage regards with superstitious respect, believing that there exists between him and every member of the class an intimate and altogether special relation. The name is derived from an Ojibway (Chippeway) word which was first introduced into literature, so far as appears, by J. Long, an Indian interpreter of last century, who spelt it *totam*.[7] The connection between a man and his totem is mutually beneficent: the totem protects the man, and the man shows his respect for the totem in various ways, by not killing it if it be an animal, and not cutting or gathering it if it be a plant. As distinguished from a fetich, a totem is never an isolated individual, but always a class of objects, generally a species of animals or of plants, more rarely a class of inanimate natural objects, very rarely a class of artificial objects.

Kinds of totems.

Considered in relation to men, totems are of at least three kinds: (1) the clan totem, common to a whole clan, and passing by inheritance from generation to generation; (2) the sex totem, common either to all the males or to all the females of a tribe, to the exclusion in either case of the other sex; (3) the individual totem, belonging to a single individual and not passing to his descendants. Other kinds of totems exist and will be noticed, but they may perhaps be regarded as varieties of the clan totem. The latter is by far the most important of all; and where we speak of totems or totemism without qualification the reference is always to the clan totem.

Clan totem.

The Clan Totem.—The clan totem is reverenced by a body of men and women who call themselves by the name of the totem, believe themselves to be of one blood, descendants of a common ancestor, and are bound together by common obligations to each other and by a common faith in the totem. Totemism is thus both a religious and a social system. In its religious aspect it consists of the relations of mutual respect and protection between a man and his totem; in its social aspect it consists of the relations of the clansmen to each other and to men of other clans. In the later history of totemism these two sides, the religious and the social, tend to part company; the social system sometimes survives the religious; and, on the other hand, religion sometimes bears traces of totemism in countries where the social system based on totemism has disappeared. We begin with the religious side.

Totemism as a religion.

Totemism as a Religion or the Relation between a Man and his Totem.—The members of a totem clan call themselves by the name of their totem, and commonly believe themselves to be actually descended from it.

Descent from totem.

Thus the Turtle clan of the Iroquois are descended from a fat turtle, which, burdened by the weight of its shell in walking, contrived by great exertions to throw it off, and thereafter gradually developed into a man.[1] The Cray-Fish clan of the Choctaws were originally cray-fish and lived underground, coming up occasionally through the mud to the surface. Once a party of Choctaws smoked them out, and, treating them kindly, taught them the Choctaw language, taught them to walk on two legs, made them cut off their toe nails, and pluck the hair from their bodies, after which they adopted them into the tribe. But the rest of their kindred, the cray-fish, are still living underground.[2] The Osages are descended from a male snail and a female beaver. The snail burst his shell, developed arms, feet, and legs, and became a fine tall man; afterwards he married the beaver maid.[3] Some of the clans of western Australia are descended from ducks, swans, and other waterfowl.[4] In Senegambia each family or clan is descended from an animal (hippopotamus, scorpion, etc.), with which it counts kindred.[5]

Somewhat different are the myths in which a human ancestress is said to have given birth to an animal of the totem species. Thus the Snake clan among the Moquis of Arizona are descended from a woman who gave birth to snakes.[6] The Bakalai in western equatorial Africa believe that their women once gave birth to the totem animals; one woman brought forth a calf, others a crocodile, hippopotamus, monkey, boa, and wild pig.[7]

Respect shown to totem.

Believing himself to be descended from, and therefore akin to, his totem, the savage naturally treats it with respect. If it is an animal he will not, as a rule, kill or eat it. In the Mount Gambier tribe (South Australia) "a man does not kill or use as food any of the animals of the same subdivision with himself, excepting when hunger compels; and then they express sorrow for having to eat their *wingong* (friends) or *tumanang* (their flesh). When using the last word they touch their breasts, to indicate the close relationship, meaning almost a part of themselves.

To illustrate: One day one of the blacks killed a crow. Three or four days afterwards a Boortwa (crow) named Larry died. He had been ailing for some days, but the killing of his *wingong* hastened his death.[8] The tribes about the Gulf of Carpentaria greatly reverence their totems: if any one were to kill the totem animal in presence of the man whose totem it was, the latter would say, "What for you kill that fellow? that my father!" or "That brother belonging to me you have killed; why did you do it?"[9] Sir George Grey says of the western Australian tribes that a man will never kill an animal of his *kobong* (totem) species if he finds it asleep; "indeed, he always kills it reluctantly, and never without affording it a chance to escape. This arises from the family belief that some one individual of the species is their nearest friend, to kill whom would be a great crime, and to be carefully avoided."[10] Amongst the Indians of British Columbia a man will never kill his totem animal; if he sees another do it, he will hide his face for shame, and afterwards demand compensation for the act. Whenever one of these Indians exhibits his totem badge (as by painting it on his forehead), all persons of the same totem are bound to do honor to it by casting property before it.[11] The Damaras in South Africa are divided into totem clans, called "eandas;" and according to the clan to which they belong they refuse to partake, *e.g.*, of an ox marked with black, white, or red spots, or of a sheep without horns, or of draught oxen. Some of them will not even touch vessels in which such food has been cooked, and avoid even the smoke of the fire which has been used to cook it.[12] The negroes of Senegambia do not eat their totems.[13] The Mundas (or Mundaris) and Oraons in Bengal, who are divided into exogamous totem clans, will not kill or eat the totem animals which give their names to the clans.[14] A remarkable feature of some of these Oraon totems is that they are not whole animals, but parts of animals, as the head of a tortoise, the stomach of a pig. In such cases (which are not confined to Bengal) it is of course not the whole animal, but only the special part, that the clansmen are forbidden to eat. Such totems may be distinguished as *split totems*. The Jagannáthi Kumhár in Bengal abstain from killing or injuring the totems of their respective clans, and they bow to their totems when they meet them.[15]

Split totems.

Plant totems.

When the totem is a plant the rules are such as these. A native of western Australia, whose totem is a vegetable, "may not gather it under certain circumstances and at a particular period of the year."[16] An Oraon clan, whose totem is the kujrar tree, will not eat the oil of that tree, nor sit in its shade.[17] The Red Maize clan of the Omahas will not eat red maize. Those of the people of Ambon and Uliase who are descended from trees may not use these trees for firewood.

Totem taboos.

The rules not to kill or eat the totem are not the only taboos; the clansmen are often forbidden to touch the totem or any part of it, sometimes even to look at it.

Thus the Elk clan of the Omahas neither eat the flesh nor touch any part of the male elk.[18] The Deer-Head clan of the Omahas may not touch the skin of any animal of the deer family, nor wear moccasins of deer skin, nor use the fat of the deer for hair-oil; but they may eat the flesh of deer.[19] Of the totem clans in Bengal it is said that they "are prohibited from killing, eating, cutting, burning, carrying, using, etc.," the totem.[20] The Bechuanas in South Africa, who have a well-developed totem system, may not eat nor clothe themselves in the skin of the totem animal.[21] They even avoid, at least in some cases, to look at the totem. Thus to a man of the Bakuena (Bakwain) or Crocodile clan, it is "hateful and unlucky" to meet or gaze on a crocodile; the sight is thought to cause inflammation of the eyes.

Totem kept in captivity.

Sometimes the totem animal is fed or even kept alive in captivity. Among the mountaineers of Formosa each clan or village keeps its totem (serpent, leopard, etc.) in a cage.[22] A Samoan clan whose totem was the eel used to present the first fruits of the taro plantations to the eels.[23] Amongst the Narrinyeri in South Australia men of the Snake clan sometimes catch snakes, pull out their teeth or sew up their mouths, and keep them as pets.[24] In a Pigeon clan of Samoa a pigeon was carefully kept and fed.[25] Amongst the Kalang in Java, whose totem is the red dog, each family as a rule keeps one of these animals, which they will on no account allow to be struck or ill-used by any one.[26]

Totem buried and mourned.

The dead totem is mourned for and buried like a dead clansman. In Samoa, if a man of the Owl totem found a dead owl by the road side, he would sit down and weep over it and beat his forehead with stones till the blood flowed. The bird would then be wrapped up and buried with as much ceremony as if it had been a human being. "This, however, was not the death of the god. He was supposed to be yet alive, and incarnate in all the owls in existence."[1] The generalization here implied is characteristic of totemism; it is not merely an individual but the species that is reverenced. The Wanika in eastern Africa look on the hyena as one of their ancestors, and the death of an hyena is mourned by the whole people; the mourning for a chief is said to be as nothing compared to the mourning for an hyena.[2] A tribe of southern Arabia used to bury a dead gazelle wherever they found one, and the whole tribe mourned for it seven days.[3] A Californian tribe which reverenced the buzzard held an annual festival at which the chief ceremony was the killing of a buzzard without losing a drop of its blood. It was then skinned, the feathers were preserved to make a sacred dress for the medicine-man, and the body was buried in holy ground amid the lamentations of the old women, who mourned as for the loss of a relative or friend.[4]

Totem not referred to by name.

As some totem clans avoid looking at their totem, so others are careful not to speak of it by its proper name, but use descriptive epithets instead. The three totems of the Delawares—the wolf, turtle, and turkey—were referred to respectively as "round foot," "crawler," and "not chewing," the last referring to the bird's habit of swallowing its food; and the clans called themselves, not Wolves, Turtles, and Turkeys, but "Round Feet," "Crawlers," and "Those who do not chew."[5] The Bear clan of the Ottawas called themselves not Bears but Big Feet.[6] The object of these circumlocutions is probably to give no offence to the worshipful animal.

Consequences of disrespect to totem.

The penalties supposed to be incurred by acting disrespectfully to the totem are various. The Bakalai think that if a man were to eat his totem the women of his clan would miscarry and give birth to animals of the totem kind, or die of an awful disease.[7] The Elk clan among the Omahas believe that if any clansman were to touch any part of the male elk, or eat its flesh or the flesh of the male deer, he would break out in boils and white spots in different parts of the body.[8] The Red Maize subclan of the Omahas believe that, if they were to eat of the red maize, they would have running sores all round their mouth.[9] And in general the Omahas believe that to eat of the totem, even in ignorance, would cause sickness, not only to the eater, but also to his wife and children.[10] The worshippers of the Syrian goddess, whose creed was saturated with totemism, believed that if they ate a sprat or an anchovy their whole bodies would break out in ulcers, their legs would waste away, and their liver melt, or that their belly and legs would swell up.[11]

The Samoans thought it death to injure or eat their totems. The totem was supposed to take up his abode in the sinner's body, and there to gender the very thing which he had eaten till it caused his death.[12]

Samoan mode of appeasing totem.

Thus if a Turtle man ate of a turtle he grew very ill, and the voice of the turtle was heard in his inside saying, "He ate me; I am killing him."[13] In such cases, however, the Samoans had a mode of appeasing the angry totem. The offender himself or one of his clan was wrapped in leaves and laid in an unheated oven, as if he were about to be baked. Thus if amongst the Cuttle-Fish clan a visitor had caught a cuttle-fish and cooked it, or if a Cuttle-Fish man had been present at the eating of a cuttle-fish, the Cuttle-Fish clan met and chose a man or woman who went through the pretence of being baked. Otherwise a cuttle-fish would grow in the stomach of some of the clan and be their death.[14]

Australian food taboos.

In Australia, also, the punishment for eating the totem appears to have been sickness or death.[15] But it is not merely the totem which is tabooed to the Australians, they have, besides, a very elaborate code of food prohibitions, which vary chiefly with age, being on the whole strictest and most extensive at puberty, and gradually relaxing with advancing years. Thus young men are forbidden to eat the emu; if they ate it, it is thought that they would be afflicted with sores all over their bodies.[16]

Totem will not injure clansman.

The relation between a man and his totem is one of mutual help and protection. If the man respects and cares for the totem, he expects that the totem will do the same by him. In Senegambia the totems, when they are dangerous animals, will not hurt their clansmen; *e.g.*, men of the Scorpion clan affirm that scorpions (of a very deadly kind) will run over their bodies without biting them.[17] A Snake clan (Ophiogenes) in Asia Minor, believing that they were descended from snakes, and that snakes were their kinsmen, submitted to a practical test the claims of any man amongst them whom they suspected of being no true clansman. They made a snake bite him; if he survived, he was a true clansman; if he died, he was not.[18] The Psylli, a Snake clan in Africa, had a similar test of kinship; they exposed their new-born children to snakes, and if the snakes left them unharmed or only bit without killing them, the children were legitimate; otherwise they were bastards.[19] In Senegambia, at the present day, a python is expected to visit every child of the Python clan within eight days after birth.[20]

Other totem clans regard a man who has been bitten by the totem, even though he survives, as disowned by the totem, and therefore they expel him from the clan. Among the Crocodile clan of the Bechuanas, if a man has been bitten by a crocodile, or merely had water splashed over him by a crocodile's tail, he is expelled the clan.[21]

Totem helps clansman.

But it is not enough that the totem should merely abstain from injuring, he must positively benefit the men who put their faith in him. The Snake clan (Ophiogenes) of Asia Minor believed that if they were bitten by an adder they had only to put a snake to the wound and their totem would suck out the poison and soothe away the inflammation and the pain.[22] Hence Omaha medicine-men, in curing the sick, imitate the action and voice of their (individual) totem.[23] Members of the Serpent clan in Senegambia profess to heal by their touch persons who have been bitten by serpents.[24] A similar profession was made in antiquity by Snake clans in Africa, Cyprus, and Italy.[25]

Totem omens.

Again, the totem gives his clansmen important information by means of omens. In the Coast Murring tribe of New South Wales each man's totem warned him of coming danger; if his totem was a kangaroo, a kangaroo would warn him against his foes.[26] The Samoan totems gave omens to their clansmen. Thus, if an owl flew before the Owl clan, as they marched to war, it was a signal to go on; but if it flew across their path, or backwards, it was a sign to retreat.[1] Some kept a tame owl on purpose to give omens in war.[2]

When the conduct of the totem is not all that his clansmen could desire, they have various ways of putting pressure on him.

Thus, in harvest time, when the birds eat the corn, the Small Bird clan of the Omahas take some corn which they chew and spit over the field. This is thought to keep the birds from the crops.[3] If worms infest the corn the Reptile clan of the Omahas catch some of them and pound them up with some grains of corn which have been heated. They make a soup of the mixture and eat it, believing that the corn will not be infested again, at least for that year.[4] During a fog the men of the Turtle subclan of the Omahas used to draw the figure of a turtle on the ground with its face to the south. On the head, tail, middle of the back, and on each leg were placed small pieces of a red breech-cloth with some tobacco. This was thought to make the fog disappear.[5]

Man assimilates himself to totem.

In order, apparently, to put himself more fully under the protection of the totem, the clansman is in the habit of assimilating himself to the totem by dressing in the skin or other part of the totem animal, arranging his hair and mutilating his body so as to resemble the totem, and representing it on his body by cicatrices, tattooing, or paint.

Among the Thlinkets on solemn occasions, such as dances, memorial festivals, and burials, individuals often appear disguised in the full form of their totem animals; and as a rule, each clansman carries at least an easily recognizable part of his totem with him.[6] Amongst the Omahas, the smaller boys of the Black Shoulder (Buffalo) clan wear two locks of hair in imitation of horns.[7] The Small Bird clan of the Omahas "leave a little hair in front, over the forehead, for a bill, and some at the back of the head, for the bird's tail, with much over each ear for the wings."[8] The Turtle subclan of the Omahas "cut off all the hair from a boy's head, except six locks; two are left on each side, one over the forehead, and one hanging down the back in imitation of the legs, head, and tail of a turtle."[9] The practice of knocking out the upper front teeth at puberty, which prevails in Australia and elsewhere, is, or was once, probably an imitation of the totem. The Batoka in Africa who adopt this practice say that they do so in order to be like oxen, while those who retain their teeth are like zebras.[10]

Tattooing.

The Haidas of Queen Charlotte Islands are universally tattooed, the design being in all cases the totem, executed in a conventional style. When several families of different totems live together in the same large house, a Haida chief will have all their totems tattooed on his person.[11] Tribes in South America are especially distinguished by their tattoo marks, but whether these are totem marks is not said.[12] The Australians do not tattoo but raise cicatrices; in some tribes these cicatrices are arranged in patterns which serve as the tribal badges, consisting of lines, dots, circles, semicircles, etc.[13] According to one authority, these Australian tribal badges are sometimes representations of the totem.[14]

Again, the totem is sometimes painted on the person of the clansman. This, as we have seen (p. 497), is sometimes done by the Indians of British Columbia. Among the Hurons (Wyandots) each clan has a distinctive mode of painting the face; and, at least in the case of the chiefs at installation, this painting represents the totem.[15] Among the Moquis the representatives of the clans at foot-races, dances, etc., have each a conventional representation of his totem blazoned on breast or back.[16]

The clansman also affixes his totem mark as a signature to treaties and other documents,[17] and paints or carves it on his weapons, hut, canoe, etc.

The identification of a man with his totem appears further to have been the object of various ceremonies observed at birth, marriage, death, and on other occasions.

Birth-ceremonies.

Birth Ceremonies.—On the fifth day after birth a child of the Deer-Head clan of the Omahas is painted with red spots on its back, in imitation of a fawn, and red stripes are painted on the child's arms and chest. All the Deer-Head men present at the ceremony make red spots on their chests.[18] When a South Slavonian woman has given birth to a child, an old woman runs out of the house and calls out, "A she-wolf has littered a he-wolf," and the child is drawn through a wolfskin, as if to simulate actual birth from a wolf. Further, a piece of the eye and heart of a wolf are sewed into the child's shirt, or hung round its neck; and, if several children of the family have died before, it is called Wolf. The reason assigned for some of these customs is that the witches who devour children will not attack a wolf.[19] In other words, the human child is disguised as a wolf to cheat its supernatural foes. The same desire for protection against supernatural danger may be the motive of similar totemic customs, if not of totemism in general.

Marriage ceremonies.

Marriage Ceremonies.—Among the Kalang of Java, whose totem is the red dog, bride and bridegroom before marriage are rubbed with the ashes of a red dog's bones.[20] Among the Transylvanian Gypsies, bride and bridegroom are rubbed with a weasel skin.[21] The sacred goatskin (*ægis*) which the priestess of Athene took to newly married women may have been used for this purpose.[22] At Rome bride and bridegroom sat down on the skin of the sheep which had been sacrificed on the occasion.[23] An Italian bride smeared the doorposts of her new home with wolf's fat.[24] It is difficult to separate from totemism the custom observed by totem clans in Bengal of marrying the bride and bridegroom to trees before they are married to each other. The bride touches with red lead (a common marriage ceremony) a mahwá tree, clasps it in her arms, and is tied to it. The bridegroom goes through a like ceremony with a mango tree.[25]

Death ceremonies.

Death Ceremonies.—In death, too, the clansman seeks to become one with his totem. Amongst some totem clans it is an article of faith that, as the clan sprang from the totem, so each clansman at death reassumes the totem form. Thus the Moquis, believing that the ancestors of the clans were respectively rattlesnakes, deer, bears, sand, water, tobacco, etc., think that at death each man, according to his clan, is changed into a rattlesnake, a deer, etc.[26] Amongst the Black Shoulder (Buffalo) clan of the Omahas a dying clansman was wrapped in a buffalo robe with the hair out, his face was painted with the clan mark, and his friends addressed him thus: "You are going to the animals (the buffaloes). You are going to rejoin your ancestors. You are going, or your four souls are going, to the four winds. Be strong."[1]

Ceremonies at puberty.

Ceremonies at Puberty.—The attainment of puberty is celebrated by savages with ceremonies some of which seem to be directly connected with totemism. The Australian rites of initiation at puberty include the raising of those scars on the persons of the clansmen and clanswomen which serve as tribal badges or actually depict the totem. They also include those mutilations of the person by knocking out teeth, etc., which we have seen reason to suppose are meant to assimilate the man to his totem.

At one stage of these Australian rites a number of men appear on the scene howling and running on all fours in imitation of the dingo or native Australian dog; at last the leader jumps up, clasps his hands, and shouts the totem name "wild dog."[2] The Coast Murring tribe in New South Wales had an initiatory ceremony at which the totem name "brown snake" was shouted, and a medicine-man produced a live brown snake out of his mouth.[3] As the fundamental rules of totem societies are rules regulating social intercourse, perhaps these pantomimes were intended to supply the youths with a symbolic language by means of which they might communicate with persons speaking different languages, and thus ascertain whether they belonged to clans with which marriage was allowed. The totem clans of the Bechuanas have each its special dance or pantomime, and when they wish to ascertain a stranger's clan they ask him, "What do you dance?"[4] We find elsewhere that dancing has been used as a means of sexual selection.

But in some cases these dances seem to be purely religious. At their initiatory rites the Yuin tribe in New South Wales mould figures of the totems in earth and dance before them, and a medicine-man brings up out of his inside the "magic" appropriate to the totem before which he stands: before the figure of the porcupine he brings up a stuff like chalk, before the kangaroo a stuff like glass, etc.[5]

Again, it is at initiation that the youth is solemnly forbidden to eat of certain foods; but, as the list of foods prohibited to youths at puberty both in Australia and America extends far beyond the simple totem, it would seem that we are here in contact with those unknown general ideas of the savage, whereof totemism is only a special product.

Thus the Narrinyeri youths at initiation are forbidden to eat twenty different kinds of game, besides any food belonging to women. If they eat of these forbidden foods it is thought they will grow ugly.[6] In the Mycoolon tribe, near the Gulf of Carpentaria, the youth at initiation is forbidden to eat of eagle-hawk and its young, native companion and its young, some snakes, turtles, ant-eaters, and emu eggs.[7] The Kurnai youth is not allowed to eat the female of any animal, nor the emu, nor the porcupine. He becomes free by having the fat of the animal smeared on his face.[8] On the other hand, it is said that "initiation confers many privileges on the youths, as they are now allowed to eat many articles of food which were previously forbidden to them."[9] Thus in New South Wales before initiation a boy may eat only the females of the animals which he catches; but after initiation (which, however, may not be complete for several years) he may eat whatever he finds.[10] In North America the Creek youths at puberty were forbidden for twelve mouths to eat of young bucks, turkey-cocks, fowls, pease, and salt.[11]

Admission to life of clan.

These ceremonies seem also to be meant to admit the youth into the life of the clan, and hence of the totem. The latter appears to be the meaning of a Carib ceremony, in which the father of the youth took a live bird of prey, of a particular species, and beat his son with it till the bird was dead and its head crushed, thus transferring the life and spirit of the martial bird to the future warrior. Further, he scarified his son all over, rubbed the juices of the bird into the wounds, and gave him the bird's heart to eat.[12] Amongst some Australian tribes the youth at initiation is smeared with blood drawn from the arms either of aged men or of all the men present, and he even receives the blood to drink. Amongst some tribes on the Darling this tribal blood is his only food for two days. Among some tribes the youths at initiation sleep on the graves of their ancestors, in order to absorb their virtues.[13] It is, however, a very notable fact that the initiation of an Australian youth is said to be conducted, not by men of the same totem, but by men of that portion of the tribe into which he may marry.[14] In some of the Victorian tribes no person related to the youth by blood can interfere or assist in his initiation.[15] Whether this is true of all tribes and of all the rites at initiation does not appear.

Resurrection.

New birth.

Connected with totemism is also the Australian ceremony at initiation of pretending to recall a dead man to life by the utterance of his totem name. An old man lies down in a grave and is covered up lightly with earth; but at the mention of his totem name he starts up to life.[16] Sometimes it is believed that the youth himself is killed by a being called Thuremlui, who cuts him up, restores him to life, and knocks out a tooth.[17] Here the idea seems to be that of a second birth, or the beginning of a new life for the novice; hence he receives a new name at the time when he is circumcised, or the tooth knocked out, or the blood of the kin poured on him.[18] Amongst the Indians of Virginia and the Quojas in Africa, the youths after initiation pretended to forget the whole of their former lives (parents, language, customs, etc.), and had to learn everything over again like new-born babes.[19] A Wolf clan in Texas used to dress up in wolf-skins and run about on all fours, howling and mimicking wolves; at last they scratched up a living clansman, who had been buried on purpose, and putting a bow and arrows in his hands, bade him do as the wolves do—rob, kill, and murder.[20] This may have been an initiatory ceremony, revealing to the novice in pantomime the double origin of the clan—from wolves and from the ground. For it is a common belief with totem clans that they issued originally from the ground.

Piacular sacrifice of totem.

Connected with this mimic death and revival of a clansman appear to be the real death and supposed revival of the totem itself. We have seen that some Californian Indians killed the buzzard, and then buried and mourned over it like a clansman. But it was believed that, as often as the bird was killed, it was made alive again. Much the same idea appears in a Zuni ceremony described by an eyewitness, Mr. Cushing. He tells how a procession of fifty men set off for the spirit-land, or (as the Zunis call it) "the home of our others," and returned after four days, each man bearing a basket full of living squirming turtles. One turtle was brought to the house where Mr. Cushing was staying, and it was welcomed with divine honors. It was addressed as, "Ah! my poor dear lost child or parent, my sister or brother to have been! Who knows which? May be my own great-great-grandfather or mother?" Nevertheless, next day it was killed and its flesh and bones deposited in the river, that it might "return once more to eternal life among its comrades in the dark waters of the lake of the dead." The idea that the turtle was dead was repudiated with passionate sorrow; it had only, they said "changed houses and gone to live for ever in the home of 'our lost others.'"[1] The meaning of such ceremonies is not clear. Perhaps, as has been suggested,[2] they are piacular sacrifices, in which the god dies for his people. This is borne out by the curses with which the Egyptians loaded the head of the slain bull.[3]

Sex totems.

Sex Totems.—In Australia (but, so far as is known at present, nowhere else) each of the sexes has, at least in some tribes, its special sacred animal, whose name each individual of the sex bears, regarding the animal as his or her brother or sister respectively, not killing it nor suffering the opposite sex to kill it. These sacred animals therefore answer strictly to the definition of totems.

Thus amongst the Kurnai all the men were called Yeerung (Emu-Wren) and all the women Djeetgun (Superb Warbler). The birds called Yeerung were the "brothers" of the men, and the birds called Djeetgun were the women's "sisters." If the men killed an emu-wren they were attacked by the women, if the women killed a superb warbler they were assailed by the men. Yeerung and Djeetgun were the mythical ancestors of the Kurnai.[4] The Kulin tribe in Victoria, in addition to sixteen clan totems, has two pairs of sex totems: one pair (the emu-wren and superb warbler) is identical with the Kurnai pair; the other pair is the bat (male totem) and the small night jar (female totem). The latter pair extends to the extreme northwestern confines of Victoria as the "man's brother" and the "woman's sister."[5] The Ta-ta-thi group of tribes in New South Wales, in addition to regular clan totems, has a pair of sex totems, the bat for men and a small owl for women; men and women address each other as Owls and Bats; and there is a fight if a women kills a bat or a man kills a small owl.[6] Of some Victorian tribes it is said that "the common bat belongs to the men, who protect it against injury, even to the half killing of their wives for its sake. The fern owl, or large goatsucker, belongs to the women, and, although a bird of evil omen, creating terror at night by its cry, it is jealously protected by them. If a man kills one, they are as much enraged as if it was one of their children, and will strike him with their long poles."[7]

The sex totem seems to be still more sacred than the clan totem; for men who do not object to other people killing their clan totem will fiercely defend their sex totem against any attempt of the opposite sex to injure it.[8]

Individual totems.

Individual Totems.—It is not only the clans and the sexes that have totems; individuals also have their own special totems, *i.e.*, classes of objects (generally species of animals), which they regard as related to themselves by those ties of mutual respect and protection which are characteristic of totemism. This relationship, however, in the case of the individual totem, begins and ends with the individual man, and is not, like the clan totem, transmitted by inheritance. The evidence for the existence of individual totems in Australia, though conclusive, is very scanty. In North America it is abundant.

In Australia we hear of a medicine-man whose clan totem through his mother was kangaroo, but whose "secret" (*i.e.*, individual) totem was the tiger-snake. Snakes of that species, therefore, would not hurt him.[9] An Australian seems usually to get his individual totem by dreaming that he has been transformed into an animal of the species. Thus a man dreamed three times he was a kangaroo; hence he became one of the kangaroo kindred, and might not eat any part of a kangaroo on which there was blood; he might not even carry home one on which there was blood. He might eat cooked kangaroo; but, if he were to eat the meat with the blood on it, the spirits would no longer take him up aloft.[10]

In America the individual totem is usually the first animal of which a youth dreams during the long and generally solitary fasts which American Indians observe at puberty. He kills the animal or bird of which he dreams, and henceforward wears its skin or feathers, or some part of them, as an amulet, especially on the war-path and in hunting.[11] A man may even (though this seems exceptional) acquire several totems in this way; thus an Ottawa medicine-man had for his individual totems the tortoise, swan, woodpecker, and crow, because he had dreamed of them all in his fast at puberty. The respect paid to the individual totem varies in different tribes. Among the Slave, Hare, and Dogrib Indians a man may not eat, skin, nor if possible kill his individual totem, which in these tribes is said to be always a carnivorous animal. Each man carries with him a picture of his totem (bought of a trader); when he is unsuccessful in the chase, he pulls out the picture, smokes to it, and makes it a speech.[12]

The Indians of Canada changed their okki or manitoo (individual totem) if they had reason to be dissatisfied with it; their women had also their okkis or manitoos, but did not pay so much heed to them as did the men. They tattooed their individual totems on their persons.[13] Amongst the Indians of San Juan Capistrano, a figure of the individual totem, which was acquired as usual by fasting, was moulded in a paste made of crushed herbs on the right arm of the novice. Fire was then set to it, and thus the figure of the totem was burned into the flesh.[14] Sometimes the individual totem is not acquired by the individual himself at puberty, but is fixed for him independently of his will at birth. Thus among the tribes of the isthmus of Tehuantepec, when a women was about to be confined, the relations assembled in the hut and drew on the floor figures of different animals, rubbing each one out as soon as it was finished. This went on till the child was born, and the figure that then remained sketched on the ground was the child's *tona* or totem. When he grew older the child procured his totem animal and took care of it, believing that his life was bound up with the animal's, and that when it died he too must die.[15] Similarly in Samoa, at child-birth the help of several "gods" was invoked in succession, and the one who happened to be addressed at the moment of the birth was the infant's totem. These "gods" were dogs, eels, sharks, lizards, etc. A Samoan had no objection to eat another man's "god;" but to eat his own would have been death or injury to him.[16] Sometimes the okkis or manitoos acquired by dreams are not totems but fetiches, being not classes of objects but individual objects, such as a particular tree, rock, knife, pipe, etc. [7]

Besides the clan totem, sex totem, and individual totem, there are (as has been indicated) some other kinds or varieties of totems; but the consideration of them had better be deferred till after the consideration of the social organization based on totemism.

Blood feud.

Social Aspect of Totemism, or the relation of the men of a totem to each other and to men of other totems.—(1) All the members of a totem clan regard each other as kinsmen or brothers and sisters, and are bound to help and protect each other. The totem bond is stronger than the bond of blood or family in the modern sense. This is expressly stated of the clans of western Australia and of northwestern America,[18] and is probably true of all societies where totemism exists in full force. Hence in totem tribes every local group, being necessarily composed (owing to exogamy) of members of at least two totem clans, is liable to be dissolved at any moment into its totem elements by the outbreak of a blood feud, in which husband and wife must always (if the feud is between their clans) be arrayed on opposite sides, and in which the children will be arrayed against either their father or their mother, according as descent is traced through the mother or through the father.[1] In blood feud the whole clan of the aggressor is responsible for his deed, and the whole clan of the aggrieved is entitled to satisfaction.[2] Nowhere perhaps is this solidarity carried farther than among the Goajiros in Colombia, South America. The Goajiros are divided into some twenty to thirty totem clans, with descent in the female line; and amongst them, if a man happens to cut himself with his own knife, to fall off his horse, or to injure himself in any way, his family on the mother's side immediately demand payment as blood-money from him. "Being of their blood, he is not allowed to spill it without paying for it." His father's family also demands compensation, but not so much.[3]

Exogamy.

(2) *Exogamy.*—Persons of the same totem may not marry or have sexual intercourse with each other. The Navajos believe that if they married within the clan "their bones would dry up and they would die."[4] But the penalty for infringing this fundamental law is not merely natural; the clan steps in and punishes the offenders. In Australia the regular penalty for sexual intercourse with a person of a forbidden clan is death.

It matters not whether the woman be of the same local group or has been captured in war from another tribe; a man of the wrong clan who uses her as his wife is hunted down and killed by his clansmen, and so is the woman; though in some cases, if they succeed in eluding capture for a certain time, the offence may be condoned. In the Ta-ta-thi tribe, New South Wales, in the rare cases which occur, the man is killed but the woman is only beaten or speared, or both, till she is nearly dead; the reason given for not actually killing her being that she was probably coerced. Even in casual amours the clan prohibitions are strictly observed; any violations of these prohibitions "are regarded with the utmost abhorrence and are punished by death."[5] An important exception to these rules, if it is correctly reported, is that of the Port Lincoln tribe, which is divided into two clans, Mattiri and Karraru, and it is said that though persons of the same clan never marry, yet "they do not seem to consider less virtuous connections between parties of the same class [clan] incestuous."[6] Again, of the tribes on the lower Murray, lower Darling, etc., it is said that though the slightest blood relationship is with them a bar to marriage, yet in their sexual intercourse they are perfectly free, and incest of every grade continually occurs.[7]

In America the Algonkins consider it highly criminal for a man to marry a woman of the same totem as himself, and they tell of cases where men, for breaking this rule, have been put to death by their nearest relations.[8]

Phratries.

In some tribes the marriage prohibition only extends to a man's own totem clan; he may marry a woman of any totem but his own. This is the case with the Haidas of the Queen Charlotte Islands,[9] and, so far as appears, the Narrinyeri in South Australia,[10] and the western Australian tribes described by Sir George Grey.[11] Oftener, however, the prohibition includes several clans, in none of which is a man allowed to marry. For such an exogamous group of clans within the tribe it is convenient to have a name; we shall therefore call it a phratry (L. H. Morgan), defining it as an exogamous division intermediate between the tribe and the clan. The evidence goes to show that in many cases it was originally a totem clan which has undergone subdivision.

American phratries.

The Choctaws, for example, were divided into two phratries, each of which included four clans; marriage was prohibited between members of the same phratry, but members of either phratry could marry into any clan of the other.[12] The Seneca tribe of the Iroquois was divided into two phratries, each including four clans,—the Bear, Wolf, Beaver, and Turtle clans forming one phratry, and the Deer, Snipe, Heron, and Hawk clans forming the other. Originally, as among the Choctaws, marriage was prohibited within the phratry but was permitted with any of the clans of the other phratry; the prohibition, however, has now broken down, and a Seneca may marry a woman of any clan but his own. Hence phratries, in our sense, no longer exist among the Senecas, though the organization survives for certain religious and social purposes.[13]

The phratries of the Thlinkets and the Mohegans deserve especial attention, because each phratry bears a name which is also the name of one of the clans included in it. The Thlinkets are divided as follows: Raven phratry, with clans Raven, Frog, Goose, Sea-Lion, Owl, Salmon; Wolf phratry, with clans Wolf, Bear, Eagle, Whale, Shark, Auk. Members of the Raven phratry must marry members of the Wolf phratry, and *vice versa*.[14] Considering the prominent parts played in Thlinket mythology by the ancestors of the two phratries, and considering that the names of the phratries are also names of clans, it seems probable that the Raven and Wolf were the two original clans of the Thlinkets, which afterwards by subdivision became phratries. This was the opinion of the Russian missionary Veniaminoff, the best early authority on the tribe.[15] Still more clearly do the Mohegan phratries appear to have been formed by subdivision from clans. They are as follows:[16] Wolf phratry, with clans Wolf, Bear, Dog, Opossum; Turtle phratry, with clans Little Turtle, Mud Turtle, Great Turtle, Yellow Eel; Turkey phratry, with clans Turkey, Crane, Chicken. Here we are almost forced to conclude that the Turtle phratry was originally a Turtle clan which subdivided into a number of clans, each of which took the name of a particular kind of turtle, while the Yellow Eel clan may have been a later subdivision. Thus we get a probable explanation of the origin of split totems; they seem to have arisen by the segmentation of a single original clan, which had a whole animal for its totem, into a number of clans, each of which took the name either of a part of the original animal or of a subspecies of it. We may conjecture that this was the origin of the Gray Wolf and Yellow Wolf and Great Turtle and Little Turtle clans of the Tuscarora-Iroquois;[17] the Black Eagle and White Eagle and the Deer and the Deer-Tail clans of the Kaws;[18] and of the Highland Turtle (striped), Highland Turtle (black), Mud Turtle, and Smooth Large Turtle clans of the Wyandots (Hurons).[19] Warren actually states that the numerous Bear clan of the Ojibways was formerly subdivided into subclans, each of which took for its totem some part of the Bear's body (head, foot, ribs, etc.), but that these have now merged into two, the Common Bear and the Grizzly Bear.[20] The subdivision of the Turtle (Tortoise) clan, which on this hypothesis has taken place among the Tuscarora-Iroquois, is nascent among the Onondaga-Iroquois, for among them "the name of this clan is Hahnowa, which is the general word for tortoise; but the clan is divided into two septs or subdivisions, the Hanyatengona, or Great Tortoise, and the Nikahnowaksa, or Little Tortoise, which together are held to constitute but one clan."[21]

On the other hand, fusion of clans is known to have taken place, as among the Haidas, where the Black Bear and Fin-Whale clans have united;[22] and the same thing has happened to some extent among the Omahas, and Osages.[23]

In Australia the phratries are still more important than in America. Messrs. Howitt and Fison, who have done so much to advance our knowledge of the

Australian phratries.

social system of the Australian aborigines, have given to these exogamous divisions the name of classes; but the term is objectionable, because it fails to convey (1) that these divisions are kinship divisions, and (2) that they are intermediate divisions; whereas the Greek term phratry conveys both these meanings, and is therefore appropriate.

We have seen examples of Australian tribes in which members of any clan are free to marry members of any clan but their own; but such tribes appear to be exceptional. Often an Australian tribe is divided into two (exogamous) phratries, each of which includes under it a number of totem clans; and oftener still there are subphratries interposed between the phratry and the clans, each phratry including two subphratries, and the subphratries including totem clans. We will take examples of the former and simpler organization first.

The Turra Tribe in Yorke Peninsula, South Australia, is divided into two phratries, Wiltū (Eaglehawk) and Mūlta (Seal). The Eaglehawk phratry includes ten totem clans (Wombat, Wallaby, Kangaroo, Iguana, Wombat-Snake, Bandicoot, Black Bandicoot, Crow, Rock Wallaby, and Emu); and the Seal phratry includes six (Wild Goose, Butterfish, Mullet, Schnapper, Shark, and Salmon). The phratries are of course exogamous, but (as with the Choctaws, Mohegan, and, so far as appears, all the American phratries) any clan of the one phratry may intermarry with any clan of the other phratry.[1] But the typical Australian tribe is divided into two exogamous phratries; each of these phratries is subdivided into two subphratries; and these subphratries are subdivided into an indefinite number of totem clans. The phratries being exogamous, it follows that their subdivisions (the subphratries and clans) are so also. The well-known Kamilaroi tribe in New South Wales will serve as an example. Its subdivisions are as follows:[2]

Phratries.	Subphratries	Totem Clans.
Dilbi,	Muri.[3] Kubi.	Kangaroo, Opossum, Bandicoot, Padimelon, Iguana, Black Duck, Eaglehawk, Scrub Turkey, Yellow-Fish, Honey-Fish, Bream.
Kupathin	Ipai. Kumbo.	Emu, Carpet-Snake, Black Snake, Red Kangaroo, Honey, Walleroo, Frog, Cod-Fish.

In such tribes the freedom of marriage is still more curtailed. A subphratry is not free to marry into either subphratry of the other phratry; each subphratry is restricted in its choice of partners to one subphratry of the other phratry; Muri can only marry Kumbo, and *vice versa;* Kubi can only marry Ipai, and *vice versa*. Hence (supposing the tribe to be equally distributed between the phratries and subphratries), whereas under the two phratry and clan system a man is free to choose a wife from half the women of the tribe, under the phratry, subphratry, and clan system he is restricted in his choice to one-quarter of the women.

Equivalence of Australian tribal divisions.

A remarkable feature of the Australian social organization is that divisions of one tribe have their recognized equivalents in other tribes, whose languages, including the names for the tribal divisions, are quite different. A native who travelled far and wide through Australia stated that "he was furnished with temporary wives by the various tribes with whom he sojourned in his travels; that his right to these women was recognized as a matter of course; and that he could always ascertain whether they belonged to the division into which he could legally marry, 'though the places were 1000 miles apart, and the languages quite different.'"[4] Again, it is said that "in cases of distant tribes it can be shown that the class divisions correspond with each other, as for instance in the classes of the Flinders river and Mitchell river tribes; and these tribes are separated by 400 miles of country, and by many intervening tribes. But, for all that, class corresponds to class in fact and in meaning and in privileges, although the name may be quite different and the totems of each dissimiliar."[5] Particular information, however, as to the equivalent divisions is very scanty.[6] This systematic correspondence between the intermarrying divisions of distinct and distant tribes, with the rights which it conveys to the members of these divisions, points to sexual communism on a scale to which there is perhaps no parallel elsewhere, certainly not in North America, where marriage is always within the tribe, though outside the clan.[7] But even in Australia a man is always bound to marry within a certain kinship group; that group may extend across the whole of Australia, but nevertheless it is exactly limited and defined. If endogamy is used in the sense of prohibition to marry outside of a certain kinship group, whether that group be exclusive of, inclusive of, or identical with the man's own group, then marriage among the totem societies of Australia, America, and India is both exogamous and endogamous; a man is forbidden to marry either within his own clan or outside of a certain kinship group.[8]

Rules of descent.

(3) *Rules of Descent.*—In a large majority of the totem tribes at present known to us in Australia and North America descent is in the female line; *i.e.*, the children belong to the totem clan of their mother, not to that of their father. In Australia the proportion of tribes with female to those with male descent is as four to one; in America it is between three and two to one.

As to the totem tribes of Africa, descent among the Damaras is in the female line,[9] and there are traces of female kin among the Bechuanas.[10] Among the Bakalai property descends in the male line, but this is not a conclusive proof that descent is so reckoned; all the clans in the neighborhood of the Bakalai have female descent both for blood and property.[11] In Bengal, where there is a considerable body of totem tribes, Mr. Risley says that after careful search he and his coadjutors have found no tribe with female descent, and only a single trace of it in one.[12] Among the totem tribes of Bengal descent is male.[13] In Assam the exogamous totem clans of the Kasias have female descent,[14] as also have the exogamous clans of the Garos, but it does not appear whether their clans are totem clans, though some of their legends point to totemism.[15]

Indirect descent.

In the Australian tribal organization of two phratries, four subphratries, and totem clans, there occurs a peculiar form of descent of which no plausible explanation has yet been offered. It seems that in all tribes thus organized the children are born into the subphratry neither of their father nor of their mother, and that descent in such cases is either female or male, according as the subphratry into which the children are born is the companion subphratry of their mother's or of their father's subphratry. In the former case we have what may be called indirect female descent; in the latter, indirect male descent. But it is only in the subphratry that descent is thus indirect. In the totem clan it is always direct; the child belongs to the clan either of its mother or of its father. Thus, in the typical Australian organization, descent, whether female or male, is direct in the phratry, indirect in the subphratry, and direct in the clan.

To take examples, the following is the scheme of descent, so far as the phratries and subphratries are concerned, in the Kamilaroi:

Phratries.	Male.	Marries	Children are
Dilbi.	Muri.	Kumbo.	Ipai
	Kubi.	Ipai.	Kumbo.
Kupathin.	Ipai.	Kubi.	Muri.
	Kumbo.	Muri.	Kubi.

This is an example of indirect female descent, because the children belong to the companion subphratry of their mother, not to the companion subphratry of their father. But in the totems the female descent is direct; *e.g.*, if the father is Muri-Kangaroo and the mother is Kumbo-Emu, the children will be Ipai-Emu; if the mother is Kumbo-Bandicoot, the children will be Ipai-Bandicoot.[1]

The following is the scheme of descent in the Kiabara tribe:[2]

Phratries.	Male.	Marries	Children are
Dilebi.	Baring.	Bundah.	Turowine.
	Turowine.	Bulcoin	Baring.
Cubatine.	Bulcoin.	Turowine.	Bundah.
	Bundah.	Baring.	Bulcoin.

This is an example of indirect male descent, because the children belong to the companion subphratry of their father, not to the companion subphratry of their mother. We have no information as to the totems, but on the analogy of indirect female descent we should expect them to be taken from the father. This at any rate is true of a large tribe or group of tribes to the south of the Gulf of Carpentaria; their rules of marriage and descent, so far as concerns the subphratries, are like those of the Kiabara, and the totems (which at the lower Leichhardt river are the names of fish) are inherited from father to son.[3]

In some Australian tribes sons take their totems from their father and daughters from their mother. Thus the Dieri in South Australia are divided into two phratries, each of which includes under it sixteen totem clans (Caterpillar, Mullet, Dog, Rat, Kangaroo, Frog, Crow, etc.);[4] and if a Dog man marries a Rat woman, the sons of this marriage are Dogs and the daughters are Rats.[5] The Ikula (Morning Star) tribe, at the head of the Great Australian Bight, has, with certain exceptions, the same rule of descent.[6]

Transition from female to male descent.

Besides the tribes whose line of descent is definitely fixed in the female or male line, or, as with the Dieri and Ikula, half-way between the two, there are a number of tribes among whom a child may be entered in either his mother's or his father's clan. Among the Haidas, children regularly belong to the totem clan of their mother; but in very exceptional cases, when the clan of the father is reduced in numbers, the newly-born child may be given to the father's sister to suckle. It is then spoken of as belonging to the paternal aunt, and is counted to its father's clan.[7] Among the Delawares descent is regularly in the female line; but it is possible to transfer a child to its father's clan by giving it one of the names which are appropriated to the father's clan.[8] In the Hervey Islands, South Pacific, the parents settled beforehand whether the child should belong to the father's or mother's clan. The father usually had the preference; but sometimes, when the father's clan was one which was bound to furnish human victims from its ranks, the mother had it adopted into her clan by having the name of her totem pronounced over it.[9] In Samoa at the birth of a child the father's totem was usually prayed to first; but if the birth was tedious, the mother's totem was invoked; and whichever happened to be invoked at the moment of birth was the child's totem for life.[10]

Arrangement of clans on the march, etc.

When a North American tribe is on the march, the members of each totem clan camp together, and the clans are arranged in a fixed order in camp, the whole tribe being arranged in a great circle or in several concentric circles.[11] When the tribe lives in settled villages or towns, each clan has its separate ward.[12] The clans of the Osages are divided into war clans and peace clans; when they are out on the buffalo hunt, they camp on opposite sides of the tribal circle; and the peace clans are not allowed to take animal life of any kind; they must therefore live on vegetables unless they can obtain meat in exchange for vegetables from the war clans.[13] Members of the same clan are buried together and apart from those of other clans; hence the remains of husband and wife, belonging as they do to separate clans, do not rest together.[14] It is remarkable that among the Thlinkets the body must always be carried to the funeral pyre and burned by men of another totem,[15] and the presents distributed on these occasions by the representatives of the deceased must always be made to men of a different clan.[16]

Phratric and subphratric totems.

Here we must revert to the religious side of totemism, in order to consider some facts which have emerged from the study of its social aspect. We have seen that some phratries, both in America and Australia, bear the names of animals;[17] and in the case of the Thlinkets and Mohegans we have seen reason to believe that the animals which give their names to the phratries were once clan totems. The same seems to hold of the names of the Australian phratries, Eaglehawk, Crow, and Seal, or at least of Eaglehawk and Crow, for these are clan totems in other tribes, and are, besides, important figures in Australian mythology. Indeed, there appears to be direct evidence that both the phratries and subphratries actually retain, at least in some tribes, their totems. Thus the Port Mackay tribe in Queensland is divided into two phratries, Yungaru and Wutaru, with subphratries Gurgela, Burbia, Wungo, and Kubera: and the Yungaru phratry has for its totem the alligator, and Wutaru the kangaroo,[18] while the subphratries have for their totems the emu (or the carpet snake), iguana, opossum, and kangaroo (or scrub turkey).[19] As the subphratries of this tribe are said to be equivalent to the subphratries of the Kamilaroi, it seems to follow that the subphratries of the Kamilaroi (Muri, Kubi, Ipai, and Kumbo) have or once had totems also. Hence it appears that in tribes organized in phratries, subphratries, and clans each man has three totems—his phratry totem, his subphratry totem, and his clan totem. If we add a sex totem and an individual totem, each man in the typical Australian tribe has five distinct kinds of totems. What degree of allegiance he owes to his subphratry totem and phratry totem respectively we are not told; indeed, the very existence of such totems, as distinct from clan totems, appears to have been generally overlooked. But we may suppose that the totem bond diminishes in strength in proportion to its extension; that therefore the clan totem is the primary tie, of which the subphratry and phratry totems are successively weakened repetitions.

[18] Fison and Howitt, 38 *sq.*, 40.

[19] Fison and Howitt, p. 41. The totems of the phratries and subphratries are given by different authorities, who write the native names of the subphratries differently. But they seem to be speaking of the same tribe; at least Mr. Fison understands them so.

Sub-totems.

In these totems superposed on totems may perhaps be discerned a rudimentary classification of natural objects under heads which bear a certain resemblance to genera, species, etc. This classification is by some Australian tribes extended so as to include the whole of nature. Thus the Port Mackay tribe in Queensland (see above) divides all nature between the phratries; the wind belongs to one phratry and the rain to another; the sun is Wutaru and the moon is Yungaru; the stars, trees, and plants are also divided between the phratries.[1] As the totem of Wutaru is kangaroo and of Yungaru alligator, this is equivalent to making the sun a kangaroo and the moon an alligator.

The Mount Gambier tribe in South Australia is divided into two phratries (Kumi and Kroki), which again are subdivided into totem clans. Everything in nature belongs to a totem clan, thus:[2]

Phratries.	Totem Clans.	Including
Kumi.	1. Mūla=Fish-Hawk.	Smoke, honeysuckle, trees, etc.
	2. Parangal=Pelican.	Dogs, blackwood trees, fire, frost (fem.)
	3. Wā=Crow.	Rain, thunder, lightning, winter, hail, clouds, etc.
	4. Wila=Black Cockatoo.	Stars, moon, etc.
	5. Karato=A harmless Snake.	Fish, stringy-bark trees, seals, eels, etc.
Kroki.	1. Wērio=Tea-Tree.	Ducks, wallabies, owls, crayfish, etc.
	2. Mūrna=An edible Root.	Bustards, quails, dolvich (a small kangaroo).
	3. Karáal=Black crestless Cockatoo.	Kangaroo, she-oak trees, summer, sun, autumn (fem.), wind (fem.).

With reference to this classification Mr. D. S. Stewart, the authority for it, says, "I have tried in vain to find some reason for the arrangement. I asked, 'To what division does a bullock belong?' After a pause came the answer, 'It eats grass: it is Boortwerio.' I then said, 'a crayfish does not eat grass; why is it Boortwerio?' Then came the standing reason for all puzzling questions: 'That is what our fathers said it was.'"[3] The natural objects thus classed under and sharing the respect due to the totem may be conveniently called, as Mr. Howitt proposes,[4] subtotems. Again, the Wotjoballuk tribe in northwestern Victoria has a system of subtotems, thus:[5]

Phratries.	Totem Clans.	Subtotems.
Krokitch.	1. Hot Wind. 2. White crestless Cockatoo. 3. Belonging to the Sun.	Each totem has subordinate to it a number of objects, animal or vegetable, *e.g.*, kangaroo, red gum-tree, etc.
Gamutch.	4. Deaf Adder. 5. Black Cockatoo. 6. Pelican.	Do.

Of the subtotems in this tribe Mr. Howitt says, "They appear to me to be totems in a state of development. Hot wind has at least five of them, white cockatoo has seventeen, and so on for the others. That these subtotems are now in process of gaining a sort of independence may be shown by the following instance: a man who is Krokitch-Wartwut (hot wind) claimed to own all the five subtotems of hot wind (three snakes and two birds), yet of these there was one which he specially claimed as 'belonging' to him, namely, Moiwuk (carpet-snake). Thus his totem, hot wind, seems to have been in process of subdivision into minor totems, and this man's division might have become hot wind carpet-snake had not civilization rudely stopped the process by almost extinguishing the tribe."

Diffusion of totemism.

Geographical Diffusion of Totemism.—In Australia totemism is almost universal.[6] In North America it may be roughly said to prevail, or have prevailed, among all the tribes east of the Rocky Mountains,[7] and among all the Indian (but not the Eskimo) tribes on the northwest coast as far south as the United States frontier. On the other hand, highly competent authorities have failed to find it among the tribes of western Washington, northwestern Oregon, and California.[8] In Panama it exists apparently among the Guaymies: each tribe, family, and individual has a guardian animal, the most prevalent being a kind of parrot.[9] In South America totemism is found among the Goajiros on the borders of Columbia and Venezuela,[10] the Arawaks in Guiana,[11] the Bosch negroes also in Guiana,[12] and the Patagonians.[13] Finding it at such distant points of the continent, we should expect it to be widely prevalent; but, with our meagre knowledge of the South American Indians, this is merely conjecture. The aborigines of Peru and the Salivas on the Orinoco believed in the descent of their tribes from animals, plants, and natural objects, such as the sun and earth;[14] but this, though a presumption, is not a proof of totemism.

In Africa totemism prevails in Senegambia, among the Bakalai on the equator, on the Gold Coast and in Ashantee, and among the Damaras and Bechuanas in southern Africa.[15] There are traces of totemism elsewhere in Africa. In eastern Africa the Gallas are divided into two exogamous sections, and have certain forbidden foods.[16] In Abyssinia certain districts or families will not eat of certain animals or parts of animals.[17] The territory of the Hovas in Madagascar is divided and subdivided into districts, the names of the subdivisions referring "rather to clans and divisions of people than to place." One of these names is "the powerful bird," *i.e.*, either the eagle or the vulture. The same clan is found occupying separate districts.[18] One Madagascar tribe regard a species of lemur as "an embodiment of the spirit of their ancestors, and therefore they look with horror upon killing them." Other Malagasy tribes and families refrain from eating pigs and goats; others will not eat certain vegetables nor even allow them to be carried into their houses.[19] The only occasion when the Sakalava tribe in Madagascar kill a bull is at the circumcision of a child, who is placed on the bull's back during the customary invocation.[20]

In Bengal, as we have seen, there are numerous totem tribes among the non-Aryan races. In Siberia the Yakuts are divided into totem clans; the clansmen will not kill their totems (the swan, goose, raven, etc.);[21] and the clans are exogamous.[22] The Altaians, also in Siberia, are divided into twenty-four clans, which, though interfused with each other, retain strongly the clan feeling; the clans are exogamous; each has its own patron divinity and religious ceremonies; and the only two names of clans of these and kindred tribes of which the meanings are given are names of animals.[23] Totemism exists among the mountaineers of Formosa,[1] and there are traces of it in China.[2] In Polynesia it existed, as we have seen, in Samoa. In Melanesia it appears in Fiji,[3] the New Hebrides,[4] and the Solomon Islands.[5] Amongst the Dyaks there are traces of totemism in the prohibition of the flesh of certain animals to certain tribes, respect for certain plants, etc.[6] It exists in the islands of Ambon, Uliase, Leti, Moa, Lakor, Keisar (Makisar), Wetar, and the Aaru and Babar archipelagos.[7] In the Philippine Islands there are traces of it in the reverence for certain animals, the belief that the souls of ancestors dwell in trees, etc.[8]

With regard to ancient nations, totemism may be regarded as certain for the Egyptians, and highly probable for the Semites,[9] Greeks, and Latins. If proved for one Aryan people, it might be regarded as proved for all; since totemism could scarcely have been developed by any one Aryan branch after the dispersion, and there is no evidence or probability that it ever was borrowed. Prof. Sayce finds totemism among the ancient Babylonians, but his evidence is not conclusive.[10]

No satisfactory explanation of the origin of totemism has yet been given. Mr. Herbert Spencer finds the origin of totemism in a "misinterpretation of nicknames"; savages first named themselves after natural objects, and then, confusing these objects with their ancestors of the same names, reverenced them as they already reverenced their ancestors.[11] But this view attributes to verbal misunderstandings far more influence than, in spite of the so-called comparative mythology, they ever seem to have exercised.

Literature.—Apart from the original authorities, the literature on totemism is very scanty. The importance of totemism for the early history of society was first recognized by Mr. J. F. M'Lennan in papers published in the *Fortnightly Review* (Oct. and Nov., 1869, Feb., 1870). The subject has since been treated of by E. B. Tylor, *Early History of Mankind*, p. 284 *sq.*; Sir John Lubbock, *Origin of Civilization*, 260 *sq.*; A. Lang, *Custom and Myth*, p. 260, etc.; Id., *Myth, Ritual, and Religion*, i. p. 58 *sq.*, etc.; E. Clodd, *Myths and Dreams*, p. 99 *sq.*; W. Robertson Smith, *Kinship and Marriage in Early Arabia*. TOTILA. See JUSTINIAN and NARSES.

TOTTENHAM, or TOTTENHAM HIGH CROSS, a suburb of London, in the county of Middlesex, is situated on the old "Great Northern" road, about 4½ miles north from Shoreditch. The cross at Tottenham is not a market-cross, and its origin is doubtful. Towards the close of the 16th century it consisted of a column of wood, capped with a square sheet of lead. The present cross of brick was erected by Dean Wood about 1600, and the ornamental work of stucco was added in 1809. In the time of Isaak Walton there stood over it a shady arbor of woodbine, sweetbrier, jessamine, and myrtle. Formerly Tottenham was noted for its "greens," in the centre of one of which stood the famous old elm trees called the "Seven Sisters"; these were removed in 1840, but the name is preserved in the Seven Sisters Road. Bruce Castle, occupying the site of the old mansion of the Bruces, but built probably by Sir William Compton in the beginning of the 16th century, is now occupied as a private boarding school. The church of All Hallows, Tottenham, was given by David, king of Scotland, probably when he visited Henry in 1126, to the canons of the church of Holy Trinity, London. It has frequently been restored and altered. The older parts are the tower, nave, and south aisle of the Perpendicular period and the south porch of the 16th century. There are a large number of monuments and brasses. Tottenham consists chiefly of an irregular line of houses for about two miles along the high road, with short side streets at intervals. There are a number of almshouses, including the Sanchez almshouses, founded in 1596 by Balthazar Sanchez, or Zanchero, confectioner to Philip of Spain; Reynardson's (1685); Pheasunt's, or "The Pound," for poor widows, originally founded by George Hynningham in 1536, and further endowed by Pheasund and Saunders; and the sailmakers' almshouses, founded in 1869 by the Drapers' Company for forty-five inmates. The free grammar school was enlarged and endowed in 1686 by Sarah, dowager duchess of Somerset. The population of the urban sanitary district (area 4642 acres) in 1871 was 22,869, and in 1881 it was 46,456.

In the reign of the Confessor the manor of Tottenham was possessed by Earl Waltheof, who in 1070 married Judith, niece of the Conqueror, and was created in 1072 earl of Northumberland, Huntingdon, and Northampton, but joined the conspiracy against William, was betrayed by his wife, and was beheaded at Winchester. It was inherited by his daughter Maud, who was married first to Simon de St. Liz and afterwards to David, son of Malcolm III., king of Scotland, who was created by Henry I. earl of Huntingdon, and received possession of all the lands formerly held by Earl Waltheof. In 1184 the manor was granted by William the Lion, king of Scotland, to his brother David, earl of Angus and Galloway, the grant being confirmed in 1199 by King John of England, who created him Earl of Huntingdon. He married Maud, heiress of Hugh, earl of Chester, and his son John inherited both earldoms. The son married Helen, daughter of Llewelyn, Prince of Wales, by whom he was poisoned in 1237, dying without issue. She retained possession till 1254, when the manor was divided between his coheirs Robert de Brus, John de Baliol, and Henry de Hastings, each division forming a distinct manor bearing the name of its owner. In 1429 they all came into the possession of Alderman Gedeney. William Bedwell, the Arabic scholar, was vicar of Tottenham, and published in 1632 a *Briefe Description of the Towne of Tottenham*, in which he printed for the first time the burlesque poem, the "Turnament of Tottenham."

See Robinson's *History of Tottenham*, 1840.

TOUCAN, the Brazilian name of a bird,[12] long since adopted into nearly all European languages and apparently first given currency in England (though not then used as an English word) in 1668[13] by Charleton (*Onomasticon*, p. 115); but the bird, with its enormous beak and feather-like tongue, was described by Oviedo in his *Sumario de la Natural Historia de las Indias*, first published at Toledo in 1527 (chap. 42),[14] and, to quote the translation of part of the passage in Willughby's *Ornithology* (p. 129), "there is no bird secures her young ones better from the *Monkeys*, which are very noisom to the young of most Birds. For when she perceives the approach of those Enemies, she so settles her self in her Nest as to put her Bill out at the hole, and gives the *Monkeys* such a welcom therewith, that they presently pack away, and glad they scape so." Indeed, so remarkable a bird must have attracted the notice of the earliest European invaders of America, the more so since its gaudy plumage was used by the natives in the decoration of their persons and weapons. In 1555 Belon (*Hist. Nat.*

[12] Commonly believed to be so called from its cry; but Prof. Skeat (*Proc. Philolog. Society*, 15th May, 1885) adduces evidence to prove that the Guarani *Tucá* is from *tí*, nose, and *cáng*, bone, *i.e.*, nose of bone.

[13] In 1656 the beak of an "Aracari of Brazil," which was a Toucan of some sort, was contained in the *Musæum Tradescantianum* (p. 2), but the word Toucan does not appear there.

[14] The writer has only been able to consult the reprint of this rare work contained in the *Biblioteca de Autores Españoles* (xxii. pp. 473–515), published at Madrid in 1852.

Oyseaux, p. 184) gave a characteristic figure of its beak, and in 1558 Thevet (*Singularitez de la France Antarctique*, pp. 88–90) a somewhat long description, together with a woodcut (in some respects inaccurate, but quite unmistakable) of the whole bird, under the name of "Toucan," which he was the first to publish. In 1560 Gesner (*Icones Avium*, p. 130) gave a far better figure (though still somewhat incorrect) from a drawing received from Ferrerius, and suggested that from the size of its beak the bird should be called *Burhynchus* or *Ramphestes*. This figure, with a copy of Thevet's and a detailed description, was repeated in the posthumous edition (1585) of his larger work (pp. 800, 801). By 1579 Ambroise Paré (*Œuvres*, ed. Malgaigne, iii. p. 783) had dissected a Toucan that belonged to Charles IX. of France, and about the same time Léry (*Voyage fait en la Terre du Bresil*, chap. xi.), whose chief object seems to have been to confute Thevet, confirmed that writer's account of this bird in most respects. In 1599 Aldrovandus (*Ornithologia*, i. pp. 801–803), always ready to profit by Gesner's information, and generally without acknowledgment, again described and repeated the former figures of the bird; but he corrupted his predecessor's *Ramphestes* (which was nearly right) into *Ramphastos*, and in this incorrect form the name, which should certainly be *Rhamphestes* or *Rhamphastas*, was subsequently adopted by Linnæus and has since been recognized by systematists. Into the rest of the early history of the Toucan's discovery it is needless to go.[1] Additional particulars were supplied by many succeeding writers, until in 1834 Gould completed his *Monograph* of the family[2] (with an anatomical appendix by Sir R. Owen), to which, in 1835, he added some supplementary plates; and in 1854 he finished a second and much improved edition. The latest systematic compendium on Toucans is Cassin's "Study of the Ramphastidæ," in the *Proceedings* of the Philadelphia Academy [of Natural Sciences] for 1867 (pp. 100–124).

By recent systematists 5 genera and from 50 to 60 species of the Family are recognized; but the characters of the former have never been satisfactorily defined, much less those of numerous subdivisions which it has pleased some writers to invent. There can be little doubt that the bird first figured and described by the earliest authors above named is the *R. toco* of nearly all ornithologists, and as such is properly regarded as the type of the genus and therefore of the Family. It is one of the largest, measuring 2 feet in length, and has a wide range throughout Guiana and a great part of Brazil. The huge beak, looking like the great claw of a lobster, more than 8 inches long and 3 high at the base, is of a deep orange color, with a large black oval spot near the tip. The eye, with its double iris of green and yellow, has a broad blue orbit, and is surrounded by a bare space of deep orange skin. The plumage generally is black, but the throat is white, tinged with yellow and commonly edged beneath with red; the upper tail-coverts are white and the lower scarlet. In other species of the genus, 14 to 17 in number, the bill is mostly particolored—green, yellow, red, chestnut, blue, and black variously combining so as often to form a ready diagnosis; but some of these tints are very fleeting and often leave little or no trace after death. Alternations of the brighter colors are also displayed in the feathers of the throat, breast, and tail-coverts, so as to be in like manner characteristic of the species, and in several the bare space round the eye is yellow, green, blue, or lilac. The sexes are almost alike in coloration, and externally differ chiefly in size, the males being largest. The tail is nearly square or moderately rounded. In the genus *Pteroglossus*, the "Aracaris" (pronounced Arassarí), the sexes more or less differ in appearance, and the tail is graduated. The species are smaller in size, and nearly all are banded on the belly, which is generally yellow, with black and scarlet, while except in two the throat of the males at least is black. One of the most remarkable and beautiful is *P. beauharnaisi*, by some authors placed in a distinct genus and called *Beauharnaisius ulocomus*. In this the feathers of the top of the head are very singular, looking like glossy curled shavings of black horn or whalebone, the effect being due to the dilatation of the shaft and its coalescence with the consolidated barbs. Some of the feathers of the straw-colored throat and cheeks partake of the same structure, but in a less degree, while the subterminal part of the *lamina* is of a lustrous pearly-white.[3] The beak is richly colored, being green and crimson above and lemon below. The upper plumage generally is dark green, but the mantle and rump are crimson, as are a broad abdominal belt, the flanks, and many crescentic markings on the otherwise yellow lower parts.[4] The group or genus *Selenodera*, proposed by Gould in 1837 (*Icones Avium*, pt. 1), contains some 6 or 7 species, having the beak, which is mostly transversely striped, and tail shorter than in *Pteroglossus*. Here the sexes also differ in coloration, the males having the head and breast black, and the females the same parts chestnut; but all have a yellow nuchal crescent (whence the name of the group). The so-called Hill-Toucans have been separated as another genus, *Andigena*, and consist of some 5 or 6 species chiefly frequenting the slope of the Andes and reaching an elevation of 10,000 feet, though one, often placed among them, but perhaps belonging rather to *Pteroglossus*, the *A. bailloni*, remarkable for its yellow-orange head, neck, and lower parts, inhabits the lowlands of southern Brazil. Another very singular form is *A. laminirostris*, which has affixed on either side of the maxilla, near the base, a quadrangular ivory-like plate, forming a feature unique in this or almost in any Family of Birds. The group *Aulacorhamphus*, or "Groove-bills," with a considerable but rather uncertain number of species, contains the rest of the Toucans.

The monstrous serrated bill that so many Toucans possess was by Buffon, after his manner, accounted a grave defect of Nature, and it must be confessed that no one has given what seems to be a satisfactory explanation of its precise use, though on evolutionary principles none will now doubt its fitness to the bird's requirements. Solid as it looks, its weight is inconsiderable, and the perfect hinge by which the maxilla is articulated adds to its efficiency as an instrument of prehension. Swainson (*Classif. Birds*, ii. p. 138) imagined it merely "to contain an infinity of nerves, disposed like net-work, all of which lead immediately to the nostrils," and add to the olfactory faculty. This notion seems to be borrowed from Trail (*Trans. Linn. Society*, xi. p. 289), who admittedly had it from Waterton, and stated that it was "an admirable contrivance of nature to increase the delicacy of the organ of smell"; but Sir R. Owen's description shows this view to be groundless, and he attributes the extraordinary development of the Toucan's beak to the need of compensating, by the additional power of mastication thus given, for the absence of any of the grinding structures that are so characteristic of the intestinal tract of vegetable-eating birds—its digestive organs possessing a general simplicity of formation. The question is one worth deciding, and would not be difficult to decide by those who have the opportunity. The nostrils are placed so as to be in most forms invisible until sought, being obscured by the frontal feathers or the backward prolongation of the horny sheath of the beak. The wings are somewhat feeble, and the legs have the toes placed in pairs, two before and two behind. The tail is capable of free vertical motion, and controlled by strong muscles, so that, at least in the true Toucans, when the bird is preparing to sleep, it is reverted and lies almost flat on the back, on which also the huge bill reposes, pointing in the opposite direction.

As may be inferred from the foregoing, the Toucans are a Neotropical form, and by far the greater number inhabit the northern part of South America, especially Guiana and the valley of the Amazons. Some three species occur in Mexico, and several in Central America. One, *R. vitellinus*, which has its headquarters on the mainland, is said to be common in Trinidad, but none are found in the Antilles proper. The precise place of the Family in the heterogeneous group *Picariæ* cannot yet be determined. Its nearest allies perhaps exist among the *Capitonidæ;* but none of them are believed to have the long feather-like tongue which is so characteristic of the Toucans, and is, so far as known, possessed besides only by the *Momotidæ* (*cf.* MOTMOT, vol. xvii. p. 9). But of these last there is no reason to deem the Toucans close relatives, and, according to Swainson (*ut supra*, p. 141), who had opportunities of observing both, the alleged resemblance in their habits has no existence. Those of the Toucans in confinement have been well described by Broderip and Vigors (*Zool. Journal*, i. p. 484; ii. p. 478), and indeed may be partially observed in many zoological gardens. Though feeding mainly on fruits, little seems amiss to them, and they swallow grubs, reptiles, and small birds with avidity. They are said to nest in hollow trees, and to lay white eggs. (A. N.)

---

[1] One point of some interest may, however, be noticed. In 1705 Plot (*N. H. Oxfordshire*, p. 182) recorded a Toucan found within two miles of Oxford in 1644, the body of which was given to the repository in the medical school of that university, where, he said, "it is still to be seen." Already in 1700 Leigh in his *Lancashire* (p. 195, Birds, tab. 1, Fig. 2) had figured another which had been found dead on the coast of that county about two years before. The bird is easily kept in captivity, and no doubt from early times many were brought alive to Europe. Besides the one dissected by Paré, as above mentioned, Joh. Faber, in his additions to Hernandez's work on the Natural History of Mexico (1651), figures (p. 697) one seen and described by Puteus (Dal Pozzo) at Fontainebleau.

[2] Of this the brothers Sturm in 1841 published at Nuremberg a German version.

[3] This curious peculiarity naturally attracted the notice of the first discoverer of the species, Poeppig, who briefly described it in a letter published in Froriep's *Notizen* (xxxii. p. 146) for December, 1831.

[4] Readers of Mr. Bates's *Naturalist on the River Amazons* will recollect the account (ii. p. 344) and illustrations there given of his encounter with a flock of this species of Toucan. His remarks on the other species with which he met are also excellent.

TOUCH may be defined as a sense of pressure, referred usually to the surface of the body. It is often understood as a sensation of contact as distinguished from pressure, but it is evident that however gentle be the contact, a certain amount of pressure always exists between the sensitive surface and the body touched. Mere contact in such circumstances is gentle pressure; a greater amount of force causes a feeling of resistance or of pressure referred to the skin; a still greater amount causes a feeling of muscular resistance, as when a weight is supported on the palm of the hand; whilst, finally, the pressure may be so great as to cause a feeling of pain. The force may not be exerted vertically on the sensory surface, but in the opposite direction, as when a hair on a sensory surface is pulled or twisted. Touch is therefore the sense by which mechanical force is appreciated, and it presents a strong resemblance to hearing, in which the sensation is excited by intermittent pressure on the auditory organ. In addition to feelings of contact or pressure referred to the sensory surface, contact may give rise to a sensation of temperature, according as the thing touched feels hot or cold. These sensations of contact, pressure, or temperature are usually referred to the skin or integument covering the body, but they are experienced to a greater or less extent when any serous or mucous surface is touched. The skin being the chief sensory surface of touch, it is there that the sense is most highly developed, both as to delicacy in detecting minute pressures and as to the character of the surface touched. Tactile impressions, properly so called, are absent from internal mucous surfaces, as has been proved in men having gastric, intestinal, and urinary fistulæ. In these cases, touching the mucous surface caused pain, and not a sensation of touch.

Organs of Touch.—Comparative Sketch.—The organs of touch present many varieties of form, from a simple filament of sensitive protoplasm to a highly complex end-organ connected with the commencement of a sensory nerve-fibre. The bodies of the lowest organisms are formed of contractile protoplasm, and mechanical contact with any resisting substances causes a change of form. Here is the simplest kind of touch—a response on the part of any portion of the surface of the body to a mechanical stimulus. The pseudopodia of the *Rhizopoda* are also organs of touch, and probably the cilia, the flagellæ, and the short rod-like bodies seen on many *Infusoria* belong to the same class of sensory organs. Among the *Cœlentera* (hydroid polyps, tubularians, *Hydromedusæ, Medusæ, Anthozoa* or sea-anemones) tentacles are found, usually arranged in circles around the mouth or on portions of the body engaged in locomotion, as on the margins of the umbrella of *Medusæ*. These have a large amount of sensibility, and serve as organs of touch. In some also there are stiff hairs on the tentacles and around the mouth, more differentiated tactile organs. The *Vermes* show organs of touch in the form of modified cells of the integument, connected with sensory nerves. These cells often assume the form of stiff rods projected from the surface (tactile setæ). Such are often found over the whole body of *Turbellaria* and *Nemertina*, on the tentacles of *Bryozoa*, on the head segment of *Lumbricidæ*, and on the tentacles and antennæ of *Chætopoda*. In the latter group of animals tactile organs are also found in ring-like arrangements, called cirrhi, on the foot-stumps or parapodia. In some *Hirudinea* (leeches) complicated tactile rods are embedded in cup-shaped organs scattered over the body. Large prominences of the cuticle, called tactile papillæ, are also found in many of the *Vermes* near the oral and genital orifices. The *Echinodermata* have also special parts devoted to touch, and these show their highest differentiation in the tentacles of the *Holothuroida*. *Arthropoda* show tactile organs in the form usually of rod-like bodies projecting from the surface of the appendages and chiefly connected with nerves passing to ganglionic cells. In *Crustacea* such organs are found on the antennæ and other appendages, and on the antennæ in *Myriapoda* and *Insecta*. In the latter they are also found on the tarsal joints of the feet. The appearance of these rod-like bodies is seen in Fig. 1.

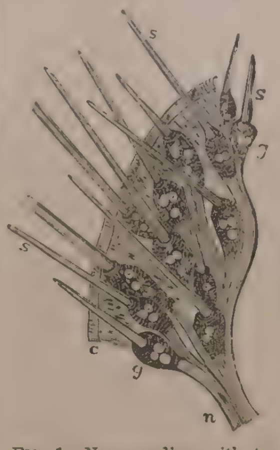

FIG. 1.—Nerve-ending with tactile rods, from the proboscis of a fly (*Musca*), *n*, nerve; *g*, ganglionic swelling; *s*, tactile rods; *c*, fine hairs of cuticle (Leydig).

Ciliated tentacular processes exist in the larva of *Brachiopoda* which are probably touch organs, but there are no definite organs of this kind in the adult form. The *Mollusca* have the sense of touch widely diffused. All the soft parts of the body are capable of feeling when touched, and in various situations there are fine hair-like prolongations from cells. These are supplied with nerves and are touch organs. Such are found on the edge of the mantle in *Lamellibranchiata* where they may be in rows: they also exist on the siphons, and "they serve to watch over the particles that get into the mantle cavity with the water" (Gegenbaur). Processes of a tactile kind are also found on the epipodium, the edge of the mantle, and the cephalic tentacles in many *Gasteropoda*, and on the dorsal tufts of the *Nudibranchiata*. Here and there also there are enlargements of the integument covered with cilia and supplied by a nerve which have been regarded as touch organs, but are by some supposed to be connected with smell (see SMELL). The *Tunicata* have cells with long filamentous processes in the integument, which are probably tactile in function.

In the great majority of fishes touch is limited to the lips, to parts of the fins, and to special organs called barbels. In the *Cyprinoids* there is a fold of skin bordering the mouth which is highly tactile. The lip of the sturgeon is covered with numerous papillæ; the sucking lip of the lamprey is papillose and highly sensitive. The fins are in many fishes modified to serve as organs of touch. Thus the gurnards (*Triglidæ*) have three soft flexible rays detached from the fin, and "the filiform radial appendages of the *Polynemidæ*, the prolonged ventral fins of *Osphromenus, Trichogaster*, and other Labyrinthibranchs, and of the *Ophidiidæ*," are examples of this class of organs (Owen). The barbels are long slender processes of skin, either single or in pairs, found in the *Siluridæ*, loaches, barbels, cods, sturgeons, and in the parasitic *Myxinidæ*. The nerves for the barbels come from the fifth pair of cranial nerves. "A cod, blind by absence or destruction of both eyeballs, has been captured in good condition, and it may be supposed to have found its food by exploring with the symphysial barbule, as well as by the sense of smell" (Owen). Bodies somewhat similar to the Pacinian corpuscles (to be afterwards described were discovered by Savi in 1844 in the torpedo; they are arranged in linear series on the anterior part of the mouth and nostrils, and over the fore part of the electrical organs. Each is composed of two capsules, one connected with the other, and containing a granular substance in which the nerve end is embedded. Peculiar mucous glands are also found outside the electrical organs of the torpedo which are believed to minister to touch. Similar organs exist in sharks, and John Hunter dissected the snout of the spotted dog-fish (*Scyllium*) "to show the manner of the nerves ramifying, as also their apparent termination in this part, each ultimate nerve appearing to terminate in the bottom of a tube or duct, the sides of which secrete and convey a thick mucus to the skin." These "nervo-mucous" organs are found in the sides and under part of the head and on the fore part of the trunk.

The *Amphibia* and *Reptilia* do not show any special organs of touch. The lips of tadpoles have tactile papillæ. Some snakes have a pair of tentacles on the snout, but the tongue is probably the chief organ of touch in most serpents and lizards. All reptiles possessing climbing powers have the sense of touch highly developed in the feet.

Birds have epithelial papillæ on the soles of the toes that are no doubt tactile. These are of great length in the capercailzie (*Tetrax urogallus*), "enabling it to grasp with more security the frosted branches of the Norwegian pine trees" (Owen). It has been suggested that the delicate "papillose" digits of the smaller birds assist them in nest-building by having the sense of touch highly developed. Around the root of the bill in many birds there are special tactile organs, assisting the bird to use it as a kind of sensitive probe for the detection in soft ground of the worms, grubs, and slugs that constitute its food. Special bodies of this kind have been detected in the beak and tongue of the duck and goose, called the tactile corpuscles of Merkel, or the corpuscles of Grandry (Fig. 2). Similar bodies have been found in the epidermis of man and mammals, in the outer root-sheath of tactile hairs or feelers. They consist of small bodies composed of a capsule enclosing two or more flattened nucleated cells, piled in a row. Each corpuscle is separated from the others by a transparent protoplasmic disk. Nerve fibres terminate either in the cells (Merkel) or in the protoplasmic intercellular matter (Ranvier, Hesse, Izquierdo). Another form of end-organ has been described by Herbst as existing in the mucous membrane of the duck's tongue. These corpuscles of Herbst are like small Pacinian corpuscles with thin and very close lamellæ. Developments of integument devoid of feathers, such as the "wattles" of the cock, the "caruncles" of the vulture and turkey, are not tactile in their function.

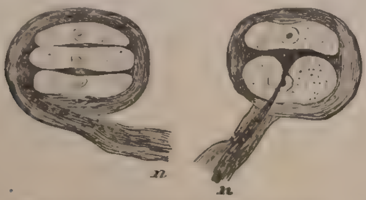

FIG. 2.—Tactile Corpuscles from duck's tongue. *n*, nerve.

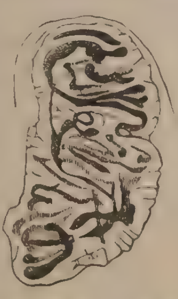

FIG. 3.—Tactile Corpuscle from the hand.

In the great majority of *Mammalia* the general surface of the skin shows sensitiveness, and this is developed to a high degree on certain parts, such as the lips, the end of a teat, and the generative organs. Where touch is highly developed, the skin, more especially the epidermis, is thin and devoid of hair. In the Monkeys tactile papillæ are found in the skin of the fingers and palms, and in the skin of the prehensile tails of various species (*Ateles*). Such papillæ also abound in the naked skin of the nose or snout, as in the shrew, mole, pig, tapir, and elephant. In the *Ornithorhynchus* the skin covering the mandibles is tactile (Owen). In many animals certain hairs acquire great size, length, and stiffness. These constitute the vibrissæ, or whiskers. Each large hair grows from a firm capsule sunk deep in the true skin, and the hair bulb is supplied with sensory nerve filaments. In the walrus the capsule is cartilaginous in texture. The marine *Carnivora* have strong vibrissæ which "act as a staff, in a way analogous to that held and applied by the hand of a blind man" (Owen). Each species has hairs of this kind developed on the eyebrows, lips, or cheeks, to suit a particular mode of existence, as, for example, the long fine whiskers of the night-prowling felines, and in the aye-aye, a monkey having nocturnal habits. In the *Ungulata* the hoofs need no delicacy of touch as regards the discrimination of minute points. Such animals, however, have broad, massive sensations of touch, enabling them to appreciate the firmness of the soil on which they tread, and under the hoof we find highly vascular and sensitive lamellæ or papillæ, contributing no doubt, not only to the growth of the hoof, but also to its sensitiveness. The *Cetacea* have numerous papillæ in the skin, regarding which John Hunter remarks: "These villi are soft and pliable; they float in water; and each is longer or shorter according to the size of the animal. In the spermaceti whale they are about a quarter of an inch long; in the grampus, bottle-nose, much shorter; in all they are extremely vascular; they are sheathed in corresponding hollows of the epiderm." In some whales the skin is thrown into numerous longitudinal plaits on the under and fore part of the body (*Balænoptera*). Prof. Owen remarks regarding these: "It is peculiar to the swifter swimming whales that pursue mackerel and herring, and may serve to warn them of shoals, by appreciation of an impulse of the water rebounding therefrom, and so conveying a sense of the propinquity of sunken rocks or sand-banks. Sensitiveness to the movements of the ambient ocean is indicated by certain observed phenomena. The whale-fishers aver that when a straggler is attacked its fellows will bear down from some miles' distance, as if to its assistance; and it may be that they are attracted by perception of the vibration of the water caused by the struggles of the harpooned whale or cachalot" (Owen's *Comparative Anatomy*, vol. iii. p. 189). Bats have the sense of touch strongly developed in the wings and external ears, and in some species in the flaps of skin found near the nose. These "nose-leaves" and expanded ears frequently show vibratile movements, like the antennæ of insects, enabling the animal to detect slight atmospheric impulses. In the vampires (*Desmodi*) and fruit-eating bats (*Pteropi*) the auricular and nasal appendages are small; "such sensitive tactile guides or warners in flight are only needed in the bats of active food, which must follow in swift evolutions, like the swallows, but in gloom, the volatile insects that people the summer air at dawn or dusk" (Owen). There is little doubt that many special forms of tactile organs will be found in animals using the nose or feet for burrowing. A peculiar end-organ has been found in the nose of the mole, while there are "end-capsules" in the tongue of the elephant and "nerve rings" in the ears of the mouse.

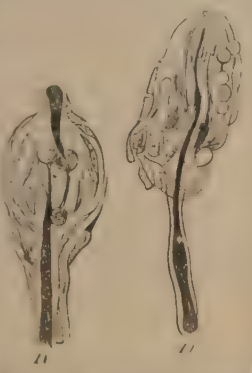

FIG. 4.—Tactile Corpuscles from clitoris of rabbit. *n*, nerve.

End-Organs of Touch in Man.—In man three special forms of tactile end organs have been described, and can be readily demonstrated.

(1) *The End-Bulbs of Krause.*—These are oval or rounded bodies, from $\frac{1}{360}$ to $\frac{1}{170}$ of an inch long. Each consists of a delicate capsule, composed of nucleated connective tissue enclosing numerous minute cells. On tracing the nerve fibre, it is found that the nerve sheath is continuous with the capsule, whilst the axis cylinder of the nerve divides into branches which lose themselves among the cells. Waldeyer and Longworth state that the nerve fibrils terminate in the cells, thus making these bodies similar to the cells described by Merkel (*ut supra*). See Fig. 5. These bodies are found in the deeper layers of the conjunctiva, margins of the lips, nasal mucous membrane,

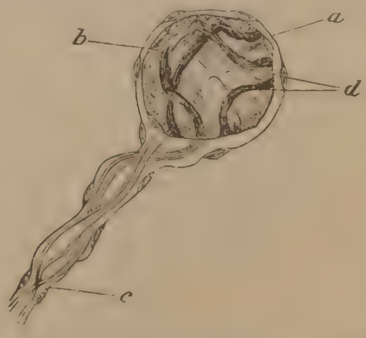

FIG. 5.—End-Bulb from human conjunctiva. *a*, nucleated capsule; *b*, core; *c*, entering nerve-fibre terminating in the core at *d*.

epiglottis, fungiform and circumvallate papillæ of the tongue, glans penis and clitoris, mucous membrane of the rectum of man, and they have also been found on the under surface of the "toes of the guinea-pig, ear and body of the mouse, and in the wing of the bat" (Landois and Stirling). In the genital organs aggregations of end-bulbs occur, known as the "genital corpuscles of Krause" (Fig. 4). In the synovial membrane of the joints of the fingers there are larger end-bulbs, each connected with three or four nerve-filaments.

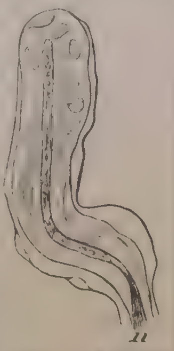

FIG. 6.—End-Bulb from conjunctiva of calf. *n*, nerve.

(2) *The Touch Corpuscles of Wagner and Meissner.*—These are oval bodies, about $\frac{1}{300}$ of an inch long by $\frac{1}{500}$ of an inch in breadth. Each consists of a series of layers of connective tissue arranged transversely, and containing in the centre granular matter with nuclei (Fig. 7). One, two, or three nerve fibres pass to the lower end of the corpuscle, wind transversely around it, lose the white substance of Schwann, penetrate into the corpuscle, where the axis cylinders, dividing, end in some unknown. The corpuscles do not contain any soft core, but are apparently built up of irregular septæ of connective tissue, in the meshes of which the nerve fibrils end in expansions similar to Merkel's cells. Dr. Thin describes simple and compound corpuscles according to the number of nerve fibres entering them. These bodies are found abundantly in the palm of the hand and sole of the foot, where there may be as many as 21 to every square millimetre (1 mm. = $\frac{1}{25}$ inch). They are not so numerous on the back of the hand or foot, mamma, lips, and tip of the tongue, and they are rare in the genital organs. "Kollmann describes three special tactile areas in the hand: (1) the tips of the fingers, with 24 touch corpuscles in a length of 10 mm.; (2) the three eminences lying on the palm behind the slits between the fingers, with 5.4—2.7 touch-corpuscles in the same length; and (3) the ball of the thumb and little finger, with 3.1–3.5 touch corpuscles. The first two areas also contain many of the corpuscles of Vater or Pacini, whilst in the latter these corpuscles are fewer and scattered. In the other parts of the hand the nervous end-organs are much less developed." (Landois and Stirling.)

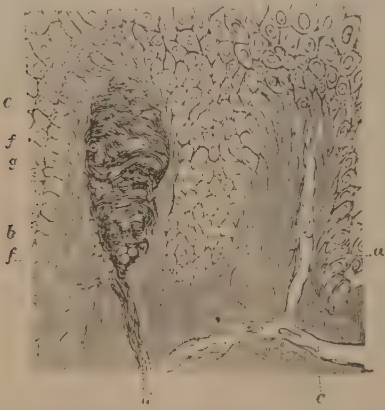

FIG. 7.—Vertical Section of the Skin of the palm of the hand. *a*, bloodvessel; *b*, papilla of the cutis vera; *c*, capillary; *d*, nerve-fibre passing to a touch-corpuscle; *e*, Wagner's touch-corpuscle; *f*, nerve fibre, divided transversely; *g*, cells of the Malpighian layer of the skin. (From Landois and Stirling, after Biesiadecki.)

(3) *The Corpuscles of Vater or Pacini.*—These, first described by Vater so long ago as 1741, are small oval bodies, quite visible to the naked eye, from $\frac{1}{15}$ to $\frac{1}{10}$ of an inch long and $\frac{1}{25}$ to $\frac{1}{20}$ of an inch in breadth, attached to the nerves of the hands and feet. They can be readily demonstrated in the mesentery of the cat (Fig. 8). Each corpuscle consists of 40 to 50 lamellæ or coats, like the folds of an onion, thinner and closer together on approaching the centre. Each lamella is formed of an elastic material mixed with delicate connective tissue fibres, and the inner surface of each is lined by a single continuous layer of endothelial cells. A double-contoured nerve fibre passes to each. The white substance of Schwann becomes continuous with the lamellæ, whilst the axis cylinder passes into the body, and ends in a small knob or in a plexus. Sometimes a bloodvessel also penetrates the Pacinian body, entering along with the nerve. Such bodies are found in the subcutaneous tissue on the nerves of the fingers and toes, near joints, attached to the nerves of the abdominal plexuses of the sympathetic, on the coccygeal gland, on the dorsum of the penis and clitoris, in the meso-colon, in the course of the intercostal and periosteal nerves, and in the capsules of lymphatic glands (William Stirling).

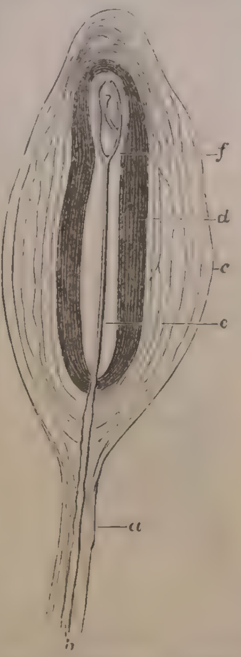

FIG. 8.—Vater's or Pacini's Corpuscle. *a*, stalk; *b*, nerve-fibre entering it; *c*, *d*, connective tissue envelope; *e*, axis cylinder, with its end divided at *f*.

Physiology of Touch in Man.—Such are the special end-organs of touch. It has also been ascertained that many sensory nerves end in a plexus or network, the ultimate fibrils being connected with the cells of the particular tissue in which they are found. Thus they exist in the cornea of the eye, and at the junctions of tendons with muscles. In the latter situation "flattened end-flakes or plates" and "elongated oval end-bulbs" have also been found (Sachs, Rollett, Golgi). A consideration of these various types of structure show that they facilitate intermittent pressure being made on the nerve endings. They are all, as it were, elastic cushions into which the nerve endings penetrate, so that the slight variation of pressure will be transmitted to the nerve. Probably also they serve to break the force of a sudden shock on the nerve endings.

Sensitiveness and Sense of Locality.—The degree of sensitiveness of the skin is determined by finding the smallest distance at which the two points of a pair of compasses can be felt. This method, first followed by Weber, is employed by physicians in the diagnosis of nervous affections involving the sensitiveness of the skin. The following table shows the sensitiveness in millimetres for an adult, whilst the corresponding numbers for a boy 12 years of age are given within brackets (Landois and Stirling, after Weber):

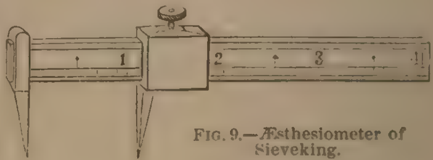

FIG. 9.—Æsthesiometer of Sieveking.

	Millimetres.	
Tip of tongue	1.1	[1.1]
Third phalanx of finger, volar surface	2–2.3	[1.7]
Red part of the lip	4.5	[3.9]
Second phalanx of finger, volar surface	4–4.5	[3.9]
First phalanx of finger, volar surface	5–5.5	
Third phalanx of finger, dorsal surface	6.8	[4.5]
Tip of nose	6.8	[4.5]
Head of metacarpal bone, volar	5–6.8	[4.5]
Ball of thumb	6.5–7	
Ball of little finger	5.5–6	
Centre of palm	8–9	
Dorsum and side of tongue; white of the lips; metacarpal part of the thumb	9	[6.8]
Third phalanx of the great toe, plantar surface	11.3	[6.8]
Second phalanx of the fingers, dorsal surface	11.3	[9]
Back	11.3	[9]
Eyelid	11.3	[9]
Centre of hard palate	13.5	[11.3]
Lower third of the fore-arm, volar surface	15	
In front of the zygoma	15.8	[11.3]
Plantar surface of the great toe	15.8	[9]
Inner surface of the lip	20.3	[13.5]
Behind the zygoma	22.6	[15.8]
Forehead	22.6	[18]
Occiput	27.1	[22.6]
Back of the hand	31.6	[22.6]
Under the chin	33.8	[22.6]
Vertex	33.8	[22.6]
Knee	36.1	[31.6]
Sacrum (gluteal region)	44.6	[33.8]
Fore-arm and leg	45.1	[33.8]
Neck	54.1	[36.1]
Back of the fifth dorsal vertebra; lower dorsal and lumbar region	54.1	
Middle of the neck	67.7	
Upper arm; thigh; centre of the back	67.7	[31.6–40.6]

These investigations show not only that the skin is sensitive, but that one is able with great precision to distinguish the part touched. This latter power is usually called the *sense of locality*, and it is influenced by various conditions. The greater the number of sensory nerves in a given area of skin the greater is the degree of accuracy in distinguishing different points. Contrast in this way the tip of the finger and the back of the hand. Sensitiveness increases from the joints towards the extremities, and, as pointed out by Vierordt, sensitiveness is great in parts of the body that are actively moved. The sensibility of the limbs is finer in the transverse axis than in the long axis of the limb, to the extent of $\frac{1}{8}$ on the flexor surface of the upper limb and $\frac{1}{4}$ on the extensor surface (Landois). It is doubtful if exercise improves sensitiveness, as Francis Galton found that the performances of blind boys were not superior to those of other boys, and he says that "the guidance of the blind depends mainly on the multitude of collateral indications, to which they give much heed, and not their superiority to any one of them." When the skin is moistened with indifferent fluids sensibility is increased. Suslowa made the curious discovery that, if the area between two points distinctly felt be tickled or be stimulated by a weak electric current, the impressions are fused. Stretching the skin, and baths in water containing carbonic acid or common salt, increase the power of localizing tactile impressions. In experimenting with the compasses, it will be found that a smaller distance can be distinguished if one proceeds from greater to smaller distances than in the reverse direction. A smaller distance can also be detected when the points of the compasses are placed one after the other on the skin than when they are placed simultaneously. If the points of the compasses are unequally heated, the sensation of two contacts becomes confused. An anæmic condition, or a state of venous congestion, or the application of cold, or violent stretching of the skin, or the use of such substances as atropine, daturin, morphia, strychnine, alcohol, bromide of potassium, cannabin, and hydrate of chloral blunt sensibility. The only active substance said to increase it is caffein.

Absolute sensitiveness, as indicated by a *sense of pressure*, has been determined by various methods. Two different weights are placed on the part, and the smallest difference in weight that can be perceived is noted. Weber placed small weights directly on the skin; Aubert and Kammler loaded small plates; Dohrn made use of a balance, having a blunt point at one end of the beam, resting on the skin, whilst weights were placed on the other end of the beam to equalize the pressure; Eulenberg invented an instrument like a spiral spring paper-clip or balance (the baræsthesiometer), having an index showing the pressure in grammes; Goltz employed an india-rubber tube filled with water, and this, "to ensure a constant surface of contact, bent at one spot over a piece of cork, is touched at that spot by the cutaneous part to be examined, and, by rhythmically exerted pressure, waves analogous to those of the arterial pulse are produced in the tube" (Hermann); and Landois invented a mercurial balance, enabling him to make rapid variations in the weight without giving rise to any shock (figured in Landois and Stirling's *Physiology*, p. 1155). These methods have given the following general results: (1) The greatest acuteness is on the forehead, temples and back of the hand and forearm, which detect a pressure of .002 gramme; fingers detect .005 to .015 gramme; the chin, abdomen, and nose .04 to .05 gramme. (2) Goltz's method gives the same general results as Weber's experiment with the compasses, with the exception that the tip of the tongue has its sensation of pressure much lower in the scale than its sensation of touch. (3) Eulenberg found the following gradations in the fineness of the pressure sense: the forehead, lips, back of the cheeks, and temples appreciate differences of $\frac{1}{40}$ to $\frac{1}{30}$ (200 : 205 to 300 : 310 grammes). The back of the last phalanx of the fingers, the forearm, hand, 1st and 2d phalanges, the palmar surface of the hand, forearm, and upper arm distinguish differences of $\frac{1}{10}$ to $\frac{1}{20}$ (200 : 220 to 200 : 210 grammes). The front of the leg and thigh is similar to the forearm. Then follow the back of the foot and toes, the sole of the foot, and the back of the leg and thigh. Dohrn placed a weight of 1 gramme on the skin, and then determined the least additional weight that could be detected, with this result: 3d phalanx of finger, .499 gramme; back of the foot, .5 gramme; 2d phalanx, .771 gramme; 1st phalanx, .82 gramme; leg, 1 gramme; back of hand, 1.156 grammes; palm, 1.108 grammes; patella, 1.5 grammes; forearm, 1.99 grammes; umbilicus, 3.5 grammes; and back, 3.8 grammes (Landois and Stirling). (4) In passing from light to heavier weights, the acuteness increases at once, a maximum is reached, and then with heavy weights the power of distinguishing the differences diminishes (Hering, Biedermann). (5) A sensation of pressure after the weights have been removed may be noticed (*after-pressure sensation*), especially if the weight be considerable. (6) Valentine noticed that, if the finger were held against a blunt-toothed wheel, and the wheel were rotated with a certain rapidity, he felt a *smooth* margin. This was experienced when the intervals of time between the contacts of successive teeth were less than from $\frac{1}{480}$ to $\frac{1}{610}$ of a second. The same experiment can be readily made by holding the finger over the holes in one of the outermost circles of a large syren rotating quickly: the sensations of individual holes become fused, so as to give rise to a feeling of touching a slit. (7) Vibrations of strings are detected even when the number is about 1500 per second; above this the sensation of vibration ceases. By attaching bristles to the prongs of tuning forks, and bringing these into contact with the lip or tongue, sensations of a very acute character are experienced, which are most intense when the forks vibrate from 600 to 1500 per second.

Information from Tactile Impressions.—These enable us to come to the following conclusions: (1) We note the existence of something touching the sensory surface. (2) From the intensity of the sensation we determine the weight, tension, or intensity of the pressure. This sensation is in the first instance referred to the skin, but after the pressure has reached a certain amount muscular sensations are also experienced—the so-called muscular sense. (3) The locality of the part touched is at once determined, and from this the probable position of the touching body. Like the visual field, to which all retinal impressions are referred, point for point, there is a tactile field, to which all points on the skin surface may be referred. (4) By touching a body at various points, from the difference of pressure and from a comparison of the positions of various points in the tactile field we judge of the configuration of the body. A number of "tactile pictures" are obtained by passing the skin over the touched body, and the shape of the body is further determined by a knowledge of the muscular movements necessary to bring the cutaneous surface into contact with different portions of it. If there is abnormal displacement of position, a false conception may arise as to the shape of the body. Thus, if a small marble or a pea be placed between the index and middle finger so as to touch (with the palm downwards) the outer side of the index finger and the inner side of the middle finger, a sensation of touching *one* round body is experienced; but if the fingers be crossed, so that the marble touches the inner side of the index finger and the outer side of the middle finger, there will be a feeling of *two* round bodies, because in these circumstances there is added to the feelings of contact a feeling of distortion (or of muscular action) like what would take place if the fingers, for purposes of touch, were placed in that abnormal position. Again, as showing that our knowledge of the tactile field is precise, there is the well-known fact that when a piece of skin is transplanted from the forehead to the nose, in the operation for removing a deformity of the nose arising from lupus or other ulcerative disease, the patient feels the new nasal part as if it were his forehead, and he may have the curious sensation of a nasal instead of a frontal headache. (5) From the number of points touched we judge as to the smoothness or roughness of a body. A body having a uniformly level surface, like a billiard ball, is smooth; a body having points irregular in size and number in a given area is rough; and if the points are very close together it gives rise to a sensation, like that of the pile of velvet, almost intolerable to some individuals. Again, if the pressure is so uniform as not to be felt, as when the body is immersed in water (paradoxical as this may seem, it is the case that the sensation of contact is felt only at the limit of the fluid), we experience the sensation of being in contact with a fluid. (6) Lastly, it would appear that touch is always the result of variation of pressure. No portion of the body when touching anything can be regarded as absolutely motionless, and the slight oscillations of the sensory surface, and in many cases of the body touched, produce those variations of pressure on which touch depends.

Theories as to Touch.—To explain the phenomenon of the tactile field, and more especially the remarkable variations of tactile sensibility above described, various theories have been advanced. (1) The one most generally known is that of E. H. Weber, as modified or restated by Lotze, Meissner, Czermak, and others. It assumes that, whilst we refer every tactile sensation to a certain position in the tactile field, we do not refer it merely to a point, but to a circular or oval area on the skin, called a circle of sensibility. Further, it is assumed that if two such circles touch or overlap they cannot be individually perceived, and that they can only be so individually perceived when one or more circles of sensibility intervene, or, in other words, when there is a "non-irritated sensory element" between the two points touched (Figs. 10 and 11).

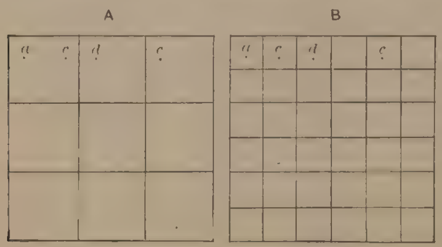

FIG. 10. FIG. 11.

FIGS. 10 and 11.—Diagrams of Tactile Innervation. (From Beaunis, *Physiologie Humaine.*)

Each circle of sensibility may be supposed to be innervated by a distinct fibre. Thus, suppose the sensitive surface of the skin to be diagrammatically represented as in Figs. 10 and 11, each square would be a "circle of sensibility." In more sensitive regions the squares would be smaller and the number of nerve terminations greater than in less sensitive regions. In Fig. 10 the area contains nine "circles" and has nine nerve terminations, whilst in Fig. 11, although the total area is the same, there are thirty-six "circles" and thirty-six nerve filaments. If the points of the compasses be placed at *a* and *c* in Fig. 10 the sensation will be that of one point; there would also be a sensation of one point if they were placed at *c* and *d*; but if the points touch *c* and *e* there will be a double sensation, because the "circle" *d* intervenes. Again, in Fig. 11, where the "circles" are much smaller and more numerous, the minimum distance at which two sensations are experienced is much less than in Fig. 10, for this would happen when the compasses touch *a* and *d*. It will also be observed that the same distance *d e* in Fig. 10 would give a single sensation, whilst it would give a double sensation in Fig. 11. But *c e* in Fig. 10 gives a double sensation, and yet the same distance would give a single sensation if the points of the compasses touched adjoining "circles." A "circle of sensibility," however, cannot be regarded as an anatomical magnitude or "cutaneous sensory unit," or, in other words, the area of distribution of a single nerve-fibre. The extent of any such hypothetical circle can be altered by practice and attention, and we may therefore assume that the circles overlap, and that even the same area of skin receives numerous nerve filaments, and that consequently, when a body is touched, it excites at once many filaments. This is illustrated by Fig. 12.

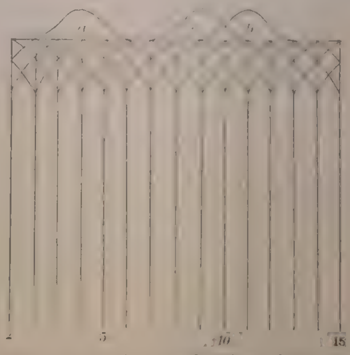

FIG. 12.—Diagram showing overlapping of "circles of sensibility." (From Beaunis.)

It will be seen that each area receives a certain number of nerve fibres and each nerve fibre supplies fibrils that cross the fibrils of adjoining nerves. If the point of the compass touch at *a*, it will irritate all the fibres from 1 to 7, but these will not be excited with equal intensity; the excitation will be at a maximum at 4, more feeble for 3 and 5, and still more feeble for 2 and 6; so that the intensity of the excitation may be represented by the curve above *a*. In this case the sensation will be that of one point, because all the fibrils have been excited. If the other point of the compass be placed at *b*, there will be an intermediary region not excited, and two points will be felt. Suppose now the second point of the compasses is moved to *c*, all the fibrils between the two points *a* and *c* are excited, and there is likely a sensation of single contact; but the excitation of the fibrils 7 and 8 is very feeble, and it is possible, by attention and practice, to leave these out, and then there will be a sensation of two contacts (Beaunis). This mechanical theory has no anatomical basis, except it be the statement made by Krause that the distance of the two points of the compasses at which two points are felt includes in the mean 12 tactile corpuscles. Whilst attention has been mainly directed to the skin as the locality where an anatomical explanation is to be sought for, it must not be forgotten that processes may be in operation in the nerve centres. It is well known that irradiation of nervous impulses occurs in the nerve centres (see PHYSIOLOGY, vol. xix. p. 32), and it is not unlikely that, when a nervous impression reaches the brain from a particular area of skin, this may be diffused to neighboring nerve-cells, exciting these, and that then the effect on these cells, in accordance with the law that sensations in nerve centres are referred to the origins in the periphery of the sensory nerve fibres reaching them, will be referred to adjoining areas of skin, or, in other words, to adjoining points in the tactile field.

Wundt has propounded a psycho-physiological theory that every part of the skin with tactile sensibility always conveys an impression of the locality of the sensation. Each area of skin has a "local color," and this diminishes from area to area. The gradation is sudden where the sense of locality is acute and gradual where it is obtuse. "A circle of sensation is an area where the local color changes so little that two separate impressions fuse into one" (Landois). Practice enables one to notice the changes of local color, and thus more and more accurately to discriminate points closer and closer together. This theory does not appear to explain anything; it simply restates the phenomena for which an explanation is desired.

SENSATIONS OF TEMPERATURE.—The skin is not merely the seat of tactile impressions, but also of impressions of temperature. This depends on thermic irritation of the terminal organs, as proved by the following experiment of E. H. Weber: "If the elbow be dipped into a very cold fluid, the cold is only felt at the immersed part of the body (where the fibres terminate); pain, however, is felt in the terminal organs of the ulnar nerve, namely, in the finger points; this pain, at the same time, deadens the local sensation of cold." If the sensation of cold were due to the irritation of a specific-nerve fibre, the sensation of cold would be referred to the tips of the fingers. When any part of the skin is above its normal mean temperature, warmth is felt; in the opposite case, cold. The normal mean temperature of a given area varies according to the distribution of hot blood in it and to the activity of nutritive changes occurring in it. When the skin is brought into contact with a good conductor of heat there is a sensation of cold. A sensation of heat is experienced when heat is carried to the skin in any way. The following are the chief facts that have been ascertained regarding the temperature sense. (1) E. H. Weber found that, with a skin temperature of from 15.5° C. [60° F.] to 35° C. [95° F.], the tips of the fingers can distinguish a difference of .25° C. [.45° F.] to .2° C. [.36° F.]. Temperatures just below that of the blood (33° C. to 27° C.) [91°–81° F.] are distinguished by the most sensitive parts, even to .05° C. [.09° F.]. (2) The thermal sense varies in different regions as follows: tip of tongue, eyelids, cheeks, lips, neck, belly. The "perceptible minimum" was found to be, in degrees C.: breast, .4° [.72° F.]; back, .9° [1.6° F.]; back of hand, .3° [.54° F.]; palm, .4° [.72° F.]; arm, .2° [.36° F.]; back of foot, .4° [.72° F.]; thigh, .5° [.90° F.]; leg, .6° [1.08° F.] to .2° [.36° F.]; cheek, .4° [.72° F.]; temple, .3° [.54° F.]. (3) If two different temperatures are applied side by side and simultaneously, the impressions often fuse, especially if the areas are close together. (4) Practice is said to improve the thermal sense. (5) Sensations of heat and cold may curiously alternate; thus "when the skin is dipped first into water at 10° C. [50° F.] we feel cold, and if it be then dipped into water at 16° C. [61° F.] we have at first a feeling of warmth, but soon again of cold" (Landois). (6) The same temperature applied to a large area is not appreciated in the same way as when applied to a small one; thus "the whole hand when placed in water at 29.5° C. [85° F.] feels warmer than when a finger is dipped into water at 32° C." [92° F.].

There is every reason to hold that there are different nerve fibres and different central organs for the tactile and thermal sensations, but nothing definite is known. The one sensation undoubtedly affects the other. Thus the minimum distance at which two compass points are felt is diminished when one point is warmer than the other. Again, a colder weight is felt as heavier, "so that the apparent difference of pressure becomes greater when the heavier weight is at the same time colder, and less when the lighter weight is colder, and difference of pressure is felt with equal weights of unequal temperature" (E. H. Weber). Great sensibility to differences of temperature is noticed after removal, alteration by vesicants, or destruction of the epidermis, and in the skin affection called herpes zoster. The same occurs in some cases of locomotor ataxy. Removal of the epidermis, as a rule, increases tactile sensibility and the sense of locality. Increased tactile sensibility is termed *hyperpselaphesia*, and is a rare phenomenon in nervous diseases. Paralysis of the tactile sense is called *hypopselaphesia*, whilst its entire loss is *apselaphesia*. Brown-Séquard mentions a case in which contact of two points gave rise to a sense of a third point of contact. Certain conditions of the nerve centres affect the senses both of touch and temperature. Under the influence of morphia the person may feel abnormally enlarged or diminished in size. As a rule the senses are affected simultaneously, but cases occur where one may be affected more than the other. Herzen states that "limbs which are sleeping" feel heat and not cold (Landois).

PAIN.—In addition to sensations of touch and of temperature referred to the skin, there is still a third kind of sensation unlike either, namely, pain. This sensation cannot be supposed to be excited by irritations of the end-organs of touch, or of specific thermal end-organs (if there be such), but rather to irritation of ordinary sensory nerves, and there is every reason to believe that painful impressions make their way to the brain along spinal tracks in the spinal cord. If we consider our mental condition as regards sensation at any moment, we notice numerous sensations more or less definite, not referred directly to the surface, nor to external objects, such as a feeling of general comfort, free or impeded breathing, hunger, thirst, malaise, horror, fatigue, and pain. These are all caused by the irritation of ordinary sensory nerves in different localities, and if the irritation of such nerves, by chemical, thermal, mechanical, or nutritional stimuli, passes beyond a certain maximum point of intensity the result is pain. Irritation of a nerve, in accordance with the law of "peripheral reference of sensation," will cause pain. Sometimes the irritation applied to the trunk of a sensory nerve may be so intense as to destroy its normal function, and loss of sensation or anæsthesia results. If then the stimulus be increased further, pain is excited which is referred to the end of the nerve, with the result of producing what has been called *anæsthesia dolorosa*. Pains frequently cannot be distinctly located, probably owing to the fact of irradiation in the nerve centres and subsequent reference to areas of the body which are not really the seat of irritations. The intensity of pain depends on the degree of excitability of the sensory nerves, whilst its massiveness depends on the number of nerve fibres affected. The quality of the pain is probably produced by the kind of irritation of the nerve, as affected by the structure of the part and the greater or less continuance of severe pressure. Thus there are piercing, cutting, boring, burning, throbbing, pressing, gnawing, dull, and acute varieties of pain. Sometimes the excitability of the cutaneous nerves is so great that a breath of air or a delicate touch may give rise to suffering. This *hyperalgia* is found in inflammatory affections of the skin. In *neuralgia* the pain is characterized by its character of shooting along the course of the nerve and by severe exacerbations. In many nervous diseases there are disordered sensations referred to the skin, such as alternations of heat and cold, burning, creeping, itching, and a feeling as if insects were crawling on the surface (formication). This condition is termed *paralgia*. The term *hypalgia* is applied to a diminution and *analgia* to paralysis of pain, as is produced by anæsthetics.

MUSCULAR SENSE.—The sensory impressions considered in this article are closely related to the so-called muscular sense, or that sense of feeling by which we are aware of the state of the muscles of a limb as regards contraction or relaxation. Some have held that the muscular sense is really due to greater or less stretching of the skin and therefore to irritation of the nerves of that organ. That this is not the case is evident from the fact that disordered movements indicating perversion or loss of this sense are not affected by removal of the skin (Claude Bernard). Further, cases in the human being have been noticed where there was an entire loss of cutaneous sensibility whilst the muscular sense was unimpaired. It is also known that muscles possess sensory nerves, giving rise, in certain circumstances, to fatigue, and, when strongly irritated, to the pain of cramp. Muscular sensations are really excited by irritation of sensory nerves passing from the muscles themselves. We are thus made conscious of whether or not the muscles are contracted, and of the amount of contraction necessary to overcome resistance, and this knowledge enables us to judge of the amount of voluntary impulse. Loss or diminution of the muscular sense is seen in chorea and especially in locomotor ataxy. Increase of it is rare, but it is seen in the curious affection called anxietas tibiarum, "a painful condition of unrest, which leads to a continual change in the position of the limbs" (Landois). See also PHYSIOLOGY. (J. G. M.)

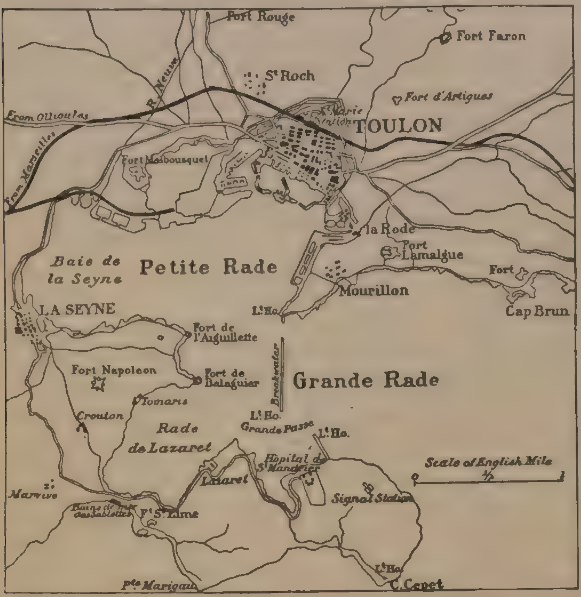
TOUL, a town of France, chef-lieu of an arrondissement in the department of Meurthe-et-Moselle, on the left bank of the Moselle, 199 miles east of Paris by the railway to Nancy, at the point where the Marne Canal joins those of the Rhine and the East. The isolated hills of St. Michel and Barine respectively rise 548 feet and 574 feet above the town, which is a stronghold of the first order, the centre of an entrenched camp protected by numerous forts and redoubts, and a link in the chain of fortifications which extends from Verdun to Belfort. The light and elegant church of St. Étienne[1] (formerly the cathedral) has a fine choir and transept, dating from the 13th century; the nave and aisles are of the 14th, and the beautiful recently restored façade and the towers (246 feet) of the 15th. The interior (118 feet in height, 289 in length, and 89 in width) has fine glass, a remarkable organ-loft, and some interesting monuments. The bas-reliefs of the charming Gothic cloister (13th and 14th centuries) were much damaged during the Revolution. The choir and transept of St. Gengoult, a fine church of the 13th century with a façade of the 15th, contain some interesting 13th-century glass; and the light groups of supporting columns, and the sculptures in the cloisters (first half of the 16th century), should also be mentioned. The old episcopal palace (18th century) is now used as the town-hall; it contains the museum and library, in which is preserved the golden bull by which the emperor Charles IV. in 1367 confirmed the liberties of the city. The population, 9632 in 1881, was 9981 in 1886 (commune 10,459).

Toul (*Tullum*) is one of the oldest towns of France; originally, capital of the Leuci, in the Belgic confederation, it acquired great importance under the Romans. It was evangelized by St. Mansuy in the latter half of the 4th century, and became one of the leading sees of northeast Gaul. After being sacked successively by Goths, Burgundians, Vandals, and Huns, Toul was conquered by the Franks in 450. Under the Merovingians it was governed by counts, assisted by elective officers. The bishops, who had become increasingly powerful, were invested with sovereign rights in the 10th century, holding only of the emperor, and for a period of 300 years (13th to 16th centuries) the citizens maintained a long struggle against them. The town was forced to yield for a time to the count of Vaudemont in the 12th century, and twice to the duke of Lorraine in the 15th, and was thrice devastated by the plague in the 16th. Charles V. made a solemn entry into the town in 1544, but in the following year, at the instance of the Cardinal de Lorraine, it placed itself under the perpetual protection of the kings of France. Henry II. took possession in 1552, but the town with its territory was not officially incorporated with France till 1648. Henry IV. was received in state in 1603, and in 1637 the parlement of Metz was transferred to Toul. In 1700 Vauban reconstructed the fortifications of the town, and in 1790 the bishopric was suppressed and the diocese united to that of Nancy. Toul capitulated in 1870 after a bombardment of twelve days from heights now included in the new fortifications.

---

[1] [The original church was begun by Bishop St. Girard in 970, but in the 12th century nothing of it remained.—AM. ED.]

TOULON, a French fortress of the first class, chef-lieu of an arrondissement in the department of Var, of the 5th naval arrondissement, and of a military subdivision, is situated on the Mediterranean, 42 miles east-southeast of Marseilles by the railway to Nice. The bay, which opens to the east, has two divisions, the "grand rade" and the "petite rade"; it is sheltered on the north and west by high hills, closed on the south by the peninsula of Capes Sicié and Cépet, and protected on the east by a huge breakwater,—the entrance, 1300 feet wide, being defensible by torpedoes. A ship coming from the open sea must first pass the forts of St. Marguerite, of Cape Brun, of La Malgue, and of St. Louis to the north, and the battery of the signal station to the south; before reaching the petite rade it must further pass under the guns of the battery of Le Salut, to the east, and of the forts of Balaguier and L'Éguillette to the west. The Bay of La Seyne lies west of the petite rade, and is defended by the forts of Les Six-Fours, Napoleon (formerly Fort Cairo), and Malbousquet, and the batteries of Les Arènes and Les Gaus. To the north of Toulon rise the defensive works of Mont Faron and Fort Rouge, to the east the forts of Artigues and St. Catherine, to the northeast the formidable new fort of Le Coudon, and to the southeast that of La Colle Noire, respectively dominating the highway into Italy and the valley of Hyères with the Bay of Carqueyranne. The port of Toulon consists of the old dock, of which one-third is reserved for the national navy, a new dock, wholly so devoted, a harbor capable of receiving trading vessels drawing from 16 to 18 feet, but only used for cargoes of wood and wine, and the Castigneau dock. The naval arsenal (including the arsenal of Castigneau, which is contiguous with it, in the direction of La Seyne) extends over 4 miles, has an area of 667 acres, and employs from 12,000 to 13,000 men. It contains the offices connected with the administration of the port, the office of naval construction, a well-stored naval museum, and a great variety of workshops. These last include a rope-work 1050 × 66 feet, covered building yards, careening basins, forges, armorers' and joiners' shops, general magazines, reconstructed on a fireproof principle since the conflagration of 1793, in which are stored all materials required in the arsenal and on board ship, a park of artillery, a splendid collection of arms, and separate storehouses for various classes of rigging. The Castigneau arsenal contains the navy bakery of twenty ovens, capable of cooking 600,000 rations daily, the foundry and boiler-making works, engineers' workshops, forges, three large careening basins, a washing house, a slaughter house, stores of provisions, coals, anchors and machinery, and the like. The Mourillon arsenal, to the southeast of the town, has stores of wood, building yards, and appliances for naval construction in wood and iron. The town, enlarged to the north under the second empire, has on that side a fine new quarter; but in the old town the streets are for the most part narrow, crooked, and dirty, and to their insanitary state the cholera epidemic of 1884 has been attributed. The chief buildings are the old cathedral of St. Marie Majeure, the church of St. Louis, the town-hall, the theatre (seating 2000 persons), the museum, the library (18,000 volumes), the naval and military hospital, with a natural history collection and an anatomical museum attached, a naval school of medicine, a school of hydrography, and large barracks. The imports are wine (2,470,000 gallons in 1881), corn, wood, coal, hemp, iron, sugar, coffee, and fresh fish; the exports are salt, copper ore, barks for tanning, and oils. In 1882 the movement of the port was represented by 280 vessels (41,000 tons). The interesting buildings and gardens of the hospital of St. Mandrier stand on the peninsula of Cape Cépet, and near them is the lazaretto. In 1881 the population of Toulon was 48,832, and in 1886 it was 53,941, exclusive of 12,487 soldiers, sailors, etc. (commune 70,122).



Environs of Toulon.

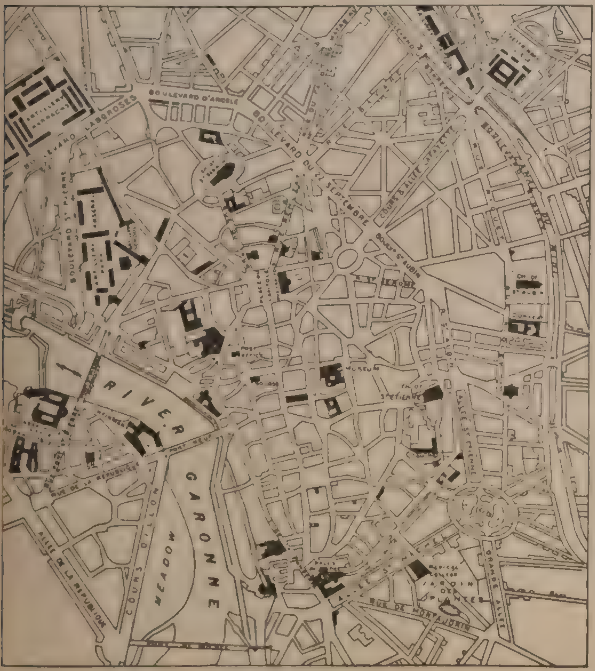
The Roman Telo Martius is supposed to have stood near the lazaretto. The town was successively sacked by Goths, Burgundians, Franks, and Saracens. During the early Middle Ages, and till conquered by Charles of Anjou in 1259, it was under lords of its own, and entered into alliance with the republics of Marseilles and Arles. St. Louis, Louis XII., and Francis I., strengthened its fortifications. It was seized by the emperor Charles V. in 1524 and 1536. Henry IV. founded a naval arsenal at Toulon, which was further strengthened by Richelieu, and Vauban made the new dock, a new enceinte, and several forts and batteries. In 1707 the town was unsuccessfully besieged by the duke of Savoy, Prince Eugene, and an English fleet. In 1721 there was an outbreak of the plague. In 1792,[1] after great and sanguinary disorder, the royalists of the town sought the support of the English and Spanish fleets cruising in the neighborhood. The convention having replied by putting the town "hors la loi," the inhabitants opened their harbor to the English. The army of the republic now laid siege to the town, and it was on this occasion that Napoleon

---

[1] [The British occupation and the consequent siege were in 1793. See vol. xvii. p. 201.—AM. ED.]

Bonaparte first made his name as a soldier. The forts commanding the town having been taken, the English ships retired after setting fire to the arsenal. The conflagration was extinguished by the prisoners, but not before 38 out of a total of 56 vessels had been destroyed. Under the Directory Toulon became the most important French military fort on the Mediterranean; it was here that Napoleon organized the Egyptian campaign, and the expedition against Algiers set out from Toulon in 1830. The fortifications have been strengthened by Napoleon I., Louis Philippe, Napoleon III., and since 1870.

TOULOUSE, chef-lieu of the French department of Haute-Garonne, 478 miles south from Paris and 160[1] southeast from Bordeaux, stands on the right bank of the Garonne, which here describes a bold outward curve to the east. On the left bank is the Faubourg St. Cyprien. The river is spanned by three bridges, —that of St. Pierre to the north, that of St. Michel towards the south, and the Pont Neuf in the centre; the last-named, a fine construction of seven arches, was begun in 1543. The city is peculiarly subject to great floods, such as that of 1855, which destroyed the suspension bridge of St. Pierre, or the still more disastrous one of June, 1875, which, besides carrying away that of St. Michel, laid the Faubourg St. Cyprien under water, destroyed 7000 houses, and drowned 300 people. East and north of the city runs the great Canal du Midi (from the Mediterranean), which here joins the Garonne. Between this canal and the city proper extends the long line of boulevards (Boulevards Lacrosses, d'Arcole, du 22 Septembre, etc.) leading by the Allée St. Étienne to the Boulingrin, whence a series of allées shoot out in all directions. Southwest the Allée St. Michel leads towards the Garonne, and south the Grande Allée towards Faubourg St. Michel. These boulevards take the place of the old city walls. Between them and the canal lie the more modern faubourgs of St. Pierre, Arnaud-Bernard, Matabiau, etc. The more ancient part of the city consists of narrow irregular pebble-paved streets. Most of the houses are of brick, and none of any great architectural pretensions, except those which date back at least to the 17th century. In 1868 the municipal authorities determined to construct two entirely new streets, broad and straight, intended to cut one another at right angles near the centre of the city. Of these the first, the Rue de Metz, starts eastward from the Pont Neuf, and will ultimately intersect the Rue d'Alsace-Lorraine running from north to south. These alterations, however, go on very slowly. The Place du Capitole may be regarded as the centre, whence the streets branch out in every direction. Eastward and northeast the Rue La Fayette leads across the boulevards towards the Allée La Fayette, beyond which, across the Canal du Midi, are the École Vétérinaire and the railway station, and still farther off the obelisk erected to commemorate the battle of Toulouse (April 10, 1814), and the observatory. From the northwest of the Place du Capitole the Rue du Taur runs due north past the ancient Église du Taur to the great Eglise St. Sernin, the largest and most famous church of southern France. From the northwest corner of the same Place the Rue des Lois conducts towards the École de Droit and the arsenal. In a more westerly direction the Rue Pargaminière stretches towards the venerable church and the bridge of St. Peter. From the southwest corner the Rue des Balances extends towards the Rue de Metz and the Pont Neuf. From the south the Rue St. Rome, Rue des Changes, and Rue des Filatiers lead to the Place des Carmes or de la République; while from the southeast corner the Rue de la Pomme and the Rue Boulbonne lead across the Rue d'Alsace-Lorraine to the cathedral of St. Stephen. In the south of the city lies the palais de justice, near which are the ancient church of the Inquisition and several of the finest houses in Toulouse. Going northwards, the traveller passes the Église de la Dalbade on his way towards the Pont Neuf, immediately to the north of which is the Église de la Daurade. North of this church, but somewhat farther from the river, is the military hospital, to the immediate east of which lie the lycée, the church of the Jacobins, and the public library. Southeast from this, about halfway towards the cathedral, is the museum. North of the military hospital and beyond the Rue Pargaminière lie the arsenal and the Faubourg St. Pierre. Slightly to the northwest of the Pont St. Pierre the Canal de Brienne (finished 1778) cuts across the angle formed by the Garonne and Canal du Midi. Between the Canal de Brienne and the Garonne is the chief manufacturing part of the city, where the great Bazacle flour-mill stands. Along the right bank of the river run the various quays of St. Pierre, etc. In the Faubourg St. Cyprien, just north of the Pont Neuf, is the Hôtel Dieu St. Jacques, said to have been founded before the 12th century, with its large gardens. Close to the Pont St. Pierre is the hospital of St. Joseph de la Grave, which makes up 1432 beds, and affords shelter to foundlings and the aged. South of the Allée St. Michel is the Jardin des Plantes, founded by the ill-fated La Pérouse.



Plan of Toulouse.

The most interesting building is the church of St. Sernin or Saturninus, whom legend represents as the first preacher of the gospel in Toulouse, where he was perhaps martyred towards the middle of the 3d century. The oldest part of the present building was consecrated by Urban II. in 1096. This church is now the largest edifice of southern France, being 375 feet from east to west and 217 feet in its utmost breadth. The nave (12th and 13th centuries) is remarkable for having double aisles. Four pillars, supporting the central tower, are surrounded by heavy masonry, which somewhat spoils the general harmony of the interior. In the southern transept is the "portail des comtes," so named because near it lie the tombs of William Taillefer, Pons, and other early counts of Toulouse. The little chapel in which these tombs (ascribed to the 11th century) are found was restored by the capitols[1] of Toulouse in 1648. Another chapel contains a Byzantine Christ of late 11th-century workmanship. The choir (11th and 12th centuries) ends in an apse, or rather chevet, surrounded by a range of columns, marking off an aisle which in its turn opens into five chapels. The stalls are of 16th century work and very grotesquely carved. Against the northern wall is an ancient *table d'autel*, which an 11th century inscription declares to have belonged to St. Sernin. In the crypts are many relics, which, however, were robbed of their gold and silver shrines during the Revolution. The finest gate is on the south, and is surmounted by a fine representation of the Ascension in Byzantine style. The capitals of the St. Sernin pillars are sometimes ornamented with leaves and sometimes with grotesque animals, etc. The belfry consists of five stories, of which the two highest are of later date, but harmonize very well with the three lower ones. The cathedral, dedicated to St. Stephen, dates from three different epochs. The nave, commenced by Raymond VI. towards the beginning of the 13th century, still displays the sculptured arms of its founder, and a few years ago preserved the pulpit in which St. Bernard and St. Dominic are said to have preached. The choir, commenced by Bertrand de Lille (*c.* 1272), was burned in 1609, but restored in the same century. It is surrounded by seventeen chapels, which were finished by the Cardinal d'Orléans, nephew of Louis XI., towards the beginning of the 16th century. These chapels are adorned with glass dating from the 15th to the 17th century. The great western gate was constructed by Peter du Moulin, archbishop of Toulouse, from 1439 to 1451. It has been greatly battered, and presents but a poor approximation to its ancient beauty. Over this grand gate, which was once ornamented with the statues of St. Sernin, St. Exuperius, and the twelve apostles, as well as those of the two brother archbishops of Toulouse, Denis (1423–1439) and Peter du Moulin, there is a beautiful 13th-century rose-window, whose centre, however, is not in a perpendicular line with the point of the Gothic arch below. In the same way the choir and the nave have not the same axis.

---

[1] [By direct line this city is 367 miles from Paris and 134 southeast from Bordeaux. The text gives railway distances.—AM. ED.]

Among other remarkable churches may be noticed those of St. Pierre des Cuisines (12th century), with its beautifully sculptured capitals; of Notre Dame de la Daurade, near the Pont Neuf, built on the site of a 9th-century Benedictine abbey, but reconstructed in 1764; and of Notre Dame de la Dalbade, perhaps existing in the 11th century but in its present form dating from the 15th. The Église des Jacobins, held by Viollet le Duc to be "one of the most beautiful brick churches constructed in the Middle Ages," was built towards the end of the 13th century, and originally consisted of but one structure divided into two aisles by a range of columns. It has a beautiful octagonal belfry. Before the Revolution it contained the mausoleum of Thomas Aquinas.[2] On the left of the Garonne stands the church of St. Nicholas, also with an octagonal belfry and a spire dating from the 15th century. There are many other churches of considerable antiquity.

Of secular buildings the most noteworthy are the capitole, the museum, and the lycée. The capitole (16–17th centuries) has a long Ionic façade constructed by Cammas (1750–60). The theatre is situated in the left wing. Running along almost the whole length of the first floor is the "salle des illustres" adorned with the busts of forty-four great natives of Toulouse; the word "native" has, however, been construed very liberally. In the capitole the Académie des Jeux Floraux holds its annual meetings. The museum (opened 1795) occupies the church and other buildings of the Augustinian convent (14th–15th cent.). It contains a splendid collection of antiquities arranged in two cloisters, and a collection of pictures. The natural history museum is at the Jardin des Plantes. The lycée occupies the group of buildings known as "Les Jacobins," the Hôtel Bernui (16th century), etc. Here is the public library (65,000 volumes).

Toulouse is singularly rich in mansions of the 16th and 17th centuries. Several of these are richly adorned by Bachelier, Michelangelo's pupil. The Hôtels d'Assezat, de St. Jean, Las Bordes, Felzins, Duranti, and Maison de Pierre may be specially mentioned. A few houses are said to date from the 14th century or even earlier. Near the Allée St. Michel is the palais de justice, the old meeting house of the parlement of Toulouse. Close by was the old Château Narbonnais.

Besides its university, which ranks next to those of Paris and Lyons, and has faculties of law, science, letters, and medicine, Toulouse possesses many educational and learned societies, among which may be mentioned the École des Beaux Arts et des Sciences Industrielles, the École Normale, the École de Musique, the Académies des Jeux Floraux, des Sciences et des Belles Lettres et Arts, and de Législation, the Société d'Agriculture, and the archæological Société du Midi.

The geographical position of Toulouse, on the plain of Languedoc, has made it the chief entrepôt of the district for wine, corn, and almost all the industries of the neighborhood. Besides the grinding of flour, its leading industries are cabinetmaking, hat-making, calico-printing, the manufacture of pots and pans, macaroni, and starch, leather-making (morocco), cloth and paper making, glass-blowing, saddlery, and pottery. The tobacco factory occupies 1250 hands, and manufactures 1000 tons of snuff, a corresponding quantity of tobacco, and 250 tons of cigars annually.

The population of the city, 127,196 in 1881, numbered 133,775 in 1886, that of the commune being 147,617.

Tolosa (Τολῶσσα), chief town of the Volcæ Tectosages, does not seem to have been a place of great importance during the early centuries of the Roman rule in Gaul, though one incident in its early history gave rise to the famous Latin proverb "habet aurum Tolosanum" (Aul. Gell., iii. c. 12). It was possessed of a circus and an amphitheatre, but its most remarkable remains are to be found on the heights of Old Toulouse (vetus Tolosa) some 6 or 7 miles to the east, where huge accumulations of broken pottery and fragments of an old earthen wall mark the site of an ancient settlement. The numerous coins that have been discovered on the same spot do not date back farther than the 2d century B.C., and seem to indicate the position of a Roman manufacturing centre then beginning to occupy the Gallic hill-fortress that, in earlier days, had in times of peril been the stronghold of the native tribes dwelling on the river bank. Tolosa does not seem to have been a Roman colony; but its importance must have increased greatly towards the middle of the 4th century. It is to be found entered in more than one itinerary dating from about this time; and Ausonius, in his *Ordo Nobilium Urbium*, alludes to it in terms implying that it then had a large population. In 419 it was taken by Wallia, king of the Visigoths, under whom or whose successors it became the seat of the great Teutonic kingdom of the West-Goths,—a kingdom that within fifty years had extended itself from the Loire to Gibraltar and from the Rhone to the Atlantic. On the defeat of Alaric II. (507) Toulouse fell into the hands of Clovis, who carried away the royal treasures to Angoulême. Under the Merovingian kings it seems to have remained the greatest city of southern Gaul, and is said to have been governed by dukes or counts dependent on one or other of the rival kings descended from the great founder of the Frankish monarchy. It figures prominently in the pages of Gregory of Tours and Sidonius Apollinaris. About 628 Dagobert erected South Aquitaine into a kingdom for his brother Charibert, who chose Toulouse as his capital. For the next eighty years its history is obscure, till we reach the days of Charles Martel, when it was besieged by Sema, the leader of the Saracens from Spain (*c.* 715–20), but delivered by Eudo, "princeps Aquitaniæ," in whom later writers discovered the ancestor of all the later counts of Toulouse. Modern criticism, however, has discredited this genealogy; and the real history of Toulouse recommences in 780 or 781, when Charlemagne appointed his little son Louis king of Aquitaine, with Toulouse for his chief city.

During the minority of the young king his tutor Chorson ruled at Toulouse with the title of duke or count. Being deposed at the council of Worms (790), he was succeeded by William Courtnez, the traditional hero of southern France, who in 806 retired to his newly founded monastery at Gellone, where he died in 812. In the unhappy days of Louis the Pious and his children Toulouse suffered in common with the rest of western Europe. It was besieged by Charles the Bald in 844, and taken four years later by the Normans, who in 843 had sailed up the Garonne as far as its walls. About 852 Raymond I., count of Querci, succeeded his brother Fridolo as count of Rouergue and Toulouse: it is from this noble that all the later counts of Toulouse trace their descent. Raymond I.'s grandchildren divided their parent's estates; of these Raymond II., the elder (d. 924), became count of Toulouse, and Ermengaud, the younger, count of Rouergue, while the hereditary titles of Gothia, Querci, and Albi were shared between them. Raymond II.'s grandson, William Taillefer (d. *c.* 1037), married Emma of Provence, and handed down part of that lordship to his younger son Bertrand.[3] William's elder son Pons left two children, of whom William IV. succeeded his father in Toulouse, Albi, Querci, etc.; while the younger, Raymond IV. of St. Gilles (*c.* 1066), made himself master of the vast possessions of the counts of Rouergue, married his cousin the heiress of Provence, and about 1085 began to rule the immense estates of his elder brother, who was still living.

---

[1] [Civic magistrates or *capitouls*, elected until Louis XIV. made them royal officers; see p. 517.—AM. ED.]

[2] [A shrine said to contain the head of Aquinas is in a chapel of St. Sernin's church.—AM. ED.]

[3] About 975 there was a partition of the estates which William Taillefer and his cousin Raymond II. of Auvergne held in common,—Albi, Querci, etc., falling to William, and Gothia, etc., to Raymond.

From this time the counts of Toulouse were the greatest lords in southern France. Raymond IV., the hero of the first crusade, assumed the formal titles of marquis of Provence, duke of Narbonne, and count of Toulouse. While Raymond was away in the Holy Land, Toulouse was seized by William IX., duke of Aquitaine, who claimed the city in right of his wife Philippa, the daughter of William IV., but was unable to hold it long (1098–1100). Raymond's son and successor Bertrand followed his father's example and set out for the Holy Land in 1109, leaving his great estates at his death to his brother Alphonse-Jourdain. The rule of this prince was disturbed by the ambition of William IX. and his granddaughter Eleanor, who urged her husband Louis VII. to support her claims to Toulouse by war. On her divorce from Louis and her marriage with Henry II., Eleanor's claims passed on to this monarch, who at last forced Raymond V. to do him homage for Toulouse in 1173. Raymond V., the patron of the troubadours, died in 1194, and was succeeded by his son Raymond VI., under whose rule Languedoc was desolated by the remorseless crusaders of Simon de Montfort. Raymond VII., the son of Raymond VI. and Princess Joan of England, succeeded his father in 1222, and died in 1249, leaving an only daughter Joan, married to Alfonso the brother of Louis IX. On the death of Alfonso and Joan in 1271 the vast inheritance of the counts of Toulouse lapsed to the crown.[1]

From the middle years of the 12th century the people of Toulouse seem to have begun to free themselves from the most oppressive feudal dues. An act of Alphonse-Jourdain (1141) exempts them from the tax on salt and wine; and in 1152 we have traces of a "commune consilium Tolosæ" making police ordinances in its own name "with the advice of Lord Raymond, count of Toulouse, duke of Narbonne, and marquis of Provence." This act is witnessed by six "capitularii," four duly appointed judges (*judices constituti*), and two advocates. Twenty-three years later there are twelve capitularii or consuls, six for the city and six for its suburbs, all of them elected and sworn to do justice in whatever municipal matters were brought before them. In 1222 their number was increased to twenty-four; but they were forbidden to touch the city property, which was to remain in the charge of certain "communarii" chosen by themselves. Early in the 14th century the consuls took the name of "domini de capitulo," or, a little later, that of "capitulum nobilium." From the 13th century the consuls met in their own house, the "palatium communitatis Tolosæ" or hôtel-de-ville. In the 16th century a false derivation changed the ancient consuls (*domini de capitulo*) into the modern "capitouls" (*domini capitolii Tolosani*), a barbarous etymology which in its turn has, in the present century, transformed the old assembly house of Toulouse into the capitole.

The parlement of Toulouse was established as a permanent court in 1443.[2] Louis XI. transferred it to Montpellier in 1467, but restored it to Toulouse before the close of the next year. This parlement was for Languedoc and southern France what the parlement of Paris was for the north. Towards the end of the 16th century, during the wars of the League, it was split up into three different sections, sitting respectively at Carcassonne or Béziers, at Castel Sarrasin, and at Toulouse. The three were reunited in 1596. Under Francis I. it began to prosecute heretics, and in 1618 rendered itself notorious by burning the philosopher Vanini. The university of Toulouse owes its origin to the action of Gregory IX., who in 1229 bound Raymond VII. to maintain four masters to teach theology and eight others for canon law, grammar, and the liberal arts. Civil law and medicine were taught only a few years later. The famous "Floral Games" of Toulouse, in which the poets of Languedoc contended (May 1–3) for the prize of the golden violet and other gold or silver flowers, given at the expense of the city, were instituted in 1323–24.

See, besides the various guide-books, De Vic and Vaissete, *Histoire de Languedoc*, ed. 1873 *sq.*; Catel, *Histoire de Toulouse*, 1623; La Faille, *Histoire de Toulouse*, 1687, 1701; Du Mège, *Histoire des Institutions de Toulouse*, 4 vols., 1844–46; D'Aldeguier, *Histoire de la Ville de Toulouse*, 1833–35. (T. A. A.)

TOUNG-NGÚ, a district in the extreme north of the Tenasserim division of Burmah, with an area of 6354 square miles, and lying between 17° 37′ and 19° 28′ N. lat., and between 95° 53′ and 96° 53′ E. long. It is bounded on the N. by Upper Burmah, on the E. by a high mountain range known as the "Great Watershed," on the S. by Shwe-gyeng district, and on the W. by the Pegu Yomas. Three mountain ranges traverse the district—the Pegu Yomas, the Poung-loung, and the Nat-toung or "Great Watershed,"—all of which have a north and south direction, and are covered for the most part with dense forest. The Pegu Yomas have a general elevation of from 800 to 1200 feet, while the central range averages from 2000 to 3000 feet. The rest of Toung-ngú forms the upper portion of the valley of the Tsit-toung (Sittang) river, the only large river in the district, the chief tributaries of which are the Tshwa, Khaboung, Hpyu, Thouk-re-gat, and Rouk-thwa-wa, all being navigable for a great portion of their course. Limestone appears in various places, and in the northeast a light gray marble is quarried for lime. The rivers form the chief means of communication during the rainy season. Of late years some good roads have been constructed, and the Burmah State Railway, when completed, will intersect the district from south to north.

In 1881 the population numbered 128,848 (males 68,484, females 60,364), of whom 93,997 were Buddhists, 17,448 Christians, 2086 Hindus, 1962 Mohammedans, and 12,612 aborigines. The only town in the district is Toung-ngú, on the Tsit-toung river in 18° 55′ 24″ N. lat. and 96° 31′ 4″ E. long., with a population of 17,199 in 1881. Of the total area only 59 square miles are actually under cultivation, owing mainly to the hilly nature of the country. Rice is the chief product; other crops include oil-seeds, sugar-cane, cotton, fruit, and vegetables. The principal manufactures are silk, saltpetre, and gunpowder. In 1885–86 the gross value of the district was £15,098, of which the land produced £5880.

TOUR, MAURICE QUENTIN DE LA (1704–1788), the renowned pastellist, was born at St. Quentin on the 5th September, 1704. On leaving Picardy for Paris he entered the studio of an artist named Du Pouche, and then that of Spoède,—an upright man, but a poor master, rector of the Academy of St. Luke, who still continued, in the teeth of the Royal Academy, the traditions of the old guild of the master painters of Paris. This possibly contributed to the adoption by De la Tour of a line of work foreign to that imposed by an academical training; for pastels, though occasionally used, were not a principal and distinct branch of work until 1720, when Rosalba Carriera brought them into fashion with the Parisian world. In 1737 De la Tour exhibited the first of that splendid series of a hundred and fifty portraits which formed the glory of the Salon for the succeeding thirty-seven years. In 1746 he was received by the Academy;[3] and in 1751, the following year to that in which he received the title of painter to the king, he was promoted by that body to the grade of councillor. His work had the rare merit to satisfy at once both the taste of his fashionable models and the judgment of his brother artists. His art, consummate of its kind, achieved the task of flattering his sitters, whilst hiding that flattery behind the just and striking likeness which, says Mariette, he hardly ever missed. His portraits of Rousseau, of Voltaire, of Louis XV., of his queen, of the dauphin and dauphiness, are at once documents and master-

[1] List of the counts of Toulouse, mainly from De Vic and Vaissete:

Chorson	778–790	Garsende, for her son,	*c.*950–*c.*975
William	790–806	William Taillefer	*c.*975–*c.*1037
......		Pons	1037–1060
Berenger	817–835	William IV	1060–*c.*1093
Ecfrid	835–845	Raymond IV.	1093–1105
Fredelo	845–852	Bertrand	1096–1109
Raymond I.	852–864	Alphonse-Jourdain	1109–1148
Bernard	864–875	Raymond V.	1148–1194
Eudo	875–918	Raymond VI.	1194–1222
Raymond II.	918–924	Raymond VII.	1222–1249
Raymond III.	924–*c.*950	Alfonso and Joan	1249–1271

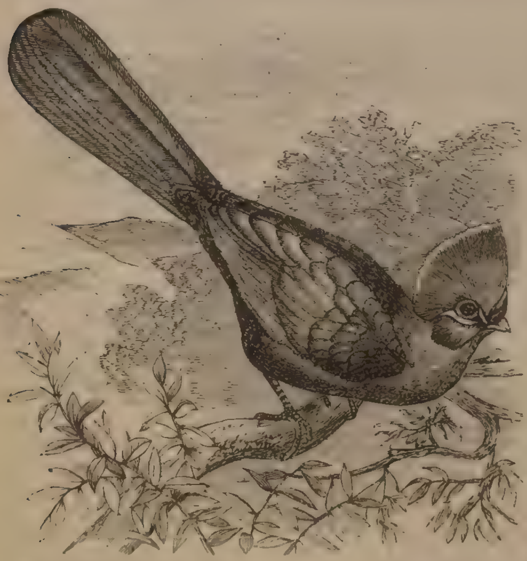
[2] [The parlements began about 1272 under Philip the Bold; thirty years later Philip the Fair formally recognized them.—AM. ED.]

[3] [Larousse says he was received as a fellow in 1738 and a member in 1744.—AM. ED.]

pieces unsurpassed except by his life-size portrait of Madame de Pompadour, which, exhibited at the Salon of 1755, is still the chief ornament of the cabinet of pastels in the Louvre. It is and will probably always be the most perfect model of this class of work as long as time and damp spare the fragile dust to which it owes its beauty. The museum of St. Quentin, however, also possesses a magnificent collection of works which at his death were in his own hands. De la Tour retired to St. Quentin at the age of 80, and there he died on 17th February, 1788. The riches amassed during his long life were freely bestowed by him in great part before his death; he founded prizes at the school of fine arts in Paris and for the town of Amiens, and endowed St. Quentin with a great number of useful and charitable institutions. He never married, but lived on terms of warm affection with his brother (who survived him, and left to the town the drawings now in the museum); and his relations to Mdlle. Fel, the celebrated singer, were distinguished by a strength and depth of feeling not common to the loves of the 18th century.

See, in addition to the general works on French art, Desmaze, three works, of which the most important is *Le Reliquaire de la Tour;* Guiffrey and Tourneux, *Correspondance Inédite de M. Q. de la Tour;* Champfleury, *De la Tour*, and *Peintres de Laon et de St. Quentin;* and Dréolle de Nodon, *Éloge Biographique de M. Q. de la Tour.*

TOURACO, the name, evidently already in use, under which in 1743 Edwards figured a pretty African bird,[1] and presumably that applied to it in Guinea, whence it had been brought alive. It is the *Cuculus persa* of Linnæus, and *Turacus* or *Corythaix persa* of later authors, who perceived that it required generic separation. Cuvier, in 1799 or 1800, Latinized its native name (adopted in the meanwhile by both French and German writers) as above, for which barbarous term Illiger, in 1811, substituted a more classical word. In 1788 Isert described and figured (*Beobacht. Gesellsch. naturf. Freunde*, iii. pp. 16–20, pl. 1) a bird, also from Guinea, which he called *Musophaga violacea.* Its affinity to the original Touraco was soon recognized, and both forms have been joined by modern systematists in the Family *Musophagidæ*, commonly Englished Plantain-eaters or Touracos, sometimes spelt Tourakoos.



White-Crested Touraco (*Turacus albicristatus*). After Schlegel.

To take first the Plantain-eaters proper, or the genus *Musophaga*, of which only two species are known. One about the size of a Crow is comparatively common in museums, and is readily recognized by having the horny base of its fine yellow bill prolonged backwards over the forehead in a kind of shield. The top of the head, and the primaries, except their outer edge and tip, are deep crimson; a white streak extends behind the eye; and the rest of the plumage is of a rich glossy purple. The second species, *M. rossæ*, which is rare, chiefly differs by wanting the white eye-streak. Then of the Touracos—the species originally described is about the size of a Jay, and has the head, crest (which is vertically compressed and tipped with red), neck, and breast of a fine grass-green, varied by two conspicuous white streaks—one, from the gape to the upper part of the crimson orbit, separated by a black patch from the other, which runs beneath and behind the eye. The wing-coverts, lower part of the back, and tail are of a bright steel-purple, the primaries deep crimson, edged and tipped with bluish-black. Over a dozen other congeneric species, more or less resembling this, have now been described, and all inhabit some district of Africa; but there is only room here to mention that found in the Cape Colony and Natal, where it is known as the "Lory" (*cf.* vol. xv. p. 9, note 1), and, though figured by Daubenton and others, first differentiated in 1841 by Strickland (*Ann. Nat. History*, vii. p. 33) as *Turacus albicristatus*—its crest having a conspicuous white border, while the steel-purple of *T. persa* is replaced by a rich and glossy bluish-green of no less beauty. In nearly all the species of this genus the nostrils are almost completely hidden by the frontal feathers; but there are two others in which, though closely allied, this is not the case, and some systematists would place them in a separate genus *Gallirex;* while another species, the giant of the Family, has been moved into a third genus as *Corythæola cristata.* This differs from any of the foregoing by the absence of the crimson coloration of the primaries, and seems to lead to another group, *Schizorrhis*, in which the plumage is of a still plainer type, and, moreover, the nostrils here are not only exposed but in the form of a slit, instead of being oval as in all the rest. This genus contains about half a dozen species, one of which, *S. concolor*, is the Gray Touraco of the colonists in Natal, and is of an almost uniform slaty-brown. A good deal has been written about these birds, which form the subject of one of the most beautiful monographs ever published—*De Toerako's afgebeld en beschreven,*—by Schlegel and Westerman, brought out at Amsterdam in 1860; while the latest collected information is contained in an elaborate essay by Herr Schalow (*Jour. f. Ornithologie*, 1886, pp. 1–77). Still, much remains to be made known as to their distribution throughout Africa, and their habits. They seem to be all fruit-eaters, and to frequent the highest trees, seldom coming to the ground. Very little can be confidently asserted as to their nidification, but at least one species of *Schizorrhis* is said to make a rough nest and therein lay three eggs of a pale blue color. An extraordinary peculiarity attends the crimson coloration which adorns the primaries of so many of the *Musophagidæ.* So long ago as 1818, Jules Verreaux observed (*Proc. Zool. Society*, 1871, p. 40) that in the case of *T. albicristatus* this beautiful hue vanishes on exposure to heavy rain and reappears only after some interval of time and when the feathers are dry.[2]

The *Musophagidæ* form a very distinct Family of Prof. Huxley's *Coccygomorphæ*, having perhaps the *Coliidæ* and *Cuculidæ* as their nearest allies. Eyton pointed out (*Ann. Nat. History*, ser. 3, ii. p. 458) a feature possessed in common by the latter and the *Musophagidæ*, in the "process attached to the anterior edge of the ischium," which he likened to the so-called "marsupial" bones of Didelphian Mammals. J. T. Reinhardt has also noticed (*Vidensk. Meddels. Naturhist. Forening*, 1871, pp. 326–341) another Cuculine character offered by the *os uncinatum* affixed to the lower side of the ethmoid in the Plantain-eaters and Touracos; but too much dependence must not be placed on that, since a similar structure is presented by the FRIGATE-BIRD (vol. ix. p. 690) and the PETRELS (vol. xviii. p. 725). A corresponding process seems also to be found in TROGON (*q.v.*). The bill of nearly all the species of *Musophagidæ* is curiously serrated or denticulated along the margin, and the feet have the outer toe reversible. No member of the Family is found outside of the continental portion of the Ethiopian Region. (A. N.)

---

[1] Apparently the first ornithologist to make the bird known was Albin, who figured it in 1738 from the life, yet badly, as "The Crown-bird of Mexico." He had doubtless been misinformed as to its proper country; but Touracos were called "Crown-birds" by the Europeans in West Africa, as witness Bosman's *Description of the Coast of Guinea* (1721), ed. 2, p. 251, and W. Smith's *Voyage to Guinea* (1745), p. 149, though the name was also given to the Crowned Cranes, *Balearica.*

[2] The fact of this coloring matter being soluble in water was incidentally mentioned at a meeting of the Zoological Society by Mr. Tegetmeier, and brought to the notice of Prof. Church, who, after experiment, published in 1868 (*Student and Intellectual Observer*, i. pp. 161–168) an account of it as "Turacin, a new animal pigment containing copper." Further information on the subject was given by Monteiro (*Chem. News*, xxviii. p. 261; *Quart. Jour. Science*, ser. 2, iv. p. 132). The property is possessed by the crimson feathers of all the birds of the Family.

TOURCOING, a manufacturing town of France in the department of Nord, 7 miles northeast of Lille on the railway to Ghent, is rapidly becoming one with the neighboring town of ROUBAIX (*q.v.*). Wool, cotton, linen, and silk are spun in more than 65 mills (40,000 spindles); there are upwards of 25 combing establishments (by machine and hand), 50 to 55 manufactories of velvet-pile carpets, furniture stuffs, and all kinds of woven goods, besides dye-works, soap-works, a sugar-refinery, and machine workshops. The total industrial production of Tourcoing may be set down at about £6,800,000 [$33,048,000] per annum. Tourcoing possesses a chamber of commerce, a conseil de prudhommes, a consultative chamber of arts and manufactures, a wool "conditioning" bureau, schools of drawing, painting, music, and architecture, and a horticultural society. In 1866 a pyramid was erected to commemorate a battle gained by Jourdan and Moreau in the neighborhood in 1794. The population, 34,415 in 1881, was 41,570 in 1886 (commune 58,008).

Famed since the 14th century for its woollen manufactures, Tourcoing was fortified by the Flemings when Louis XI. of France disputed the inheritance of Charles the Bold with Mary of Burgundy. The town suffered much from the French in 1477, from the Huguenots in 1556, and by fire in 1607 and 1711. The inhabitants, 18,000 in 1789, were reduced by the French Revolution to 10,000, but a new era of prosperity began in 1832. In 1801 the population of the commune was 23,493, and in 1871 it was 43,322.

TOURGUENIEFF, IVAN[1] (1818–1883), the descendant of an old Russian family, was born at Orel, in the government of the same name, in 1818. His father, the colonel of a cavalry regiment, died when our author was sixteen years of age, leaving two sons, Nicholas and Ivan, who were brought up under the care of their mother, the heiress of the Litvinoffs, a lady who owned large estates and many serfs. Ivan studied for a year at the university of Moscow, then at St. Petersburg, and was finally sent in 1843 to Berlin. His education at home had been conducted by German and French tutors, and was altogether foreign, his mother only speaking Russian to her servants, as became a great lady of the old school. For his first acquaintance with the literature of his country the future novelist was indebted to a serf of the family, who used to read to him verses from the *Rossiad* of Kheraskoff, a once-celebrated poet of last century. Tourguenieff's early attempts in literature, consisting of poems and trifling sketches, may be passed over here; they were not without indications of genius, and were favorably spoken of by Bielinski, then the leading Russian critic, for whom Tourguenieff ever cherished a warm regard. Our author first made a name by his striking sketches "The Papers of a Sportsman" (*Zapiski Okhotnika*), in which the miserable condition of the peasants was described with startling realism. The work appeared in a collected form in 1852. It was read by all classes, including the emperor himself, and it undoubtedly hurried on the great work of emancipation. Tourguenieff had always sympathized with the *muzhiks*; he had often been witness of the cruelties of his mother, a narrow-minded and vindictive woman. In some interesting papers recently contributed to the "European Messenger" (*Viestnik Evropî*) by a lady brought up in the household of Mme. Tourguenieff, sad details are given illustrative of her character. Thus the dumb porter of gigantic stature, drawn with such power in *Mumu*, one of our author's later sketches, was a real person. We are, moreover, told of his mother that she could never understand how it was that her son became an author, and thought that he had degraded himself. How could a Tourguenieff submit himself to be criticised? The next production of the novelist was "A Nest of Nobles" (*Dvorianskoe Gniezdo*), a singularly pathetic story, which greatly increased his reputation. This appeared in 1859, and was followed the next year by "On the Eve" (*Nakanuné*),—a tale which contains one of his most beautiful female characters, Helen. In 1862 was published "Fathers and Children" (*Otzi i Dieti*), in which the author admirably described the nihilistic doctrines then beginning to spread in Russia, he himself inventing the word nihilism, which seems likely to become permanent. In 1867 appeared "Smoke" (*Dim*), and in 1877 his last work of any length, "Virgin Soil" (*Nov*). Besides his longer stories, many shorter ones were produced, some of great beauty and full of subtile psychological analysis, such as *Rudin*, "The Diary of a Useless Man" (*Dnevnik Lishnago Chelovieka*), and others. These were afterwards collected into three volumes. The last works of the great novelist were "Poetry in Prose" and "Clara Milich," which appeared in the pages of the "European Messenger."

Tourguenieff, during the latter part of his life, did not reside much in Russia; he lived either at Baden Baden or Paris, and chiefly with the family of the celebrated singer Viardot Garcia, to the members of which he was much attached. He occasionally visited England, and in 1879 the degree of D.C.L. was conferred upon him by the university of Oxford. He died at Bougival, near Paris, on September 4, 1883; according to his wish, his remains were taken to St. Petersburg, and buried in the Volkoff cemetery, near those of the critic Bielinski.

Unquestionably Tourguenieff may be considered one of the greatest novelists of our own or any other times, and worthy to be ranked with Thackeray, Dickens, and George Eliot: with the genius of the last of these he has many affinities. His studies of human nature are profound, and he has the wide sympathies which are essential to genius of the highest order. A melancholy, almost pessimist, feeling pervades his writings, but perhaps this is always found in those who have truly listened to the "still, sad music of humanity." This morbid self-analysis seems natural to the Slavonic mind, and Tourguenieff has given abundant proof of possessing it. The closing chapter of "A Nest of Nobles" is one of the saddest and at the same time truest pages in the whole range of existing novels.

The writings of Tourguenieff have been made familiar to persons unacquainted with Russian by French translations. There are some versions in English, but the only two worthy of notice are the translation of the "Nest of Nobles" under the name of "Lisa," by Mr. Ralston, and "Virgin Soil," by the late Mr. Ashton Dilke.

TOURMALINE. See ELECTRICITY, vol. viii. pp. 8, 93. GEOLOGY, vol. x. p. 203; and MINERALOGY, vol. xvi. p. 426.

TOURNAI (Flem. *Doornik*), a town of Belgium, capital of an arrondissement in the province of Hainault, 53 miles by rail west-southwest from Brussels, is divided into two parts by the Scheldt, which is here spanned by seven bridges and lined with spacious tree-shaded quays. The older, which is also the busier and more important portion of the town, stands on the left bank; the new town is distinguished by its neat regular streets and modern architecture. The cathedral, which is a fine example of the Romanesque style, is a cruciform basilica, with a series of chapels and five towers. The nave was probably consecrated in 1171; the transepts date from the 13th century; and the (Gothic) choir was completed in 1338, at which time also the Romanesque façade was altered, and a porch in the Pointed style added. The sculptures in the porch range in date from the 13th to the 17th century, and deserve special notice, particularly those of later date by native artists. The general effect of the interior is harmonious and impressive. The capitals of the pillars are rich and varied; the passage round the choir contains several pictures of the Flemish school; the richly sculptured Renaissance roodloft dates from 1566; and most of the stained glass in the transept dates from about 1456. The adjacent belfry, dating originally from 1187, and partly rebuilt in 1391, was restored in 1852. In the Grande Place, not far from the cathedral, is the church of St. Quentin, sometimes spoken of as "la petite cathédrale," in the Transition style, and nearly of the same date as the cathedral. The church of St. Jacques dates from the 13th and 14th centuries, and that of St. Brice from the 12th. The buildings of the old monastery of St. Martin, on the southwest side of the town, are now used as an hôtel de ville, in connection with which there is a small picture gallery containing some examples of Rembrandt, Rubens, and Van Dyck. The town contains courts of law, an athenæum, a theatre, a school of arts and manufactures, an episcopal palace and seminary, a natural history museum, besides other public buildings. The fortifications of Vauban, extended after the second treaty of Paris, are now demolished, and their place taken by boulevards. The leading objects of manufacture are stockings and "Brussels" carpets; the other industries include paper-making, thread-making, and the spinning of wool and flax. The trade of the place is very considerable, as vessels of 150 tons burden can ascend the river to this point, and its railway communications are good. The population in 1876 was 32,145 [and in 1886 was 34,580].

---

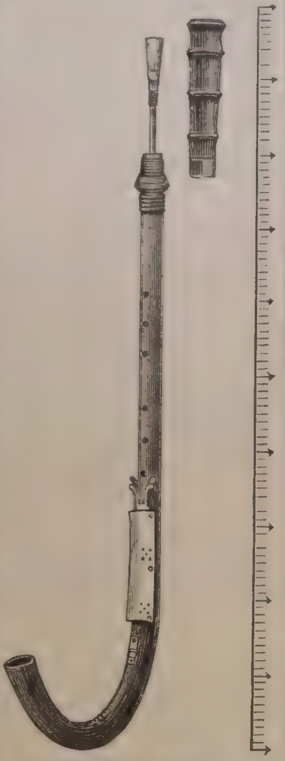
[1] [Tourguenieff's full name was Ivan Sergevitch and his birthday is usually given as the 9th November. An extensive bibliography of this subject is given in the *Literary World* (Boston, 22 September, 1883), in which occurs a notice of Eugene Schuyler's translation of *Fathers and Sons*, mentioned in the text under a similar title.—AM. ED.]

Tournay, supposed to be the *Civitas Nerviorum* of Cæsar, and afterwards known as Tournacus, was one of the first places conquered by the Franks, and Clovis made it for a time his capital. In modern times, standing as it does on the frontier between Belgium and France, it has been frequently besieged and taken. History records specially the siege by Alexander of Parma in 1581, when it was bravely but unsuccessfully defended by the princess D'Espinoy, whose statue now stands in the Grande Place. Perkin Warbeck was a native of Tournai.

TOURNAMENTS. Tournaments and jousts were the chief military exercises and displays of the age of chivalry. Besides being the appropriate sports and pastimes of a warlike era and caste, they were intended to test the skill and exhibit the prowess of the knights and squires who took part in them. Considered under their more serious aspect, apart from their association with pomp and festivity, they were, practically speaking, the equivalents of the reviews and sham-fights of later times, and were designed as a preparation for the actual manœuvres and real conflicts of the battlefield. Tournaments and jousts differed from one another principally in the circumstance that in the first several combatants on each side were engaged at once, and in the second the contention was between two combatants only. The former consisted of the mutual charges of equal troops of cavalry, while the latter consisted of a duel on horseback. Du Cange says that the French *tournoi*, English "tournament," "was a general expression which comprehended all sorts of combats that were performed by way of exercise. But it more properly meant such as were performed by companies, where many were in conflict against the same number, representing the form of a battle. When those general combats were ended, then single ones commenced; for all who were desirous of displaying their address, and attracting public notice for their valor, offered single combat with sword or lance against all who should present themselves;" and he adds that these combats were called by the old French writers "joustes," which is the same word as the English "jousts." But jousts were held far more frequently than, and quite independently of, regular tournaments throughout the period in which the customs of chivalry were observed, and, according to some authorities, the lance alone was used in them, while in the others all weapons except firearms were employed. In both cases such weapons were usually although not invariably rendered innocuous, and it was only rarely that the combatants were killed or injured by wounds, as distinguished from falls and bruises. But in one way or another tournaments and jousts were always extremely dangerous, and a long list of eminent persons met their deaths in them, from Raoul, Comte de Guines, to Henry II. of France. It may be assumed that jousts in some shape existed at all periods, in which men fought in armor and on horseback, and were in the habit of practicing themselves in time of peace for the exigencies of warfare. But it is very doubtful when and where tournaments, in the proper sense of the term, were originally instituted. The older writers on the subject sought to connect them with the "Troja" or "ludus Trojæ" among the Romans. But this is a piece of archæology of the same sort as that which identified the knighthood of the Middle Ages with the ancient "ordo equestris," and will not, of course, bear examination. Much reliance again has been placed by some of them on the account of a sham-fight which was held at the celebrated interview between the emperor Louis and Charles the Bald in 841, which in certain respects bore a close resemblance to a tournament, and was no doubt the kind of exhibition out of which the tournament of a later age was developed. Others attribute the institution of tournaments to the emperor Henry the Fowler, who died in 936, or to Geoffrey de Preuilly, the ancestor of the counts of Tours, who died in 1066. However this may be, it is certain that they were in vogue on the Continent at the end of the 11th century, and that in the early part of the 12th century they were introduced into England. In the 13th and 14th centuries they were common all over Christendom, including the Eastern as well as the Western empire and the states comprised in or adjacent to it. It was not until the end of the 16th century that tilts and hastiludes passed out of fashion in Britain, and even in the earlier years of the 17th century they were occasionally celebrated under the patronage of Henry, prince of Wales, son of King James I.

The older authorities on tournaments and jousts are exceedingly numerous. But all that is material in what they have written will be found in Ste Palaye's *Mémoires sur l'Ancienne Chevalerie* and Mill's *History of Chivalry*. The "Dissertations" of Du Cange at the end of Joinville's *Memoirs* and the *Chronicles* of Froissart and Monstrelet may also be consulted. Ste Palaye and Mills were both industrious compilers, and the second is much indebted to the first.

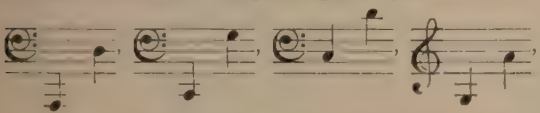
TOURNEBOUT, a wind instrument of wood, in which a cylindrical column of air is set in vibration by a reed. The lower extremity is turned up in a half circle, and from this peculiarity it has gained the French names *tournebout* and *cromorne*,—the latter a corruption of the German name *Krummhorn*. There appears to be no English equivalent. The reed of the tournebout, like that of the bassoon, is formed by two tongues of cane, adapted to the small end of a conical brass tube, the large end being inserted in the body of the instrument. It presents, however, this difference, that it is not, like that of the bassoon, in contact with the player's mouth, but is covered again by a cap pierced with a hole in the upper part, through which opening the air is introduced which sets the reed in vibration, the reed being therefore subject to no pressure of the lips. The compass of the instrument is naturally limited to the simple fundamental sounds which the successive opening of the lateral holes gives rise to. The tournebouts have not much length for the deep sounds they produce, which arises from these instruments sounding, like all tubes of cylindrical bore provided with reeds, the same as the stopped pipes of an organ. That is to say, theoretically they require only half the lengths necessary for the open pipes of an organ, or for conical tubes provided with reeds, to produce notes of the same pitch. Moreover, when, to obtain a harmonic, the column of air is divided, the tournebout will not give the octave like the oboe and bassoon, but the twelfth, corresponding in this peculiarity with the clarinet and all stopped pipes or bourdons. With the ordinary boring of eight lateral holes, the tournebout possesses a limited scale embracing a ninth. Sometimes, however, the deeper sounds are completed by the addition of one or more keys. By its structure the tournebout is one of the oldest wind instruments; it is evidently derived from the Greek *aulos* and the Roman *tibia*, which consisted equally of a simple cylindrical pipe of which the column of air was set in vibration by a double reed.



Bass Tournebout.

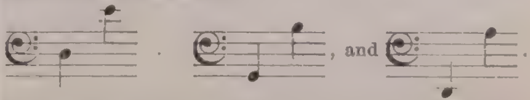
Notwithstanding the successive improvements that were introduced in the manufacture of wind instruments, the tournebout scarcely ever varied in the details of its construction. Such as we see it represented in the treatise by Virdung[1] we find it again about the epoch of its disappearance in *L' Art du Faiseur d' Instruments de l' Encyclopédie de Diderot et d' Alembert* (Paris, 1751–80).

The tournebouts existed as a complete family from the 15th century. According to Virdung, it was formed of four individual instruments; Prætorius[2] cites five,—the deep bass, the bass, the tenor or alto, the cantus or soprano, and the high soprano, with compass respectively of



and  A band, or, to use the expression of Prætorius, an "accort," of tournebouts comprehended—1 deep bass, 2 bass, 3 alto-tenor, 2 cantus (soprano), 1 high soprano = 9.

The tournebouts were not always an orchestra by themselves; they allied themselves also to other instruments, and notably to flutes and oboes. It was thus that the little groups of musicians in the service of princes or those engaged by some large town on the occasion of a festival or public ceremony, where composed of several tournebout players combined with some flautists and oboe players. In 1685 the orchestra of the Neue Kirche at Strasburg comprised two tournebouts, and until the middle of the last century these instruments formed part of the music called "la grande écurie" in the service of the French kings. Tournebouts have in our days become of extreme rarity, and scarcely exist in collections. The museum of the Conservatoire Royal de Musique at Brussels has the good fortune to possess a complete family, which is regarded as having belonged to the duke of Ferrara, Alphonso II. d'Este, a prince who reigned from 1559 to 1597. The soprano (cantus or discant) has the same compass as above, while the alto, the tenor (furnished with a key), and bass have an extent respectively of



The bass (see accompanying figure), besides having two keys, is distinguished from the others by a kind of small bolt, two of which slide in grooves and close the two holes that form the lowest notes of the instrument. It is very curious to observe that the employment of these bolts, placed at the extremity of the tournebout and out of reach of the fingers of the instrumentalist, forces him to require the assistance of a person whose sole mission is to attend to these bolts during the performance.

The "Platerspil" of which Virdung gives a drawing is only a kind of tournebout. It presents especially the peculiarity that instead of having a cap to cover over the reed, there is a spherical receiver surrounding the reed to which the tube for insufflation is adapted. This receiver was of wood worked round, or perhaps consisted of a simple gourd. (V. M.)

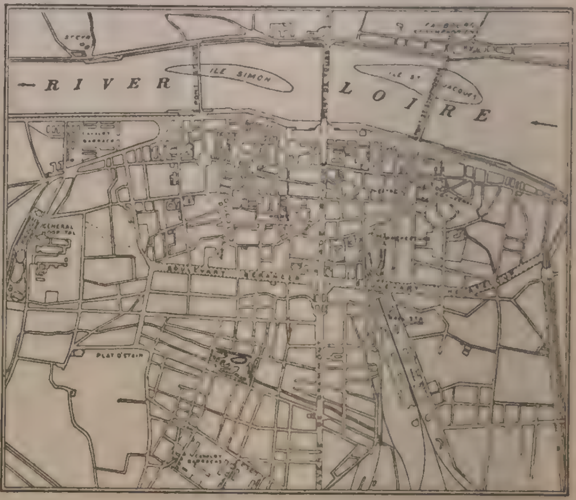
TOURNEFORT, Joseph Pitton de (1656–1708), a botanist of considerable reputation, was born at Aix, in Provence, in 1656. He studied in the convent of the Jesuits at Aix, and was destined for the church, but the death of his father left him free to follow his botanical inclinations. After a couple of years collecting, he studied medicine at Montpellier, but soon returned to his favorite pursuit, and was appointed professor of botany at the Jardin des Plantes in 1683. By the king's order he travelled through western Europe where he made very extensive collections, and subsequently spent three years in Greece and Asia Minor (1700–1702). Of this journey a description in a series of letters was posthumously published in 3 vols. (*Relation d'un Voyage du Levant*, Lyons, 1717). His principal work is entitled *Institutiones Rei Herbariæ* (3 vols., Paris, 1700), and upon this rests chiefly his claims to remembrance as one of the most eminent of the systematic botanists who prepared the way for Linnæus. His exact position among these has been discussed at length by Sachs (*Geschichte d. Botanik*, Munich, 1875). He died December 28, 1708.

TOURNEUR, Cyril, a tragic poet of the first order, has left no record of his existence beyond the respective dates of his first and last extant works (1600–1613). An allegorical poem, worthless as art and incomprehensible as allegory, is the earliest of these; an elegy on the death of Prince Henry, son of James I., is the latest. The two plays on which his fame rests and on which it will rest forever, were published respectively in 1607 and 1611, but all students have agreed to accept the internal evidence which assures us that the later in date of publication must be the earlier in date of composition. His only other known work is an epicede on Sir Francis Vere, of no great merit as poetry, but of some value as conveying in a straightforward and masculine style the poet's ideal conception of a perfect knight or "happy warrior," comparable by those who may think fit to compare it with the more nobly realized ideals of Chaucer and of Wordsworth. But if Tourneur had left on record no more memorable evidence of his powers than might be supplied by the survival of his elegies, he could certainly have claimed no higher place among English writers than is now occupied by the Rev. Charles Fitzgeoffrey, whose voluminous and fervent elegy on Sir Francis Drake is indeed of more actual value, historic or poetic, than either or than both of Tourneur's elegiac rhapsodies. The singular power, the singular originality, and the singular limitation of his genius are all equally obvious in *The Atheist's Tragedy*, a dramatic poem no less crude and puerile and violent in action and evolution than simple and noble and natural in expression and in style. The executive faculty of the author is in the metrical parts of his first play so imperfect as to

[1] *Musica getutscht und ausgezogen*, Basel, 1511.
[2] *Organographia*, Wolfenbüttel, 1618.

suggest either incompetence or perversity in the workman; in *The Revenger's Tragedy* it is so magnificent, so simple, impeccable, and sublime, that the finest passages of this play can be compared only with the noblest examples of tragic dialogue or monologue now extant in English or in Greek. There is no trace of imitation or derivation from an alien source in the genius of this poet. The first editor of Webster has observed how often he imitates Shakespeare; and, in fact, essentially and radically independent as is Webster's genius also, the sovereign influence of his master may be traced not only in the general tone of his style, the general scheme of his composition, but now and then in a direct and never an unworthy or imperfect echo of Shakespeare's very phrase and accent. But the resemblance between the tragic verse of Tourneur and the tragic verse of Shakespeare is simply such as proves the natural affinity between two great dramatic poets, whose inspiration partakes now and then of the quality more proper to epic or to lyric poetry. The fiery impulse, the rolling music, the vivid illustration of thought by jets of insuppressible passion, the perpetual sustenance of passion by the implacable persistency of thought, which we recognize as the dominant and distinctive qualities of such poetry as finds vent in the utterances of Hamlet or of Timon, we recognize also in the scarcely less magnificent poetry, the scarcely less fiery sarcasm, with which Tourneur has informed the part of Vindice—a harder-headed Hamlet, a saner and more practically savage and serious Timon. He was a satirist as passionate as Juvenal or Swift, but with a finer faith in goodness, a purer hope in its ultimate security of triumph. This fervent constancy of spirit relieves the lurid gloom and widens the limited range of a tragic imagination which otherwise might be felt as oppressive rather than inspiriting. His grim and trenchant humor is as peculiar in its sardonic passion as his eloquence is original in the strenuous music of its cadences, in the roll of its rhythmic thunder. As a playwright his method was almost crude and rude in the headlong straightforwardness of its energetic simplicity; as an artist in character, his interest was intense but narrow, his power magnificent but confined; as a dramatic poet, the force of his genius is great enough to ensure him an enduring place among the foremost of the followers of Shakespeare. (A. C. S.)

TOURS, a town of France, formerly the capital of Touraine, now chef-lieu of the department of Indre-et-Loire, the see of an archbishop, and the headquarters of the 9th corps d'armée, lies 145 miles (by rail) south-west of Paris, on the left bank of the Loire, a little above the junction of the Loire and Cher. Many foreigners, especially English, live at Tours, attracted by the town itself, its mild climate, its beautiful situation in "the garden of France," and the historic chateaus of the neighborhood. The Loire is crossed by two suspension bridges, by a railway bridge, and by a fine stone bridge, but its waters too often either expose large stretches of sand, or come down in devastating flood. Many of the inhabitants belong to the leisured class, and the town possesses societies of science, art, and literature, of agriculture, of horticulture, of archæology, of medicine, and a library (50,000 volumes, and 1200 MSS., including a gospel of the 8th century, on which the kings of France took oath as honorary canons of the church of St. Martin). The industrial establishments include four large silk mills, the printing and publishing works of Mame (1200 workmen), manufactories of cloth, carpets, files, white lead, stained glass, boots and shoes, and pottery. A considerable trade is carried on in wine, brandy, and dried fruits, and the sausages and confectionery of the town are well known. The population, 52,209 in 1881, was 59,585 in 1886.



Plan of Tours.

Tours, under the Gauls the capital of the Turones or Turons, originally stood on the right bank of the Loire, a little above the present village of St. Symphorien. At first called *Altionos*, the town was afterwards officially known as *Cæsarodunum*. The Romans removed the town from the hill where it originally stood to the plain on the left bank of the river. Behind the present cathedral, remains of the amphitheatre (443 feet in length by 394 in breadth) built towards the end of the 2d century might till lately be seen. Tours became Christian about 250 through the preaching of Gatien, who founded the bishopric. The first cathedral was built a hundred years later by St. Litorius. The bishopric became an archbishopric when Gratian made Tours the capital of Lugdunensis Tertia, and about the same time the official name of Cæsarodunum was changed for that of *Civitas Turonorum*. St. Martin, the great apostle of the Gauls, was Bishop of Tours in the 4th century, and he was buried in a suburb which soon became as important as the town itself from the number of pilgrims who flocked to his tomb. Towards the end of the 4th century, apprehensive of barbarian invasion, the inhabitants pulled down some of their earlier buildings in order to raise a fortified wall, the course of which can still be traced in places. Their advanced fort of Larcay still overlooks the valley of the Cher. Affiliated to the Armorican confederation in 435, the town did not fall to the Visigoths till 473, and the new masters were always hated. It became part of the Frankish dominions under Clovis, who, in consideration of the help afforded by St. Martin, presented the church with rich gifts out of the spoils taken from Alaric, confirmed and extended its right of sanctuary, and accepted for himself and his successors the title of canon of St. Martin. The basilica, built under Bishop St. Perpetuus from 472 to 477, was the largest and finest church of France, and one of the most important built in the West during the decline of the Roman empire; it is said by St. Gregory of Tours to have been 160 feet long, 60 wide, and 45 high. It seems to have been one of the first which had an ambulatory round the choir. Tours grew rapidly in prosperity under the Merovingians, but abuse of the right of sanctuary led to great disorder, and the church itself became a hot-bed of crime. Charlemagne re-established discipline in the disorganized monastery and set over it the learned Alcuin, who established at Tours one of the oldest public schools of Christian philosophy and theology. The abbey was made into a collegiate church in the 11th century, and was for a time affiliated to Cluny, but soon came under the direct rule of Rome, and for long had bishops of its own. The suburb in which the monastery was situated became as important as Tours itself under the name of Martinopolis. The Normans, attracted by its riches, pillaged it in 853 and 903. Strong walls were erected from 906 to 910, and in the 12th century the name was changed to that of Châteauneuf. Philip Augustus abolished the disorderly commune in 1212, but the innumerable offerings of princes, lords, and pilgrims maintained the prosperity of the town all through the Middle Ages. A 13th-century writer speaks with enthusiasm of the wealth and luxury of the inhabitants, of the beauty and chastity of the women, and of the rich shrine of the saint. A third church, replacing one which had been built after the burning of that of St. Perpetuus in 997, was begun in 1175, and finished in the 13th century. It was 374 feet long and 85 feet high, and had five towers, of which only two remain. The rest of the church, sold to speculators after the Revolution, disappeared under the first empire. Of the monastic buildings, only a beautiful inclosed gallery, built by Bastien François, nephew of Michel Colomb, in the time of the Renaissance, remains, but the streets which formerly belonged to Châteauneuf show many interesting relics of ecclesiastical and civil architecture. About 1130 Archbishop Hildevert built a cathedral in the old Roman town itself, on the ruins of those successively erected by Litorius and Gregory of Tours. This was burnt in 1166 during the quarrel between Louis VII. of France, and Henry II. of England, the latter being lord of Tours and count of Anjou. The work was resumed in 1175, but not finished till 1547. Part of the towers belong to the 12th century; the choir to the 13th; the transept and first bays of the nave to the 14th; the remaining bays, the cloister on the north, and the fine façade to the 15th; and the two Renaissance towers (217 feet and 223 feet) to the 16th. The building is nevertheless remarkable for the harmony and regularity of its construction; specially noteworthy details are the triple western portal, the upper staircase of the north tower, a Renaissance staircase in the cloister, the old wood-work in chestnut-wood, and the splendid glass of the 13th, 14th, and 15th centuries. A pretty little mausoleum, built in 1506 by Jean Juste, is the burial-place of three young sons of Charles VIII. The archbishop's palace is to the right of the cathedral, with an interesting chapel of the 12th century, and an outside pulpit of the 16th. During the 10th century the Benedictine abbey of St. Julien was re-established by Archbishop Théotolon, and a Romanesque church built, of which the great square tower still remains. St. Julien has a fine nave and double aisles; the straight terminal wall has two 16th-century apses attached. There are some paintings of the 12th century under the tower.

The magnificence of Tours declined in the 14th century; it was then united to Châteauneuf by a common wall, of which an elegant round tower (the Tour de Guise) remains near the quay, and both towns were put under the same government. The numerous and long-continued visits of Charles VII., Louis XI., and Charles VIII. in Touraine during the 15th century favored the commerce and industry of the town, then peopled by 75,000 inhabitants. To the flourishing school of art which existed at the Renaissance are due several private houses, a fountain, and the church of Notre Dame La Riche, with splendid windows by Pinaigrier. An unimportant building, part of a modern chateau, is all that remains of the royal residence and magnificent gardens of Plessis-lès-Tours, where Louis XI. shut himself up and died, the states in 1506 proclaimed Louis XII. the father of his people, and Henry III. and Henry of Navarre united in 1589 against the League. From that year Tours was deserted by the kings of France. A fine bridge of fifteen arches was built across the Loire from 1765 to 1777 by Bayeux. The chief modern buildings are the theatre, the church of St. Joseph, the railway station, and a museum with collections of antiquities, pictures, pottery, and mineralogy. There are also antiquities, in the museum of the archæological society of Indre-et-Loire. The gardens and a remarkable portal of the archbishop's palace, a magnificent iron gate of the 18th century in the prefecture, once the convent of the Visitation, and the general hospital (1200 beds) should also be mentioned. In 1870 Tours was the seat of the government of the national defence. Tours is the birthplace of the heretic Berengarius, the two marshals Boucicaut, the novelist Honoré de Balzac, the poet Destouches, the painters Fouquet and Clouet, and Madame de la Vallière.

TOUSSAINT LOUVERTURE, PIERRE-DOMINIQUE (1746–1803), one of the liberators of Hayti, claimed to be descended from an African chief, his father, a slave in Hayti, being the chief's second son. He was born 20th May, 1746, at Breda, and was at first surnamed Breda, which was changed to Louverture in token of the results of his valor in causing a gap in the ranks of the enemy. From childhood he manifested unusual abilities, and succeeded, by making the utmost use of every opportunity, in obtaining a remarkably good education. He obtained the special confidence of his master, and was made superintendent of the other negroes on the plantation. After the insurrection of 1791 he joined the insurgents, and having acquired some knowledge of surgery and medicine, acted as physician to the forces. His rapid rise in influence aroused, however, the jealousy of Jean François, who caused his arrest on the ground of his partiality to the whites. He was liberated by the rival insurgent chief Baisson, and a partisan war ensued, but after the death of Baisson he placed himself under the orders of Jean François. Subsequently he joined the Spaniards, but, when the French Government ratified the Act declaring the freedom of the slaves, he came to the aid of the French. In 1796 he was named commander-in-chief of the armies of St. Domingo, but, having raised and disciplined a powerful army of blacks, he made himself master of the whole country, renounced the authority of France, and announced himself "the Buonaparte of St. Domingo." For further details of his career see HAYTI (vol. xi. p. 487). He was taken prisoner by treachery on the part of France, and died in the prison of Joux, near Besançon, 27th April, 1803.

See *Mémoires* written by himself, 1853; Saint-Rémy, *Vie de Toussaint Louverture*, 1850; Gragnon-Lacoste, *Toussaint Louverture, Général en Chef de l' Armée de Saint-Domingue surnommé le Premier des Noirs*, based on private papers of the Louverture family, 1877.

TOWN, TOWNSHIP. See BOROUGH, CITY, MUNICIPALITY, and UNITED STATES, pp. 776–884.

TOWNSHEND, CHARLES TOWNSHEND, SECOND VISCOUNT (1674–1738), a statesman of unsullied integrity was the eldest son of Horatio, the first viscount, and was born in 1674. He succeeded to the peerage in December, 1687, and was educated at Eton and King's College, Cambridge. When he took his seat in the House of Lords his sympathies leant to Toryism but this predilection soon faded away, and in February, 1701–2, it was rumored among the courtiers that he would hold the office of privy seal in the Whig ministry which William III. had in view. For some years after the accession of Queen Anne he remained without office, but on 29th September, 1707, he was created captain of the yeomen of the guard, and in the same year he was summoned to the privy council, a distinction renewed by the queen's two successors on the throne. The command of the yeomen remained in his hands until 13th June, 1711, but its responsibilities did not prevent him from acting as joint plenipotentiary with the duke of Marlborough in the peace negotiations with France which were carried on at Gertruydenberg, near Breda, or from serving as ambassador extraordinary at The Hague congress (2d May, 1709,–26th March, 1711). Townshend was high in favor with George I., and on that king's arrival at The Hague in September, 1714, he published the appointment of Townshend as secretary of state for the southern department, and entrusted to his new minister the privilege of nominating his own colleague. Horace Walpole, his brother-in-law and private secretary, recommended Stanhope for the vacant post, and Stanhope was duly appointed. Townshend did not neglect to avail himself of the advantages afforded by his attendance on the king, and before the arrival of George I. in England he had obtained complete ascendency both over his mind and the dispositions of the advisers by whom his line of conduct was generally determined. The policy of the new ministers at home and abroad lay in the promotion of peace. With this object they endeavored to limit the charges against their predecessor Harley, Lord Oxford, to high crimes and misdemeanors. To gain this end they brought about, in 1716, an alliance between those ancient rivals in arms, France and England. In spite of their success their influence was gradually undermined by the intrigues of Lord Sunderland and by the discontent of the Hanoverian favorites, who deemed the places and the pensions which they had gained an insufficient reward for their exertions. In October, 1716, Stanhope accompanied the king on his journey to Hanover, and during this visit was seduced from his allegiance to his colleagues by the wily Sunderland, who had ingratiated himself into the royal favor. George I. was induced to believe that Townshend and Walpole were caballing with the prince of Wales, and were forming designs against the royal authority. Townshend was dismissed in December, 1716, from his place of secretary of state, and was offered in lieu thereof the splendid banishment of lord-lieutenant of Ireland, a gilded sinecure which he at first contemptuously declined and only condescended ultimately to accept on the condition that he was not required to set foot on Irish soil. His latent spirit of hostility to this arrangement quickly developed into open antagonism, and in March, 1717, Townshend was dismissed from his position. At the close of May, 1720, a partial reconciliation took place between the opposing Whig sections of Stanhope and Townshend. The latter was readmitted into the ministry as lord president of the council (11th June, 1720), and his devoted relation and colleague Sir Robert Walpole became paymaster-general. When the South Sea Bubble burst, the fortunes of the principal members of the ministry shared in the misfortune of the scheme which they had promoted. Stanhope, in a paroxysm of passion during a heated debate, broke a bloodvessel, and Sunderland, though acquitted of the charge of personal corruption, was forced to retire into private life. The withdrawal of these statesmen assigned to their rivals the chief prizes in the state: Townshend became (10th February, 1721) secretary of state, and Walpole gained the position of first lord of the treasury and chancellor of the exchequer. The death of George I. threatened a change of advisers, but the dismay of the new king's favorite, Spencer Compton, at being called upon to draw up the royal speech, led to the old ministers of the crown being retained in their places. What the attacks of the opposition could not effect, the internal strife of the administration accomplished. Townshend was of a proud, impetuous disposition, born with a nature more accustomed to rule than to obey. His family had for several generations stood higher in the social life of Norfolk than Walpole's progenitors, and when he himself attained to distinction in politics his position as a member of the Upper House was greater than that enjoyed by his friend in the Commons. As the power of the Lower House increased, and as Walpole became more and more the object of the attacks of the Tories, the pre-eminence of Townshend passed from him. So long, to use the witty remark of Sir Robert Walpole, as the firm was Townshend and Walpole, things went well with them, but when the positions were reversed jealousies arose between the partners. The growing alienation was hastened by the death, in 1726, of the secretary's wife, the sister of Walpole. At the close of 1729 Townshend endeavored to obtain the appointment of his old and attached friend, Lord Chesterfield, as his fellow secretary of state, and the failure of the attempt brought about a fierce scene between Walpole and himself. They broke out into passionate words, seized one another by their coat-collars, and would have come to blows had they not been prevented by their friends who were present. After this outbreak of passion further co-operation was impossible, and Townshend, having the good sense to recognize the position, retired into private life on 15th May, 1730. The chief domestic events of his ministry were the impeachment of Bishop Atterbury, the partial restoration of Lord Bolingbroke, and the troubles in Ireland over the granting to a man called Wood of a patent for coining halfpence. Its concluding act was the signing of the treaty of Seville (9th November, 1729). Townshend died of apoplexy 21st June, 1738.

Townshend was slow in forming, but resolute in adhering to, his opinion, and, like most other men of that stamp, was impatient of contradiction. His manners have been styled "coarse, rustic, and seemingly brutal," but these defects were not visible in his domestic life. Never did minister leave office with cleaner hands; he did not add one acre to his estate nor leave large fortunes to his younger children.

TOWNSHEND, Charles (1725–1767), a politician ever to be remembered as the embodiment of wit and indiscretion, was the second son of Charles, third Viscount Townshend, who married Audrey, the daughter and heiress of Edward Harrison of Ball's Park, near Hertford, a lady who rivalled her son in brilliancy of wit and frankness of expression. Charles was born 29th August, 1725, and was sent for his education to Leyden and Oxford. At the Dutch University, where he matriculated 27th October, 1745, he associated with a small knot of English youths, afterwards well known in various circles of life, among whom were Askew, the book-collector, Dowdeswell, his subsequent rival in politics, Wilkes, the witty and unprincipled reformer, and Alexander Carlyle, the genial Scotchman, who devotes some of the pages of his *Autobiography* to chronicling their sayings and their doings. He represented Great Yarmouth in parliament from 1747 to 1761, when he found a seat in the treasury borough of Harwich. Public attention was first drawn to his abilities in 1753, when he delivered a lively attack, as a younger son who might hope to promote his advancement by allying himself in marriage to a wealthy heiress, against Lord Hardwicke's marriage bill. Although this measure passed into law, he attained this object in August of the following year by marrying Caroline, the eldest daughter of the second duke of Argyle and the widow of Francis, Lord Dalkeith, the eldest son of the second duke of Buccleugh. In April, 1754, Townshend was transferred from the position of a member of the Board of Trade, which he had held from 1749, to that of a lord of the admiralty, but at the close of 1755 his passionate attack against the policy of the ministry, an attack which shared in popular estimation with the scathing denunciations of Pitt, the supreme success of Single-Speech Hamilton, and the hopeless failure of Lord Chesterfield's illegitimate son, caused his instant dismissal. In the administration which was formed in December, 1756, and which was ruled by Pitt, the lucrative office of treasurer of the chamber was given to Townshend, and in the following spring he was summoned to the privy council. With the accession of the new monarch in 1760 this volatile politician transferred his attentions from Pitt to the young king's favorite, Bute, and when, at the latter's instance, several changes were made in the ministry, Townshend was promoted to the post of secretary of war. In this place he remained after the great commoner had withdrawn from the cabinet, but in December, 1762, he threw it up. Bute, alarmed at the growth in numbers and in influence of his enemies, tried to buy back Townshend's co-operation by sundry tempting promises, and at last secured his object in March, 1763, with the presidency of the Board of Trade. When Bute retired and George Grenville accepted the cares of official life, the higher post of first lord of the admiralty fell to Townshend's lot, but with his usual impetuosity he presumed to designate one of his satellites to a place under him at the board, and the refusal to accept the nomination led to his exclusion from the new administration. While in opposition his mind was swayed to and fro with conflicting emotions of dislike to the head of the ministry and of desire to share in the spoils of office. The latter feeling ultimately triumphed; he condescended to accept in the dying days of Grenville's cabinet, the to retain through the "lutestring" administration of Lord Rockingham, —"pretty summer wear," as Townshend styled it, "but it will never stand the winter,"—the highly-paid position of paymaster-general, refusing to identify himself more closely with its fortunes as chancellor of the exchequer. The position which he refused from the hands of Lord Rockingham he was forced to accept from the imperious Pitt (August, 1766), and a few weeks later his urgent appeals to the great minister for increased power were favorably answered, and he was admitted to the inner circle of the cabinet. Dowdeswell, his predecessor at the exchequer, resented his removal for his brilliant rival. The new chancellor proposed the continuance of the land tax at four shillings in the pound, while he held out hopes that it might be reduced next year to three shillings, whereupon his predecessor, by the aid of the landed gentlemen, carried a motion that the reduction should take effect at once. This defeat proved a great mortification to Lord Chatham, and in his irritation against Townshend for this blow, as well as for some acts of insubordination, he meditated the removal of his showy colleague. Before this could be accomplished Chatham's mind became impaired by some mysterious malady, and Townshend, who was the most determined and influential of his colleagues, swayed the ministry as he liked. His wife was created (August, 1767) Baroness Greenwich, and his brother was made lord-lieutenant of Ireland. He himself delivered in the House of Commons many speeches unrivalled in parliamentary history for wit and recklessness; and one of them still lives in history as the "champagne speech." His last act was to pass through parliament resolutions which even his colleagues deprecated in the cabinet, for taxing several articles, such as glass, paper, and tea, on their importation into America, which he estimated would produce the insignificant sum of £40,000 [$194,400] for the English treasury, and which shrewder observers prophesied would lead to the loss of the American colonies. Shortly after this event he retired to his wife's country seat in Oxfordshire, where he died on 4th September, 1767, from a fever which he had neglected.

The universal tribute of Townshend's colleagues allows him the possession of boundless wit and ready eloquence, set off by perfect melody of intonation, but marred by an unexampled lack of judgment and discretion. He shifted his ground in politics with every new moon, and the world fastened on him the nickname, which he himself adopted in his "champagne" speech, of the weathercock. His official knowledge was considerable; and it would be unjust to his memory to ignore the praises of his contemporaries or his profound knowledge of his country's commercial interests. The House of Commons recognized in him its spoilt child, and Burke happily said that "he never thought, did, or said anything" without judging its effect on his fellow-members. Charles Townshend is the subject of a memoir by Mr. Percy Fitzgerald [1866].

TOXICOLOGY. See POISONS.

TRACHIS, a city of ancient Greece, at the foot of Mount Œta, a little to the northwest of Thermopylæ. As commanding the approach to Thermopylæ from Thessaly, it was a place of great military importance. According to Homer, it was one of the places subject to Achilles, and was famed in legend as the scene of Hercules's death—an event which forms the subject of Sophocles's play *The Trachinian Women*. In historical times it first attained importance on the foundation of Heraclea by the Spartans in 426 B.C. The Thessalians, jealous of the establishment of a Spartan outpost on their borders, attacked Heraclea, and in 420 the Heracleots were defeated by them with heavy loss. In the winter of 409-8 Heraclea sustained another disastrous defeat. In 395 the Thebans expelled the Spartans, and restored the city to the old Trachinian and Œtæan inhabitants. In later times Heraclea was one of the mainstays of the Ætolian power in northern Greece. In 191 B.C., after the defeat of Antiochus at Thermopylæ, Heraclea was besieged and taken from the Ætolians by the Romans under the consul Acilius Glabrio. From Livy's account of the siege (xxxvi. 24), it appears that the citadel was outside the town, which lay on the low ground between the rivers Karvunaria (Asopus) and Mavra-Neria (Melas). There are still traces of the citadel on a lofty rock above.

TRACT SOCIETIES are associations for publishing or circulating religious treatises or books. The circulation of short treatises for the promotion of Christian knowledge is older than the invention of printing. Wickliffe, for instance, was a great writer and circulator of tracts, employing his Oxford friends and pupils to multiply copies. So was Luther in his day, with the help by that time of printer and bookseller. In later times John Wesley was a busy worker in this way; and Hannah More, from her own pen, produced what were known as the "Cheap Repository Tracts," highly lauded by Bishop Porteus, and widely used towards the close of the 18th century.[1] Before this time there had been efforts of associated labor for the same object, a "book society for promoting religious knowledge among the poor" having been established in 1750. A similar society was formed at Edinburgh in 1793. But it was at the close of the century, in 1799, that there was founded in London the Religious Tract Society, an institution unparalleled in the extent and variety of its operations, and the parent of numerous societies in different parts of the empire as well as in the United States and on the continent of Europe. There are other associations with kindred objects, but in connection with particular ecclesiastical systems. Thus the tract department of the Christian Knowledge Society is specially connected with the Church of England; and the Wesleyans, Baptists, and other denominations have their own tract societies. The Church of Rome also has now similar associations. The Religious Tract Society is alone in being confined to the diffusion of religious truth common to all Protestant Christians, to the exclusion of topics touched by ecclesiastical divisions. This catholicity is secured by the fundamental rules of the society, and by its managing committee being composed half of Churchmen and half of Nonconformists of all denominations.

A brief statement of the proceedings of the Religious Tract Society, as presented in its latest annual *Report*, will best serve to show the general objects and operations of all such organizations,—any special or varied action elsewhere adopted being noted as we proceed. The main object of the society is the preparation and publication of religious literature. At first this consisted mostly of tracts and small treatises. After a time larger books were published, including series of reprinted works of the early Reformers and English Protestant theologians and Biblical expositors, and also books on common subjects treated in a religious spirit. The society also issues magazines for all classes. Four of these periodicals, the *Leisure Hour*, the *Sunday at Home*, the *Boys' Own Paper*, and the *Girls' Own Paper*, have a united circulation, including monthly parts and yearly volumes, of nearly 600,000 numbers weekly, or above 30 millions in the year. The total annual issue, including books, tracts, etc., at home and abroad, is nearly 86 millions.

The distribution of this is chiefly through the ordinary channels of trade, with the exception of the tracts, which are circulated by home and foreign missionary societies, and various agencies public and private. Almost every missionary agency is indebted to the Religious Tract Society for the work carried on through the press. Grants are made, either free or as nearly as possible at cost price; and, when it is advisable to produce publications at foreign stations, grants of paper and other material, as well as money payments, are voted. The publications are in almost every tongue, the list containing works in 174 languages and dialects.

The funds for this large and varied work come partly from donations, subscriptions, and legacies, but chiefly from the profits of the sales of the society's publications. The total missionary and evangelistic expenditure in the year ending March 31, 1886, amounted to £47,722 [$231,928.92], of which £19,019 [$92,432.34] was supplied from the trade funds, which have also borne the entire cost of management, both of the business and missionary departments. The total amount received from sales, subscriptions, and all other sources was £212,731, 11s. 8d. [$1,033,875.50].

The American Tract Society and some of the Continental societies undertake the distribution as well as the production of tracts and books, by means of paid colporteurs and other agents. The Continental societies produce most of their own books and tracts, aided largely by grants of money and paper from the Religious Tract Society.[2]

---

[1] [The tracts produced from 1795-8 (see vol. xvi. p. 840) long retained their popularity and circulation in America.—AM. ED.]

[2] [The evangelical movement which gave rise to the Religious Tract Society of London was equally efficient in the United States about the beginning of the present century. Local tract distribution societies were formed in the Northern States, among which

TRACTION, Electric. The driving of vehicles by electricity was made commercially practicable by the invention of the dynamo-electric machine, which gave a ready means of producing electrical energy by the expenditure of mechanical work, and by the further discovery that the function of the dynamo could be reversed,—that it was capable of acting efficiently as a motor to do mechanical work when supplied with energy in the electrical form. Experiment has shown that when a dynamo is used to produce an electric current, which, in its turn, drives another dynamo serving as a motor, the double conversion of energy may be performed with no very serious loss. In favorable cases, when the dynamo and motor are close together, the motor will yield more than 80 per cent. of the work which is spent in driving the dynamo. When they are far apart there is an additional loss, due to the resistance of the conductor which connects them, and a further loss due to its imperfect insulation. The use of high electromotive force, which reduces the first of these, tends to increase the second; it is, however, practicable to keep both within reasonable limits. Early attempts to apply electricity to traction were made by Robert Davidson, who placed an electromagnetic locomotive on the Edinburgh and Glasgow Railway in 1837, and by Jacobi of St. Petersburg, who propelled a boat on the Neva in 1839 by an electromagnetic engine driven by a battery of Grove's cells. The inefficiency and bulkiness of early electromotors, and the cost of producing electric energy when a galvanic battery was the source, made it impossible for electricity under such conditions as these to compete with other methods of traction. A good battery using zinc as the active metal consumes from 1 to 2 ℔ of zinc per hour per horse-power developed; a good steam-engine consumes from 2 to 3 ℔ of coal in doing the same amount of work, and the cost of zinc is about fifty times that of coal. Hence, notwithstanding modern improvements in electromotors, the cost of producing mechanical power by means of electricity, when a zinc-consuming battery is the source, is still prohibitive.

The earliest practical electric railway was constructed at the Berlin exhibition of 1879 by Dr. Werner Siemens. At one station was a dynamo driven by a steam-engine. The current was conducted to the moving car through a special rail placed between the ordinary rails and insulated from the ground by blocks of wood. From this rail it passed through a motor-dynamo on the car, and the ordinary rails completed the circuit. Electrical contact with the ordinary rails was made by the wheels, and with the central rail by a pair of brushes made of copper wire which rubbed against its sides. Spur-wheels were used to connect the motor shaft with the wheels and to effect a suitable reduction of speed. The line was half a mile long and of 2-feet gauge. The motor developed about 3½ horse-power, and was carried by a separate truck, forming a locomotive which drew a car with 20 passengers at a speed of from 4 to 7 miles an hour.

The success of the Berlin experiment was complete, and Messrs. Siemens followed it up in 1881 by the construction of a permanent electric tramway, 1½ miles in length, at Lichterfelde, which has now (1887) been in continuous operation for six years. At Lichterfelde the ordinary rails, insulated by wooden sleepers, are the only conductors. Where roads cross the line the rails are cut out of circuit, and the current is carried past the gap by underground cables, but switches are provided by which the current can be sent into the insulated sections if required. Each car takes 24 passengers, and runs at a speed of 12 miles an hour. There is no separate locomotive, the motor-dynamo being on the car itself. In 1882 Messrs. Siemens constructed an electric tramway in the mines of Zankerode, in Saxony, and built for it a locomotive able to draw 8 tons at a speed of 7½ miles an hour. Overhead conductors were employed, consisting of a pair of insulated ⊥-shaped rails fixed to the roof of the workings; the current was conveyed to and from the locomotive by means of a pair of contact carriages sliding on these conductors, and connected with the car by short flexible cables. A similar line was opened in 1883 at the Hohenzollern colliery in Upper Silesia.

The same year witnessed the completion of another pioneer undertaking of the first importance, an electric tramway 6 miles long connecting Portrush and Bushmills, in the north of Ireland. Here the insulated conductor is a special rail, carried alongside of the line on wooden posts at a height of 1½ feet above the ground. Contact is made by springs shaped like carriage-springs, which project from one side of the car at both ends, so that the length of the car enables continuous contact to be maintained at cross-roads, where there are gaps in the conducting rail, past which the current is taken by underground cables. The ordinary rails serve as return conductors. The dynamos are driven by turbines at a station nearly a mile distant from the line; they supply a current of 100 amperes with an electromotive force of 250 volts. The motors are placed on passenger cars; their speed is regulated by means of resistance coils, which the driver of the car switches into the circuit. A similar tramway, 3 miles long, connecting Bessbrook and Newry, was opened in 1885; there also water-power is made use of to drive the generating dynamos. On these lines the train usually consists of a motor car with passengers, followed by two or three good wagons, and the whole working expenses are from 3d. to 4d. [6 to 8 cts.] per train-mile. The speed is 10 miles an hour.

Amongst early electrical railways Mr. Volk's short line on the beach at Brighton deserves mention. There the rails themselves act as conductors, and are insulated only by wooden sleepers lying on the shingle. The line has been in operation since 1883, with a working expense of only 2d. per car-mile.

Other English and Continental lines will be referred to later; it is, however, in America that electrical traction has hitherto found its widest development. In 1880 Mr. Edison ran an electric locomotive on an experimental track near his laboratory at Menlo Park. Soon after the Chicago exhibition of 1883, at which an electric railway was shown in action, a large number of permanent lines were established. There are now more than twenty electrical tramways at work in the United States, under the patents of Edison, Field, Daft, Van Depoele, Sprague, and others. Many more lines are projected, and experiments are in progress on the application of electrical traction on a large scale to the elevated railways of New York.

In all the instances which have been referred to above, electricity is employed as a means of transmitting power as it is wanted from a generating station to the cars, through a conductor extending along the track. Another method of

the New York Religious Tract Society, formed in 1812, and the New England Tract Society in 1814 became prominent. The latter in 1823 changed its name to the American Tract Society with headquarters at Boston. In May, 1825, it was merged in a new organization, bearing the same name, but formed from a wider constituency, and having its publication-house in New York. At first this society issued only tracts, but in 1827 it began to publish books, in 1843 a monthly paper, in 1852 the *Child's Paper*, and in 1871 the *Illustrated Christian Weekly*. The publication of the latter has since been transferred to other hands. In 1858 the American Tract Society, Boston, resumed its separate work when the main society had suppressed everything bearing on the slavery question. In 1878 a coalition was again formed. The Western Tract and Book Society, Cincinnati, which had been distinctively anti-slavery, is now an auxiliary in the general work. Besides tracts, books, and periodicals in English, the American Tract Society has issued similar literature in German, French, Spanish, Portuguese, Italian, Swedish, Dutch, Danish, Welsh, Finnish, and Hungarian, for the use of immigrants. It has also contributed for the printing of approved works at foreign mission stations Its list of publications comprises 5000 tracts and over 1500 volumes. The total circulation has been not less than 30,000,000 volumes and 450,000,000 tracts. The Methodist Book Concern, which dates from 1789, has also published many tracts for colportage, and the tendency in the United States seems to be away from union and towards separate denominational presses for evangelistic work.—Am. Ed.]

Electric traction by storage batteries.

effecting electric traction is to carry a store of energy on the car or on a special locomotive, by using secondary batteries which are charged from time to time at the generating station. This system, which was introduced in England by Mr. Reckenzaun and on the Continent by M. Julien, has been successfully employed on several lines.

The system of storage, by means of secondary batteries, has the great advantage over the system of transmission through a conductor that it makes each car independent and that it is applicable to ordinary tramway lines. As regards economy of power, we have in the storage system a more complex series of transformation of energy, and therefore a larger number of items of loss. In both systems alike we have a certain loss of energy at the dynamo and at the motor. A secondary battery yields in the electrical form only about 70 per cent. of the energy given to it. In comparing the two methods, the loss which this involves has to be set off against that which occurs in the transmission system in the process of conduction, an item which may be very small in favorable cases, but which becomes large when there are many cars to be driven, when the line is long, and when, owing to the use of an exposed conductor, the electromotive force has to be kept low. Under average conditions it is probable that the conductor system has a slight advantage over the other in this respect, but the difference is not material, especially as the cost of power is a comparatively small part of the whole working expense of a line. The difference is slightly affected by the fact that in the storage system there is an extra weight to be carried—namely, the batteries—amounting to about ¼ or ⅕ of the whole weight, and the tractive force required to overcome friction is increased in a corresponding degree. A serious objection to the storage system is the probable cost of renewing batteries. In respect, however, both of durability and of power (in relation to weight) secondary batteries have of late undergone a marked improvement; and it is likely that the storage system will prove the most applicable to tramways in city streets, where conductors on the level of the road are impracticable and overhead conductors would not be permitted.

Classification of systems.

The existing methods of electrical traction as applied to tramways may be classified as follows:

I. Motor driven by storage batteries, the batteries and motor being carried either (*a*) in the car itself or (*b*) on a separate truck forming a locomotive. Reckenzaun's and Julien's cars, in which the batteries are under the seats, are examples of the first plan, which is in operation on lines at Antwerp, Hamburg, Brussels, and New York. Mr. Elieson's tramway locomotive working in London on the North Metropolitan tramways is an example of the second plan. It is obviously preferable, when space can be found on the car itself for the motor and batteries, to place them there rather than on a separate truck. When a separate locomotive is used it must be heavy enough to grip the rails, and the whole weight to be drawn is then considerably greater.[1]

II. Conductor systems, which may be classified thus:

(*a*) Those using the ordinary rails as the only conductors. The lines at Lichterfelde and Brighton, already mentioned, are examples of this plan, which is quite inapplicable where the rails are laid flush with the roadway as in city streets.

(*b*) Those using a third (insulated) rail above ground. To this class belong the Portrush, the Bessbrook, and several American lines. This plan, like the last, is not applicable to city streets.

(*c*) Those using one (or in some cases two) overhead conductors. A line of this type has been successfully worked between Mödling and Hinterbrühl, near Vienna, and another between Frankfort and Offenbach, both since 1884, at a cost of about 3½d. per car-mile. The conductors consist of slotted tubes 1 inch in bore supported on posts 18 feet high and stayed by wires at intermediate points to keep them from sagging. The contact carriages are pistons sliding in the tubes.[2] The Daft lines at Baltimore and other places in America and the Van Depoele lines, of which some 30 miles are in operation, are mostly worked by means of overhead conductors.

(*d*) Those using underground conductors in a slotted channel or conduit. This system, which has the obvious advantage that the conductor is placed entirely out of the way of street traffic, has been introduced at Blackpool by Mr. Holroyd Smith, and, in America, at Cleveland by Messrs. Bentley and Knight and at Philadelphia by Mr. Schlesinger. In the Blackpool line the conductor is split into two parts which run parallel to each other within the conduit on its two sides, and are touched by a contact arm which reaches down through a narrow central slot at the level of the street; an electromotive force of 200 volts is employed. The conduit is placed midway between the rails, but it may be questioned whether, in view of the conditions of ordinary street traffic, a better place for it would not be at one side. Mr. Field has proposed a tramway with two conduits, one beside each rail, containing two conductors, one to be charged positively and the other negatively, so that a comparatively high resultant difference of potential is available for the motor although the potential of neither conductor differs to a dangerous degree from that of the earth.

(*e*) One system remains to be described, which was proposed in 1881 by Messrs. Ayrton and Perry as specially applicable to electric railways of considerable length, in which an exposed conductor would give rise to much loss through leakage. Their plan is to use a well-insulated conductor in a closed channel underground. The line is divided into short sections; each of these has an exposed conductor, which may be one of the rails, and this is placed in temporary contact with the insulated conductor as the train passes, by the pressure of the wheels on a flexible rail or stud, or by means of automatic electromagnetic switches. Leakage is thus restricted to the continuous and well-insulated conductor together with that section of the surface conductor which is in contact with the former at any one time; and the system has the further advantage that it gives the means of providing an automatic block by which successive trains are kept from overtaking one another.

The form and disposition of the motor-dynamo and the mode by which it is connected with the driving-axle of the car are matters in which much variety of practice exists. The question of gearing is complicated by the fact that the frame of the car oscillates vertically with respect to the axles. Spur-wheels, worm-gear, friction-gear, belts, multiple-band gear, and chain-gear are or have been used. Mr. Reckenzaun's car is carried by two bogie trucks, one under each end, and each bogie carries a motor whose axle, placed longitudinally, drives a central spur-wheel on one axle of the bogie by means of a worm. An advantage possessed by two motors is that, by coupling them in series or parallel, or by using one only, the driver is able to command different grades of power without the use of resistance coils. In cars driven by storage batteries the same object may be secured by various groupings of the cells.

Telpherage.

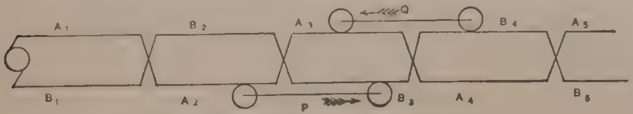
Telpherage.—In all the methods of electrical traction to which reference has been made the road on which the cars run is esentially a railway or tramway of the kind used in horse traction and steam traction. In 1881 the late Prof. Fleeming Jenkin devised a system of electric locomotion in which the vehicles are hung upon what resembles an exaggerated telegraph line. To this he gave the name of *telpherage*. As developed by the inventor, in conjunction with Messrs. Ayrton and Perry, the system is especially adapted to the transport of goods at a slow speed, in localities where the traffic would be insufficient to support an ordinary railway.

The telpher line is a steel rod or cable, suspended from brackets on posts about 70 feet apart; it serves at once as carrier of weights and conductor of electricity. The line may be made rigid, and in that case a high speed of transit may be attained; but in general the line is flexible and the trains travel slowly in what may be, if the volume of traffic requires it, a nearly continuous stream. Each train consists of a series of buckets or skeps which hang each from a single running wheel or pair of wheels, and are spaced by wooden connecting bars. A small electric motor, which hangs below the line and is geared by spur and chain gearing to a pair of driving-wheels, forms the locomotive. In general, the line is electrically divided into equal sections, which have the same length as a single train, so that the front carriage is always on the section in advance of the rear carriage. The train is furnished with a continuous conductor from end to end, through which it makes electric contact between the section in front and the section behind, and the motor is included in the circuit of this conductor. Two systems of working are used, which enable trains to be run either in electrical series or "parallel." In the series system the successive sections of the line are electrically connected, so long as no train is on them, by means of switches at the joints between the sections, so that the whole forms one continuous conductor. When a train comes on any one section it breaks contact at the joint between that section and the one behind it; the circuit, however, remains closed through the conductor on the train itself, and in this way the motor receives the current which is passing through the line. Other trains at other places in the line receive the same current, each by breaking for the time the ordinary contact between the two sections it touches, and substituting a contact through its own conductor and motor. When a train leaves a section it replaces the switch that makes contact with the section behind. If, however, there are more than one train on the line, an automatic block system is added to prevent one from overtaking another by letting the section which a train leaves stand insulated for a time. No control is exercised from the vehicles themselves; in fact, the trains run without attendants. In the simplest parallel system of telpherage a continuous conductor distinct from the line is stretched alongside of it; the trains make contact between the two. The figure shows another plan, known as the cross-over parallel system, which is suitable where a double line of trains is desired. There A_1, B_2, A_3, . . . form successive sections of one line, and B_1, A_2, B_3 . . . of another. A_1, A_2, A_3 . . . are electrically continuous, and are connected to one pole of the dynamo. B_1, B_2, B_3 . . . are also continuous, and are connected to the other pole. Thus the sections of each line are alternately positive and negative. Any train, such as P or Q, bridges the gap between two sections and receives a current which suffers reversal as the train passes from one section to the next. It is to be regretted that space does not admit of any description of the details of telpherage, many of which present the utmost ingenuity. The system was shown to be practicable by experiments on an experimental line at Weston. The first telpher line on a commercial basis was erected in 1885 at Glynde, in Sussex, and has been maintained in operation notwithstanding many difficulties inseparable from so completely novel an undertaking.

---

[1] For a comparison of the weights to be drawn and the tractive force required in different systems, see a paper by Mr. Reckenzaun, *Elect. Rev.*, May 21, 1886.

[2] For details of the construction and working expenses of these and other lines, see the valuable paper by Mr. Reckenzaun, *Jour. Soc. of Arts*, April 20, 1887. Statistics of American lines will be found in a paper by T. C. Martin, read before the American Institute of Electrical Engineers, May 18, 1887.



Cross-over Parallel System of Telpherage.

Propulsion of boats.

The electrical propulsion of boats by means of storage batteries, has been the subject of several successful experiments, but has not found systematic application. In this connection reference should be made to a scheme proposed by Ayrton and Perry for the haulage of boats on canals or of wagons upon roads. Their proposal was to have a conductor ranged along the towing path, or along the side of the road. A motor running on this was to pull itself along and drag the boat or wagon after it.

Aerial navigation.

In aerial navigation, storage batteries working an electric motor have been used to drive the propeller of a "dirigible" balloon.

Theory of motors.

Space does not admit of more than the briefest reference to the theory of electric motors. A motor may be regarded as a dynamo acting to produce an electromotive force e which is opposite in direction to the externally impressed electromotive force E. The resultant electromotive force is $E - e$, and on this, together with the resistance of the circuit, the strength of the current C depends. The electrical power supplied is CE, and of this the motor utilizes Ce. The efficiency is e/E. It is easily seen, as was first shown by Jacobi, that the power developed by the motor (Ce) is a maximum when $e = \frac{1}{2} E$. But this condition of maximum power involves that half the energy supplied is wasted; to secure higher efficiency, motors are in practice run at much less than their maximum power, so that e may approach more nearly to equality with E. The field magnets of motors, like those of dynamos, may be wound with coils in series with the armature coil, or with coils forming a shunt to the armature, or with a combination of both. A very important part of the theory deals with the automatic regulation of speed by the use of compound winding. In a paper of fundamental importance with regard to this part of the subject, Messrs. Ayrton and Perry[1] have shown that a motor may be made to run at constant speed under varying loads when the external electromotive force is constant, provided that a differential combination of direct shunt and reverse series winding be employed,—the shunt coil serving to energize the magnets and the series coil to reduce their magnetism to a certain extent when the current in the armature is increased. The proportion of series to shunt winding necessary for this result depends on the relation of the resistance of the armature to that of the shunt coil, and it is an easy deduction from the theory that, when the resistance of the armature is negligibly small, the speed of a simple shunt-wound motor driven by means of a constant external electromotive force is sensibly constant, a result which has been experimentally demonstrated by Mr. Mordey (*Phil. Mag.*, Jan., 1886). It is shown in the same paper that a similar means of governing may be used when the current passing through the motor is kept constant, instead of the external electromotive force. The principle of differential compound winding to secure automatic regulation of speed has been applied in several American motors, notably by Mr. Sprague.

Details of most of the electrical tramways and railways mentioned in the text will be found in the journals *Electrical Review*, *Electrician*, and *Electrical World* (New York) of the dates referred to. See also *The Electric Motor and its Applications*, by T. C. Martin and J. Wetzler (New York, 1887). The Portrush line is described by E. Hopkinson and A. Siemens in a paper read before the Society of Arts, April, 1883. For telpherage, in addition to articles in the journals named, see Fleeming Jenkin, "On Telpherage," *Jour. Soc. Arts*, May, 1884; also *Professional Papers* of the corps of Royal Engineers, Chatham, vol. x. 1884.

(J. A. E.)

TRACY, ANTOINE LOUIS CLAUDE DESTUTT, COMTE DE (1754–1836), was born in Bourbonnais on July 20, 1754. The noble family to which he belonged was of Scottish descent, tracing its origin to Walter Stutt, a gentleman who in 1420 accompanied the earls of Buchan and Douglas to the court of France, and whose family afterwards rose to be counts of Tracy. The father of Destutt de Tracy (as he is usually called) was a soldier, and died a field-marshal. Destutt de Tracy began his studies under the superintendence of his mother, and afterwards prosecuted them at the university of Strasburg. During his student days, however, he was chiefly noted for his skill in every kind of manly exercise. On leaving the university he embraced a military career, in which his advance was rapid. When the Revolution broke, Tracy, who was then thirty-five years of age, took an active part in the provincial assembly of Bourbonnais. He was elected a deputy of the nobility to the states-general, where he sat alongside of his friend La Fayette. In the spring of 1792 he received the rank of field-marshal, along with the sole command of the cavalry in the army of the North; but, as the conduct of affairs fell more and more into the hands of the extremists, he took an indefinite leave of absence, and settled with his family at Auteuil. Here, in the society of Condorcet and Cabanis, he devoted himself to scientific studies. Under the Reign of Terror he was arrested and imprisoned for nearly a year. It was his solitary meditations at this period, we are told, which discovered to him his true bent. Under the influence of Locke and Condillac he abandoned the natural sciences for the study of mind. On the motion of Cabanis he was named associate of the Institute in the class of the moral and political sciences. He soon began to attract attention by the *mémoires* which he read before his colleagues—papers which formed the first draft of his comprehensive work on ideology. The society of "ideologists" at Auteuil embraced, besides Cabanis and Tracy, who have been called respectively the physiologist and the metaphysician of the school, Volney, who has been called its moralist, and Garat, its professor in the National Institute. Under the empire he was a member of the senate, but took little part in its deliberations. Under the Restoration he became a peer of France, but protested against the reactionary spirit of the Government, and remained in opposition. In 1808 he was elected a member of the French Academy in room of Cabanis, and in 1832 he was also named a member of the Academy of Moral Sciences on its reorganization. He appeared, however, only once at its conferences. He was old and nearly blind, and filled with sadness, it is said, by the loss of his friends and the discredit into which his most firmly cherished opinions had fallen. "His only distraction was to have Voltaire read aloud to him." He died at Paris on the 9th of March, 1836.

---

[1] "Electromotors and their Government," *Jour. Soc. Tel. Eng.*, 1883.

Destutt de Tracy was the last eminent representative of the sensualistic school which Condillac founded in France upon a one-sided interpretation of the doctrines of Locke. He pushed the sensualistic principles of Condillac to their last consequences, being in full agreement with the materialistic views of his friend Cabanis, though the attention of the latter was devoted more to the physiological, that of Tracy to the psychological or "ideological" side of man. His ideology, he frankly stated, formed "a part of zoology," or, as we should say, of biology. To think is to feel. The four faculties into which he divides the conscious life—perception, memory, judgment, will—are all varieties of sensation. Perception is sensation caused by a present affection of the external extremities of the nerves; memory is sensation caused, in the absence of present excitation, by dispositions of the nerves which are the result of past experiences; judgment is the perception of relations between sensations, and is itself a species of sensation, because if we are aware of the sensations we must also be aware of the relations between them; will he identifies with the feeling of desire, and therefore includes it as a variety of sensation. It is easy to see that such conclusions ignore important distinctions, and are, indeed, to a large extent an abuse of language. As a psychologist Destutt de Tracy deserves credit for his distinction between active and passive touch, which has developed into the modern theory of the muscular sense. His account of the notion of external existence, as derived, not from pure sensation, but from the experience of action on the one hand and resistance on the other, may be compared with the account of Bain and later psychologists. Tracy worked up his separate monographs extending over a number of years into the *Éléments d'Idéologie* (1817-18 and 1824-25), which presents his complete doctrine. He also wrote in 1806 a *Commentaire sur l'Esprit des Lois de Montesquieu*, in which he argues ably in support of a free constitution on grounds which hardly admit of being harmonized with his general philosophical principles. The book was translated in America by his friend President Jefferson, who recommended it for use in the colleges. The first French edition appeared in 1817, and it was several times reprinted.

TRADE, BOARD OF. The greater part of such supervision of commerce and industry as exists in the United Kingdom is exercised by the "Committee of Privy Council for Trade" (see PRIVY COUNCIL), or, as it is usually called the Board of Trade. As early as the 14th century councils and commissions had been formed from time to time to advise parliament in matters of trade, but it was not till the middle of the 17th century, under the Commonwealth, that any department of a permanent character was attempted. Cromwell's policy in this respect was continued under the Restoration, and in 1660 a committee of the privy council was appointed for the purpose of obtaining information as to the imports and exports of the country, and improving trade. A few years later another committee of the council was appointed to act as intermediaries between the crown and the colonies, or foreign plantations as they were then called. This joint commission of trade and plantations was abolished in 1675, and it was not until twenty years later that the Board of Trade was revived under William III. Among the chief objects set before this board were the inquiry into trade obstacles and the employment of the poor; the state of the silver currency was also a subject on which John Locke, its secretary, lost no time in making representations to the Government. Locke's retirement in 1700 removed any chance of the Board of Trade advocating more enlightened opinions on commercial subjects than those generally held at that time. It had only a small share in making the constitutions of the colonies, as all the American ones except Georgia and Nova Scotia were formed before the reign of Charles II.; and in 1760 a secretary of state for the colonies was appointed, to whom the control drifted away. In 1780 Burke made his celebrated attack on the public offices, which resulted in the abolition of the board. In 1786, however, another permanent committee of the privy council was formed by order in council, and with one or two small exceptions the legal constitution of the Board of Trade is still regulated by that order. Under it all the principal officers of state, including the first lords of the treasury and admiralty, the secretaries of state, and certain members of the privy council, among whom was the archbishop of Canterbury, obtained seats at the board *ex officio*; and ten unofficial members, including several eminent statesmen, were also placed on the committee. The duties of the revived board were made the same as they were in the beginning of the century, but, in addition, the regulation of the food supply of the country, by restricting or relaxing the export and import of corn, was brought into prominence owing to a larger population requiring to be fed. New duties were thrown on the board by the growth of joint-stock companies, the development of railways, and the increase in shipping, and it was necessary to break it up into departments charged with the administration of the various Acts of Parliament. The Board of Trade thus became a mere name, the president being practically the secretary of state for trade, and the vice-president became, in 1867, a parliamentary secretary, with similar duties to those of a parliamentary under-secretary of state. At present, besides the president, who has usually a seat in the cabinet, the parliamentary secretary, and a permanent secretary, there are six assistant secretaries, each in charge of a department.

1. *The Commercial Department* is the real remains of the original Board of Trade, as it combines the charge of the trade statistics with the general consultative duties with which King Charles II.'s board was originally entrusted. The statistical work includes compiling the abstracts relating to the United Kingdom, the colonies, and foreign countries, the supervision of the trade accounts, and the preparation of shipping, railway, emigration, and fishery statistics. A record of the prices of corn has been obtained from actual sales in the chief market towns for about a hundred years, the original object being the sliding scale of corn duties, but these are now continued to govern the tithe payments, and form an unbroken series of prices based on actual transactions, and not mere market quotations. Foreign and colonial customs tariffs and regulations are also matters on which information is published, and labor statistics are for the future to have special attention. In 1872 one of the most important functions of the commercial department, viz., the negotiation of commercial treaties, was transferred to the Foreign Office, but the Board of Trade is still consulted on these matters by the Foreign Office, as well as by the Colonial Office on colonial commercial matters, and by the other public departments. The Bankruptcy Act of 1883 added a new branch of work, but for this there is now a separate establishment under an inspector-general. The last new work undertaken by the department is the publication (begun August, 1886) of a *Monthly Journal* of commercial information, chiefly from official sources.

2. *The Railway Department* was originally constituted in 1840, and performs multifarious duties under various Railway Acts, including the inspection of railways before they are open, inquiries into accidents, reports on proposed railways, approval of by-laws, appointment of arbitrators in disputes, as well as many duties under private Railway Acts. The inspection of tramways, their by-laws and "provisional orders," are all dealt with here, as are similar orders relating to gas and water schemes and to electric lighting. Patents, designs and trade-marks are now dealt with by the Patent Office, which is subordinate to the railway department, and copyright, art unions, and industrial exhibitions are also among the matters dealt with by the department.

3. *The Marine Department* was created a separate branch of the Board of Trade in 1850, about which time many new and important marine questions came under the Board of Trade, such, for example, as the survey of passenger steamers, the compulsory examination of masters and mates, the establishment of shipping offices for the engagement and discharge of seamen. Further work fell to the marine department by the Act of 1853, which gave it the control of lighthouse funds, and to a certain extent of pilotage. The consolidating Merchant Shipping Act of 1854 and subsequent legislation so much increased the department that in 1866 it was divided into three, viz., the present marine department, which deals with ships and seamen, the harbor department, and the finance department.

4. *The Harbor Department* was, as stated above, a branch of the marine department until 1866, so far as it is connected with the physical adjuncts of navigation, but various other matters have since been added, *e.g.*, the charge of the foreshores belonging to the crown, formerly managed by the commissioners of woods and forests, and the protection of navigable harbors and channels, long under the control of the Admiralty. Lighthouse funds, provisional orders for oyster and mussel fisheries, the management of Holyhead and Ramsgate harbors and of Dover pier, wreck, and quarantine are all among the matters dealt with by this department, which also has charge of the standards department for weights and measures.

5. *The Finance Department* was, like the harbor department, separated in 1866 from the marine department. The accounts of all the branches of the Board of Trade are in its charge, including the subordinate offices. It also deals with the accounts of harbors, lighthouses, and mercantile marine offices, and of the merchant seamen's fund, and with the consul's accounts for disabled seamen abroad. Savings banks and seamen's money orders are also among the accounts and payments with which it is charged, and outside these marine matters it has to prepare for parliament the life insurance companies' accounts and to take charge of the bankruptcy estate accounts.

6. *The Fisheries Department.*—By a recent Act the powers of the Home Office over salmon and other fisheries have been transferred to the Board of Trade, and a small department has consequently been created charged with the care of those industries.[1]

TRADE-MARKS. There seems no reason to doubt that the practice of employing a mark to denote the goods of a particular trader (not necessarily the manufacturer) grew out of the use of signs, which, first affixed to the dealer's shop, were afterwards represented on his tokens, and eventually placed on the goods themselves. Trade-marks proper appear to have been in use in England in the reign of Elizabeth. The first reported case was in 1783, when Lord Mansfield decided that the sale by the defendants of a certain medicine under the name or mark of the plaintiff was a fraud. By other decisions it was affirmed that the use of another's trade-mark was actionable, even without the intent to defraud. The law, however, remained in an unsatisfactory condition till, by the Merchandise Marks Act in 1862, it was made a misdemeanor to forge or counterfeit a trade mark, while penalties were inflicted for the sale of articles bearing a forged mark.

In 1875 the Trade Marks Registration Act established for the first time a registry of trade-marks in Britain, greatly facilitating the proof of title. A more precise definition of a trade-mark was also provided. In 1883 this Act was repealed by the Patents, Designs, and Trade Marks Act, in which its principal provisions were incorporated. All proceedings for the registration of trade-marks are now regulated by the Patents Act. A trade-mark may be a name printed or otherwise delineated in some particular or distinctive manner, or a signature, or a device, mark, brand, etc. Registration is compulsory, at least in the sense that the owner cannot prevent infringement or sue for damages for infringement unless he has registered, though it would appear that this disability exists only in the case of a mark capable of being registered under the Act. There are certain *indicia* which cannot be registered because they do not fall within the definition of a trade-mark, but which may yet be protected at equity. Registration is deemed equivalent to public use of the mark, and, after the expiration of five years, is conclusive evidence of right to exclusive use. Applications for registration have to be addressed to the comptroller of patents; should he refuse to register, there is an appeal to the Board of Trade. If there is opposition, the matter goes to the High Court of Justice. Registration holds good for fourteen years, at the end of which time it has to be renewed. Special provision is made in the Act for the retention of certain of the ancient privileges of the Cutlers Company of Sheffield. The total number of marks now upon the register is nearly 50,000.

The Customs Consolidation Act, 1876, forbids the importation of articles of foreign manufacture bearing any mark purporting to be the mark of manufacturers resident in the United Kingdom, or stating or implying that such articles were manufactured in the United Kingdom. The Merchandise Marks Act, 1887, consolidated and amended the law of offences relating to trade-marks and trade descriptions. It repealed the Act of 1862 and replaced it by fuller provisions. It is now an offence to forge a trade-mark, to falsely apply to goods any trade-mark or any mark so nearly resembling a trade-mark as to deceive, to make any die, etc., for the purpose of forging or for being used for forging a trade-mark, to apply any false trade description to goods, to dispose of or have in possession any die, etc., for the purpose of forging a trade-mark, or to cause any of the above-mentioned things to be done. There are special sections in the Act dealing with its application to watches and watch-cases. Where a watch-case is of foreign manufacture it must, if stamped at an assay office in the United Kingdom, bear a mark differing from the mark placed upon watches manufactured in the United Kingdom. A warranty is applied in the sale of goods bearing a trade-mark or trade description. See WARRANTY.

In most foreign countries provisions have long existed for the registration of trade marks; and they also form one of the classes of "industrial property" for the protection of which an international convention was formed in 1883. This convention now includes sixteen states,—the more important being Belgium, France, Great Britain, Italy, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, and the United States. The subjects of all the contracting states enjoy in each state the same rights and privileges as that state grants to its own subjects for the protection of trade-marks. Registration also in one of the states confers certain rights of priority in the others.

United States.—The legislation of the different States and Territories varies considerably, some providing for the registration of trade-marks either with or without protection for unregistered trade-marks, while others provide only for protection without registration. On March 3, 1881, Congress passed an Act "to authorize the registration of trade-marks and protect the same," which provides that owners of trade-marks used in commerce with foreign nations or with the Indian tribes, provided such owners be domiciled in the United States or located in any foreign country or tribe which affords similar privileges to citizens of the United States, may obtain registration of trade-marks under the Act. Registration is not compulsory; failure to register a trade-mark, or to renew registration, does not deprive the owner of any remedy he might have at law or in equity; and the courts will, generally speaking, protect the unregistered equally with the registered.

For fuller information see L. B. Sebastian's *Law of Trade Marks*, or R. W. Wallace's edition of the Patents, Designs, and Trade Marks Act; and in America Rowland Cox's *American Trade-Mark Cases*, Cox's *Manual of Trade-Mark Cases*, and William Henry Brown's *Treatise on the Law of Trade Marks.*

TRADE UNIONS are combinations for regulating the relations between workmen and masters, workmen and workmen, or masters and masters, or for imposing restrictive conditions on the conduct of any industry or business. By the common law all such combinations were, with certain rare and unimportant exceptions, regarded as illegal. They were considered to be contrary to public policy, and were treated as conspiracies in restraint of trade. Those who were engaged or concerned in them were liable to be criminally prosecuted by indictment or information, and to be punished on conviction by fine and imprisonment. The offence was precisely the same whether it was committed by masters or by workmen. But, although the provisions of the common law applied *mutatis mutandis* to both of them alike, it was, practically speaking, in reference rather to the latter than to the former that their effects were developed and ascertained. While it was held to be perfectly lawful for workmen, as individuals, to consent or to refuse to labor for any remuneration or for any time they pleased, when two or more of them joined together, and agreed to labor only on certain stipulated terms with respect either to the payment or the duration of their labor, they were guilty *ipso facto* of a misdemeanor. It was immaterial whether the end they had in view was to determine wages or to limit work; or whether the means they adopted for promoting its attainment was a simultaneous withdrawal from employment, an endeavor to prevent other workmen from resuming or taking employment, or an attempt to control the masters in the management of their trade, the engagement of journeymen or apprentices, or the use of machinery or industrial processes; or whether in seeking to enforce their demands they relied merely on advice and solicitation, or resorted to reproach and menace, or proceeded to actual violence. In any event their combination in itself constituted a criminal conspiracy, and rendered them amenable to prosecution and punishment. From the reign of Edward I. to the reign of George IV. the operation of the common law was enforced and enlarged by between thirty and forty Acts of Parliament, all of which were more or less distinctly and explicitly designed to prohibit and prevent what we have learned to describe and recognize as the "organization of labor." But the rise of the manufacturing system towards the end of the last century, and the revolution which accompanied it in the industrial arrangements of the country, were attended by a vast and unexpected extension of the movement which the legislature had for so long and with so much assiduity essayed to suppress. Among the multitudes of workmen who then began to be employed in single factories or in neighboring factories in the same towns, trade unions in the form of secret societies speedily became numerous and active, and to meet the novel requirements of the situation a more summary method of procedure than that which had hitherto been available was provided by the 40th Geo. III. cap. 106. By this statute, passed in 1800, it was enacted that all persons combining with others to advance their wages or decrease the quantity of their work, or in any way to affect or control those who carried on any manufacture or trade in the conduct and management thereof, might be convicted before one justice of the peace, and might be committed to the common jail for any time not exceeding three calendar months, or be kept to hard labor in the house of correction for a term of two calendar months. The discontent and disorder of which, in conjunction with a state of commercial depression and national distress, the introduction of steam and improved appliances generally into British manufactures was productive in the first quarter of the current century led to the nomination of a select committee by the House of Commons, to inquire into the whole question of what were popularly and comprehensively designated the "combination laws," in the session of 1824. After taking evidence, the committee reported to the House that "those laws had not only not been efficient to prevent combinations either of masters or workmen, but on the contrary had, in the opinion of many of both parties, had a tendency to produce mutual irritation and distrust, and to give a violent character to the combinations, and to render them highly dangerous to the peace of the community." They further reported that in their judgment "masters and workmen should be freed from such restrictions as regards the rate of wages and the hours of working, and be left at perfect liberty to make such agreements as they mutually think proper." They therefore recommended that "the statute laws which interfered in these particulars between masters and workmen should be repealed," and also that "the common law under which a peaceable meeting of masters or workmen might be prosecuted should be altered." In pursuance of their report, the 4th Geo. IV. cap. 95 was at once drafted, brought in, and passed. But the immediate results of the change which it effected were regarded as so inconvenient, formidable, and alarming that in the session of 1825 the House of Commons appointed another select committee to reexamine the various problems, and review and reconsider the evidence which had been submitted to their predecessors in the previous year. They reported without delay in favor of the total repeal of the 4th Geo. IV. cap. 95, and the restoration of those provisions of the combination laws, whether statutory or customary, which it had been more particularly intended to abrogate. The consequence was the enactment of the 6th Geo. IV. cap. 129, of which the preamble declares that the 4th Geo. IV. cap. 95 had not been found effectual, and that combinations such as it had legalized were "injurious to trade and commerce, dangerous to the tranquillity of the country, and especially prejudicial to the interests of all who were concerned in them." The effect of the 6th Geo. IV. cap. 129 was to leave the common law of conspiracy in full force against all combinations in restraint of trade, except such as it expressly exempted from its operation, as it had been before the 4th Geo. IV. cap. 95 was passed. It comprised, however, within itself the whole of the statute law relating to the subject, and under it no persons were liable to punishment for meeting together for the sole purpose of consulting upon and determining the rate of wages or prices which they, being present, would require for their work or pay to their workmen, or the hours for which they would work or require work in any trade or business, or for entering into any agreement, verbal or written, for the purpose of fixing the rate of wages or prices which the parties to it should so receive or pay. But all persons were subjected to a maximum punishment of three months' imprisonment with hard labor who should by violence, threats or intimidation, molestation, or obstruction do, or endeavor to do, or aid, abet, or assist in doing or endeavoring to do, any of a series of things inconsistent with freedom of contract which the Act enumerated and defined. Afterwards, in order to remove certain doubts which had arisen as to the true import and meaning of the words "molestation" and "obstruction," it was provided by the 22d Vict. cap. 34 that "no person, by reason merely of his endeavoring peaceably and in a reasonable manner, and without threat or intimidation direct or indirect, to persuade others to cease or abstain from work, in order to obtain the rate of wages or the altered hours of labor agreed to by him and others, should be deemed to have been guilty of 'molestation' or 'obstruction.'" In spite of the partial recognition which trade unions had thus received, they continued to be unlawful, although not necessarily criminal, associations. In certain cases, they were by statute exempted from penal consequences, and their members were empowered to combine for specified purposes, and to collect funds by voluntary contributions for carrying them into effect. But in the estimation of the common law the special privileges which had been accorded to them under particular circumstances did not confer any general character of legality upon them, and where their rules were held to be in restraint of trade, as in the prohibition of piece-work or the limitation of the number of apprentices, they were still regarded as conspiracies. Hence they were practically excluded from the advantages in regard to the security of their property and the settlement of their disputes which, under the Friendly Societies Act, 18th and 19th Vict. cap. 63, had been granted to all associations established for any purposes which were not illegal. In this condition the law was when what became notorious as the "Sheffield and Manchester outrages" suggested the appointment of the royal commission on trade unions, which investigated the subject from 1867 to 1869. The outcome was, first, a temporary measure for the more effectual protection of the funds of trade unions, passed in 1869, and, secondly, the two measures which, as amended and amending, are cited together as the "Trade Union Acts 1871 and 1876"—the 34th and 35th Vict. cap. 22 and the 39th and 40th Vict. cap. 31.

---

[1] [In the United States boards of trade, chambers of commerce, and cotton, coal, metal, produce, and other exchanges are voluntary associations to promote the business interests of their members. They exist in all the principal cities and towns. Most of them publish Reports, Statistics, etc.—AM. ED.]

By these statutes, construed with the Conspiracy and Protection of Property Act, 1875, the 38 and 39 Vict. cap. 86, the law relating to combinations, whether of workmen or of masters, assumed the shape in which it exists at the present time. In connection with trade disputes no person can now be prosecuted for conspiracy to commit an act which would not be criminal if committed by him singly, and consequently employers and employed alike may lawfully do in combination all that they would be entitled to do as individuals. The purposes of a trade union are not to be deemed illegal merely because they are in restraint of trade, and the circumstance that they are in restraint of trade is not to render any member of it liable to prosecution, nor is it to avoid or make voidable any agreement or trust relating to it. No court, however, can entertain legal proceedings with the object of directly enforcing or recovering damages for the breach of an agreement between the members of a trade union as such, concerning the conditions on which the members for the time being shall or shall not sell their goods, transact their business, employ or be employed, or the payment by any person of any subscription or penalty to a trade union, or for the application of the funds of a trade union to provide benefits or to furnish contributions to any employer or workmen not a member of such trade union in consideration of such employer or workman acting in conformity with the rules or resolutions of such trade union, or to discharge any fine imposed upon any person by any court of justice or any agreement made between one trade union and another, or any bond to secure such agreements. But such incapacity to sue on such agreements is not to be taken as constituting any of them illegal. Every person, however, commits a misdemeanor, and on conviction is liable to a maximum fine of £20 [$97.20], or to a maximum imprisonment of three months with hard labor, who wilfully and maliciously breaks a contract of service or hiring, knowing, or having reasonable cause to believe, that the probable consequence of his so doing, either alone or in combination with others, will be to endanger human life or cause serious bodily injury, or to expose valuable property, whether real or personal, to destruction or serious injury; or who, being employed by a municipal authority or by any company or contractor on whom is imposed by Act of Parliament, or who have otherwise assumed, the duty of supplying any place with gas or water, wilfully and maliciously breaks a contract of service or hiring, knowing, or having reasonable cause to believe, that the probable consequence of his so doing, alone or in combination with others, will be to deprive the inhabitants of that place, wholly or in part, of their supply of gas or water; or who, with a view to compel any other person to do or to abstain from doing any act which such other person has a right to abstain from doing or to do, wrongfully and without legal authority uses violence to or intimidates such other person or his wife or children, or injures his property; or who persistently follows such person about from place to place; or who hides any tools, clothes, or other property owned or used by such other person, or deprives him of or hinders him in the use thereof; or who watches or besets the house or other place where such person resides or works or carries on business or happens to be, or the approach to such house or place; or who follows such other person with two or more other persons in a disorderly manner in or through any street or road. But attending at or near the house or place where a person resides or works or carries on business in order merely to obtain or communicate information is not watching or besetting within the statute. In regard to registration, trade unions are placed on a similar footing with friendly and provident and industrial societies, and they enjoy all the privileges, advantages, and facilities which those associations possess and command. On their side, however, they have to comply with the same conditions, are subject to the same liabilities, and are compelled to make the same periodical returns.

Although there are several large and influential societies among the employers of labor which come within the legal definition of trade unions, what are commonly as well as more accurately meant by trade unions are societies exclusively composed of the employed,—the suppliers of labor whether skilled or unskilled. Of trade unions in this sense,—those of which the members are all artisans or laborers,—the organization is everywhere pretty much the same, although the rules and regulations of various associations differ in detail more or less distinctly and widely from one another. Their ordinary constitution is that of a society divided into districts, and again into smaller local bodies. The seat of the governing authority—the general or executive council—is usually fixed at some large centre of industry or commerce, as London, Manchester, or Birmingham, and it is often changed at stated intervals by a vote of the society at large. It is the policy of the trade unions, by this method of organization, to extend the area of their influence, and so to increase their power in dealing with the masters or in controlling their own members in any emergency. Each of the branches has a separate government for special purposes. But for general purposes all the branches are under the command of the executive council or central committee, which is constituted of members or officers who are elected by the whole society. The terms on which members are admitted are different in different associations. But in all of them there are certain limits as to age and the number of years during which the candidate has been apprenticed to or has worked in the trade. The revenue and reserve of all the societies are derived from admission fees and weekly or monthly subscriptions, together with the amount of the fines which are imposed for neglect of duty and breaches of the rules and regulations. These sources of income are sufficient for ordinary purposes; and extraordinary charges, such as are entailed by a "strike" or a "lock-out," are nearly always, if not invariably, met by means of "levies" made on the members by order of the executive council or central committee. The following account of the Amalgamated Society of Engineers may be accepted as furnishing a typical example of the organization and management of a large and flourishing trade union.

According to the thirty-third annual *Report* of that society, it appears that in 1883 the union consisted of 424 branches, chiefly in towns in the British Isles, but with a fair sprinkling in Canada, the United States, Australia, India, and other parts of the globe. The number of members was 50,418. A branch must consist of not fewer than seven members or more than three hundred. The constitution is pre-eminently democratic. Each branch is itself a completely organized body. It selects and elects its own officers; it collects, holds, and spends its own funds; and it manages the whole of the business which affects itself alone. The officers of the branch are elected at general meetings at which every member must be present under the penalty of a fine. Members who refuse to be nominated for office, or who refuse to serve if elected, are also subject to fines, and officers who neglect their business either by coming late to meetings or absenting themselves altogether are similarly punished. A meeting of the members of each branch is held every fortnight for the transaction of ordinary business, such as receiving subscriptions and deciding upon propositions for new members. These meetings begin at half-past 7 in the evening, and close at half-past 9 or 10 o'clock, but the hours are altered when it is convenient to alter them. The duties of the secretary are onerous, and his responsibility is great. No one therefore is eligible who has not been in the society two years successively, and "no member shall be elected as secretary who keeps a public or beer house." He has charge of the accounts of his branch, and conducts its correspondence. He has to see to the payment of members who are entitled to travelling relief donation, sick, superannuation, or funeral benefit. He has to summon meetings, keep minutes, report to the general secretary as to the state of trade in the district, the number of men out of work, or on the other hand he has to state what men are wanted, and he has also "to transact any other business that belongs to his office." The president, vice-president, and assistant secretary of a branch are elected quarterly, while the secretary and referee are elected annually. Members are exempt if they are fifty years of age, or if they reside more than 3 miles from the club house; and they are disqualified if they are 10s. [$2.43] in arrear with their contributions. There are also bookkeepers, money stewards, doorkeepers, treasurers, and auditors, the nature of whose work is evident from their titles. There are also sick stewards, whose duties are to visit the sick twice a week, to report their visits to the meetings of the branch, and to carry the invalid his sick benefit. None of the officers are honorary. In branches numbering fewer than fifty members every officer is allowed 4d. [8 cts.], and in branches numbering fifty and upwards 6d. [12 cts.], for his attendance on branch meeting nights. The secretary is paid annually and according to the size of the branch. The lowest amount is £1, 5s. [$7.29] for a branch of ten members, the highest £10, 4s. [$49.57] for a branch of three hundred. The auditors are paid at a lower rate, which varies from 9d. [18 cts.] to 4s. 8d. [$1.13]; while the treasurer is paid 10 per cent. on the sum set apart for use. Each branch has also a committee, which has power to determine anything whereon the society's rules are silent. The books of the branch are open to their inspection; they can summon meetings, and they have various other duties. Each member of this committee receives 6d. [12 cts.] for each meeting he attends, and is fined 6d. [12 cts.] for each meeting from which he is absent. In any district in which there are more branches than one, a local district committee must be formed, consisting of seven members, each branch as nearly as practicable selecting an equal number. Where there are seven branches, each one sends a representative. The duties of this committee are to "watch over the interests of the trade, and transact such business as affects the district generally." It must not, however, interfere with the business of any particular branch of the society. The central authority is vested in a general or executive council, consisting of thirty-seven members, of whom eleven represent metropolitan branches, the others being from the provinces, including Scotland and Ireland. As the country councillors cannot conveniently attend frequent meetings in London, the ordinary management is entrusted to the eleven London members, who are called the local council, and the council is also further broken up into various committees for managing the details of the society. This council hears appeals from branches, advises, forbids, initiates, and terminates strikes. The general secretary receives a salary of £4 [$19.44] a week and lives rent free. He also receives 1s. 6d. [36 cts.] each time he attends a council meeting, and is paid for any special journeys undertaken or extra work done. His assistants receive £2, 10s. [$12.15] a week each, and have to give the whole of their time to the association. They have to compile and issue a monthly report as well as quarterly and yearly reports. The last named is quite a formidable volume, consisting of nearly 400 pages of large post octavo, and those of other societies are similar. The general secretary's hours of business are fixed from 9 A.M. to 6 P.M. He has power to authorize members who are on donation to be removed from one branch to another where there is a probability of employment, and he has to keep a register of all the members of the society, stating when and where admitted, age, married or single, and whether a member has received any part of the financial money. In the Amalgamated Society of Engineers the contribution of each member is generally 1s. [24 cts.] a week, and if a man be in arrears he is suspended from the benefits of the society, unless indeed he is out of work or in distressed circumstances. At the end of 1883 the union had a balance in hand of £178,128 [$865,702.08], or upwards of £3, 10s. [$17] a man.

In some trade unions—for example, those of the compositors—there is a special body ("fathers of chapels") whose business it is to see that the rules and regulations of the societies they belong to are faithfully observed in the establishments where they are employed. In others again—for instance, in the National Agricultural Laborers Union, as distinguished from the Federal Union of Agricultural Laborers—the system of management is completely centralized, the secretary of the executive committee having entire control of the funds and business of the whole association. In all large towns there are trade councils formed of delegates from the different trade unions within their area, whose function it is to discuss and supervise the general interests of the unionists in the several trades of which they are representative. Moreover, an annual trade unions congress is held in some great centre of industry and population in one of the three kingdoms, at which delegates from almost all the trade unions throughout the realm are present and take part in debating questions, whether social or political, which are of special interest to the working classes. At these assemblies, which have now been held for twenty consecutive years, a parliamentary committee, which remains in existence for the ensuing twelvemonth, is chosen, to whom the whole body of trade unionists looks for counsel and assistance with respect to legislation intended or desired on their behalf. To the action of the trade unions congress and their parliamentary committee much of the legislation which has been recently effected on questions affecting the welfare of the order of the community to which they belong is to be attributed,—notably the Employers' Liability Act and the amended Factory and Mines Acts. (See *Trade Unions*, etc., by William Trant.)

The objects of trade unions are twofold,—first, those of a friendly or benefit society, and secondly, those of a trade society or guild. In the former capacity they afford relief to their members when they are out of work from any cause, including sickness or accident; they occasionally provide them with superannuation allowances, and they almost always make burial allowances on account of deceased members and their wives. In the latter capacity it is their special business to promote what they conceive to be the interests of the trade with which they are connected by placing the workmen, so far as combination will fulfil that purpose, on a footing approaching to equality with the capitalists by whom they are employed in the disposal of their labor. Of course this is the great object for which the unions really exist. But, as the commissioners on trade unions have pointed out, it is found desirable to conjoin the objects of a friendly or benefit society with it, because by that means additional members and funds are obtained, and the authority which the union as a trade society has over its members is thus augmented. The leading aims of all trade unionism are to increase wages and to diminish the labor by which it is needful to earn them, and further to secure a more equal distribution of work among the workmen in any given trade than would be the case under a régime of unrestricted competition. Hence their rules prescribe a minimum amount of wages to be accepted and a maximum amount of work to be done by their members, and prohibit piece work or working overtime. The methods by which the unionists endeavor to accomplish their end, which is in a sense the monopoly of the labor market, are either direct or indirect. The direct method is a "strike," or simultaneous cessation of labor on the part of the workmen. It is the ultimate sanction as between the employed and their employers of the demands made by the union. But, where the unionists are strong, the mere threat of a strike is often sufficient to fulfil the intended purpose, and arbitration is still more frequently found effectual for bringing about a settlement or compromise. The indirect methods to which the trade unionists resort for reaching their aims are by limiting the number of workmen to be employed in any trade and by repressing or discountenancing competition among those who are actually employed in it. Most of them forbid the admission of more than a stipulated proportion of apprentices, and some of them prohibit the engagement of women to do work which can be done by men. Nearly all of them resist the common employment of unionists and non-unionists, and do their best to exclude non-unionists from employment altogether. But the amount expended by trade unions in the conduct of trade disputes is very much less than is generally imagined. Mr. George Howell, for instance, showed conclusively in the *Contemporary Review* that such was the case three or four years ago, and Mr. Murchie, the chairman of the parliamentary committee, stated at the trade unions congress at Stockport in the autumn of 1885 that Mr. Howell's contentions had been signally confirmed by more recent experience. Taking the seven largest trade unions, those whose statistics had been relied on by Mr. Howell—namely, the Amalgamated Engineers, the Ironfounders, the Boiler Makers and Iron Shipbuilders, the Steam-Engine Makers, Ironmoulders of Scotland, Amalgamated Tailors, and Amalgamated Carpenters and Joiners—he affirmed that, while in the nine years preceding 1884 their receipts were £2,818,548 [$13,698,143.28], their expenditure was £2,963,186 [$14,401,083.96], of which amount £1,207,180 [$5,866,894.80] was spent in unemployed benefit, £592,273 [$2,878,446.78] in sick benefit, £975,052 [$4,738,752.72] in compensation for loss of tools, superannuations, accidents, funerals, minor grants and benefits, and expense of management, only £188,680 [$916,984.80] had been spent in connection with "trade movements," or about 6½ per cent. of the whole sum expended.

There are no really trustworthy means of arriving at anything approaching to an accurate estimate of the actual numerical strength of the trade unions in the United Kingdom. According to the last *Report* of the registrar general of friendly societies, there were in the year 1883 registered in his office 195 trade unions with 253,088 members and £431,495 [$2,097,065.70] funds, of which 12 returned over £10,000 [$48,600] funds, 9 over 10,000 members, and six over £10,000 [$48,600] income. But this of course conveys a very inadequate notion of the dimensions to which trade unionism has attained, since many of the largest and most influential societies are still unregistered.

The following table shows the number of delegates and the aggregate membership of the societies represented by them at the trade unions congresses in the years from 1880 to 1886, both inclusive:

	Number of delegates.	Number of bodies represented.	Trade Councils represented.	Trade Unions represented directly.	Total Number of Persons represented.	Number represented by Trade Councils.	Unionists represented directly (approximate).
1880	122	105	17	88	474,213	92,511	381,702
1881	154	122	18	104	460,797	86,376	374,421
1882	153	126	23	103	508,337	102,972	405,365
1883	173	135	21	114	561,091	94,166	466,925
1884	142	116	21	95	597,636	109,984	487,652
1885	162	136	27	109	631,606	131,368	500,238
1886	143	121	24	97	635,380	122,207	513,173

We shall not be far wrong, perhaps, if we set down the number of trade unionists in all the three kingdoms at about 800,000. (F. DR.)

TRAGEDY. See DRAMA.

TRAJAN (*c.* 53–117 A.D.). MARCUS ULPIUS TRAIANUS, the fourteenth Roman emperor, was a native of Italica, in Spain. The family to which he belonged was probably Italian and not Iberian by blood. His father began life as a common legionary soldier, and fought his way up to the consulship and the governorship of Asia. He was one of the hardest fighters in Judæa under Vespasian and Titus; he served too against the Parthians, and won the highest military distinction open to a subject, the grant of the triumphal insignia. Thus he acquired a prominent place among the brand new patricians created by the Flavians as substitutes for the nobles of old descent who had succumbed to the cruelty and rapacity of the emperors from Tiberius to Nero. The younger Trajan was rigorously trained by his father, and deeply imbued with the same principles and tastes. He was a soldier born and bred. No better representative of the true old hardy Roman type, little softened either by luxury or education, had come to the head of affairs since the days of Marius. The date of his birth was probably 53 A.D. His training was almost exclusively military, but his experience as an officer gave him an acquaintance with almost every important province of the empire, which was of priceless value to him when he came to the throne. For ten years he held a commission as military tribune, which took him to many lands far asunder; then he filled important posts in Syria and Spain. How much actual warfare Trajan saw in those days we can hardly tell; he certainly went through some severe service under his father's command against the Parthians. By the year 89 he had achieved a considerable reputation. At that time L. Antonius Saturninus headed a rebellion in Germany, which threatened seriously to bring Domitian's rule to an end. Trajan was ordered in hot haste from Further Spain to the Rhine. Although he carried his troops over that long and arduous march with almost unexampled rapidity, he only arrived after the insurrection had been put down. But his promptitude raised him higher in the favor of Domitian, and he was advanced to the consulship in 91. Of the next five years of his life we know nothing positively. It is not unlikely that they were spent at Rome or in Italy in the fulfilment of some official duties. When the revolution of 96 came, and Nerva replaced the murdered Domitian, Trajan had conferred upon him one of the most important posts in the empire, that of consular legate of Upper Germany. An officer whose nature, as the event showed, was interpenetrated with the spirit of legality was a fitting servant of a revolution whose aim it was to substitute legality for personal caprice as the dominant principle of affairs. The short reign of Nerva really did start the empire on a new career, which lasted more than three quarters of a century. But it also demonstrated how impossible it was for any one to govern at all who had no claim, either personal or inherited, to the respect of the legions. Nerva saw that if he could not find an Augustus to control the army, the army would find another Domitian to trample the senate under foot. In his difficulties he took counsel with L. Licinius Sura, a lifelong friend of Trajan, and in October, 97, he ascended the Capitol, and with all due solemnity proclaimed that he adopted Trajan as his son. The senate confirmed the choice, and acknowledged the emperor's adopted son as his successor. In a letter which Nerva sent at once to Trajan he quoted most significantly a line from the beginning of the Iliad, where Chryses, insulted by Achilles, prays to Apollo: "May thy shafts afford me vengeance on the Greeks for my tears." After a little hesitation Trajan accepted the position, which was marked by the titles of imperator, Cæsar, and Germanicus, and by the tribunician authority. He immediately proceeded to Lower Germany, to assure himself of the fidelity of the troops in that province, and while at Cologne he received news of Nerva's death (January, 98). The authority of the new emperor was recognized at once all the empire over. The novel fact that a master of the Romans should have been born on Spanish soil seems to have passed with little remark, and this very absence of notice is significant. Trajan's first care as emperor was to write to the senate an assurance like that which had been given by Nerva, that he would neither kill nor degrade any senator. He ordered the establishment of a temple and cult in honor of his adoptive father, but he did not present himself at Rome for nearly two years after his accession. Possibly he had taken measures before Nerva's death to secure the revenge which Nerva craved, but probably did not live to see. In his dealings with the mutinous prætorians the strength of the new emperor's hand was shown at once. He ordered a portion of the force to Germany. They did not venture to disobey, and were distributed among the legions there. Those who remained at Rome were easily overawed and reformed. It is still more surprising that the soldiers should have quietly submitted to a reduction in the amount of the donative or gift which it was customary for them to receive from a new emperor, though the civil population of the capital were paid their largess (*congiarium*) in full. By politic management Trajan was able to represent the diminution as a sort of discount for immediate payment, while the civilians had to wait a considerable time before their full due was handed to them.

The secret of Trajan's power lay in his close personal relations with the officers and men of the army and in the soldierly qualities which commanded their esteem. He possessed courage, justice, and frankness to a high degree. Having a good title to military distinction himself, he could afford, as the unwarlike emperors could not, to be generous to his officers. The common soldiers, on the other hand, were fascinated by his personal prowess and his somewhat ostentatious camaraderie. His features were firm and clearly cut; his figure was tall and soldierly, and exhibited the sinewy hard health of a veteran campaigner. His hair was already gray before he came to the throne, though he was not more than forty-four years old. The stoutness of the emperor's arm had been proved in the face of his men in many a hard fight. When on service he used the mean fare of the common private, dining on salt pork, cheese, and sour wine. Nothing pleased him better than to take part with the centurion or the soldier in fencing or other military exercise, and he would applaud any shrewd blow which fell upon his own helmet. He loved to display his acquaintance with the career of distinguished veterans, and to talk with them of their battles and their wounds. Probably he lost nothing of his popularity with the army by occasional free indulgence in sensual pleasures, with which, as Bacon remarks, the soldier is apt to pay himself for the perils he encounters. Yet every man felt and knew that no detail of military duty, however minute, escaped the emperor's eye, and that any relaxation of discipline would be rigidly punished, yet with unwavering justice. Trajan emphasized at once his personal control and the constitutionality of his sway by bearing on his campaigns the actual title of "proconsul," which no other emperor had done. All things considered, it is not surprising that he was able, without serious opposition from the army, to remodel the whole military institutions of the empire, and to bring them into a shape from which there was comparatively little departure so long as the army lasted. In disciplinary matters no emperor since Augustus had been able to keep so strong a control over the troops. Pliny rightly praises Trajan as the lawgiver and the founder of discipline, and Vegetius classes Augustus, Trajan, and Hadrian together as restorers of the morale of the army. The confidence which existed between Trajan and his army finds expression in some of the coins of his reign.

For nearly two years after his election Trajan did not appear in Rome. He had decided already what the great task of his reign should be—the establishment of security upon the dangerous northeastern frontier. Before visiting the capital he determined to put affairs in train for the attainment of this great object. He made a thorough inspection of the great lines of defence between the Danube and the Rhine, and framed and partly carried out a vast scheme for strengthening and securing them. The policy of opposing uncivilized tribes by the construction of the *limes*, a raised embankment of earth or other material, intersected here and there by fortifications, was not his invention, but it owed in great measure its development to him. It is probable that the northernmost part of the great *limes Germaniæ*, from the Rhine at Rheinbrohl, nearly midway between Coblenz and Bonn, to a point on the Main east of Frankfort, where that river suddenly changes its course from north to west, was begun by Domitian. The extension of this great barrier southwards was undertaken by Trajan, though we cannot say how far he carried the work, which was not entirely completed till long after his time. The *limes* leaves the main at Miltenberg, a point at which the north and south course of the river is broken by a great angle, and then follows a line generally parallel to the stream of the Neckar, till it reaches Lorch, a place between Stuttgart and Aalen. Here it meets the so-called *limes Rætiæ*, which trends eastward till it cuts the Danube at Kelheim, a place some distance short of Ratisbon, the ancient *Castra Regina*. This grand work, which would have excited the envy of Augustus, is traceable in its main extent at the present day. We may without hesitation follow the opinion of Mommsen, who maintains that the *limes* was not intended, like Hadrian's wall between the Tyne and the Solway, and like the great wall of China, to oppose an absolute barrier against incursions from the outside. It was useful as marking definitely the boundary of the Roman sway, and as assuring the Romans that no inroad could be made without intelligence being had of it beforehand, while the *limes* itself and the system of roads behind it enabled troops to be directed rapidly to any threatened point, and the fortified positions could be held against large numbers till reinforcements arrived. Great importance was no doubt attached to the perfection of the lines of communication bearing on the *limes*. Among a people of roadmakers, Trajan was one of the greatest, and we have definite evidence from inscriptions that some of the military roads in this region were constructed by him. The more secure control which the Romans now maintained over the territory within the *limes* tended to its rapid civilization, and the Roman influence, if not the Roman arms, soon began to affect powerfully the regions beyond.

After his careful survey of the Rhine end of the great defensive barrier, Trajan proceeded to consider it and plan it from the Danube. From the age of Tiberius onwards the Romans possessed the whole southern bank of the river from its source to the Euxine. But the precarious tenure of their possession had been deeply impressed on them by the disasters and humiliations they had undergone in these districts during the reign of Domitian. A prince had arisen among the Dacians, Decebalus by name, worthy to be placed at the head of all the great barbarian antagonists of Rome. Like Maroboduus, he was able to combine the forces of tribes commonly hostile to each other, and his military ability almost went the length of genius. After he had swept the province of Mœsia bare, he was defeated by one of Domitian's lieutenants, but the position of affairs on the Danubio-Rhenish border was still so threatening that the emperor was glad to conclude a treaty which conferred extraordinary advantages on his foe. Not only did the Romans stipulate to pay to Decebalus an annual subsidy, which he must have regarded as a tribute, but they agreed to supply him with engineers and craftsmen skilled in all kinds of construction, but particularly in the erection of fortifications and defensive works. During the nine or ten years which had elapsed since the conclusion of this remarkable treaty, the Dacian prince had immensely strengthened the approaches to his kingdom from the Roman side. He had also equipped and drilled his formidable army after the Roman fashion. It was impossible for a soldier like Trajan to endure the conditions laid down by Domitian; but the conquest of Dacia had become one of the most formidable tasks that had ever confronted the empire. Trajan no doubt planned a war before he left the Danube for Rome late in 99.

The arrival of the emperor had been awaited in the capital with an impatience which is expressed by Pliny and by Martial.[1] All that had happened since Trajan's elevation to the throne had raised high at Rome the hope of a prosperous and glorious reign. As he entered the city and went on foot to the Capitol, the plaudits of the people were unmistakably genuine. During his stay in the city he riveted more firmly still the affections both of the senate and of the people. The reconciliation of the empire with liberty, inaugurated, as Tacitus says, by Nerva, seemed now to be securely achieved. Trajan was absolutely open and simple, and lived with men at Rome as he had lived with his soldiers while on service. He realized the senate's ideal of the citizen ruler. The assurance that no senator should suffer was renewed by oath. All the old republican formalities were most punctiliously observed—even those attendant on the emperor's election to the consulate, so far as they did not involve a restoration of the old order of voting at the comitia. The veneration for republican tradition is curiously attested by the reproduction of many republican types of coin struck by senatorial officers. Trajan seized every opportunity for emphasizing his view that the *princeps* was merely the greatest of the magistrates, and so was not above but under the laws. He was determined, he said, to be to his subjects such a ruler as he had desired for himself when a subject. There is a pretty story to the effect that he handed the commander of the prætorians his sword, and said, "Use it for me if I do well, but against me if I do ill." Martial, who had called Domitian his lord and his god, now cried, "In him we have no lord, but an imperator!" Real power and influence were accorded to the senate, which had now, by the incorporation of members whose origin was provincial, become in a manner representative of the whole empire. Trajan associated with the senators on equal terms, and enjoyed in their company every kind of recreation. All pomp was distasteful to him, and discarded by him. There was practically no court, and no intrigues of any kind were possible. The approach to his house was free, and he loved to pass through the city unattended, and to pay unexpected visits to his friends. He thirsted for no senator's blood, and used severity against the *delatores* alone. There was but one insignificant conspiracy against him during his whole reign. Though not literary himself, Trajan conciliated the literary men, who at all times had close relations with the senate. His intimate, M. Licinius, played an excellent Mæcenas to his Augustus. In his efforts to win the affections of Roman society, Trajan was excellently aided by his wife Plotina, who was as simple as her husband, benevolent, pure in character, and entirely unambitious. The hold which Trajan acquired over the people was no less firm than that which he maintained upon the army and the senate. His largesses, his distributions of food, his public works, and his spectacles were all on a generous scale. The exhibitions in the arena were perhaps at their zenith during his tenure of power. Though, for some unexplained reason, he abolished the mimes, so beloved of the populace, at the outset of his reign, he availed himself of the occasion of his first triumph to restore them again. The people were delighted by the removal of the imperial *exedra* in the circus, whereby five thousand additional places were provided. Taxation was in many directions reduced, and the financial exactions of the imperial officers controlled by the erection of a special court. Elaborate precautions were taken to save Italy from famine; it is said that corn for seven years' consumption at the capital was retained in the granaries. Special encouragement was given to merchants to import articles of food. The corporation of bakers was organized, and made more effective for the service of the public. The internal trade of Italy was powerfully stimulated by the careful maintenance and extension of the different lines of road. But the most striking evidence of Trajan's solicitude for his people's welfare is found in his institution of the *alimenta*, whereby means were provided for the rearing of poor and orphan children in Italy. The method had been sketched out by Nerva, but its great development was due to Trajan. The moneys allotted by the emperor were in many cases supplemented by private benevolence. As a soldier, Trajan realized the need of men for the maintenance of the empire against the outer barbarians, and he preferred that these men should be of Italian birth. He was only carrying a step farther the policy of Augustus, who by a system of rewards and penalties had tried to encourage marriage and the nurture of children. The actual effect of Trajan's regulations is hard to measure; they were probably more effectual for their object than those of Augustus. The foundations were confiscated by Pertinax, after they had existed less than a century.

---

[1] It has been conjectured, not improbably, that the *Germania* of Tacitus, written at this period, had for one of its aims the enlightenment of the Romans concerning the formidable character of the Germans, so that they might at once bear more readily with the emperor's prolonged absence and be prepared for the necessity of decisive action on the frontier.

During the year 100, when Trajan was consul for the third time, Pliny, who had been designated consul for a part of it, was appointed to deliver the "Panegyric" which has come down to us, and which forms the most important source of our knowledge concerning this emperor. Pliny's eulogy of Trajan and his denunciation of Domitian are alike couched in extravagant phrases, but the former perhaps rests more uniformly on a basis of truth and justice than the latter. The tone of the "Panegyric" certainly lends itself to the supposition of some historians that Trajan was inordinately vain. That the emperor had an honest and soldierly satisfaction in his own well-doing is clear; but if he had had anything like the vanity of a Domitian, the senate, ever eager to outrun a ruler's taste for flattery, would never have kept within such moderate bounds.

Towards the end of 100, or early in 101, Trajan left Rome for the Danube. Pretexts for a Dacian war were not difficult to find. Although there was no lack of hard fighting, victory in this war depended largely on the work of the engineer. The great military road connecting the posts in Upper Germany with those on the Danube, which had been begun by Tiberius, was now extended along the right bank of the river as far as the modern Orsova. The year 101 was spent mainly in road-making and fortification. In the following campaign, after desperate fighting to the north of the Danube in the mountainous region of Transylvania, such as Cæsar never encountered in all his Gaulish wars, the capital of Decebalus was taken, and he was forced to terms. He agreed to raze all fortresses, to surrender all weapons, prisoners, and Roman deserters, and to become a dependent prince under the suzerainty of Rome. Trajan came back to Italy with Dacian envoys, who in ancient style begged the senate to confirm the conditions granted by the commander in the field. The emperor now enjoyed his first Dacian triumph, and assumed the title of Dacicus. At the same time he royally entertained the people, and no less royally rewarded his brave officers. But the Dacian chief could not school his high spirit to endure the conditions of the treaty, and Trajan soon found it necessary to prepare for another war. A massive stone bridge was built across the Danube, near the modern Turn Severin, by Apollodorus, the gifted architect who afterwards designed the forum of Trajan. In 105 began the new struggle, which on the side of Decebalus could now only lead to victory or to destruction. The Dacians fought their ground inch by inch, and their army as a whole may be said to have bled to death. The prince put an end to his own life. His kingdom became an imperial province; in it many colonies were founded, and peopled by settlers drawn from different parts of the empire. The work done by Trajan in the Danubian regions left a lasting mark upon their history. The emperor returned to the capital in 106, laden with captured treasure. His triumph outdid in splendor all those that went before it. Games are said to have been held continuously for four months. Ten thousand gladiators contended in the arena, and eleven thousand beasts were killed in the contests. Congratulatory embassies came from all lands, even from India. The grand and enduring monument of the Dacian wars is the noble pillar which still stands on the site of Trajan's forum at Rome.

The end of the Dacian wars was followed by seven years of peace. During part of that time Pliny was imperial legate in the provinces of Bithynia and Pontus, and in constant communication with Trajan. The correspondence is extant, and gives us the means of observing the principles and tendencies of the emperor as a civil governor.

The provinces (hitherto senatorial) were in considerable disorder, which Pliny was sent to cure. It is clear from the emperor's letters that in regard to nine out of ten of the matters which his anxious and deferential legate referred to him for his decision he would have been better pleased if the legate had decided them for himself. Trajan's notions of civil government were, like those of the duke of Wellington, strongly tinged with military prepossessions. He regarded the provincial ruler as a kind of officer in command, who ought to be able to discipline his province for himself, and only to appeal to the commander-in-chief in a difficult case. In advising Pliny about the different free communities in the provinces, Trajan showed the same regard for traditional rights and privileges which he had exhibited in the face of the senate at Rome. At the same time, these letters bring home to us his conviction that, particularly in financial affairs, it was necessary that local self-government should be carried on under the vigilant supervision of imperial officers. The control which he began in this way to exercise, both in Italy and in the provinces, over the "municipia" and "liberæ civitates," by means of agents entitled (then or later) "correctores civitatium liberarum," was carried continually farther and farther by his successors, and at last ended in the complete centralization of the government. On this account the reign of Trajan constitutes a turning point in civil as in military history. In other directions, though we find many salutary civil measures, yet there were no far-reaching schemes of reform. Many details in the administration of the law, and particularly of the criminal law, were improved. To cure corruption in the senate the ballot was introduced at elections to magistracies. The finances of the state were economically managed, and taxpayers were most carefully guarded from oppression. Trajan never lacked money to expend on great works of public utility; as a builder, he may fairly be compared with Augustus. His forum and its numerous appendages were constructed on a magnificent scale. Many regions of Italy and the provinces besides the city itself benefited by the care and munificence which the emperor bestowed on such public improvements. His attitude towards religion was, like that of Augustus, moderate and conservative. The famous letter to Pliny about the Christians is, according to Roman ideas, merciful and considerate. It was impossible, however, for a Roman magistrate of the time to rid himself of the idea that all forms of religion must do homage to the civil power. Hence the conflict which made Trajan appear in the eyes of Christians like Tertullian the most infamous of monsters. On the whole, Trajan's civil administration was sound, careful, and sensible, rather than brilliant or epoch-making.

In 113 or 114 Trajan left Italy to make war in the East. The never-ending Parthian problem confronted him, and with it were more or less connected a number of minor difficulties. Already by 106 the position of Rome in the East had been materially improved by the peaceful annexation of districts bordering on the province of Syria. The district of Damascus, hitherto a dependency, and the last remaining fragment of the Jewish kingdom, were incorporated with Syria; Bostra and Petra were permanently occupied, and a great portion of the Nabathæan kingdom was constituted the Roman province of Arabia. Rome thus obtained mastery of the most important positions lying on the great trade routes from East to West. These changes could not but affect the relations of the Roman with the Parthian empire, and the affairs of Armenia became in 114 the occasion of a war which has been described under Persia, vol. xviii. p. 614. Trajan's campaigns in the East ended in complete though brilliant failure. In the retreat from Ctesiphon (117) the old emperor tasted for almost the first time the bitterness of defeat in the field. He attacked the desert city of Hatra, westward of the Tigris, whose importance is still attested by grand ruins. The want of water made it impossible to maintain a large force near the city, and the brave Arabs routed the Roman cavalry. Trajan, who narrowly escaped being killed, was forced to withdraw. A more alarming difficulty lay before him. Taking advantage of the absence of the emperor in the far East, and possibly by an understanding with the leaders of the rising in Armenia and the annexed portions of Parthia, the Jews all over the East had taken up arms at the same moment, and at a given signal. The massacres they committed were portentous. In Cyprus 240,000 men are said to have been put to death, and at Cyrene 220,000. At Alexandria, on the other hand, many Jews were killed. The Romans punished massacre by massacre, and the complete suppression of the insurrection was long delayed, but the Jews made no great stand against disciplined troops. Trajan still thought of returning to Mesopotamia, and of avenging his defeat at Hatra, but he was stricken with sickness and compelled to take ship for Italy. His illness increasing, he landed in Cilicia, and died at Selinus in that country about the end of July, 117. Trajan, who had no children, had continually delayed to settle the succession to the throne, though Pliny in the "Panegyric" had pointedly drawn his attention to the matter, and it must have caused the senate much anxiety. Whether Hadrian, the cousin of Trajan, was actually adopted by him or not is impossible to determine; certainly Hadrian had not been advanced to any great honors by Trajan. Even his military service had not been distinguished. Plotina asserted the adoption, and it was readily and most fortunately accepted, if not believed, as a fact.

The senate had decreed to Trajan as many triumphs as he chose to celebrate. For the first time a dead general triumphed. When Trajan was deified, he appropriately retained, alone among the emperors, a title he had won for himself in the field, that of "Parthicus." He was a patient organizer of victory rather than a strategic genius. He laboriously perfected the military machine, which when once set in motion went on to victory. Much of the work he did was great and enduring, but the last year of his life forbade the Romans to attribute to him that *felicitas* which they regarded as an inborn quality of the highest generals. Each succeeding emperor was saluted with the wish that he might be "better than Trajan and more fortunate than Augustus." Yet the breach made in Trajan's *felicitas* by the failure in the East was no greater than that made in the *felicitas* of Augustus by his retirement from the right bank of the Rhine. The question whether Trajan's Oriental policy was wise is answered emphatically by Mommsen in the affirmative. It was certainly wise if the means existed which were necessary to carry it out and sustain it. But succeeding history proved that those means did not exist. The assertion of Mommsen that the Tigris was a more defensible frontier than the desert line which separated the Parthian from the Roman empire can hardly be accepted. The change would certainly have created a demand for more legions, which the resources of the Romans were not sufficient to meet without danger to their possessions on other frontiers.

The records of Trajan's reign are miserably deficient. Our best authority is the 68th book of Dio Cassius; then comes the "Panegyric" of Pliny, with his correspondence. The facts to be gathered from other ancient writers are scattered and scanty. Fortunately the inscriptions of the time are abundant and important. Of modern histories which comprise the reign of Trajan the best in English is that of Merivale; but that in German by H. Schiller (*Geschichte der römischen Kaiserzeit*, Gotha, 1883) is more on a level with recent inquiries. There are special works on Trajan by H. Francke (Güstrow. (1837), De la Berge (Paris, 1877), and Dierauer (in M. Büdinger's *Untersuchungen zur römischen Kaisergeschichte*, Leipsic, 1868). A paper by Mommsen in *Hermes*, iii. pp. 30 *sq.*, entitled "Zur Lebensgeschichte des jüngeren Plinius," is important for the chronology of Trajan's reign. (J. S. R.)

TRALEE, a market-town and seaport, and the chief town of Kerry, Ireland, is situated on the Ballymullen or Leigh river, about a mile from where it discharges itself into Tralee Bay, and on the Great Southern and Western Railway, 21 miles northwest of Killarney and 18 southwest of Listowel. It is a neat, well-built, and comparatively prosperous town. The principal public buildings are the court-house, the town-hall, the corn exchange, the chamber of commerce, the workhouse, the infantry barracks, the county hospital, and the fever hospital. A ship canal, permitting the passage of ships of 200 tons burden, and constructed at an expense of £30,000 [$145,800], connects it with Tralee Bay. Coal, iron, and timber are imported, and there is a considerable export of grain. There is a large trade in butter. The population of the town in 1871 was 9506 and in 1881 it was 9396.

Tralee, anciently Traleigh, the "strand of the Leigh," owes its origin to the foundation of a Dominican monastery in 1213 by John Fitz-Thomas, of the Geraldine family. During the reign of Elizabeth it was in the possession of Earl Desmond, on whose forfeiture it came into possession of the Dennys. At the time of the rebellion in 1641 the English families in the neighborhood asked to be placed in the castle under the charge of Sir Edward Denny, but during his absence a surrender was made. The town was incorporated by a charter in the 10th of James I., and had the privilege of sending two members to the Irish parliament. Though disfranchised at the Union, it obtained the privilege of returning one member in 1832, but in 1885 it was merged in the county.

TRAMWAY. Originally a tramway signified a wheel track laid with timbers, and afterwards with iron plates, having a flange on the inner edge by which wheels of the ordinary sort were kept in the track (see Railway). The introduction of the flanged wheel and edge rail caused tramways to be superseded by railways, but not until many miles of tramroads had been laid and successfully worked in various parts of the United Kingdom. Although the name is sometimes given to a light railway, by a tramway is now generally understood a street railway, constructed so as to interfere but little with the ordinary traffic, on which vehicles having flanged wheels are propelled by animal or mechanical power. Tramways in this sense originated in the United States.

A street railway for passengers was laid in New York in 1832, but it was soon removed on account of the accidents caused by it. In 1852 a French engineer, Loubât, revived tramways in New York, and they were soon afterwards laid in other American cities. A short line was also laid in Paris in 1853. The rails used were of wrought-iron, 5 inches wide, having a groove for the flanged wheels of the cars 1¾ to 2¼ inches wide and 1 to 1½ inches deep (Fig. 1). To lessen the inconvenience to ordinary traffic occasioned by this rail, the "step-rail" (Fig. 2) was introduced, consisting of a flat surface 3 to 5 inches wide, which can be used by ordinary wheels, and a raised tread on the outer side 1 inch higher and 1¾ inch wide, on which the flanged wheels of the cars run. This form of rail is still very general in America, and is a good one for the tramways, though not for the general public. In 1858–59 George F. Train, an American, endeavored to obtain an Act of Parliament authorizing tramways in London; failing in that, he laid tramways, by consent of the road authority, first in 1860 at Birkenhead, and soon afterwards in London. The rail laid at Birkenhead had a step of ¾ inch between flat surfaces 3 inches and 1½ inches wide. That laid in London was narrower, with a step of half an inch, but the slippery flat surface and the step of the rail caused serious inconvenience and numerous accidents to carriages, and the tramways were removed in a few months, after one of them had been successfully indicted as a nuisance. In Birkenhead, in spite of complaints of the inconvenience caused to the general traffic, the original rails remained until 1864, when, after a short length had been laid as an experiment with a rail of the grooved section now in general use (Fig. 3), the whole of the tramway, several miles in length, was relaid with it. The tramway was subsequently indicted as a nuisance, but the trial resulted in a verdict in favor of the grooved rail. In 1868 an Act of Parliament authorizing the construction of about 6¾ miles of tramways in Liverpool was obtained; and in 1869–71 Acts for 61 miles of tramways in London were passed, and were soon followed by other Acts for tramways in Glasgow, Dublin, Edinburgh, and other provincial towns.

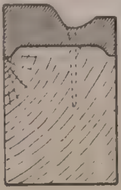


FIG. 1.

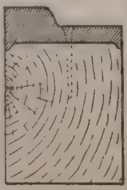

FIG. 2.

Tramways Act.

In 1870 the Tramways Act was passed, enabling the Board of Trade to make provisional orders authorizing the construction of tramways in Great Britain, with the consent of the local authorities, and giving considerable powers for regulating their construction and working. By the Act the gauge, unless otherwise prescribed by special Act, is to be such as will admit of the use of carriages constructed for use on railways of a gauge of 4 feet 8½ inches. Tramways for which Acts had been previously obtained were of 4 feet 8½ inches gauge, to comply with a standing order intended for railways, and not to make them available for railway rolling stock, which the narrow groove of an ordinary tramway rail will not admit. There is reason to think that a narrower gauge, such as 3 feet 6 inches, is often sufficient and preferable to the 4 feet 8½ inches gauge.

Tramways in towns, authorized by provisional order, are to be constructed in the middle of the road, and are not to be so laid that for 30 feet and upwards a less space than 9 feet 6 inches shall be left between the outside of the foot-path and the rail, if one-third of the owners or occupiers of premises abutting upon that part of the road object. Vehicles are thus enabled to stop at the road side without hindrance from the tramcars. To leave 9 feet 6 inches on each side of a single line of tramway of 4 feet 8½ inches gauge a street must be upwards of 24 feet wide. No carriage used on a tramway must extend more than 11 inches beyond the outer edge of the wheels, and there must be a space of at least 15 inches between the sides of the widest carriages or engines to be used, when passing one another. A width of not less than 3 feet 2 inches between double lines and at passing places is thus necessary, and a double line of tramway, leaving 9 feet 6 inches space on each side, requires a street at least 32 feet 6 inches wide between the footways. In narrow roads there is a convenience in having the tramway at the side, and it is sometimes provided for in special Acts. The space between the rails, and for 18 inches beyond them, is repairable as part of the tramway. Power is given to local authorities to purchase tramways at the expiration of twenty-one years, and they may be removed under certain circumstances.

It appears from a parliamentary return that in 1886 there were 779 miles of street tramways open for traffic in Great Britain, on which a capital of £11,503,438 [$55,906,708.68] had been expended, the net receipts for the year being £563,735 [$2,739,752.10] and the working expenses 79 per cent. of the gross receipts.

Construction.

The grooved rail first laid in England was 4½ inches wide and an inch thick, having a tread or rolling surface for the wheel 1⅞ inches wide, and a groove ⅞ inch deep, ¾ inch wide at the bottom, and 1¼ inches wide at the top (Fig. 3). The rail was spiked through to a longitudinal timber laid on cross sleepers, and secured to them by angle brackets and spikes. This rail and method of laying were generally adopted, but it was found that the heads of the spikes wore off, and the rails required re-spiking, and split and worked loose at the joints. A rail known as the box-rail was introduced, having flanges below on each side, through holes in which clips are driven to fasten the rail to the timber. This constitutes a good fastening, and the flanges give stiffness to the rail, but the clips cause gaps between the rail and the paving stones, which lead to the formation of ruts alongside the rails. The longitudinal timbers, instead of being laid on cross sleepers, on which the paving does not bed well, are often fixed in cast-iron chairs connected by transverse tie-bars. A bed of concrete is always laid under the longitudinal timbers, and should extend to the whole width of the paving. The rails first laid weighed 40 ℔ per yard, but it was soon found desirable to increase the weight to 60 ℔ per yard. It is, however, impossible to fish the joints of rails like the above, and it was found that the working of the joints under the passage of the cars loosened the ends of the rails, dislocated the paving, and damaged both the tramway cars and ordinary vehicles. Tramways proved hardly able to withstand heavy street traffic; and to provide for steam traction a stronger form of rail and a better system of permanent way became necessary. Many forms of iron bearings have been devised, the rail being either supported continuously or on chairs at intervals. In the best of these the train rail can be replaced when worn without disturbing the foundation. In the system used in Liverpool cast-iron longitudinal sleepers weighing 80 and 90 ℔ a yard carry steel rails of a ⊤ section (Fig. 4) weighing 40 ℔ a yard, both sleepers and rails being held down by bolts to jaws anchored in the concrete foundation. The rails can be renewed and the sleepers can be taken up with very little disturbance of the paving. Steel rails of a flat-footed or a bridge section, and of such a depth as to constitute both rail and sleeper, are also used. In some of the latest and best examples the rail is of a flatfooted section (Fig. 5), 6 or 7 inches deep, and 6 or 7 inches wide at the base, weighing 65 to 93 ℔ per yard. The head has a groove either planed out or rolled in it, giving the usual profile to the upper surface. The joints are fished in the ordinary

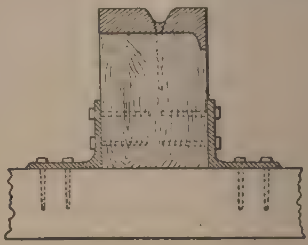

FIG. 3.

way, and are as strong as the rail itself. Cross ties are sometimes used, but when the rail is slightly bedded in the concrete foundation they are dispensed with. The paving is set in cement close against the rail, and is bedded directly or in sand on the base of the rail, upon which there is a bearing of 1½ or 2 inches. Such a tramway will stand steam traction and the heaviest street traffic, but the rail, which is of an expensive section, requires entire renewal when the head is worn out. Iron or steel continuous bearings are less elastic, and therefore more jarring and noisy than timber sleepers.

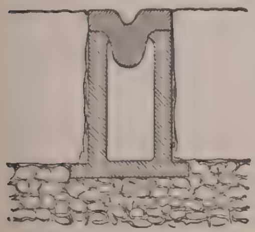

FIG. 4.

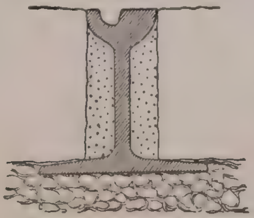

FIG. 5.

The profile of the upper surface of tram rails has been little altered since the first grooved rail was devised for Birkenhead in 1863, though slight modifications have been made in the form of the groove with the object of lessening tractive resistance. For the sake of the ordinary traffic the groove should not exceed 1 inch in width, and a rounded section with sides splaying outwards facilitates the forcing out of the mud and dirt. A nearly upright side next the tread or rolling surface with a splay on the inner side throws the mud away from the wheel. The upper corners of the rail should be angular, to make as thin a joint as possible between the rail and the paving. There has been a tendency to diminish the width, and a rail as narrow as 3 inches has been laid. A deviation from the usual profile has been adopted in Liverpool, where the groove is in the middle of a rail 3¼ inches wide.

Paving.

A tramway must not only afford a good rolling surface capable of bearing the weights running on it, but it must also be able to resist the shocks of heavy vehicles crossing the rails in all directions. The space between the rails, and for 18 inches beyond them, which is repairable with the tramway, is always paved, sometimes in provincial towns and in the suburbs of London with wood, but generally with stone sets in the best manner on a concrete foundation. The sets alongside the rail should be carefully dressed and fitted to make a thin joint. There is much extra wear, and a tendency to form a rut alongside the rail, arising from ordinary wheels using the tram rail, and unless the surface of the paving is kept to the level of the rail the wheels of carriages are caught by the rail, and damage and accidents are caused. To resist the wear near the rails, chilled cast-iron blocks have been used where the traffic is great. On a macadamized road there is the same tendency to form a rut along the outer edge of the tramway paving, which is to some extent prevented by giving a serrated edge to the paving. There is always great difficulty in keeping the road surface to the level of the paving, and it is better to pave the entire width of a street in which a tramway is laid.

Curves.

Although cars can be drawn round very sharp curves, the latter should be as easy as possible. A radius of 150 to 200 feet is the least that should be used when there is any choice, but necessity may compel the use of curves of 50 or even 30 feet radius. On such curves, however, the cars are liable to be strained, and the resistance to traction is greatly increased.

Passing places.

A single line of tramway must have passing places for the cars, consisting of pieces of double line of length sufficient to hold two cars at least, with connecting curves and the necessary points and crossings. Where steam or other mechanical power is to be used the passing loops should be at least 200 feet in length. There is inevitable delay and interference with the street traffic at passing places, and where cars are to be run at frequent intervals it is better to lay down a double line if the street is wide enough. It is a great advantage to the ordinary traffic to have the cars moving always in the same direction on the same line of rails.

Points and crossings.

For horse traction fixed points of chilled cast-iron or steel are sufficient, as the driver can turn his horses and direct the car on to either line of rails. When mechanical power is used, drop points or movable points are required. In the former the groove leading into the road to be taken is of the full depth, and the other groove shallow, so that the engine and cars naturally take the former. On coming out of the shallower groove to the deeper there is, however, a drop encountered which is damaging to the rolling stock, and especially to the engines. Movable points require setting by hand, or they are actuated by a spring or balance weight. In one form of spring point one groove is filled up by a tongue which is pressed down by wheels passing out of a loop, but which forms the side of the groove for wheels running the opposite direction. A spring point of steel, which is forced aside by the flange of the wheel passing out, and shuts close again by its own elasticity, is also successfully used. A movable point on one side of the way is sufficient. Crossings are either built up from rails cut to the required angle, or they are cast solid in steel or chilled iron. Filling pieces of the same material, roughened on the surface for foot-hold, are inserted between the rails at the angles of points and crossings. Both points and crossings wear rapidly, and are troublesome to maintain in good condition, and when not so maintained are dangerous to ordinary traffic.

Cars.

The tramcars generally in use in the United Kingdom are constructed to carry 22 persons inside and 24 outside. They are 16 feet long in the body, or 24 feet including the platforms at each end, and weigh 2½ to 2¾ tons when empty and about 5½ tons when fully loaded. Smaller cars to carry 20 or 14 persons inside, drawn by one horse, are useful to run at short intervals when the traffic is not great, a frequent service of cars being a great element of success. The car wheels are usually of steel or chilled iron, with a flange half an inch deep, and are fitted with powerful brakes. The axles are about 6 feet apart, giving a short wheel-base to enable the cars to pass sharp curves, but with the disadvantage of overhanging ends. Cars to be drawn by mechanical power, especially if outside passengers are to be carried, should have a flexible wheel-base, either by means of bogie frames or radiating axles. In Hamburg and Copenhagen tramcars have wheels without flanges, and a small guiding wheel running in the groove, which can be raised to allow the car to leave the track.

Traction.

The tractive force required on a straight and level tramway is found to vary from $\frac{1}{150}$ to $\frac{1}{50}$ of the load, according to the condition of the rails. On a tramway in average condition it is about $\frac{1}{100}$. The resistance is thus at the best nearly double that on a railway, and sometimes as much as on a good pavement. This is due to the friction of the flange of the wheel in the grooved rail, and to the circumstance that the latter is always more or less clogged with dirt. The clearance between the flange and the groove is necessarily small, as the former must have sufficient strength, and the latter must be narrow. The least inaccuracy of gauge, therefore, causes extra friction, which is greatly increased on curves. By removing the flanges from two of the four wheels of a tramway car Tresca found that the resistance was reduced from $\frac{1}{100}$ to $\frac{1}{148}$ of the load. The resistance due to gravity is of course not lessened on a tramway; and, if $\frac{1}{100}$ of the load be the tractive force required on the level, twice as much, or $\frac{1}{50}$ of the load, will be required on a gradient of 1 in 100 and three times as much on a gradient of 1 in 50. To start a tramcar, four or five times as great a pull is required as will keep it in motion afterwards, and the constant starting after stoppages, especially on inclines, is very destructive to horses. Horses employed on tramways are worked only a few hours a day, a day's work being a journey of 10 or 12 miles, or much less on steep gradients. In London a tramcar horse bought at the age of five years has to be sold at a low price after about four years' work. On the Edinburgh tramways, in consequence of the steep gradients, the horses last a less time, and they have to be constantly shifted from steep to easier gradients. The cost of traction by horses is generally 6d. or 7d. per mile for two horses, and more when the gradients are steep.

Steam traction.

The application of steam as a motive power on street tramways is attended with special difficulties, arising from the conditions under which the engines have to work. A tramway engine must be able to draw its load up steep gradients, demanding perhaps seven or eight times the power required on a level, and it must have the necessary adhesion without being too heavy for the permanent way. It must be capable of traversing sharp curves, of going backwards or forwards with safety, and of stopping and starting quickly. For the safety and convenience of the public the Board of Trade require that tramway engines shall have brakes to each wheel, to be applied by hand and by steam, a governor so arranged as to shut off the steam and apply the brakes when the engine exceeds the speed of 10 miles an hour or other stated speed, an indicator to show the speed, a whistle or bell to be sounded as a warning, and a fender to push aside obstructions; the engine must be free from noise produced by blast, and from clatter of machinery such as to constitute a reasonable ground of complaint; and the machinery and fire must be concealed from view; no smoke or steam must be emitted so as to constitute any reasonable ground of complaint to passengers or the public.

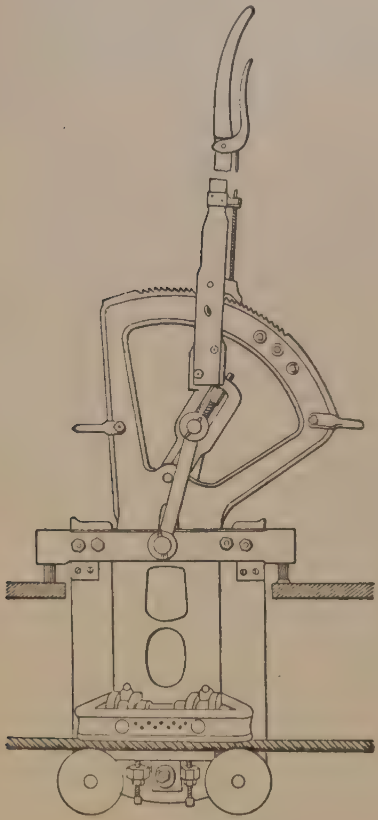

FIG. 6.—Gripper.

The first attempt to use steam on a modern tramway was with Grantham's combined engine and car. It was about 25 feet long, having a vertical boiler in a central compartment, with the steam cylinders below, driving one pair of wheels 2 feet 6 inches in diameter. It carried 20 passengers inside and 24 outside, weighing 6½ tons empty and 12 tons when fully loaded. In a later car the boiler and machinery were at one end, and the body of the car was carried on a bogie frame. In a combined engine and car the weight of the car and passengers is utilized for adhesion of the driving wheels, and this is conveniently effected in Rowan's car, in which there are two four-wheel bogies, the leading one carrying the engine and boiler, and half the body of the car and passengers. The engine can be detached from the car for repair and another engine can be substituted in a few minutes. Economy of rolling stock, and the advantage of being able to use cars intended for horses, are in favor of independent engines. They are usually in general construction similar to locomotives, but are enclosed so as to resemble in outward appearance a short tramcar. The cylinders are 6 to 9 inches in diameter, with a stroke of 10 to 12 inches. The wheels are coupled, 2 to 3 feet in diameter, and the engines weigh 4 to 6 tons with fuel and water. The governor to shut off steam and apply the brakes when any determined speed is attained is actuated either by the engine wheels or by an independent wheel to prevent the possibility of the brakes being put on when the driving-wheels slip. An effectual way of rendering the exhaust steam invisible is to condense it by passing it through water in a tank, or through a shower of water let off at each blast, but when the water gets hot it must be changed, and in streets it is difficult to get rid of the hot water. Several methods of superheating by passing the exhaust steam through the fire have been adopted, but they are all attended with an increased consumption of fuel which in cold damp weather is considerable. It is now preferred to pass the steam into tubes exposed to the air on the top of the engine car, from which the condensed water is returned to the feed-tank, to be again pumped into the boiler at a high temperature. Any steam remaining uncondensed passes into the smoke-box. Compound cylinders have been applied to tramway engines, giving a greater range of power, economizing fuel, and rendering the exhaust steam easier to deal with. The extra complication of a compound engine is, however, a drawback.

The cost of steam traction with engines of ordinary size is generally 3d. to 4d. per mile run by the engine, and more on lines with steep gradients. To this must be added for depreciation 10 per cent., or, according to some authorities, 15 per cent. on the original cost of the engines, making altogether 4d. to 6d. per mile run on a tramway with average gradients.

Fireless engines.

Fireless engines were first tried in New Orleans, and have been in successful use on tramways in France for some years. The motive power is obtained from water heated under pressure to a very high temperature in stationary boilers and carried in a reservoir, where it gives off steam as the pressure and temperature are reduced. Two tons of water heated to give a steam-pressure of 250 ℔ to the square inch serves for a run of 8 or 10 miles, leaving more than $\frac{9}{10}$ of the water and a pressure of 20 to 25 ℔ above the atmosphere on returning to the boiler. Large boiler-power is required to reheat the engine reservoirs quickly, and this cannot be afforded for only a few engines, but, when worked on a sufficient scale, the fireless engines are claimed to be economical, the economy resulting from the generation of the steam in large stationary boilers.

Compressed air.

Compressed air as a motive power offers the advantage of having neither steam nor the products of combustion to be got rid of. In Scott Moncrieff's engine, which was tried on the Vale of Clyde tramways in 1876, air was compressed to 310 ℔ on the square inch, and expanded in the cylinders from a uniform working pressure to that of the atmosphere. There is a considerable loss of heat during the expansion of the air which is attended with a serious loss of pressure, and in Mékarski's system, which has been in use for the propulsion of tramcars at Nantes for seven years, the loss of pressure is considerably lessened by heating the air during expansion. The air, at a pressure of 426 ℔ per square inch, is stored in cylindrical reservoirs beneath the car, and before use is passed through a vessel three-quarters full of water heated to 300° F., by which it is heated and mixed with steam. The heat of the latter is absorbed by the air during its expansion, first to a working pressure which can be regulated by the driver, and then to atmospheric pressure in the cylinders. At Nantes the average cost for three years for propelling a car holding 34 persons was about 6d. [12 cts.] per mile.

In San Francisco a main charged with air at a pressure of about 120 ℔ per square inch has been laid along the tram route, from which reservoirs on the cars are charged by means of standpipes and flexible connections at convenient points, the operation taking a very short time. The inventor claims to utilize 30 per cent. of the power applied to the compressor.

Cable tramways.

Street tramways worked by means of a wire rope have been in successful operation in San Francisco since 1873. There are now upwards of 24 miles of double line in San Francisco, and 10 miles in Chicago, and the system is being adopted in other American and colonial cities. It has also been in operation in England at Highgate Hill for several years, and is about to be adopted in other localities. The motive power is transmitted from a stationary engine by a rope of steel wire running always in one direction up one track and down the other, in a tube midway between the rails, on pulleys which are arranged so as to suit curves and changes of gradient as well as straight and level lines. Over the rope is a slot $\frac{3}{4}$ inch wide, in which travels a flat arm of steel connecting the dummy car with the gripper which grasps the cable. The flat arm is in three pieces, the two outer ones constituting a frame which carries the lower jaw of the gripper, with grooved rollers at each end of it, over which the cable runs when the gripper is not in action. The upper jaw is carried by the middle piece, which slides within the outer frame, and can be depressed by a lever or screw, pressing the cable first on the rollers, and then on the lower jaw until it is firmly held. The speed of the cable, which is generally 6 to 8 miles an hour, is thus imparted to the car gradually and without jerk. The arrangements for passing the pulleys, for changing the dummy and cars from one line to the other at the end of the road, for keeping the cable uniformly taut, and for crossings and junctions with other lines are of considerable ingenuity. When the cars are cast off from the cable they must be stopped by hand brakes, which on steep gradients especially must be of great power.

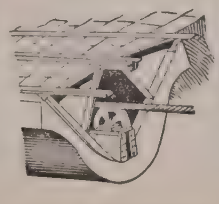

Fig 7.—Carrying Pulley.

The system has advantages on double lines with few and easy curves when the gradients are long and steep, and it can be employed on gradients too steep for steam traction. On level lines it is doubtful if it could compete in economy with steam, or even with horse traction, unless with a very frequent service of cars, though then it presents the advantages of being comparatively quiet and free from smoke and steam, and of admitting a frequent service of cars with little extra cost. On the cable roads of San Francisco it has been found that, of the average daily power employed, 68 per cent. is expended in moving the cables, etc., 28 per cent. for the cars, and 4 per cent. for passengers. It is considered that it is practicable to utilize in moving cars and passengers as much as 50 per cent. of the power, provided the cars are fully loaded and run at short intervals.

Electric motors.

Electricity has been applied as a motive power on a tramway about 2 miles long at Blackpool. The current is conveyed by two copper conductors in a central channel beneath the roadway, and is communicated to the motors in the car by a collector running upon the conductors and passing through a narrow slit in the channel. The return current passes through the rails. The cars carry as many as 56 passengers on a level line. Tramways have also been worked by accumulators at Antwerp and Brussels, but the weight of them appears to be at present prohibitory to this method of applying electricity, except for short trips. See TRACTION.

E.*, vol. i.–vol. lxvii.; "The Working of Tramways by Steam," *Ibid.*, vol. lxxix.; and F. B. Smith, *Cable Tramways*. (T. C.)

TRANCE. See SLEEP; also MAGNETISM (ANIMAL).

TRANI, a seaport of Italy, on the Adriatic, in the province of Bari, and 26 miles by rail west-northwest of that town, still retains its old walls and bastions, with the citadel, now used as a prison. Some of the streets remain much as they were in the mediæval period, and many of the houses display more or less of Norman decoration. The cathedral, on a raised open site near the sea, dating from about the year 1100, is a basilica with three apses, a large crypt, and a lofty tower. The arches of the Romanesque portal are beautifully ornamented, in a manner suggestive of Arab influence; the bronze doors, executed by Barisanus of Trani in 1175, rank among the best of their period in southern Italy. The capitals of the pillars in the crypt are fine examples of the Romanesque. The interior of the cathedral has been barbarously modernized. The vicinity of Trani produces an excellent wine (Moscado di Trani), and its figs, oil, almonds, and corn are also profitable articles of trade, The harbor was once deep and good, but lately has got silted up. The population of the town in 1881 was 25,173 (commune 25,647).

Trani is the *Turenum* of the itineraries. It first became a flourishing place under the Normans and during the crusades, but attained the acme of its prosperity as a seat of trade with the East under the Angevine princes. Several synagogues continue to afford an indication of its former commercial prosperity.

TRANQUEBAR, a seaport town in the Tanjore district of Madras presidency, India, in 11° 1′ 37″ N. lat. and 79° 55′ E. long. In the 17th century it belonged to the Danes; it was taken by the British with other Danish settlements in 1807, but restored in 1814, and finally purchased in 1845 for a sum of £20,000 [$97,200]. In Danish times Tranquebar was a busy port, but its prosperity has fluctuated considerably of late years, and is now at a very low ebb. It was the first settlement of Protestant missionaries in India, founded by Ziegenbalg and Plutschau (Lutherans) in 1706; and as a mission station it still retains its importance.

See vol. xxii. Plate I.

TRANSBAIKALIA (*Zabaikalskaya Oblast*), a province of Eastern Siberia, to the east of Lake Baikal, has Irkutsk on the west, Yakutsk on the north, the province of Amur on the east, and Mongolia on the south. Its area (240,780 square miles) is about as great as that of Austria-Hungary, but its population is under half a million. With regions of a purely Siberian character on the one hand, and including on the other the outer borders of the Mongolian steppes and the upper basin of the Amur, Transbaikalia forms an intermediate link between Siberia, Mongolia, and the northern Pacific littoral. The mountains of the Yablonovoi Khrebet, which run in a northeasterly direction from the sources of the Kerulen̄ to the bend of the Olekma in 56° N. lat., divide the province into two quite distinct parts: to the west the upper terrace of the high East Asian plateau continued from the upper Selenga and Yenisei (from 4000 to 5000 feet high) towards the plateau of the Vitim (3500 to 4000 feet); and to the east the lower terrace of the same plateau (about 2800 feet high), which appears as a continuation of the eastern Gobi. The continuity of the high plateau extending from the upper Selenga to the upper Vitim was for a long time overlooked in consequence of a broad and deep valley by which it is intersected. Beginning at Lake Baikal, it pierces the huge northwestern border-ridge of the plateau, and runs eastward up the Uda, with an imperceptible gradient, like a gigantic railway cutting enclosed between two steep slopes, sending another branch south towards Kiakhta. After having served, through a succession of geological periods, as an outlet for the water and ice which accumulated on the plateau, it is now utilized for the two highways which lead from Lake Baikal over the plateau (3500 to 4000 feet) to the Amur in the east and the Chinese depression in the south. Elsewhere, the high and massive border-ridge on the northwestern edge of the plateau can be crossed only by difficult footpaths. The border-ridge just mentioned, pierced by the wide opening of the Selenga, runs from southwest to northeast under different names, being known as Khamar-daban to the south of Lake Baikal (the Khamar-daban peak raising its bald summit to a height of 6900 feet above the sea), and as the Barguzin Mountains (7000 to 8000 feet) along the eastern bank of the Barguzin river, while farther to the northeast it has been described by the present writer under the names of the South Muya and Tchara Mountains (6000 to 7000 feet). Resting its southeast base on the plateau, it descends steeply on the northwest to the lake, or to the broad picturesque valleys of the Barguzin, the Muya, and the Tchara. Larch, fir, and cedar forests thickly clothe the ridge, whose dome-shaped rounded summits (*goltsy*) rise above the limits of tree vegetation, but do not reach the snow-line (here above 10,000 feet). The high plateau itself has the aspect of an undulating table land, intersected by low ranges, which rise some 1500 or 2000 feet above its surface, and are separated by broad, flat, and marshy valleys, which the rivers languidly traverse till they find their way across the border-ridges. Those of the valleys which are better drained have fine meadow lands, but as a whole the plateau has the appearance, especially in the north, of a wet or marshy prairie in the hollows, while the hills are thickly clothed with forests (almost exclusively of larch and birch). Numberless lakes and ponds occur along the river courses. Tungus hunters find a livelihood in the forests and on the meadows, but permanent agricultural settlements are impossible, corn seldom ripening on account of the early frosts. The lower parts of the broad and flat valley of the Djida have, however, a few Cossack settlements, and on the upper Selenga and Yenisei Mongolian shepherds (Uryankhes and Darkhates) inhabit the high grassy valleys about Lake Kossogol) 5560 feet above the sea). Quite different is the lower terrace of the plateau, occupied by the eastern Gobi and the Nertchinsk region of Transbaikalia, and separated from the above by the Yablonovoi ridge. This last is the southeastern border ridge of the higher terrace. It rises to 8250 feet in the Sokhondo peak, but elsewhere its dome-shaped summits do not exceed 5000 or 6000 feet. When crossing it from the northwest, about Tchita, the traveller hardly perceives that he is approaching the great water-parting between the Arctic and the Pacific oceans. Numberless lakes, with flat undefined borders, feed streams which flow lazily amidst marshes, some of them to join the great northward rivers, others to find their way to the Amur and the Pacific. Low hills rise gently above the edge of the plateau, but an abrupt slope descends towards the southeast, where the hill-foots of the Yablonovoi are nearly 1500 and 2000 feet lower than on the northwest. Climate, flora, and fauna suddenly change as soon as the Yablonovoi has been crossed; the steppes of Dauria (continuations of those of the Gobi), covered with a bright luxuriant vegetation, meet the view of the spectator. The Siberian flora gives way to the much richer Daurian flora, which in turn is exchanged for the Pacific littoral flora as soon as the traveller descends from the lower terrace of the plateau towards the Manchurian plains and lowlands.

The lower terrace, occupied in Transbaikalia by the Nertchinsk district, has the character of a steppe, but is also intersected by a number of ranges, all running southwest to northeast, and all being plications of Silurian and Devonian rocks, containing silver, lead, and copper, and also auriferous sands. Agriculture can be easily carried on in the broad prairies, the only drawbacks being droughts, and also frosts in the settlements in the higher close valleys of the Nertchinsk or Gazimur Mountains. The lower terrace is in its turn fringed by a border-ridge—the Great Khingan—which has, with reference to the lower terrace, the same characters as the Yablonovoi in relation to the upper, and separates Siberia from northern Manchuria. This important ridge, as shown elsewhere (vol. xxii. pp. 7, 8), does not run from south to north, as represented on the old maps, but from southwest to northeast; it is pierced by the Amur near Albazin, and joins the Okhotsk ridge, which in its turn does not join the Yablonovoi Mountains. The mountains drawn west and east on older maps to connect the Yablonovoi with the Okhotsk ridge have no actual existence.

The rivers belong to three different systems,—the affluents of Lake Baikal, of the Lena, and of the Amur. Of the first the Selenga (800 miles long) rises in the Hanghai Mountains of northwestern Mongolia, one of its great tributaries (the Ebin-gol) being an emissary of Lake Kossogol. It flows past Selenghinsk and enters Lake Baikal from the southeast, forming a wide delta. The Tchikoi, the Khiłok, and the Uda are its chief tributaries in Transbaikalia.[1] The Barguzin and the Upper Angara are two large tributaries of Lake Baikal from the northeast. Of the tributaries of the Lena, the Vitim with its affluents (Karenga, Tsipa, Muya, Kałar, Kałakan) flows on the high plateau through uninhabited regions, as also does the Olekma. The tributaries of the Amur, which is formed by the junction of the Shilka and the Arguñ, are much more important. The Arguñ, which at a quite recent epoch received the waters of the Dalai-nor, and thus had the Keruleñ for its source, is no longer in communication with the rapidly drying Mongolian lake, and has its sources in the Gañ, which flows from the Great Khingan. It is not navigable, but receives the Gazimur and several other streams which water the Nertchinsk mining district. The Shilka is formed by the union of the Onon and the Tchita rivers, and is navigable from the town of Tchita, thus being an important channel of transit to the Amur.

Lake Baikal, with an area of 12,430 square miles (nearly equal to that of Switzerland), extends in a half crescent from southwest to northeast; it has a length of over 400 miles and a width of from 20 to 53 miles. Its level is 1561 feet above the sea.[2] About the middle it is divided into two parts, the Great Lake and the Little Lake, by the island Olkhon and the peninsula of Svyatoi Nos, which closely approach one another. Between the two there is a submerged ridge, which must be considered as a continuation of the Barguzin Alps. The wide delta of the Selenga narrows the Great Lake in its middle part, and renders it more shallow in the east than in the west—the greatest depth (4186 feet) having been reached by Dr. Godlevski in the southwest. The depth of the Little Lake does not exceed 210 feet. According to Tchersky, the trough now occupied by the base had its origin in three separate synclinal valleys, which date from the Azoic epoch, and were gulfs of the ocean during the Silurian or Huronian period. They coalesced at a much later epoch.[3] Of other lakes, the Gusinoye and Lake Baunt on the Vitim plateau, and Oron at its base, are worthy of notice. Many lakes yield common salt or sulphate of natron.

The high plateau consists of granites, gneisses, and syenites, covered with Laurentian schists. Silurian and Devonian marine deposits occur only on the lower terrace. Since that time the region has not been under the sea, and only freshwater Jurassic deposits and coal-beds are met with in the depressions. During the Glacial period most of the high terrace of the plateau and its border ridges were undoubtedly covered with vast glaciers. Volcanic rocks of more recent origin (Mesozoic?) are met with in the northwestern border ridge and on its slopes, as well as on the Vitim plateau. During the Glacial period the fauna of the lowest parts of Transbaikalia was decidedly arctic; while during the Lacustrine or Post-Glacial period it was covered with numberless lakes, the shores of which were inhabited by Neolithic man. Only few traces of these have remained, and they are rapidly drying up. Earthquakes are very frequent on the shores of Lake Baikal, especially at the mouth of the Selenga, extending as far as Irkutsk, Barguzin, and Selenghinsk; in 1862 an extensive area was submerged by the lake. Numerous mineral springs, some of them of high repute, are spread all over Transbaikalia. The chief of them are the hot alkaline springs (130° F.) at Turka, at the mouth of the Barguzin, whither hundreds of patients resort annually, those of Pogromna on the Uda (very similar to the Seltzer springs), those of Mołokova near Tchita, and those of Darasun in the Nertchinsk district (very rich in carbonic acid and phosphate of iron).

The flora and fauna of Transbaikalia, owing to their intermediate character between a purely Siberian flora and fauna and those characteristic of the Mongolian and Manchurian regions, have been the subject of many careful investigations since the time of Pallas down to those of Turczaninoff, Middendorff, Schrenck, Radde, and Polyakoff. Their various characters in different parts of this extensive territory could not be described without entering too largely into details. The reader may consult the works of the authors just named (see vol. xxii. p. 17–18).

The climate is, as a whole, exceedingly dry and extreme. The winter is cold and dry; snow is so trifling that the horses of the Buriats find their food throughout the winter on the steppes, and in the very middle of the winter wheeled vehicles are used all over the west. To the east of the Yablonovoi ridge the Nertchinsk district feels the influence of the North Pacific monsoon region, and snow falls more thickly, especially in the valleys, but the summer continues to be hot and dry. On the high plateau, even the summer is cold, owing to the altitude and the humidity arising from the marshes, and the soil is frozen to a great depth. In the vicinity of Lake Baikal the moderating influence of the great water-basin is felt to some extent, and there is a cooler summer; in winter exceedingly deep snow covers the *goltsys* and valleys of the mountains around the lake.[4]

The population (497,760 in 1882) is exceedingly sparse, unless the immense uninhabitable spaces of the plateaus be left out of account. Even on the lower terrace nearly the whole of the region on the left bank of the Shilka is unsuited for agriculture, as also are the Gazimur Mountains, where only a few settlers gain a livelihood in some of the valleys, struggling against an unhealthy climate and the influence of goitre. The Russian population there gathers around the crown mines of the Nertchinsk district, while the steppes are occupied by Buriats. A succession of villages, supported partly by agriculture and partly by hunting and trade with Mongolia, are settled along the Shilka between Tchita and Sryetensk, while farther down the river flows in such a wild mountain region that only a few families are settled, at distances some 20 miles apart, to maintain communication. The same is true with regard to the lower Arguñ. The valleys of the Uda, the lower Selenga, and especially the Tchikoi and the Khilok have been occupied since the beginning of the century by Raskolniks, who have received the name of *Semeiskiye* on account of their large (compound) families, and there one finds, in a condition of prosperity such as is unknown in Russia proper, some of the finest representatives of the Russian race. The remainder of the steppe of the Uda is occupied by Buriats, while the forests and marshes of the plateau are the hunting grounds of the nomad Tunguses. Only the valley of the Djida in the south of the Khamardaban is settled in its lower parts.

---

[1] Steamers have ascended the lower Selenga and the Uda up to Verkneudinsk.

[2] According to the levelling made in 1875–76 from Zverinogolovsk, in Orenburg, to Lake Baikal. There is uncertainty as to the absolute altitude, that of Zverinogolovsk, 818 feet, having still to be verified. See *Mem. Russ. Geogr. Soc., Phys. Geogr.*, vol. xv., 1885.

[3] I. Tchersky, "Results of the Exploration of Lake Baikal," in *Mem. Russ. Geogr. Soc., Phys. Georgr.*, vol. xv., 1886, with a geological map on a scale of 7 miles to an inch; Fr. Schmidt's report in the yearly *Report* of the Russian Geographical Society for 1886 (both Russian).

[4] "Das Klima von Ost-Sibirien," by A. Woyeikoff, in *Meteor Zeitsch.*, 1884.

The Russians of Transbaikalia present a great variety of ethnological types. Mainly owing to the difficulties of communication, many Great Russian Raskolniks and Little Russian settlers have preserved their ethnographical features pure from any admixture; while there are, on the other hand, villages in the Nertchinsk district, chiefly composed of the earliest Russian settlers, where a great admixture of Tungusian or Mongolian blood is observable. On the upper Arguñ the Cossacks are in features, character, language, and manners largely Mongolian. The Russians along the Chinese frontier constitute a separate *voisko* of the Transbaikalian Cossacks. There is great uncertainty as to the numbers of the Buriats; they are estimated at about 150,000. The Tunguses number only a very few thousands.

Agriculture is carried on to a limited extent by the Buriats and in all Russian settlements; but it prospers only in the valleys of west Transbaikalia, and partly in the Nertchinsk region, while in the steppes of the Arguñ and Onon even the Russians resort chiefly to cattle-breeding and trade, or to hunting. On the whole, corn has to be imported; summer wheat and summer rye, oats, and barley are the chief crops in the east, winter rye not being sown in consequence of the want of snow. Cattle-rearing is extensively carried on, especially by the Buriats, but their herds and flocks, which wander freely over the steppes throughout the winter, are often destroyed in great numbers by the snow-storms of spring. Hunting is an important occupation, even with the Russians, many of whom leave their homes in October to spend six weeks in the *taiga* (forest-region). The fisheries of Lake Baikal and the lower parts of its affluents are important. Enormous quantities of *Salmo omul* are taken every year; and, although the curing is most primitive, the annual yield is valued at £20,000 [$97,200]. The *Salmo thymallus*, *S. oxyrhynchus*, and *S. fluviatilis* are also taken largely.

The possibilities of discoveries of gold are absorbing all the industrial forces of Transbaikalia. Gold-diggings occur chiefly in the basins of the Shilka and the upper Vitim, also on the Tchikoi and the Khilok. No less than 25,400 ℔ is extracted annually by private enterprise, and about 3200 ℔ by the crown, at the Kara gold-diggings, where nearly 1400 convicts are employed. The silver mining formerly carried on at several crown works is now on the decrease (see NERTCHINSK); the quantity extracted in 1884 was only 241 ℔. Every kind of manufactured ware has to be imported from Russia; and even petty trades are almost unknown in the villages.

The trade of the province is chiefly represented by that of Kiakhta. The Cossacks on the frontier carry on some trade in brick-tea, cattle, and hides with Mongolia. The export of furs is of considerable value.

The communications of Transbaikalia are limited to the great Amur highway, which fringes the south coast of Lake Baikal and passes through Verkhneudinsk, Tchita, and Nertchinsk to Sryetensk, whence steamers ply down to the mouth of the Amur; in winter, further communication with the Amur beyond Sryetensk is maintained on sledges on the ice of the Shilka, but in the autumn and spring a horseback journey as far as Kumara is the only possible method of reaching the middle Amur. Steamer communication is also maintained for six or seven months across Lake Baikal, from Posolskoye, at the mouth of the Selenga, to Listvenichnaya, 40 miles from Irkutsk. A highway connects Verkhneudinsk with Selenghinsk and Kiakhta, and communication on the steppes of the Arguñ and the Onon as well as up the Barguzin is easy. The rest of Transbaikalia can be visited only on horseback.

Transbaikalia is divided into five districts, the chief towns of which (with populations in 1880) are Tchita, capital of the province (12,600 inhabitants), Barguzin (800), Nertchinsk (4070), Selenghinsk (1150), and Verkhneudinsk (4150). Kiakhta has 4290 inhabitants, and Sryetensk, being at the head of the navigation, is a rising town.

(P. A. K.)

TRANSCASPIAN REGION (*Zakaspiyskaya Oblast*), an extensive territory to the east of the Caspian, annexed by Russia within the last fifteen years, is bounded on the S. by the highlands of Khorasan and Afghanistan, on the N. by Uralsk (from which it is divided by a line drawn from the Mortvyi Kultuk Bay of the Caspian to the south extremity of Lake Aral), on the N.E. by Khiva and Bokhara, and on the S.E. (where it penetrates towards Herat on the slopes of the Paropamisus, and includes the Badhyz plateau) by Afghan Turkestan. So defined, it has an area of 220,000 square miles.

See vol. ii. Plate XXVI.

Although nine-tenths of this territory consists of uninhabitable desert, an interest attaches to it on account of the great physical changes it has undergone during the Post-Glacial period. Since Pallas visited its borders, and still more since Humboldt discussed its history, it has never ceased to attract the attention of geographers. In fact, some of the most interesting problems of geography, such as those relating to the changes in the course of the Jaxartes and the Oxus, the bifurcation and the oscillation of a great river, and the supposed periodical disappearance of Lake Aral, are connected with the Transcaspian deserts; and it is here that we must look for a clue to the great physical changes which transformed the Mediterranean of Western Asia—the Aral-Caspian and Pontic basin—into a series of separate seas, and desiccated them, powerfully influencing the distribution of floras and faunas, and compelling the inhabitants of Western and Central Asia to enter upon their great migrations. But down to a very recent date the dry and barren deserts, peopled only by wandering Turcoman bands, remained almost a *terra incognita*, and only now are we beginning to make the very first steps towards their really scientific exploration.

A mountain chain, in length comparable to the Alps, separates the deserts of the Transcaspian from the highlands of Khorasan. It runs from northwest to southeast, and appears as a continuation of the Caucasus. It begins in the Krasnodovsk peninsula of the Caspian, under the names of Kuryanin-kara and Great Balkans, whose masses of granite and other crystalline rock reach a height of more than 5000 feet. Farther to the southeast these are continued in the much lower Little Balkans and Kyuren-dagh (2000 feet), the Kopepet dagh, Kosty-dagh, Asilma, and Zarynkul,—the name of Kopepet-dagh or Kopet-dagh being often now used to designate the whole chain which rises steep and wild above the flat deserts from the Caspian to the river Murghab,—a stretch of 600 miles. In structure it is homologous with the Caucasus chain; it appears as an outer wall of the Khorasan plateau, and is separated from it by a broad valley, which, like the Rion and Kura valley of Transcaucasia, is watered by two rivers flowing in opposite directions,—the Atrek, which flows northwest into the Caspian, and the Keshefrud, which flows to the southeast, and is a tributary of the Murghab. On the other side of this valley the Allah-dagh and the Binalund border-ridges (9000 to 11,000 feet) fringe the edge of the Khorasan plateau. At its southeastern extremity this outer wall loses its regularity where it meets with the spurs of the Hindukush. Descending towards the steppe with steep stony slopes, it rises to heights of 6000 and 9000 feet to the east of Kizil-arvat, while the passes which lead from the Turcoman deserts to the valleys of Khorasan are seldom as low as 3500, usually rising to 5000, 6000, and even 8500 feet, and in most cases being very difficult. This wall is pierced by but one wide opening, that between the Great and Little Balkans, through which the sea which once covered the steppe maintained connection with the Caspian.

While the Allah-dagh and Binalund border-ridges are chiefly composed of crystalline rocks and metamorphic slates covered with Devonian deposits, a series of more recent formations—Upper and Lower Cretaceous, and Miocene—are shown in the outer wall of the Kopet-dagh. Here again we find that the mountains of Asia which stretch towards the northwest continued to be uplifted at a geologically recent epoch. Quaternary deposits have an extensive development on its slopes, and its hillfoots are bordered by a girdle of loess.

The loess terrace, called "Atok" ("mountain base"), is but narrow, ranging in width from 10 to 20 miles; still its chain of settlements have rendered it possible to lay down a railway which now connects the Caspian with Sarakhs. It is very fertile, but could produce nothing without irrigation, and the streams flowing from the Kopet-dagh are few and meagre. The winds which reach the northern slope of the mountains have been deprived of all their moisture in crossing the Kara-kum—the Black Sands of the Turcoman desert; and even such rain as falls on the Kopet-dagh (10½ inches at Kizil-arvat) too often reaches the soil in the shape of showers which do not saturate it, so that the average relative humidity is but 56 and the average nebulosity only 3.9, as against 62 and 4.1 at even so dry a place as Krasnovodsk. Still, at those places where the mountain streams are closer to one another, as at Geok-tepe, Askabad, Lutfabad, and Kahka, the villages are more populous, and the houses are surrounded by gardens, every square yard and every tree of which is fed by irrigation.

Beyond this narrow strip of irrigated land begins the desert,—the Kara-kum,—which extends from the mountains of Khorasan to Lake Aral and the Ust-Urt, and from the Caspian to the Amu, interrupted only by the oases of Merv and Tejeñ. It appears, however, that the terrible shifting sands blown into *barkhans*, or elongated hills, sometimes 50 and 60 feet in height, are grouped chiefly in the west, where the country has more recently emerged from the sea. Farther to the east the *barkhans* are more stable, their slopes being covered with bushes (for the most part leafless); the caravans sometimes follow their crests, and the shifting sands occupy restricted spaces. Large areas amidst the sands are occupied by *takyrs*, or flat surfaces covered with clay which is hard as a rule, but becomes almost impassable after heavy rains. In these *takyrs* the Turcomans dig ditches, draining into a kind of cistern—the *kak*—where the water of the spring rains keeps for a few months. Wells are sunk also along the routes of the caravans, and water is found in them at depths of 10 to 50 or occasionally 100 feet and more. All is not desert in the strict sense; in spring there is for the most part a covering of grass, which allows of journeys across the desert. There are footpaths in several directions, especially from the irrigated and cultivated Atok towards Khiva.

The vegetation of the Kara-kum cannot be described as poor; the typical representative of the sand deserts of Asia, the saksaul (*Anabasis Ammodendron*), has been almost destroyed within the last hundred years, and never appears in forests, but the borders of the spaces covered with salted clay are brightened by forests of tamarisk, which are inhabited by great numbers of the desert warbler (*Atraphornis aralensis*)—a typical inhabitant of the sands,—sparrows, and ground-choughs (*Podoces*); the *Houbara macquennii*, Gray, though not frequent, is characteristic of the region. Hares and foxes, jackals and wolves, marmots, moles, hedgehogs, and one species of marten live in the steppe, especially in spring. As a whole, the fauna is richer than might be supposed, while in the Atok it contains representatives of all the species known in Turkestan, mixed with Persian and Himalayan species.[1]

The Uzboi.—A feature distinctive of the Turcoman desert is seen in the very numerous *shors*, or elongated depressions, the lower portions of which are occupied mostly with sand impregnated with brackish water. They are obviously the remains of brackish lakes, and, like the lakes of the Kirghiz steppes, they often follow one another in close succession, thus closely resembling river-beds. As the direction of these *shors* is generally from the higher terraces watered by the Amu-Daria towards the lowlands of the Caspian, they were usually regarded as old beds of the Amu-Daria, and were held to support the idea of its once having flowed across the Turcoman desert towards what is now the Caspian Sea. A few years ago it seemed almost settled, not only that that river (see OXUS) flowed into the Caspian during historical times, but that, after having ceased to do so in the 7th century, its waters were again diverted to the Caspian about 1221. A succession of elongated depressions, having a faint resemblance to old river-beds, was traced from Urgenj to the gap between the Great and the Little Balkans, marked on the maps as the Uzboi, or old bed of the Oxus.[2] The idea of again diverting the Amu into the Caspian was thus set afloat, and expeditions were sent out for explorations with this view. The result of these investigations by Russian engineers, especially Hedroitz, Konshin, Mushketoff, Lessar, and Svintsoff,[3] was, however, to show that the Uzboi is no river-bed at all, and that no river has ever discharged its waters in that direction. The existence of an extensive lacustrine depression, where the small Sary-kamysh lakes are now the only remains of a wide basin, was proved, and it became evident that this depression, having a length of more than 130 miles, a width of 70 miles, and a depth of 280 feet below the present level of Lake Aral, would have to be filled by the Amu, before its waters could advance farther to the southwest. The sill of this basin being only 28 feet below the present level of Lake Aral, this latter could not be made to disappear, nor even be notably reduced in size by the Amu flowing from Urgenj to the southwest. A more careful exploration of the Uzboi has shown moreover that, while the deposits in the Sary-kamysh depression, and the Aral shells they contain, bear unmistakable testimony as to the fact of the basin having once been fed by the Amu-Daria, no such traces are found along the Uzboi below the Sary-kamysh depression;[4] on the contrary, shells of mollusks still inhabiting the Caspian are found in numbers all along it, and the supposed old bed has all the characters of a series of lakes which continued to subsist at the hillfoots of the Ust-Urt plateau, while the Caspian was slowly receding westwards during the Post-Pliocene period. On rare occasions only did the waters of the Sary-kamysh, when raised by inundations above the sill just mentioned, send their surplus into the Uzboi. It appears most probable that in the 16th century the Sary-kamysh was confounded with a gulf of the Caspian;[5] and this gives much plausibility to Konshin's supposition that the changes in the lower course of the Amu (which no geologist would venture to ascribe to man, if they were to mean the alternative discharge of the Amu into the Caspian and Lake Aral) merely meant that by means of appropriate dams the Amu was made to flow, in the 13th, 14th, 15th, and 16th centuries, alternately into Lake Aral and into the Sary-kamysh.

As for the ancient texts with regard to the Jaxartes and Oxus, it becomes more and more probable that their interpretation, if possible at all, is only so when it is admitted that, since the epoch to which these relate, the outlines of the Caspian Sea and Lake Aral have undergone notable changes, commensurate with those which are supposed to have occurred in the courses of the Central Asian rivers. The desiccation of the Aral-Caspian basin proceeded with such rapidity that the shores of the Caspian could not possibly maintain for some twenty centuries the outlines which they have at present. When studied in detail, the general configuration of the Transcaspian region leaves no doubt that both the Jaxartes and the Oxus, with its former tributaries, the Murghab and the Tejeñ, once flowed towards the west; but the Caspian of that time was not the sea of our days; its gulfs penetrated the Turcoman steppe, and washed the base of the Ust-Urt plateau, as is shown by the deposits of its shells described by the Russian engineers.

Kelif-Uzboi.—There is also no doubt that, instead of flowing northwestward of Kelif, the Amu once flowed to join the Murghab and Tejeñ; the succession of depressions described by the Russian engineers as the Kelif-Uzboi[6] supports this hypothesis, which a geographer cannot avoid making when studying a map of the Transcaspian region; but the date at which the Oxus followed such a course, and the extension which the Caspian basin then had towards the east, remain unsettled. Much, however, has still to be done before we can fully reconstruct the geological history of that region since the Pliocene epoch, or show how far the data of Pliny, Strabo, and Ptolemy were descriptions of actual facts.[1]

---

[1] See N. Zarudnyi, "Les Oiseaux de la Contrée Transcaspienne," in *Bull. Soc. Nat. Mosc.*, 1885.

[2] It is to be observed that on the original Russian map of the Transcaspian, drawn immediately after the survey of the Uzboi had been completed, the Uzboi has not the continuity which is given to it on subsequent maps.

[3] Their original papers are printed in the *Izvestia* of the Russian Geogr. Soc., 1883 to 1887, as also in the *Journal* of the Russian Ministry of Roads and Communications.

[4] According to A. E. Hedroitz and A. M. Konshin the old Tonu-Daria bed of the Amu contains shells of mollusks now living in the Amu (*Cyrena fluminalis*, *Dreissena polymorpha*, and *Anodonta*). The Sary-kamysh basin is characterized by deposits containing *Neritina liturata*, *Dreissena polymorpha*, and *Lymnæus*, characteristic of this basin. Below the Sary-kamysh there are no more deposits containing shells characteristic for the Amu; *Anodontæ* are found quite occasionally on the surface, not in beds, in company with the Caspian *Cardium* (*Didacna*) *trigonoides*, var. *crassum*, *Cardium piramidatum*, *Dreissena polymorpha*, *D. rostriformis*, *Hydrobia caspia*, *Neritina liturata*, and *Dreissena brardii*; the red clays with these fossils extend for 130 miles to the east of the Caspian (*Izvestia* of Russ. Geog. Soc, 1883 and 1886).

[5] As by Jenkinson, who mentions a sweet-water gulf of the Caspian within six days' march from Khwarezm, by which gulf he could mean nothing but the Sary-kamysh depression.

[6] In connection with this southern "old bed," it is worthy of notice that the Ersari-Turcomans call it Unghyuz or Onguz ("dry old bed"), and there can be no doubt that when the Bolshoi Tchertezh of the 16th century (speaking from anterior information) mentions a river, Ughyuz or Ugus, flowing to the west from the Amu towards the Caspian, it is merely describing as a river what its very name shows to have been a dry bed, only supposed to have been once occupied by a river. The similarity of the names Ongus and Ugus with the Ogus and Ochus is so striking that one is inclined to see in the Ogus or Ochus nothing but the mention of a dry old bed. Compare Petrusevitch, "The South-East Shores of the Caspian," in *Zapiski* of the Caucasian Geogr. Soc., vol. xi., 1880.

Population.—With the exception of some 35,000 Kirghiz encamped with their herds on the Ust-Urt plateau (a swelling some 600 to 1000 feet in height and nearly 92,000 square miles in extent, which, owing to its dryness and cold winter, can be inhabited only by nomad cattle-breeders) and a few Persians in the Lutfabad and Shilghyan villages of the Atok, the whole of the population of the Transcaspian region consists of Turcomans. Until a very recent date their chief occupation was cattle-rearing and robbery. Even those Turcomans who had settled abodes on the oases of the Atok, Tejeñ, and Merv were in the habit of encamping during spring in the steppes, and there practicing robbery. Robber bands were easily formed, and on their powerful horses they extended their excursions to distances of 200 and 300 miles from their abodes. They infested the Astrabad province; and the villages of the khanates of Afghan Turkestan, from Balkh to Meshhed, were periodically devastated by them. The aspect of the steppe has, however, greatly changed since the Russian advance, the fall of the Turcoman stronghold of Geok-tepe, and the massacres which ensued; the Persians are already beginning to avenge themselves on the inhabitants of the Atok by disputing with them the supplies of water coming from the Kopet-dagh.

The chief oasis of the Turcoman desert is the Atok, which extends along the base of the Kopet-dagh, and is now traversed by the Transcaspian railway. The Akhal and the Arakadj oases, collectively called Atok, now have a population of about 42,000 Tekke-Turcomans, who have recently settled there, and live for the most part in miserable clay huts or in felt tents (*kibitkas*). They raise wheat, barley, and lucerne; and the Persians have excellent gardens. Some cotton is also grown, and the culture of the silk-worm is beginning to spread. The chief settlements are Askabad, Kizil-arvat, and Geok-tepe.

The oasis of MERV (*q.v.*) is inhabited by Akhal-tekkes (about 160,000), mostly poor. In January, 1887, they submitted to Russia.

The oasis of Tejeñ has recently sprung up where the river Tejeñ (Heri-rud) terminates in the desert. Formerly it was only temporarily visited by the Tekkes who came to cultivate the fields in summer. In 1883 it was estimated to have 7500 inhabitants.

Southwest Turcomania.—The region between the Heri-rud and the Murghab, as they issue from the highlands, described in English maps under the name of Badhyz, and by the Russians as Southwest Turcomania, has of late attracted a good deal of attention since the Russian occupation of Sarakhs on the Tejeñ (see AFGHANISTAN and PERSIA) and Penjdeh on the Murghab. It has the characters of a plateau reaching about 2000 feet above the sea, with hills 500 and 600 feet high covered with sand, the spaces between being filled with loess. The Borkhut Mountains which connect the Kopet-dagh with the Sefid-kuh, reach 3000 to 4000 feet, and are crossed in a gorge by the Heri-rud. Thickets of poplar and willow follow the courses of both the Murghab and Heri-rud, and the trees reach a considerable size. Pistachio and mulberry trees grow in isolated groups on the hills; but there are few places available for culture, and the Saryks (some 60,000 in number) congregate in only two oases at Yoł-otan and Penjdeh. Cattle-breeding is their chief occupation, and enables them to live in a certain degree of affluence. Brigandage, formerly a notable source of income, is now being suppressed. The Sarakhs oasis is now occupied by the Salors, hereditary enemies of the Tekkes, who number about 3000 tents at Old Sarakhs, and 1700 more on the Murghab, at Tchardjui, at Maimene, and close to Herat.

Great modifications in the life of the steppe have of course been brought about by the Russian conquest, which was followed with great rapidity by the construction of a railway from Mikhailovsk on the Caspian to Kizil-arvat and Sarakhs, and thence to Merv and northeastward to Tchardjui on the Amu, from which point it is now being continued across Bokhara towards Samarkand. Attempts at growing cotton and tea are being made, and land has been rented at Merv for cotton plantations. Cotton is to be pressed by steam at Bokhara and Tchardjui, to be sent to Russia by the Transcaspian railway.[2]

Caspian Littoral.—The Caspian littoral is divided into two districts, Krasnovodsk and Manghishłak. The former has about 15,500 settled inhabitants and 3056 Turcoman kibitkas (partly shifted in summer to Persian territory). The chief settlements of the district are Krasnovodsk on the Krasnovodsk Gulf; Mikhailovsk, the terminus of the Transcaspian railway, in regular communication by steamer with Baku; and Tchikishlyar, close to the mouth of the Atrek. The Manghishłak district, which includes the Ust-Urt plateau, has a population of about 34,500 Kirghiz. Its chief settlement is Alexandrovsk.

The total population of the Transcaspian region was estimated in 1883—that is, before the annexations in Southwest Turcomania—at from 214,000 to 260,000 inhabitants.

(P. A. K.)

TRANSCAUCASIA, the name given to that portion of the Russian empire (in Caucasus, Armenia, and Asia Minor) which lies to the south of the main Caucasus ridge. It comprises the governments of Kutais (inclusive of the province of Batum), Tiflis, Elisabethpol, Erivañ, and Kars, with parts of Daghestan and most of Baku, and the separate military districts of Tchernomorsk and Zakatały. Sometimes Transcaucasia is identified with Southern Caucasus, and then it is intended to include the whole of Daghestan. So defined, it would have an area of 95,930 square miles, and a population of 4,173,380.

See vol. xxi. Plates II., III.

Three regions must be distinguished: (1) the narrow strip of land between the main Caucasus ridge and the Black Sea (TCHERNOMORSK district, *q.v.*); (2) the broad valley, watered by the Rion in the west and the Kura in the east, which separates the main Caucasus ridge from the region next to be mentioned; (3) the highlands, mountains, and plateaus of Lazistan, Kars, and Armenia.

The valley referred to, which crosses the isthmus from the Black Sea to the Caspian, consists of two widely different sections,—the drainage-area of the Rion, which is Mediterranean in its physical characteristics, and the valley of the Kura and Araxes, which slopes to the Caspian, and in its lower parts becomes purely cis-Caspian. The Mesques or Meshik Mountains (3000–5000 feet), a ridge running southwest to northeast, and probably a continuation of the Black Sea coast ridge (Tchorokh Mountains), separate the two. The drainage-area of the Rion, which corresponds approximately to the government of Kutais, includes the former provinces of Imeritia, Mingrelia, Guria, and Swanetia on the upper Ingur and Tshenistshali. With the exception of the valley of the Rion (some 25 miles broad), and the sandy and marshy littoral, it is wholly occupied by spurs of the main Caucasus ridge, the Meshik, and the Wakhan Mountains; the last-named rise to 10,000 and 11,000 feet above the sea in their highest summits, and are intersected by deep and fertile valleys. The region is characterized by a heavy rainfall and a moist maritime climate. The vegetation, which is luxuriant, is of a circum-Mediterranean character: fine forests of deciduous trees clothe the mountain slopes, and the highland villages nestle amid thickets of azalea, almond, and rhododendron. Maize, the mulberry, the vine, and a great variety of fruit trees are cultivated. Mingrelia and Imeritia are the real gardens of Caucasus; but the high valleys tributary to the Ingur, inhabited by Swanians, are wild and difficult of access; in some of them, which are narrow and marshy, fevers and scurvy prevail. The Rion is not navigable, and of its tributaries only the Tshenistshali and the Kvirila are worthy of mention. Several lakes (such as the Paleostom, surrounded by marshes at the mouth of the Rion) occur in the coast region. The population consists of Imeritians, Mingrelians, Gurians, and Swanians, all belonging to the Kartvelian branch of Caucasians (see vol. x. p. 389), with a few Ossetians, Jews, Armenians, and Tartars. Russians are not numerous.

---

[1] Such an intermingling of modern data with older traditions is not unknown to geographers. A striking instance of it is given in the supposed connection of Lake Aral with the Arctic Ocean during historical times; physical changes are proceeding so rapidly in Asia that we find traces of like survivals of traditions even in this age of accurate surveys.

[2] No Russian sea shows so rapid a growth of navigation as the Caspian Sea during the last fifteen years. In 1884 no less than 1945 steamers (611,000 tons), engaged in foreign trade, entered the Russian ports of the Caspian, as against 409 (113,000 tons) in 1876.

The pass of Suram, by which the Transcaucasian railway now crosses the Mesques Mountains, leads from the valley of the Rion to that of the Kura. Spurs from the Caucasus and the Anticaucasus fill up the broad longitudinal depression between these, so that above Tiflis the bottom of the valley is but a narrow strip. But below that city it suddenly widens, and stretches for nearly 350 miles eastward towards the Caspian with a steadily increasing breadth, until it becomes nearly 100 miles wide in the steppe of Mugañ on the Caspian littoral. The snow-clad peaks of the main Caucasus, descending by short steep slopes, fringe the valley on the northeast: while a huge wall, much lower, and having the characters of a border-ridge of the Armenian plateau, bounds the valley on the southwest.[1] The floor of the valley gently slopes from 1200 feet at Tiflis to 500 feet in its middle, and to 85 feet below the level of the ocean on the Caspian shore; but a plateau ranging from 2000 to 3000 feet in height, very fertile along the Ałazañ, a left-hand tributary of the Kura, stretches along the southern hillfoots of the main ridge. In its lower course the Kura is joined by the Araxes, a river nearly as large as itself, which brings to it the waters of the Armenian plateau.

The highest mountains of the Caucasus enclose the upper parts of the valley (now the government of Tiflis). An unbroken series of peaks, from 10,000 to 12,600 feet in height, mostly snow-clad and separated by but slight depressions, is seen in profile as one looks from some height of the Anticaucasus towards the main chain and the broad valley of the Kura. Deep short gorges and valleys indent the steep slopes which are inhabited by Ossetians, Tushes, Pshavs, and Khevsurs in the west, and by the various tribes of the Lesghians in the east. Every available patch is used in these high and stony valleys for the culture of barley, even at heights of 7000 and 8000 feet above the sea; but cattle-breeding is the chief resource of the mountaineers, whose little communities are separated from one another by passes in few cases lower than 10,000 feet. The steppes which cover the bottom of the valley are for the most part too dry to be cultivated without irrigation. It is only nearer the hillfoots in Kahetia, where multitudinous streams supply the fields and the gardens of the plateau of the Ałazañ, that wheat, millet, and maize are grown, and orchards, vineyards, and mulberry-tree plantations are possible. Lower down the valley cattle-rearing becomes the chief source of wealth, while in the small towns and villages of the former Georgian kingdom (see GEORGIA) various petty trades, testifying to a high development of artistic taste and technical skill, are widely diffused. Further down the Kura, in the government of Elizabethpol, and especially on the right bank of the river, a population of Russian agriculturalists—chiefly Nonconformists—is rapidly springing up, so that corn is exported from the villages on the Ganja. The slopes of the Anticaucasus are covered with beautiful forests, and the vine is grown at their base, while in the broad and wide steppes the Tartars rear cattle, horses, and sheep. The lower part of the Kura valley, which belongs mainly to the province of Baku, assumes the character of a dry steppe where the rainfall hardly reaches 13.7 inches at Baku, and is still less in the Mugañ steppe (in most striking contrast with the moistness of the Lenkorañ region close by). The steep slopes of the Great Caucasus are still covered with thriving forests; but forests and meadows disappear in the steppe, whose scanty vegetation has a Central-Asian character. Only *tugais*, or thickets of poplar, dwarf oak, tamarisk, and so on, follow the actual course of the Kura, whose delta is covered with impenetrable growths of rushes. The Mugañ steppe, however, does not deserve its ancient evil reputation; the serpents with which it was said to abound are entirely fabulous, and in the winter it is full of life; herds of antelopes roam over it, and its southern irrigated parts promise to become the granary of Caucasus,[2] although its unirrigated parts will probably never recover their former richness, the Kura having excavated its bed to a much greater depth. The Apsheron peninsula, in which the Great Caucasus terminates at Baku, to be continued farther southeast by a submarine plateau of the Caspian, is the seat of those remarkable naphtha springs which have recently given rise to an important industry and now supply most of the Volga steamers with fuel; while the western shores of the wide Kizil-agatch Bay—the Tałysh, or Lenkorañ district on the slopes of the Armenian plateau—on account of their rich vegetation, fertile soil, and moist climate, are one of the most beautiful possessions of Russia in Asia.

The population includes only a few Russians (about 16,000); the majority are Tartar shepherds, next to whom come the Iranian Tates and Talyshes (the latter probably aborigines of Baku), who constitute 23.1 per cent. of the population; some 27,000 Armenians, chiefly about Shemakha, and 35,000 Kurins, or Lezghians, on the slope of the Great Caucasus, must be added, as also some Jews and Arabs.

A mining industry of some importance has been growing up of late in this part of Transcaucasia. The copper works of Kedabek in Elizabethpol yield from 10,000 to 15,000 cwt. of copper annually; nearly 300,000 cwt. of manganese are extracted in Kutais, and 30,000 cwt. of sulphur in Daghestan and Baku; the coal mines of Kutais, the alum ores of Elizabethpol and the fire-clay and cement of Tchernomorsk, are but recently opened up.

The highlands of Transcaucasia, which extend from northwest to southeast for nearly 375 miles, with an average width of 160 miles, must in their turn, be subdivided into two sections—the Armenian plateau, including the provinces of Erivañ and Kars and parts of Baku, and the Black Sea coast-region, including the former province of Batum (now the Batum and Artvin districts of Kutais).

The former of those is an immense plateau separated by the valley of the Araxes from the highlands of Adherbaijan and of Turkish Armenia, which belong to the drainage-areas of the Euphrates or those of Lakes Van and Urmia. All over Kars and Erivañ is a series of plateaus ranging in altitude from 5000 to 6500 feet, sometimes quite flat, sometimes broadly undulating, covered with rich meadows, and for the most part available for agriculture. Dome-shaped mountains, isolated, or grouped into relatively low ridges, rise from these plateaus to heights which range from 8000 to 9500 feet, and occasionally reach 10,000 or 11,000 above sea-level. Several summits in the east exceed that height, and the Alaghöz reaches 13,436 feet.

This plateau region is bounded on the south by the valley of the Araxes, the river which forms the frontier with Turkey, except where it is crossed by Russia in the south of Kars and west of Erivañ. There the river flows in a broad valley 4500 feet above sea-level, and the Kars plateau falls towards it by a steep slope, while on the other side a steep, rocky ridge of exceedingly wild aspect rises as the northern border-ridge of the South Armenian (Alashkert) plateau and the water-parting between the Caspain Sea and the Indian Ocean. This ridge, which includes the Allah-dagh and Kösa-dagh (10,720 and 11,260 feet respectively), as also the Great and Little Ararats (17,100 and 12,990 feet), has no general name, but is described under the names of Shah-ioly, or Agri-dagh.[3]

A number of lakes occur on the plateau, especially along its northern border-ridge, the chief being that of Goktcha, an extensive alpine basin (500 square miles 6310 feet above sea-level) surrounded by wild mountains. Most of the depressions of the plateau bear traces of having been under water during the Lacustrine (Post-Glacial) period. Granites and other unstratified rocks constitute the nucleus of the Armenian and Kars plateaus. These are covered with Azoic slates, and partly with Devonian and Carboniferous deposits; Jurassic and Cretaceous are wanting, but the Tertiary (Eocene and Miocene) are widely spread both in the valley of the Rion and Kura and in the depressions of the plateau. Rocks of volcanic origin are widely diffused all over Erivañ: the Alexandropol plateau, surrounded by extinct volcanoes, is all covered with volcanic products, which overlie the Tertiary deposits and in turn are covered with Glacial boulder-clay.

The Alagböz, the Ararats, and the peaks around Lake Goktcha are huge trachitic masses surrounded by volcanic rocks. Iron and copper ores are widely spread; alum and rock-salt are obtained, the latter at Kulpi and Nakhichevañ. Mineral springs are numerous. The region is watered by the upper Araxes—too rapid and rocky to be navigated—and its tributaries, most of which flow at the bottoms of deep gorges. The upper Kura waters western Kars. The climate presents all the varieties which might be expected in a region of so varied altitudes. While cotton grows in the dry and hot climate of the valley of the lower Araxes, the winter is severe on the plateau, and Alexandropol (5010 feet) has an average temperature of only 41.5° (Jan. 12.8°;

---

[1] For this valley and the contrasts between the Caucasus and Anticaucasus, see Radde's *Ornis Caucasica*, Cassel, 1884.

[3] W. Massalsky, "Government of Kars," in *Izvestia* of Russ. Geogr. Soc., vol. xxiii., 1887.

July, 73.6°). The difference between summer and winter is still more striking at Erivañ (3210 feet), which has in January an average of only 5° while that of August reaches 77.7°. On the Kars plateau the winter is still more severe. Kaghyzman (4620 feet) and Sary-kamysh (7800 feet) have the winter temperature of Finland, and the latter place, with an annual mean the same as that of Hammerfest (36° F.), has frosts of [*i. e.*—27°] 27° and heats of 99°. The vegetation of the Kars plateau reflects these extremes of climate, and, besides the alpine vegetation of the high *yailas* (alpine meadows), we find there the Anatolian, Armenian, and Pontic floras meeting. The population of Erivañ consists of Armenians (54 per cent.), Tartars (40 per cent.), some 23,000 Kurds, and some 4400 Russians, together with a few Greeks and Jews. In localities under 4000 feet cotton and rice are the chief crops, oil-yielding plants, the vine, the mulberry, and fruit trees being also cultivated. Higher up wheat and barley are grown, while at altitudes above 6000 and 7000 feet the Tartars and Kurds support themselves by rearing cattle. Many petty trades are developed in the towns among the Armenians, and the trade of Erivañ with Persia and Turkey amounts to about 10,000,000 roubles. [$7,700,000].

The population of the province of Kars (167,610 in 1883) is very mixed. In a remote antiquity it was inhabited by Armenians, whose capital Ani, Mren with its beautiful ruins of a grand cathedral, and several other towns now in ruins testify to the former wealth and populousness of the country. After the fall of the Armenian empire the Turks occupied the region; Kurds from Kurdistan and Diarbekr invaded the alpine pasturages of the valley of the Araxes; later on, Kabards, Circassians, Osses, and Karapapakhs found refuge there; and finally, after the last war, the Mohammedans emigrated to Asia Minor (82,760 in 1878–81), while Christian Armenians, Greeks, Russians, Raskolniks, and some Yezids took their place. The population consists now of Turks, Armenians, Turcomans, Greeks, Kurds, Adherbaijan Tartars, Gypsies, and Russians. The Kars *sanjak*, which was one of the granaries of Turkey, has lost this reputation; but the crops (chiefly wheat and barley) are now again increasing where the early frosts do not interfere with agriculture. Cotton is raised in the Olty region; and in the valley of the Araxes gardening and the culture of the silkworm are widely diffused; while cattle-rearing is the chief source of income in the highlands, especially with the Kurds, who move their felt tents on the *yailas* to higher levels as the summer sun burns up the vegetation.

The western part of the Transcaucasian highlands comprises the Batum and Artvin districts, which now belong to Kutais. The whole of the region is occupied by alpine ridges—the Pontic ridge in the west, and those of Arjar and Arsian in the east, whose highest peaks rise to 10,000 and 11,000 feet, without, however, reaching the limits of perpetual snow. The Tchorokh and its tributaries, mountain streams enclosed in deep valleys, water the region; the Tchorokh is navigable by small boats for 60 miles.

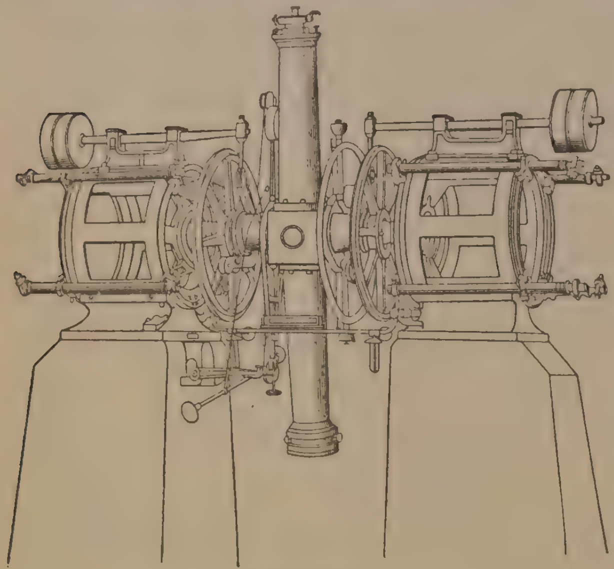
The coast region enjoys an excellent climate; the average yearly temperature at Batum is 65° F., that of the coldest month (February) being 41.5°, and that of July 76.5°. During the last four years the thermometer never fell lower than 39.5° at Batum. The rainfall is excessive (93.4 inches) and days are recorded on which the amount of rain exceeded 10 inches. The region has accordingly a very luxuriant and subtropical vegetation, and even higher up the hills the villages are literally buried amidst gardens. The higher hills have luxuriant meadows. Rice is cultivated in the coast region, and millet, barley, tobacco, and a variety of fruit-trees on higher altitudes. The inhabitants (about 90,000 in 1884) are chiefly Georgians, approaching the Gurians most nearly. The Lazes number about 2000 and the Kurds about 1000. A few Khemshilli, or Mohammedan Armenians, have found refuge in the gorge of Makrial.

Towns.—The chief towns of Transcaucasia are more important than those of northern Caucasus. TIFLIS (*q.v.*), with 104,024 inhabitants in 1883, is the capital of Caucasia. KUTAIS (*q.v.*) (13,000), to which tradition assigns an age of 4000 or 5000 years, has grown rapidly of late, owing to its situation at the head of the alluvial plain of the Rion and the proximity of the Tkvibula coal deposits and the Kvirila manganese mines. Khoni (4000) and Orpiri are mere administrative centres of Kutais. Redut-kale (620) has lost its importance as a seaport, and Poti (3110), at the mouth of the Rion, has not yet become an important port, notwithstanding efforts to improve its roadstead and its railway connection with Tiflis and Baku. The chief Black Sea port of Transcaucasia is BATUM (*q.v.*), which has been diligently fortified of late, and has now a population of 12,000. Artvin (5860) and Ardjari are the two other chief towns of the Batum region. The chief towns of the government of Tiflis besides its capital are Gori, capital of Georgia (population 4800), Mtzhet (770) at the junction of the Vladikavkaz highway with the Transcaucasian railway, Telav (7020), Dushety (3600), Zakatały (1080), chief town of a separate military district, and Signakh (10,340), which are built in the spurs of the main chain; while Akhałtsikh (18,270), on the upper Kura and on the Kars plateau, is a busy centre for petty trades. The old city of Ahałkałaki (3200) on the same plateau is now a Russian fort. ELIZABETHPOL, NUKHA and SHUSHA (*qq.v.*), are the principal towns in the province of Elizabethpol. BAKU (*q.v.*) the terminus of the Transcaucasian railway, and in regular steamer communication with Mikhailovsk in the Transcaspian region, derives its importance from the naphtha wells which surround it. SHEMAKHA (*q.v.*) (28,810), and Saliany (10,170), at the head of the delta of the Kura, and notable for its fisheries, are the only places of importance in the province of Baku. ERIVAÑ (*q.v.*) (12,450), capital of the province of Erivañ, and the chief city of the Armenian plateau, is one of the oldest cities of the country, and, owing to its position, would be much more important than it is, but for its climate. Etchmiadzin, or Vagarshapad (2910), is the real capital (the Rome) of Armenia, for its antiquities, monastery, library, and printing offices. Nakhitchevañ (5390)—the Naxuana of Ptolemy—is another centre of Armenia. The most populous town of the region, however, is Alexandropol (23,010) or GUMRI (*q.v.*) the chief Russian fortress of Transcaucasia—the other towns of Erivañ being Ani, or Oni, Novobayazet at Lake Goktcha, and Ordubad (3600). The long-disputed KARS (*q.v.*), which has now 7340 inhabitants, is the chief town of the new Russian province of the same name, annexed in 1878. Kaghyzman (3700), on the upper Araxes, is but a collection of clay houses surrounded by rich gardens; Ardahan (1270), on the upper Kura, and Olty (530) are the only other towns of Kars worthy of notice as administrative centres. (P. A. K.)

TRANSIT CIRCLE, or MERIDIAN CIRCLE, an instrument for observing the time of a star's passing the meridian, at the same time measuring its angular distance from the zenith. The idea of having an instrument (quadrant) fixed in the plane of the meridian occurred even to the ancient astronomers, and is mentioned by Ptolemy, but it was not carried into practice until Tycho Brahe constructed a large meridian quadrant. This instrument enabled the observer to determine simultaneously right ascension and declination, but it does not appear to have been much used for right ascension during the 17th century, the method of equal altitudes by portable quadrants or distance measures with a sextant being preferred (see OBSERVATORY and TIME). These methods were, however, very inconvenient, which induced ROEMER (*q.v.*) to invent the transit instrument about 1690. It consists of a horizontal axis in the direction east and west resting on firmly fixed supports, and having a telescope fixed at right angles to it, revolving freely in the plane of the meridian. At the same time Roemer invented the altitude and azimuth instrument for measuring vertical and horizontal angles, and in 1704 he combined a vertical circle with his transit instrument, so as to determine both coordinates at the same time. This latter idea was, however, not adopted elsewhere, although the transit instrument soon came into universal use (the first one at Greenwich was mounted in 1721), and the mural quadrant continued till the end of the century to be employed for determining declinations. The advantage of using a whole circle, as less liable to change its figure, and not requiring reversal in order to observe stars north of the zenith, was then again recognized by RAMSDEN (*q.v.*), who also improved the method of reading off angles by means of a micrometer microscope as described below. The making of circles was shortly afterwards taken up by TROUGHTON (*q.v.*), who in 1806 constructed the first modern transit circle for Mr. Groombridge's observatory at Blackheath, but he afterwards abandoned the idea, and designed the mural circle to take the place of the mural quadrant. In the United Kingdom the transit instrument and mural circle continued till the middle of the present century to be the principal instruments in observatories, the first transit circle constructed there being that at Greenwich (mounted in 1850), but on the Continent the transit circle superseded them from the years 1818–19, when two circles by REPSOLD (*q.v.*) and by REICHENBACH (*q.v.*) were mounted at Göttingen, and one by Reichenbach at Königsberg.[1] The firm of Repsold was for a number of years eclipsed by that of Pistor and Martins in Berlin, who furnished the observatories of Copenhagen, Albany, Leyden, Leipsic, Berlin, Washington, and Dublin with first-class instruments, but since the death of Martins the Repsolds have again taken the lead, and have of late years made transit circles for Strasburg, Bonn, Wilhelmshafen, Williamstown (Massachusetts), Madison (Wisconsin), etc. The observatories of Harvard College (United States), Cambridge, and Dun Echt have large circles by Troughton and Simms, who also made the Greenwich circle from the design of Airy.[2]

We shall describe the principal features of a transit circle, referring for smaller transit instruments and altazimuths to the article SURVEYING (vol. xxii. p. 756).

In the earliest transit instrument the telescope was not placed in the middle of the axis, but much nearer to one end, in order to prevent the axis from bending under the weight of the telescope. It is now always placed in the centre of the axis. The latter consists of one piece of brass or gun-metal with carefully turned cylindrical pivots at each end. The centre of the axis is shaped like a cube, the sides of which form the basis of two cones which end in cylindrical parts. The pivots rest on V-shaped bearings, either let into the massive stone or brick piers which support the instrument or attached to metal frameworks bolted on the tops of the piers. In order to relieve the pivots from the weight of the instrument, which would soon destroy their figure, the cylindrical part of each end of the axis is supported by a hook supplied with friction rollers, and suspended from a lever supported by the pier and counter-balanced so as to leave only about 10 pounds pressure on each bearing. Near each end of the axis is attached a circle or wheel (generally of 3 or 3½ feet diameter) finely divided to 2′ or 5′ on a slip of silver let into the face of the circle near the circumference. The graduation is read off by means of microscopes, generally four for each circle at 90° from each other, as by taking the mean of the four readings the eccentricity and to a great extent the accidental errors of graduation are eliminated.[3] In the earlier instruments by Pistor and Martins the microscopes were fixed in holes drilled through the pier, but afterwards they let the piers be made narrower, so that the microscopes could be at the sides of them, attached to radial arms starting from near the bearings of the axis. This is preferable, as it allows of the temporary attachment of auxiliary microscopes for the purpose of investigating the errors of graduation of the circle, but the plan of the Repsolds and of Simms, to make the piers short and to let the microscopes and supports of the axis be carried by an iron framework, is better still, as no part of the circle is exposed to radiation from the pier, which may cause strain and thereby change the angular distance between various parts of the circle. Each microscope is furnished with a micrometer screw, which moves a frame carrying a cross, or better two close parallel threads of spider's web, with which the distance of a division line from the centre of the field can be measured, the drum of the screw being divided to single seconds of arc (0.1″ being estimated) while the number of revolutions are counted by a kind of comb in the field of view. The periodic errors of the screw must be investigated and taken into account, and care must be taken that the microscopes are placed and kept at such a distance from the circle that one revolution will correspond to 1′, the excess or defect (error of run) being determined from time to time by measuring standard intervals of 2′ or 5′ on the circle.



Transit Circle.

The telescope consists of two slightly conical tubes screwed to the central cube of the axis. It is of great importance that this connection should be as firm and the tube as stiff as possible,[4] as the flexure of the tube will affect the declinations deduced from the observations. The flexure in the horizontal position of the tube may be determined by means of two collimators or telescopes placed horizontally in the meridian, north and south of the transit circle, with their object glasses towards it. If these are pointed on one another (through holes in the central cube of the telescope), so that the wire-crosses in their foci coincide, then the telescope, if pointed first to one and then to the other, will have described exactly 180°, and by reading off the circle each time the amount of flexure will be found. M. Loewy has constructed a very ingenious apparatus[5] for determining the flexure in any zenith distance, but generally the observer of standard stars endeavors to eliminate the effect of flexure in one of the following ways: either the tube is so arranged that eye-piece and object-glass can be interchanged, whereby the mean of two observations of the same star in the two positions of the object-glass will be free from the effect of flexure, or a star is not only observed directly (in zenith distance Z), but also by reflection from a mercury trough (in zenith distance $180° - Z$), as the mean result of the Z.D. of the direct and reflection observations, before and after reversing the instrument east and west, will only contain the terms of the flexure depending on $\sin 2Z$, $\sin 4Z$, etc. In order to raise the instrument a reversing carriage is provided which runs on rails between the piers, and on which the axis with circles and telescope can be raised by a kind of screw-jack, wheeled out from between the piers, turned exactly 180°, wheeled back, and gently lowered on its bearings.

The eye end of the telescope has in a plane through the focus a number of vertical and one or two horizontal wires (spider lines). The former are used for observing the transits of the stars, each wire furnishing a separate result for the time of transit over the middle wire by adding or subtracting the known interval between the latter and the wire in question. The intervals are determined by observing the time taken by a star of known declination to pass from one wire to the other, the pole star being best on account of its slow motion.[6] The instrument is provided with a clamping apparatus, by which the observer, after having beforehand set to the approximate declination of a star, can clamp the axis so that the telescope cannot be moved except very slowly by a handle pushing the end of a fine screw against the clamp arm, which at the other side is pressed by a strong spring. By this slow motion the star is made to run along one of the horizontal wires (or if there are two close ones, in the middle between them), after which the microscopes are read off. The field or the wires can be illuminated at the observer's pleasure; the lamps are placed at some distance from the piers in order not to heat the instrument, and the light passes through holes in the piers and through the hollow axis to the cube, whence it is directed to the eye-end by a system of prisms.[1]

---

[1] The most notable exception was the transit instrument and vertical circle of the Pulkova observatory, specially designed by the elder Struve for fundamental determinations.

[2] This instrument differs in many particulars from others; the important principle of symmetry in all the parts (scrupulously followed in all others) is quite discarded; there is only one circle; and the instrument cannot be reversed. There is a similar instrument at the Cape observatory.

[3] On Reichenbach's circles there were verniers instead of microscopes, and they were attached to an alidade circle, the immovability of which was tested by a level.

[4] Reichenbach supplied his tubes with counterpoising levers like those on the Dorpat refractor (see TELESCOPE, Fig. 20).

[5] *Comptes Rendus*, vol. lxxxvii. p. 24.

[6] The transits are either observed by "eye and ear," counting the second beats of the clock and comparing the distance of the star from the wire at the last beat before the transit over the wire with the distance at the first beat after the transit, in this way estimating the time of transit to 0.1^s; or the observer employs a

The time of the star's transit over the middle wire is never exactly equal to the actual time of its meridian passage, as the plane in which the telescope turns never absolutely coincides with the meridian. Let the production of the west end of the axis meet the celestial sphere in a point of which the altitude above the horizon is b (the error of inclination), and of which the azimuth is $90° - a$ (the azimuth being counted from south through west), while the optical axis of the telescope makes the angle $90° + c$ with the west end of the axis of the instrument, then the correction to the observed time of transit will be $a\dfrac{\sin(\phi-\delta)}{\cos\delta} + b\dfrac{\cos(\phi-\delta)}{\cos\delta} + c \sec\delta$, where ϕ is the latitude of the station and δ the declination of the star (see GEODESY, vol. x. p. 149). This is called Tobias Mayer's formula, and is very convenient if only a few observations have to be reduced. Putting $b \sin\phi - a\cos\phi = n$, we get Hansen's formula, which gives the correction $= b \sec\phi + n(\tan\delta - \tan\phi) + c \sec\delta$, which is more convenient for a greater number of observations. The daily aberration is always deducted from c, as it is also multiplied by $\sec\delta$ (being $0.31'' \cos\phi \sec\delta$). The above corrections are for upper culmination; below the pole $180° - \delta$ has to be substituted for δ. The constant c is determined by pointing the instrument on one of the collimators, measuring the distance of its wire-cross from the centre wire of the transit circle by a vertical wire movable by a micrometer screw, reversing the instrument and repeating the operation, or (without reversing) by pointing the two collimators on one another and measuring the distance of first one and then the other wire-cross from the centre wire. The inclination b is measured directly by a level which can be supported on the pivots. Having thus found b and c, the observation of two stars of known right ascension will furnish two equations from which the clock error and the azimuth can be found. For finding the azimuth it is most advantageous to use two stars differing as nearly 90° in declination as possible, such as a star near the pole and one near the equator, or better still (if the weather permits it) two successive meridian transits of a close circumpolar star (one above and one below the pole), as in this case errors in the assumed right ascension will not influence the result.

The interval of time between the culminations or meridian transits of two stars is their difference of right ascension, 24 hours corresponding to 360° or 1 hour to 15°. If once the *absolute right ascensions* of a number of *standard stars* are known, it is very simple by means of these to determine the R.A. of any number of stars. The absolute R.A. of a star is found by observing the interval of time between its culmination and that of the sun. If the inclination of the ecliptic (ϵ) is known, and the declination of the sun (δ) is observed at the time of transit, we have $\sin \alpha \tan\epsilon = \tan\delta$, which gives the R.A. of the sun, from which together with the observed interval of time corrected for the rate of the clock, we get the R.A. of the star. Differentiation of the formula shows that observations near the equinoxes are most advantageous, and that errors in the assumed ϵ and the observed δ will have no influence if the $\Delta\alpha$ is observed at two epochs when the sun's R.A. is A and 180 — A or as near thereto as possible. A great number of observations of this kind will furnish materials for a standard catalogue; but the right ascensions of many important catalogues have been found by making use of the R.A.'s of a previous catalogue to determine the clock error and thus to improve the individual adopted R.A.'s of the former catalogue.

In order to determine absolute declinations or polar distances, it is first necessary to determine the co-latitude (or distance of the pole from the zenith) by observing the upper and lower culmination of a number of circumpolar stars. The difference between the circle reading after observing a star and the reading corresponding to the zenith is the zenith distance of the star, and this plus the co-latitude is the north polar distance or $90° - \delta$. In order to determine the zenith point of the circle, the telescope is directed vertically downwards and a basin of mercury is placed under it, forming an absolutely horizontal mirror. Looking through the telescope the observer sees the horizontal wire and a reflected image of the same, and if the telescope is moved so as to make these coincide, its optical axis will be perpendicular to the plane of the horizon, and the circle reading will be 180° + zenith point. In observations of stars refraction has to be taken into account as well as the errors of graduation and flexure, and, if the bisection of the star on the horizontal wire was not made in the centre of the field, allowance must be made for curvature (or the deviation of the star's path from a great circle) and for the inclination of the horizontal wire to the horizon. The amount of this inclination is found by taking repeated observations of the zenith distance of a star during the one transit, the pole star being most suitable owing to its slow motion.

Literature.—The methods of investigating the errors of a transit circle and correcting the results of observations for them are given in Brünnow's and Chauvenet's manuals (see TIME). For detailed descriptions of modern transit circles, see particularly *Annalen der Sternwarte in Leyden* (vol. i.), the *Washington Observations* for 1865, and the *Publications* of the Washburn observatory (vol. ii.). The Greenwich circle is described in an appendix to the *Greenwich Observations* for 1852. (J. L. E. D.)

TRANSMIGRATION. See METEMPSYCHOSIS.

TRANSPORTATION. See PRISON DISCIPLINE.

TRANSUBSTANTIATION. See EUCHARIST.

TRANSVAAL, or SOUTH AFRICAN REPUBLIC, a country in South Africa, northernmost of the European states, lying between 22° 15′ and 28° S. lat., and 25° and 32° 10′ E. long., is bounded N. and N.W. by the Limpopo, separating it from the Makalaka and Bamangwato countries; W. partly by the Marico and the Hart, partly by an irregular line between these streams, separating it from the new British protectorate of Bechuanaland; S. by the Vaal and the Buffalo, separating it from the Orange Free State and Natal; E. by the Libomba Mountains, separating it from Zululand and the Portuguese East African possessions.[2] Transvaal thus forms a compact inland territory nearly as broad as long, not more than 45 or 50 miles from the Indian Ocean at Delagoa Bay, but otherwise lying completely within the outer rim of the vast South African tableland. A line drawn from the southwest extremity, where it touches Griqualand West, northeastwards to the Limpopo-Shasha confluence, gives an extreme length of 500 miles, the distance from the same confluence southwards to the Natal frontier being 425, and the greatest length east and west between the Zulu and Bechuana frontiers about 400 miles. In the absence of accurate surveys, the total area has been variously estimated at from 110,000 to 120,000 square miles, with a population (including aborigines) roughly calculated at from 750,000 to 800,000.

See vol. i. Plate II.

Physical Features.—Physically Transvaal forms a well-marked section of the great South African plateau, an elevated shallow basin with a mean altitude of over 3000 feet, whose conformation has been compared to that of a saucer. On the south and east this basin is separated from the coast by a lofty inner and less elevated outer rim, the former from 6000 to 10,000, the latter about 2000 feet high, sweeping round in curves concentric with that of the seaboard, from Cape Colony through Natal and the east side of Transvaal northwards to the equatorial regions. The inner rim, whose various sections in the extreme south are known as the Roggeveld, Nieuweveld, and Quathlamba ranges, takes in Natal and Transvaal the general name of the Drakenberg Mountains. From the Natal frontier to the Lipalule (Olifant) tributary of the Limpopo, the Drakenberg maintains the aspect of a more or less

---

"chronograph," and by pressing an electric key causes a mark to be made on a paper stretched over a uniformly revolving drum, on which the clock beats are at the same time also marked electrically.

[1] The idea of illuminating through the axis is due to Ussher, professor of astronomy in Dublin (d. 1790).

[2] The boundaries of Transvaal, long a subject of dispute with Great Britain and the other conterminous states, were at last precisely defined by the convention of February 27, 1884.

continuous range 5000 to 7000 feet high, culminating in the Mauchberg (8725), the highest point in Transvaal. A little to the east is the Spitskop (5637), and further south the Klipstad (6020) and Holnek (5600). This section, whose several ridges are known as the Verzamelberg, Randberg, Slangapiesberg, and Komatiberg, falls everywhere precipitously eastwards towards the Libomba range, or outer rim of the plateau, which maintains a mean elevation of 2000 feet along the eastern border of Transvaal. Beyond the Lipalule, the Drakenberg loses the character of a well-defined mountain system, broadening out into uplands moderately elevated above the surrounding plateau, and breaking into ridges, such as the Murchison and Zoutpansberg ranges, which run east and west between the Lipalule and Limpopo. The whole system slopes gently westwards to the central tableland, which is itself intersected by several broken ranges, such as the Maquassieberg, Gat Rand, Witwater Rand, and Magaliesberg in the south, the Dwarsberg, Marikele, Hanglip, Waterberg, and Blauberg in the north, all mostly trending in the direction from east to west. But few of these ridges rise much above 4000 feet, and, as the plateau has a mean altitude of considerably over 3000 feet, they detract little from the aspect of a vast level or slightly rolling upland plain, almost everywhere presented by Transvaal west of the Drakenberg orographic system.

The numerous fossil remains of aquatic life, together with extensive sandy tracts and the presence in several places of water-worn shingle, give to the central tableland the appearance of an upheaved lacustrine basin, whose waters escaped at one time through the Limpopo to the Indian Ocean, at another through the Vaal to the Orange river, and thence to the Atlantic. The Vaal and Limpopo are still the two great fissures in the plateau, which carry off most of the surface waters to the surrounding marine basins. The waterparting between these two river systems lies, not in the Drakenberg, itself pierced by the Lipalule and several of its affluents, but in the Witwater Rand towards the southwest of the state. From this point the Limpopo, or Crocodile, sweeps round first to the west, then to the northeast, describing a semicircle of about 1000 miles to the Limvuba (Pafuri) confluence, where it leaves Transvaal, flowing thence for nearly 340 miles through Portuguese territory southeast to the Indian Ocean. Captain G. A. Chaddock has shown (1884) that it is navigable for steamers to this confluence, above which it is obstructed by the Tolo Azime and other rapids. Throughout its whole course it receives numerous affluents on both sides, such as the Shasha and Nuanetsi from the north, the Marico, Nyl, Limvuba, Lipalule and others from Transvaal, of which region it drains fully 95,000 square miles. With the exception of a few tracts watered by the headstreams of the Buffalo (Tugela), Mvolozi, Usutu, and Umcomati (King George), flowing in independent channels eastwards to the Indian Ocean, all the rest of Transvaal is drained by the Vaal westwards to the Orange and Atlantic. The Vaal has its easternmost sources in the Wakkerstroom district on the west slope of the Drakenberg, whence it flows for about 450 miles, partly within, but mainly along, the southern frontier of Transvaal, of which, with the Hart and other tributaries on its right bank, it drains about 20,000 square miles altogether. Besides these perennial streams, there are numerous shallow lagoons or saltpans scattered over the western and northern districts, as well as thermal and mineral waters, such as the Warmbad in the Nyl valley. But the only lake properly so called is Lake Chrissie, a sheet of water nearly 40 miles round, and in parts very deep, which lies on the west side of the Drakenberg, 5755 feet above sea-level.

Climate.—Although lying on the border of and partly within the tropics, Transvaal, thanks to its great elevation above the sea, and to the absence of extensive marshy tracts, enjoys on the whole a healthy invigorating climate, well suited to the European constitution. Owing to the dryness of the air, due to the proximity of the Kalahari desert, the western and central districts are specially favorable to persons suffering from consumption and other chest complaints. But some of the low-lying moist tracts along the Limpopo and other river valleys, close to or within the torrid zone, are extremely insalubrious, fever of the general African type being here endemic, and its prevalence usually marked by the presence of the destructive tsetse fly. The route from Delagoa Bay to the interior also traverses a fever-stricken coast district between the sea and the Libomba escarpment, dangerous especially in the rainy summer season. The rains generally begin about October, sometimes a little before or after, and last intermittently till April. But the rainfall is very unequally distributed, most of the moisture-bearing clouds from the Indian Ocean being arrested by the great barrier of the Drakenberg, or counteracted by the dry west winds from the Kalahari desert. Thus, while there is abundance of rain in the east, the country gradually becomes drier as it approaches Bechuanaland. During the dry winter season (April to September) keen frosty winds blow from the south, sweeping freely over the central plains and carrying the moisture to be precipitated as snow along the eastern highlands. Nevertheless, according to the careful meteorological observations made by Mr. Lys at Pretoria between 1877 and 1880, the mean annual temperature is considerably over 68° F., falling to about 40° in June and rising to 90° and occasionally even 95° in January. The rainfall in the same central district seldom reaches 30 inches, which is probably a fair average for the whole of Transvaal, falling to 12 towards the western and rising to 60 on the eastern frontier.

Mineral Resources.—Transvaal yields to no other African region in the abundance of its mineral resources, while it is altogether unrivalled in their extraordinary variety. These include, besides the precious metals and diamonds, iron, copper, lead, cobalt, sulphur, saltpetre, and coal, this last with gold, copper, and iron being probably the most abundant and widely distributed. Gold, largely diffused throughout the Drakenberg and in the northern Zoutpansberg and Waterberg districts and in the Rustenburg and Marico districts in the extreme west, as well as in the highlands between Transvaal and the Zambesi, has hitherto been worked chiefly in the rich auriferous region of Lydenburg about Mount Mauchberg and Mount Spitskop in the central parts of the Drakenberg range, and farther south in the Johannesburg and Lower Kaap (Sheba) district, Middelburg. The Lydenburg deposits, discovered in 1873, lie at an elevation of 4500 to 5000 feet 40 miles south of the Lipalule river and 125 northwest of Lorenzo Marques on Delagoa Bay, the chief diggings being at Pilgrim's Rest and Mac Mac close to the Spitskop. In the Middelburg district the chief centres of mining operations are the recently founded towns of Barberton and Johannesburg. In some years the Lydenburg, Marabastad, and other diggings have jointly yielded over £300,000 [$1,458,000], obtained by washing and without any quartz-crushing. Iron ores are also widely distributed, and the Yzerberg ("Iron Mountain") near Marabastad (24° S., 30° E.) consists of an enormous mass of rich iron ore, which the natives have worked for ages. Diamonds are chiefly confined to the Bloemhoff district on the Vaal above the great diamantiferous region of Kimberley in Griqualand West. Coal abounds in the southeastern districts (Wakkerstroom, Utrecht), and also farther north in Middelburg (Nazareth) and Lydenburg. In some places seams 7 or 8 feet thick lie so near the surface that they are quarried and the coal carted away by the natives. The prevailing formations where this great mineral wealth is embedded are quartz, porphyry, granites, clay slates, greenstone, Lower Devonian strata, conglomerates, and limestones.

Flora.—In Transvaal, as in most of the continent, an herbaceous flora prevails largely over forest growths, which are here confined chiefly to the deep kloofs (gorges) of the mountain ranges, and to the courses of the larger streams. Bush, including mimosas, thorn thickets, and creepers, covers extensive tracts on the northern and southern plains, and the Wakkerstroom and Utrecht districts towards Natal are well wooded. But elsewhere the characteristic features are grasslands, downs, hill slopes, flats, and even many parts of the higher uplands being covered with savannahs generally affording good pasturage and fodder for cattle. In the woodlands the prevailing species are three varieties of yellow wood (*Podocarpus*), often growing to an enormous size, the Cape beech (*Myrsine*), several varieties of the wild pear (*Olinia*) and of stinkwood (*Oreodaphne*), ironwood, and ebony. The Boers and other settlers have hitherto occupied themselves chiefly with stock-breeding (sheep, cattle, and horses), but there can be no doubt that much of the country is eminently suited for the cultivation of cereals, yielding two annual crops and producing some of the finest wheat in the world. Tobacco, the vine, and most European fruits and vegetables also thrive well, while semi-tropical products, such as cotton, sugar, and coffee, might be raised in the warmer northern districts.

Fauna.—By the early settlers Transvaal was described as the "paradise of hunters,"[1] abounding in the characteristic large animals, such as the lion, leopard, rhinoceros, elephant, giraffe, zebra, quagga, several varieties of antelope, and the ostrich, which roam over the continent from Soudan to the Cape. All these animals still exist, but in greatly reduced numbers, being now largely replaced by the domestic animals—cattle, sheep, and horses—introduced by the white settlers. All the large rivers are inhabited by the hippopotamus and crocodile, the latter giving an alternative name to the Limpopo; the buffalo, gnu, eland, springbok, wildbeeste, baboon, and several other members of the ape family are also frequently met with. The country is occasionally swept by destructive flights of locusts; but the greatest enemy of the stock-breeder is the tsetse fly, which infests the coastlands and many of the riverine tracts, but shows a tendency to disappear with the large game, retreating with the advance of the plough. A tsetse belt 40 miles wide along the whole course of the Limpopo still bars the spread of European settlements beyond Transvaal in the direction of the Zambesi.

Inhabitants.—Of the population not more than 50,000 are whites, mostly Boers (descendants of the early Dutch, French, and German immigrants to the Cape), with a large and increasing percentage of British settlers, attracted in recent years especially to the Lydenburg and other mining districts. All the rest are natives, belonging mainly to the Basuto and Bechuana branches of the Bantu family, and consequently allied in speech and to a large extent in physique to their Zulu-Kaffre neighbors. A considerable number of these natives have abandoned the tribal state and taken service, either freely or by compulsion, with the whites as farm laborers in the rural districts, and as domestic servants in the towns, and are now also largely employed in mining operations. The great bulk of the rest, who retain their national usages and recognize the authority of more or less independent tribal chiefs, are concentrated in the northern and eastern provinces of Zoutpansberg (364,000), Waterberg (174,000), and Lydenburg (123,000). There are also about 40,000 in Bloemhoff (extreme southwest), and the same number in the western provinces of Rustenburg and Marico, but only a few scattered groups in all the rest of the country. These western and southwestern tribes (Barolongs, Batlapins, Bakwenas, Bakhatlas, etc.) are all Bechuanas; the others mainly Makatis, as the Basutos are here collectively called. It may be stated in a general way that the whole country south of the Lipalule is now free of native claims and open to European colonization, while the northern region between that river and the Limpopo is still to a large extent occupied by unreduced or unbroken Basuto communities.

Natural and Political Divisions.—Transvaal has been divided into three more or less distinct natural regions, determined chiefly by the relief of the land, and its climatic and economic conditions. These are—(1) the *Hooge veld*, or uplands, comprising the southern districts drained by the Vaal and the Drakenberg highlands as far north as the Lipalule, about 35,000 square miles altogether, with an altitude ranging from 4000 to 7000 feet; (2) the *Banken veld*, or terrace lands, comprising the low eastern zone between the Drakenberg and Libomba ranges, falling in many places down to a level of 2000 feet, with an area of 15,000 to 20,000 square miles; (3) the *Bosch veld*, or bush country, comprising all the rest of the land, with an altitude of 3000 to 4000 feet and an area of 60,000 square miles. For administrative purposes the country is again divided into thirteen provinces: Zoutpansberg and Waterberg in the north; Lydenburg, Middelburg (formerly Nazareth), Pretoria, Rustenburg, and Marico in the centre; Utrecht, Londina, Wakkerstroom, Heidelberg, Potchefstroom, and Bloemhoff in the south. In the southern part of Lydenburg lies the somewhat detached district of New Scotland, comprising some 500,000 acres selected by the late Mr. M'Corkindale as a Scotch pastoral and agricultural settlement. It is a healthy prosperous country, lying on the slopes of the Drakenberg, within 310 miles of Durban, Natal. But the most thickly settled province is Potchefstroom, a fertile tract, 3500 to 5000 feet high, abundantly watered by the Mooi, Schoen, and other streams flowing to the Vaal, and well suited for tillage and pasturage. Its capital of like name (derived from elements in those of Potgieter, Scherf, and Stockenstroom, three popular Boer leaders during the early migrations) is the most settled and one of the largest towns in Transvaal. The only other places deserving the name of town are Pretoria, capital of the province of like name and of the state, occupying a somewhat central position 100 miles northeast of Potchefstroom, 980 from Cape Town, 820 from Port Elizabeth, and 400 from Durban; Barberton, in the Lower Kaap mining district, 150 miles by road from Delagoa Bay, only three years old, but already by far the largest place in the state, with a population (1887) of 15,000; and Johannesburg, centre of the gold-fields of the same name, 30 miles southeast of Pretoria, and 72 east of Potchefstroom, founded in 1886, but already larger than Pretoria, with a population of over 4000.

Administration and Statistics.—Transvaal enjoys representative institutions, with a volksraad or parliament of forty-four members elected for four years, one-half retiring every two years, the executive being entrusted to a president elected for five years by the whole body of electors, assisted by a council of four, the *ex-officio* vice-president and the state secretary, with two others appointed by the volksraad. The revenue, derived chiefly from land sales, quit rents, stamps, hut-tax, and customs, balanced the expenditure in 1885, and exceeded it by £15,000 [$72,900] in 1886, the respective sums being £260,000 [$1,263,600], and £245,000 [$1,190.700]. In 1884 the public debt was £396,000 [$1,824.560], the exports (gold, ivory, corn, wool, hides, cattle, ostrich feathers, etc.) about £600,000 [$2,916,000], and the imports probably over £1,000,000 [$4,860,000]. The long-projected railway, intended to afford an outlet to the coast at Delagoa Bay, was completed in 1887 from Lorenzo Marques, the seaward terminus, to the Transvaal frontier, a distance of 50 miles. Transvaal is in telegraphic communication with the Cape and the rest of the world through the Orange Free State.

History.—The historic life of Transvaal begins with the "Great Trek," or general exodus of the Cape Colony Boers, who, being dissatisfied, especially with the liberal policy of the British Government towards the natives, removed northwards in large numbers between the years 1833 and 1837. By 1836 some thousands had already crossed the Vaal, that is, had reached the "Trans-Vaal" country, which at that time was mostly under the sway of the powerful refugee Zulu chief Moselekatze, whose principal kraal was at Mosega in the present Marico district on the west frontier. To avenge the massacre of some emigrant bands, the Boers under Maritz and Potgieter attacked and utterly defeated Moselekatze at this place in 1837. Next year the Zulu chief withdrew beyond the Limpopo, where he founded the present Matebele state between that river and the Zambesi, thus leaving the region between the Vaal and Limpopo virtually in the hands of the Trekkers. But their position was rendered insecure on the east side by the military despotism of the fierce Zulu chief Dingaan, who, after the murder of his brother Chaka, had asserted his authority over the whole of Zululand and most of the present Natal. The situation was rendered almost desperate by the complete rout and wholesale massacre (1838) of the right division of the emigrant Boers, who had ventured to cross the Buffalo under Pieter Retief, and who were defeated by Dingaan, first at Umkongloof ("Aceldama"), then at Weenen ("Weeping"), and again soon after under Uys, Maritz, and Potgieter, when as many as 800 fell before the irresistible onslaught of the disciplined Zulu warriors. At this critical juncture the Trekkers were saved from utter extermination by Andries Pretorius of Graaff Reinet, by whom Dingaan met with a first check before the close of 1838, followed in January, 1840, by a still more crushing defeat. Dingaan having been soon after murdered, the friendly Panda was set up in his place, and Natal proclaimed a Boer republic. But the British occupation of that territory in 1843 induced the Boers to retire in two bands across the Drakenberg, the southern division settling in the present Orange Free State, the northern again passing into Transvaal. But, owing to internal dissensions, and the perpetual bickerings of the two most prominent personalities, Pretorius and Potgieter, all attempts at establishing an organized system of government throughout Transvaal ended in failure, till Pretorius induced the British Government to sign the Sand River convention (January 17, 1852), which virtually established the political independence of that region. The death both of Pretorius and Potgieter in 1853 prepared the way for a period of internal peace under Pretorius's eldest son Marthinus Wessels Pretorius, first president of the "Dutch African Republic," whose title was afterwards altered (1858) to that of the "South African Republic." But a fatal element of weakness lay in the persistent refusal of the Boers to treat the natives on a footing of equality, or even with common justice. The murder of Hermann Potgieter and family (1854), avenged by Pretorius at Makapan's Cave, was followed (1856) by the "Apprentice Law," establishing a system of disguised slavery, which was further strengthened by the sanction (1858) of the *Grond wet*, or "Fundamental Law," declaring that the "people will admit of no equality of persons of color with the white inhabitants either in state or church." Owing to this policy opposition was constantly shown both to the English traders, disposed to deal fairly with all, and to the missionaries, preachers of universal equality, as illustrated by the plunder of Livingstone's house by the commando sent against the native chief Secheli in 1852. A brief chronicle must here suffice of subsequent events down to the present time:

---

[1] On the route between the Orange and Vaal (1835–37) the "voortrekkers" are said to have killed as many as 200 lions.

1857. Invasion of the Orange Free State by Pretorius; dispute settled without bloodshed by the treaty of June 1.
1859. Pretorius elected president of the Free State; fails to effect the union of the two states.
1863. Return of Pretorius, during whose absence affairs had fallen into confusion; continued troubles with the natives; quarrels with the Batlapins, Barolongs, and Griquas in the west; in the east with Ketchywayo, king of Zululand, about the Boers' right to the Wakkerstroom and Utrecht districts.
1867. Discovery of diamonds, and Mauch's announcement of gold-fields in the interior.
1868. Pretorius's proclamation extending the boundaries of the state west to Lake Ngami, east to Delagoa Bay, whence disputes and negotiations with England and Portugal, Delagoa Bay being ultimately awarded (July, 1875) to Portugal by the French president Marshal MacMahon, to whose decision the matter had been referred.
1871. Boundary disputes towards the southwest settled by the award of Lieutenant-Governor Keate of Natal, leading to the resignation of Pretorius and appointment of President Burgers.
1875. The Fundamental Law forces Burgers to measures leading to the war with Sikokuni, chief of the Bapedi, south of the Olifant river, who claimed large part of Lydenburg and even of Pretoria; Burgers's visit to Europe in connection with the Delagoa Railway scheme; on his return he finds everything in the greatest confusion; Boers dispirited by repeated reverses in the Sikokuni war; an empty treasury; broken credit; the state practically bankrupt and exposed to imminent danger of invasion by Bapedis and Zulus. Hence
1876–77. Intervention of England, and Sir Theophilus Shepstone's proclamation (April 12, 1877) annexing Transvaal, followed by the appointment of Sir W. Owen Lanyon as British administrator.
1830–81. Revolt of the discontented Boers, who, being successful in a few contests with the British troops, induced the British Government to restore the republic under the "suzerainty" of the queen, by the treaty of peace of March 21, 1881, a British resident being appointed, with the functions of a consul-general.
1883. S. J. Paul Krüger elected president.
1884. Convention of London (February 27, ratified by the volksraad, August 8) recognizing the state as the South African Republic, and considerably restricting the British suzerainty.
1885. Proclamation (March 23) of the British protectorate over Bechuanaland, thereby arresting the westward advance of the Boers into the Bamangwato, Bakwena, Bangwaketsi, and Barolong territories, and keeping open the great trade route from Cape Colony through Hopetown and Shoshong to the Zambesi.
1886. Fresh discoveries of rich auriferous deposits especially in the Middelburg province, followed by a great influx of English-speaking populations, threatening to swamp the Boer element.
1886. Projected South African confederation, opposed by Krüger, but supported by the Orange State, Cape Colony, and a majority of the Transvaal Boers. Connected with this scheme is the proposal of a uniform tariff and the immediate construction of a through railway from Cape Town to Delagoa Bay.

(A. H. K.)

TRANSVERSE FLUTE, The,—or German Flute, as it was formerly designated in Great Britain,—may be described as a musical instrument in which a column of air is set in vibration by regular pulsations derived from a current of air directed by the lips of the executant against the side of an orifice serving as an embouchure, pierced laterally in the substance of the pipe and towards its upper extremity. This mode of blowing appears to be of very ancient origin: the Hindus, Chinese, and Japanese claim to have used it from time immemorial; in Europe the high antiquity of a lateral embouchure is generally admitted, although it does not really rest, so far as our present knowledge goes, on any conclusive evidence.[1]

The oblique flute of the Greeks was of Egyptian origin, and it is therefore safest to suppose it to have been like the instrument frequently figured on the monuments of ancient Egypt, which, held obliquely, was blown through the orifice itself of the pipe at its upper extremity. The same instrument (called "nay") is still used in Mohammedan countries. The flute is often mentioned in mediæval poetry, but no details of its construction are given. It was the custom, moreover, to designate various instruments by this name. The oldest representation we know of the transverse flute is found in the 11th-century frescos of the cathedral of St. Sophia at Kieff. Eustache Deschamps, a French poet of the 14th century, in one of his ballads, makes mention of the "flute traversaine," and we are justified in supposing that he refers to the transverse flute. It had certainly acquired some vogue in the 15th century, being figured in an engraving in Sebastian Virdung's celebrated work,[2] where it is called "Zwerchpfeiff," and, with the drums, it already constituted the principal element of the military music. Agricola[3] alludes to it as the "Querchpfeiff" or "Schweizerpfeiff," the latter designation dating, it is said, from the battle of Marignan (1515), when the Swiss troops used it for the first time in war.

From Agricola onwards transverse flutes formed a complete family, said to comprise the discant, the alto and tenor, and the base,— , ,  respectively. There is evidently an error in the indications of pitch here given, for the instruments must in fact have produced sounds an octave higher than those noted. Prætorius,[4] who in a special note warns his readers against inaccuracies of this kind which were then frequent, designates the transverse flute as "traversa Querpfeiff" and "Querflöt," and notifies the bass in , the tenor and alto in , and the discant in  as varieties then in use. A flute concert at that time included two discants, four altos or tenors, and two basses. The same author distinguishes between the "Traversa" and the "Schweizerpfeiff" (which he also calls "Feldpfeiff," *i.e.*, military flute), although the construction was the same. There were two kinds of "Feldpfeiff," in  and  respectively; they were employed exclusively with the military drum[5]

Mersenne's[6] account of the transverse flute, then designated "flûte d'allemand" or "flûte allemande" in France, is obscure enough; but the tablatures and an "Air de Cour" for four flutes in his work lead us to believe that there were then in use in France the soprano flute in , the tenor or alto flute in  and the bass flute descending to . The Museum of the Conservatoire Royal of Brussels possesses specimens of all varieties hitherto mentioned except the last. All of them are laterally pierced with six finger holes;[1] they have a cylindrical bore, and are fashioned out of a single piece of wood. Their compass consists of two octaves and a fifth. The successive opening of the lateral holes gives rise to a series of fundamental notes forming the first octave. By a stronger pressure of the breath these notes are reproduced in the next octave higher, and the extent of compass of the instrument is completed in the higher region by the production of other harmonics.[2]

---

[1] The Louvre has two ancient statues (from the Villa Borghese) representing satyrs playing upon transverse flutes. Unfortunately these marbles have been restored, especially in the details affecting our present subject, and are therefore examples of no value to us. Another statue representing a flute-player occurs in the British Museum. The instrument has been supposed to be a transverse flute, but erroneously, for the insufflation of the lateral tube against which the instrumentalist presses his lips, could not, without the intervention of a reed, excite the vibratory movement of the column of air.

[3] *Musica Instrumentalis*, Wittenberg, 1529.

[4] *Organographia*, Wolfenbüttel, 1618.

[5] It is from the word *Pfeiff* that the French *Fifre* and the English *Fife*, still applied to the military flutes in present use, are evidently derived.

[6] *Harmonie Universelle*, Paris, 1636.

The largest bass flute in the Brussels museum is in  at the French normal pitch A 435 double vibrations per second. It measures 0.95 m. from the centre of the blow orifice to the lower extremity of the tube. The disposition of the lateral holes is such that it is impossible to cover them with the fingers if the flute is held in the ordinary way. The instrument must be placed against the mouth in an almost vertical direction, inclining the extremity of the tube either to the right or the left. This inconvenient position makes it necessary that the instrument should be divided into two parts, enabling the player to turn the head joint that the embouchure may be most commodiously approached by the lips, which is not at all easy. The first and fourth of the six lateral holes are double, but those holes are stopped up with wax which have become useless through the player's habit of using the fingers of the right or left hand to cover the higher three holes. The bass flute shown in Fig. 1 is the fac-simile of an instrument in the Museo Civico of Verona. The original, unfortunately no longer fit for use, is nevertheless sufficiently well preserved to allow of all its proportionate measurements being given. The lowest note, E♭, is obtained with a remarkable amplitude of sound, thus upsetting a very prevalent opinion that it is impossible to produce by lateral insufflation sounds which go a little lower than the ordinary limit downwards of the modern orchestral flute.[3]

FIG. 1.

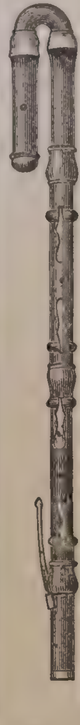

FIG. 2.

The bass flute cited by Mersenne should not differ much from that of the Museo Civico at Verona. We suppose it to have been in , and that it was furnished with an open key like that which was applied to the recorders (*flûtes douces*) of the same epoch, the function of the key being to augment by another note the compass of the instrument in the lower part. Following Quantz,[4] it was in France and about the middle of the 17th century that the first modifications were introduced in the manufacture of the flute. The improvements at this period consisted of the abandonment of the cylindrical bore in favor of a conical one, with the wide part in the head of the instrument. At the same time the flute was made of three separate pieces called head, body, and foot, which were ultimately further subdivided. The body or middle joint was divided into two pieces, so that the instrument could be tuned to the different pitches then in use by a replacement with longer or shorter pieces. It was probably about 1677, when Lully introduced the German flute into the opera, and recourse was had for the first time to keys, and that the key of D♯ was applied to the lower part of the instrument.[5] The engraving of B. Picart, dated 1707, which ornaments the work of the French flautist Hotteterre-le-Romain,[6] represents the flute as having reached the stage of improvement of which we have just spoken, but the body was still formed of one piece only. In 1726 Quantz,[7] finding himself in Paris, had a second key applied to the flute, placed nearly at the same height as the first, that of the , intended to differentiate the D♯ and the E♭. This innovation was generally well received in Germany, but does not appear to have met with corresponding success in other countries. In France and England manufacturers adopted it but rarely; in Italy it was declared useless.[8] About the same time flutes were constructed with the lower extremity lengthened and furnished with two supplementary keys to produce the C♯ and C. This innovation, spoken of by Quantz, did not meet with a very favorable reception, and was shortly afterwards abandoned. Passing mention may be made of the drawing of a flute with a C key in the *Music-Saal* of J. F. B. Mayers, Nuremberg, 1741.

The tuning of the instrument to different pitches was effected, as already explained, by changes in the length, and notably by substituting a longer or shorter upper piece in the middle joint. So wide were the differences in the pitches then in use that seven such pieces for the upper portion of it were deemed necessary. The relative proportions between the different parts of the instrument being altered by these modifications in the length, it was conceived that the just relation could be re-established by dividing the foot into two pieces, below the key. These two pieces were adjusted by means of a tenon, and it was asserted that, in this way, the foot could be lengthened proportionately to the length of the middle joint. Flutes thus improved took the name of "flûtes à registre." The register system was, about 1752, applied by Quantz to the head joint, and, the embouchure section being thus capable of elongation, it was allowable to the performer, according to the opinion of this professor, to lower the pitch of the flute a semitone, without having recourse to other lengthening pieces, and without disturbing the accuracy of intonation.

The upper extremity of the flute, beyond the embouchure orifice, is closed by means of a cork stopper. On the position of this cork depends, in a great measure, the accurate tuning of the flute. It is in its right place when the accompanying octaves are true.  Quantz, in speaking of this accessory, mentions the use of a nut-screw to give the required position to the cork. He does not name the inventor of this appliance, but, according to Tromlitz,[9] the improvement was due to Quantz himself. The invention goes back to 1726.

When the *Method* of Quantz appeared there were still in use, besides the orchestral flute in D, the little fourth flute in G, the low fourth flute in A, and the flûte d'amour a note higher; in France they had, moreover, the little octave flute in D (octave). A bass flute in D had also been attempted (see Fig. 2). When Ribocq published his *Bemerkungen über die Flöte*[10] the flute had already the five keys here shown.  This author does not cite the inventor of these new keys, but some claim them for Kusder, a musical instrument maker in London, others for Johann George Tromlitz of Leipsic, and Ribocq declares he has seen no flutes so constructed other than by these two makers. But Tromlitz lays no claim for himself to the credit of this improvement. He only says that "he had occupied himself for several years in applying these keys so as not to augment the difficulty of playing, but, on the contrary, to render the handling of them as easy as possible."[11] We may therefore regard the London maker as the author of the first flute with five keys, with, however, a reservation as to the G♯ key, which, from 1727, had been applied by Hoffmann of Rastenberg[12] to the transverse flute and the oboe. The higher key of C♮, adopted from 1786 by Tromlitz, we believe to have been first recommended by Ribocq (1782).

In 1785 Richard Potter, of London, improved Quantz's slide applied to the head joint as well as to the register of the foot by a double system of tubes forming double sliding air-tight joints. In the document[13] describing this improvement Potter patented the idea of clothing the holes which were covered by keys formed by metal conical valves. The keys mentioned in the patent were four,—D♯, F, G♯, A♯. The idea of extending the compass of the flute downwards was taken up again about the same time by two players of the flute in London named Tacet and Florio. They devised a new disposition of the keys C and C♯, and confided the execution of their invention to Potter. In Dr. Arnold's *New Instructions for the German Flute* occurs a tablature, the engraving of which goes back to the end of the 18th century, and bears the following title, "A Complete Drawing and Concise Scale and Description of Tacet and Florio's new invented German Flute, with all the additional keys explained." It explains the use of six keys,—C, C♯, D♯, F, G♯, A♯,—that are not always figured, because the employment of so many keys was at once admitted. Tromlitz himself, who, however, made flutes with nine keys,—adding E♭, another F, and C♮, declared that he was not in favor of so great a complication, and that he preferred the flute with only two keys, D♯ and E♭, with a register foot joint and a cork nut-screw at the head joint. This instrument met all requirements. He was even against the use of the keys for C♮ and C♯, because they altered the recognized quality of tone of the instrument. When Tromlitz published his method, the family of flutes had become modified. It comprehended only the typical flute in D, the flûte d'amour a minor third lower, a "third" flute a minor third higher, and, finally, the little octave flute.

---

[1] It is usual to indicate the tonality of flutes by the note produced when the six lateral holes are covered by the fingers. This custom is objectionable because it is the disposition of the fingers which is made use of to sound D. The practice has for its result that the tonality is always a note lower than the signature used. Thus the flute in D is really in C; that in F in E♭, etc.

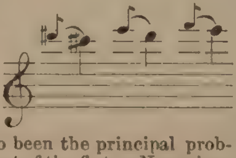
[13] English patent, No. 1499

While Tromlitz was struggling in Germany with the idea of augmenting the compass of the flute downwards by employing open keys for C♮ and C♯, an Italian, Giovanni Batista Orazi,[1] increased the scale of the instrument downwards by the application of five new keys, viz., B, B♭, A, A♭, and G. At the same time that he produced this invention[2] he conceived the plugging of the lateral holes by the valve keys then recently invented by Potter. But it was hardly possible to obtain a perfect plugging of seven lateral holes with the aid of as many keys, for the control of which there were only the two little fingers, and therefore this invention of Orazi proved a failure.

In 1808 Frederick Nolan,[3] of Stratford, near London, conceived an open key, the lever of which, terminating by a ring, permitted the closing of a lateral hole at the same time the key was being acted upon. The combination in this double action is the embryo of the mechanism that a little later was to transform the system of the flute. Two years later Macgregor,[4] a musical-instrument maker in London, constructed a bass flute an octave lower than the ordinary flute. The idea was not new, as is proved by the existence of the bass flute mentioned above. The difference between the two instruments lies in the mechanism of the keys. That employed by Macgregor consisted of a double lever, a contrivance dating from before the middle of the 18th century, of which the application is seen in an oboe of large dimensions preserved in the National Museum at Munich.[5]

About 1830 the celebrated French flautist Tulou added two more keys, those of F♯ and C♯, and a key, called "de cadence," to facilitate the accompanying shakes.



To increase the number of keys, to improve their system of plugging, and to extend the scale of the instrument in the lower region,—these had hitherto been the principal problems dealt with in the improvement of the flute. No maker, no inventor whose labors we have called attention to, had as yet devoted his attention to the rational division of the column of air by means of the lateral holes. In 1831 Theobald Boehm, a Bavarian, happening to be in London, was struck with the power of tone the celebrated English performer Charles Nicholson drew from his instrument. Boehm learned, and not without astonishment, that his English colleague obtained this result by giving the lateral holes a much greater diameter than was then usually admitted. About the same time Boehm made the acquaintance of an amateur player named Gordon, who had effected certain improvements; he had bored the lateral hole for the lower E, and had covered it with a key, while he had replaced the key for F with a ring. These innovations set Boehm about attempting a complete reform of the instrument.[6] He went resolutely to work, and during the year 1832 he produced the new flute which bears his name. This instrument is distinguished by a new mechanism of keys, as well as by larger holes disposed along the tube in geometrical progression.

Boehm's system had preserved the key of G♯ open; Coche,[7] a professor in the Paris Conservatoire, assisted by Auguste Buffet the younger, a musical-instrument maker in that city, modified Boehm's flute by closing the G♯ with a key, wishing thus to render the new fingering more conformable to the old. He thus added a key, facilitating the shake upon C♯ with D♯, and brought about some other changes in the instrument of less importance.

Boehm had not, however, altered the bore of the flute, which had been conical from the end of the 17th century. In 1846, however, he made further experiments, and the results obtained were put in practice by the construction of a new instrument, of which the body was bored cylindrical, but the head was modified at the embouchure. The inventor thus obtained a remarkable equality in the tones of the lower octave, a greater sonorousness, and a perfect accuracy of intonation, by establishing the more exact proportions which a column of air of cylindrical form permitted.

The priority of Boehm's invention was long contested, his detractors maintaining that the honor of having reconstructed the flute was due to Gordon. But an impartial investigation vindicates the claim of the former to the invention of the large lateral holes.[8] His greatest title to fame is the invention of the mechanism which allows the production of the eleven chromatic semitones intermediate between the fundamental note and its first harmonic by means of eleven holes so disposed that in opening them successively they shorten the column of air in exact proportional quantities.[9] Boehm[10] has published a diagram or scheme to be adopted in determining the position of the note-holes of wind instruments for every given pitch. This diagram gives the position of the intermediate holes which he had been enabled to establish by a rule of proportion based on the law of the lengths of strings.

The Boehm flute, notwithstanding the high degree of perfection it has reached, has not secured unanimous favor; even now there are players who prefer the ordinary flute. The change of fingering required for some notes, the great delicacy and liability to derangement of the mechanism, have something to do with this. In England especially, the ordinary flute retains many partisans, thanks to the improvements introduced by a clever player, Abel Siccama, in 1845.[11] He bored the lateral holes of E and A lower, and covered them with open keys. He added some keys, and made a better disposition of the other lateral holes, of which he increased the diameter, producing thus a sonorousness almost equal to that of the Boehm flute, while yet preserving the old fingering for the notes of the first two octaves. But in spite of these improvements the old flute will not bear an impartial comparison with that of Boehm. (V. M.)

TRANSYLVANIA (Germ. *Siebenbürgen*), a mountainous principality (Gross-Fürstenthum) forming the extreme eastern portion of Austria-Hungary, is bounded on the W. and N. by Hungary proper, on the E. by Bukowina and Moldavia, and on the S. by Walachia. The German name is usually derived from the seven principal fortified towns or "burgs" founded by the German colonists, though some authorities prefer to connect it with the Zibin Mountains on the south frontier. The Latin name appears first after the 12th century, and signifies "beyond the woods," *i.e.*, from Hungary; the Magyar and Roumanian names (Erdély and Ardealu) both mean "forest-land." For all political and administrative ends, and in the official statistics and returns, Transylvania is now wholly incorporated with HUNGARY (*q.v.*), and to all intents and purposes is a part of that kingdom. The principality has the form of an irregular circle, with an area of about 21,000 square miles, and is on all sides surrounded by mountain chains, while the interior is barred and striped with lower ranges. On the west or Hungarian side there are various wide and comparatively easy passes into the interior, but on the east and south frontiers the lofty bounding mountains present steep and rugged faces outwards, giving to Transylvania the general aspect of a huge natural fortress. These mountains are a continuation of the Hungarian and Galician Carpathians; in fact, the mountains of Transylvania may be regarded together as forming the southeastern main group of the Carpathian system. The loftiest and most rugged peaks are on the north and south boundaries. On the north the highest summit is the Pietross (7534 feet), one of the Rodna Alps; on the south are the Butshetsh (8262 feet), the Königstein (7357 feet), and the Negoi (8340 feet). The east is bounded by several parallel chains, the highest peak in which is the Pietrossul (6910 feet); and on the west border the greatest height is attained towards the south, where several peaks reach 7200 feet. On the west are the Transylvanian Ore Mountains (Erzgebirge), with the curious Detunata ("thunder-smit"), and the Bihar group, with its numerous caverns. There are numerous valleys, ravines, and cañons in the network of mountains covering the interior of the country, but it is only along the courses of the principal rivers that plains of any size are found. The chief rivers are the Aluta or Alt, which flows south, pierces the southern boundary mountains at the Rother Thurm Pass, and joins the Danube, and the Maros, to the west, and the Szamos, to the north, both tributaries of the Theiss, which also falls into the Danube. All these are navigable, and are fed by various tributaries. The largest lake is the Hodoser or Eseger See, 13 miles long. Transylvania abounds in mineral springs of all kinds, especially saline and chalybeate. The climate is tolerably severe: hot summers alternate with very cold winters; but the rainfall is not great.

[11] Patent, No. 10,553.

The mineral wealth of Transylvania is very considerable. Gold is found in certain quantity in mines, and it is also "washed" in some of the streams, chiefly by Gypsies. The gold is often found in conjunction with tellurium (first discovered in Transylvania in 1782, and until the present century not found anywhere else, see TELLURIUM). Silver, copper, lead, and iron are also worked to some profit. Coal occurs in considerable abundance, and it is mined in the Schilthal, but the superabundance of timber has retarded its exploitation. Hills largely formed of pure salt are met with here and there, and there are also very rich subterranean deposits of salt, sometimes cropping up on the surface. Some of the saline springs also yield salt enough to render their evaporation profitable. The vegetation of Transylvania is luxuriant, except of course in the higher mountain zones. Fruits abound, as apples, pears, peaches, apricots, plums, cherries, chestnuts, and almonds; mulberries are also cultivated. The vine flourishes best in the valley of the Maros. Agriculture is one of the most important industries, though the available good land is by no means fully taken up. The chief crop is maize; but wheat, rye, and other grains, potatoes, saffron, hemp, flax, and tobacco are also grown. Extensive forests clothe much of the country, but are in a somewhat neglected condition. On the boundary mountains the trees are mainly coniferous: in the interior oaks, elms, beeches, and ashes are conspicuous.

The forests afford cover for many wild animals. Bears, wolves, foxes, boars, and various varieties of game are found, and on some of the mountains the chamois. There is abundant pasturage on which excellent cattle are reared; and in some districts buffaloes are bred for draught purposes. More important is the breeding of a sturdy race of horses, thousands of which are annually exported. The mountains maintain very large flocks of sheep, of which two kinds are distinguished—with a fine short-stapled and a coarse long-stapled wool respectively. Silkworms are bred, and some silk is spun; and the export of honey and wax, from both wild and domestic bees, is not inconsiderable. Neither the means of communication with the external world nor the manufacturing industry in Transylvania is developed to any important extent; the latter, indeed, has to a certain extent gone back. The most industrious and in general the most advanced of the population are the "Saxons"; and trade, the great bulk of which is with Roumania, is mainly in the hands of Armenians and Greeks. The chief commercial centres and principal towns are Herrmannstadt, Kronstadt, Bistritz, and Szamos-Ujvar.

Perhaps the most interesting point in connection with Transylvania is the variety of its population, which in 1880 numbered 2,084,048 in all. Until 1848 the chief influence and privileges, as well as the only political rights, were divided among the three "privileged nations" of the Hungarians, Szeklers, and Saxons. The first are the descendants of the Magyar conquerors. The Szeklers, *i.e.*, "guardians," chiefly on the east borders, settled in eastern Transylvania to act as guardians of the frontiers. The Saxons are the posterity of the German immigrants brought by King Geisa II. (1141–1161) from Flanders and the lower Rhine to cultivate and repeople his desolated territories. At first these were known as Teutones, Teutonici Hospites, and Flandrenses, but since the beginning of the 13th century the general name of "Saxons," as tantamount to "Germans," has prevailed (*cf.* SAXONY, vol. xxi. p. 367). The Hungarians and Szeklers together number 609,208, and the Saxons 204,713, but by far the most numerous element, though long excluded from power and political equality, is formed by the Walachians or Roumanians, 1,146,611 in number, a mixed race, not entitled to the descent which they claim from the early Roman colonists of Dacia. The Gypsies of Transylvania, who are heard of under a voivode or prince of their own in 1417, are estimated at 46,460; many of them have abandoned a nomadic life and have taken to agriculture or gold-washing. Jews, Armenians, Bulgarians, Ruthenians, and Greeks are also represented in the medley of peoples. About 70,000 (chiefly children) are returned, unclassed, as "not able to speak." The Magyars are mostly Roman Catholics or Unitarians, the Germans Protestants, and the Roumanians adherents of the Greek Church.

Transylvania formed part of the Roman province of Dacia. After the withdrawal of the Romans the country became for centuries the prey of the various peoples who swept across it in their restless migrations. At the beginning of the 11th century (1004) Stephen I. of Hungary made himself master of the land, which was thenceforward governed as an Hungarian province by a voivode. In 1538 the voivode, John Zapolya, succeeded in rendering himself independent, and he and his successors, who were generally elected by the people, were supported by the Turks against the house of Austria, while the difficult nature of their country preserved them on the other hand from becoming too dependent on their powerful allies. After the defeat of the Turks at Vienna in 1683, their influence in Transylvania waned, and in 1699, by the peace of Carlowitz, the Porte acknowledged the suzerainty of Leopold I. of Austria over Transylvania. By the Leopoldine diploma of 1691 Leopold had guaranteed the ancient rights and laws of the land, and united it formally with the Hungarian crown. In 1765 Maria Theresa made it a grand principality (Gross-Fürstenthum). The efforts of the Roumanian inhabitants to secure recognition as a fourth "nation," and the opposition of the non-Magyar population to a closer union with Hungary, led to troubles and disagreement early in the 19th century, culminating in bloody internecine struggles in 1848. In 1849, Transylvania was divided from Hungary by an imperial decree, and became an Austrian crown-land; but in 1860 the old order was renewed, and the complete incorporation with Hungary was perfected in 1868. Since that time the policy of the Hungarian party has on the whole prevailed, and the Magyarization of the principality is steadily being carried through, in spite of the bitter protests and discontent of both the Saxons and Roumanians. An Hungarian university was founded at Klausenburg in 1872; and Hungarian is recognized as the official language.

(F. MU.)

TRAPANI, a seaport of Italy, capital of the province of Trapani, and an episcopal see, lies on the extreme northwest coast of Sicily, 19 miles to the north-northeast of Marsala and 4 miles to the west-southwest of Monte St. Giuliano. It lies on a sandy peninsula resembling a sickle (whence the name, from *δρέπανον*), projecting westward and concave towards the north. It is a place of considerable enterprise; the streets are, comparatively speaking, regularly built and well kept; and the population are above the average in industry and intelligence. The town is still surrounded by a wall with bastions. Some of the mediæval houses are interesting architecturally, but none of the public buildings require special notice. Among the institutions of Trapani may be mentioned the lyceum (with natural history collection and picture gallery), the gymnasium, the technical and navigation schools, and the library. Some of the churches contain choice works of art. The industries of the place include linen manufacture and works in coral, wood, iron, marble, alabaster, mother-of-pearl; there are also extensive salt lagoons in the immediate neighborhood, and there is considerable traffic in salt, soda, sulphur, and grain. The harbor, on the southwest side of the sickle, is sheltered by a mole and protected by a fort in the islet of Columbara; it has a lighthouse at the entrance, and is accessible to vessels of about 400 tons. The population in 1881 was 32,020.

Trapani, the ancient *Drepanum* or *Drepana*, was the seaport of Eryx (see ERYX and MONTE SAN GIULIANO), and is represented by Virgil as the scene of the death of Anchises, and of the funeral games celebrated in his honor. Towards the beginning of the First Punic War (*c.* 260 B.C.) it was made a fortress by Hamilcar Barca, who removed hither the greater number of the inhabitants of Eryx, the remainder being transferred in 249. It fell into the hands of the Romans at the end of the war, and does not figure again in ancient history. It appears, however, to have continued to flourish as a commercial town, being mentioned both by Cicero and by Pliny. In the Middle Ages it became a royal residence.

TRAPPISTS. The abbey of Notre Dame de la Maison-Dieu de la Trappe was founded in 1140 by Rotrou, count of Perche, at Soligny-la-Trappe, a village of Haut-Perche, now in the arrondissement of Mortagne, department of the Orne, so named from the narrow gorge which forms its entrance, comparable to a trap-door. It was at first attached to the congregation of Savigny, a minor offshoot of the order of Fontevrault, but that congregation was united in 1148 to the Cistercian order, and, by the special intervention of St. Bernard, was affiliated, with all its dependencies, to his own abbey of Clairvaux. No mediæval monastic order fell more rapidly and signally from the spirit of its original institute than the Cistercian, and La Trappe formed no exception to the general decay. Indeed, its geographical position in a district fiercely contested during the long war between France and England hastened its declension, for it was several times taken and pillaged, while the members of the community, at last compelled to break up and disperse, returned at the close of the war with their traditions interrupted, their discipline relaxed, and their moral tone deteriorated. Nor was this the worst. The introduction of the "commendam" system into the French Church, whereby secular ecclesiastics were empowered to hold monastic benefices without residence or conformity to the rule of the society in which they ranked as heads, wrought yet further mischief; and, though the Trappists at first endeavored to resist Jean du Bellay, the celebrated bishop of Paris (afterwards cardinal-bishop of Ostia), whom Francis I. nominated in 1526 as abbot commendatory, and were upheld by the pope in continuing to elect their own abbots, yet their efforts were fruitless, and Du Bellay was succeeded by a series of titular abbots, under whose nominal rule the estates of the abbey were impoverished, the buildings suffered to fall into nearly total ruin, and the conduct of the monks became a public scandal. In fact, the community was broken up, the dismantled monastic buildings were abandoned to a few domestics and their families, and the scattered Trappists seldom reassembled save for hunting parties and similar amusements. Such was the condition of things when a reformer arose in the person of one of those very abbots commendatory who had been the ruin of the institute.

Armand Jean Bouthillier de Rancé, second son of Denis Bouthillier de Rancé and Charlotte Joly his wife, was born in Paris on January 9, 1626. By his father's side he was sprung from a patrician family of Breton origin long settled in Normandy; by his mother's he was connected with powerful members of the official hierarchy. His near kindred were wealthy, titled and highly placed in the magistracy, the army, and the dignities of the church; while the fact that Cardinal Richelieu was one of his sponsors and gave him his own fore-names sufficiently attests the political influence just then at their disposal. The child showed early tokens of considerable abilities, and was intrusted by his father to accomplished tutors, under whom he made rapid progress. He was originally intended to enter the order of the Knights of Malta, but the death of his elder brother in 1637, after a long illness, changed his father's plans, and the child (who had been tonsured in 1635 by way of precaution against such a contingency) was at once put in possession of the various benefices which had been secured for his elder; so that while still under eleven years of age, he was canon of Notre Dame de Paris, abbot of La Trappe, of Notre Dame du Val, and of St. Symphorian of Beauvais, and prior of Boulogne, near Chambord, and of St. Clementin, in Poitou. In 1642 he was sent to the Collége d'Harcourt, where he began the usual course of philosophy, but addicted himself almost at once to the then popular study of judicial astrology, which he soon forsook for the cognate delusion of alchemy. Nevertheless, he distinguished himself in the more accredited studies of the college, and graduated as M.A. in 1644. It was then usual for Parisian students in theology to attend the course of lectures delivered at the Sorbonne, but De Rancé preferred to return home and pursue his theological studies under private instruction. He was ordained deacon in 1648, and, being in the heyday of youth, with high spirits and popular manners, fell readily into the dissipations of the time, leading a very irregular life, yet not so as to forfeit the goodwill of even his stricter acquaintance. He was ordained priest in 1651, but made no alteration in his habits, and yet so far kept up his studies that, when examined in 1652 for his license as bachelor in theology, he came out at the head of the candidates, while the famous Bossuet ranked only as third. In 1653 he lost his father, who bequeathed property to him which doubled his already large income, and in 1654 he graduated as doctor of divinity, when his uncle, the archbishop of Tours, made him one of his archdeacons, hinting that this preferment would be merely the preliminary of a mitre. He never so much as pretended to discharge the duties of his new office, but spent his time amusing himself at his chateau of Véretz; in despite of which his uncle nominated him as deputy from the diocese of Tours to the general assembly of the French clergy convoked by the king in 1655 to discuss the Jansenist controversy. The chief matter of interest in this connection is that he was one of the minority of 65 doctors of the Sorbonne who refused to vote, with the majority of 127, a censure upon the Jansenist leader Arnauld, though he took part later against that school. The sudden death of the duchess of Rohan-Montbazon, with whom he was intimate, and whose relations with him were the subject of much hostile comment, is said to have been the first great shock which began the process of change in his views of life and duty. A story, which was first given currency in an anonymous account of his conversion published at Cologne in 1668, much heightens this by alleging that De Rancé arrived at the Duchess's house unaware of her death, and went direct to her apartment without being warned by the servants, only to find her head lying apart from her decapitated body, having been cut off because the coffin was too short and there was no time to procure another. The truth of this story (itself containing several improbable incidents) was promptly denied by Maupeou, the earliest of De Rancé's biographers, and has been rejected by Bayle and St. Simon, though accepted by La Harpe and Voltaire. What is certain is that the alteration in his habits nearly synchronizes with the death of Madame de Montbazon, and that the years 1657, 1658, and 1659 were mainly spent in solitary studies or in visits to the monasteries of which he was titular head, varied by conferences with eminent ecclesiastics whose advice he sought, while in 1660 the death of the duke of Orleans, whose chief almoner he was, appears to have given the final direction to his thoughts, though it was not for some years that he carried out his new plans to the full. His first resolution was to sell his patrimony and resign his benefices, and in 1662 he actually sold his chateau of Véretz, made over two mansions in Paris to the hôtel-dieu, and obtained permission to transfer all his abbeys except Boulogne and La Trappe to resident heads chosen by himself. His canonry of Notre Dame had been resigned so far back as 1653 because of some difficulty about residence. After making provision for family claims, and retaining a comparatively small sum for the repair of Boulogne and La Trappe, he distributed the remainder of his property to the poor. In 1662 he visited La Trappe, which he found in a deplorable condition, and the few resident monks so indisposed to listen to his projects of reform that they threatened to murder him and throw his body into the abbey ponds. In his turn he threatened them with the king's direct interference, and such was the terror of Louis XIV.'s name that they at once submitted, and consented to retire upon the payment of a moderate pension; whereupon De Rancé filled their places in 1663 with monks of the strict Cistercian observance, and carefully repaired the monastic buildings there and at Boulogne. In that same year he finally decided to enter the monastic life, and began his noviciate at the Cistercian abbey of Perseigne in Maine, assuming, on his profession in 1664 the actual headship of the abbey of La Trappe, whose nominal abbot he had been for nearly thirty years. Associating himself with other personages who desired to revive the Cistercian discipline, he made two journeys to Rome to obtain papal sanction for their plans, and after considerable delay a brief was procured from Alexander VII. authorizing the abbot of Citeaux, as general of the Cistercians, to hold a grand chapter of the order to discuss the proposed reforms, which actually did meet in 1667. But De Rancé's ideas went much beyond the mere re-establishment of the strict observance; and, though he judged some details of the original rule unsuited to his own day, and blended with it some particulars borrowed from the Benedictine rule, yet he was so far from diminishing its general austerity that he added to the protracted fasts, the total abstinence from flesh-meat, fish, eggs, and wine, the laborious manual occupations, the hard beds, and the severe asceticism, even in the church services, which made part of the original rule, also the obligation of perpetual silence,—save at prayers (to which eleven hours daily are devoted), and save also the "Memento mori" with which the Trappists greet each other on first meeting,—which is the distinguishing feature of La Trappe, a rule from which none are dispensed save the abbot and the guest-master, as obliged to hold some degree of intercourse with outsiders; and he further ordained that each monk should spend some time each evening digging his own grave, and should sleep on straw in his coffin for a bed. These austerities, though cheerfully embraced by the monks of La Trappe, and attracting enthusiasts from without, were far from being approved generally, even in the Cistercian order itself, and when a decree was issued by the council of state in 1675 giving the abbot of Citeaux absolute authority over all Cistercians of the strict observance, De Rancé took alarm, and, thinking it possible that an attempt might be made to mitigate the severities he had introduced (particularly as the mortality amongst the members of his society had been very large, and was currently attributed to insufficient nutriment), induced them to renew their vows and to pledge themselves against the admission of any relaxations. Nor was he content with opposing this kind of resistance to the bishops, abbots, and others who remonstrated with him upon the subject, but he also took up his pen in defence of his views, and published in 1683 his treatise *De la Sainteté et des Devoirs de la Vie Monastique*, which involved him in much controversy, notably with the learned Benedictine Mabillon, who replied to him in his well-known work *Traité des Études Monastiques*, published in 1691. Advancing years and unremitting asceticism told even on the strong constitution of De Rancé, and he found himself unable to take his share of the manual labors of the house, or even to be present in chapter, so that in 1695 he felt obliged to resign the abbacy, and procured the nomination to succeed him of the prior Zosimus, who died before the arrival of the bulls for his installation, and Dom Francis-Armand was substituted in his room, and inducted into office in 1696. He proved a failure as a ruler, and La Trappe broke up into two factions during his headship, some holding to him and others to De Rancé, till the new abbot resigned in a fit of disgust of which he soon repented, but could not succeed in recalling his abdication. Dom Jacques de la Tour, a man in sympathy with De Rancé, was then nominated by the crown, and while he was still abbot De Rancé died, on October 20, 1700, in the seventy-fifth year of his age.

De Rancé was a tolerably copious author, though most of his writings were little more than occasional pamphlets suggested by the controversies in which he was engaged, short devotional treatises, and notices of deceased members of his community, but his reputation for ability and scholarship was never contested. He was a successful administrator, and, though the extreme severity of his institute resulted in the failure of fully six-sevenths of the postulants who presented themselves, he gathered round him during his government of the abbey no fewer than three hundred ascetics, French, Belgians, Germans, Italians, and Irishmen, one-third of whom were drawn from less austere communities or from the ranks of the parochial clergy and candidates for the priesthood. Of lay outsiders who joined him, the largest proportion consisted of rural artisans and laborers, and of soldiers, from officer to private (a class for which La Trappe has always continued to have attractions), with a small sprinkling of the legal profession; while two physicians and a single tradesman complete the tale of those who persevered out of the two thousand or so who presented themselves. No daughter houses were founded from La Trappe during De Rancé's life, for, though he was ready enough to send some of his monks for a time or even permanently to revive the Cistercian discipline in other monasteries, he was opposed on principle to every scheme which tended to drain the resources of La Trappe itself, and it was not till 1705 that the first offshoot of the Trappists was planted at Buon-Solazzo, near Florence, at the solicitation of Cosmo III., grand-duke of Tuscany.

No remarkable events occurred in connection with La Trappe till the French Revolution, when the order was included in the general suppression of monastic societies by the Constituent Assembly in 1790. Even then the high character borne by La Trappe, and honorably distinguishing it from too many monasteries at that time, seemed likely to exempt it from the common fate, and great efforts were made to obtain its exclusion from the operation of the decree. A petition addressed by the Trappists to the National Assembly was referred to the council-general of the department of the Orne at Alençon, which reported against it to the ecclesiastical committee of the assembly, though admitting that all the local municipalities which they had consulted were in favor of sparing the abbey. Dom Augustin (Louis Henri L'Estrange), at that time master of the novices, foreseeing the result of the inquiry, went to Switzerland to provide a refuge for the brethren, and obtained permission from the authorities of canton Freiburg to take possession of Val-Sainte, an unoccupied Cistercian monastery, and to bring no more than twenty-five persons thither. This necessitated leaving more than a hundred at La Trappe to await the coming storm, which burst upon Trinity Sunday, June 3, 1792, when commissioners seized all the movable goods scheduled in their inventory, and compelled the inmates to disperse. Some betook themselves to Soleure; a few retired singly into private dwellings; but various groups set out together to found colonies in Spain, Germany, England, and Canada; while the earlier Swiss and Tyrolese houses were compelled to break up and seek refuge elsewhere from the French invaders. But amidst all difficulties and discouragements the order not merely maintained itself, but grew and strengthened, and in 1808 ventured to plant anew two houses in France itself. This same year, however, saw the division of the order into two congregations, because the Trappists of Darfeld, under their prior Eugène de Prade, resisted what they considered to be the excessive demands made upon them by the abbot of the order, that very L'Estrange who had led out the colony of Val-Sainte (and who had been constituted its head, and that of the whole society, by a brief of Pius VI. in 1794), and the dispute was appealed to Rome, with the result that in June, 1808, judgment was given against L'Estrange, and Darfeld was erected into an independent abbey under De Prade as abbot, and subjected to the jurisdiction of the bishop of Münster. Nearly every Trappist house at this date was within Napoleon's dominions, and, as the order sided with the pope against the emperor, the latter expelled its monks from all monasteries in the empire, and imprisoned not a few of them. With his fall they revived again, and obtained permission to return to France, whither between 1814 and 1825 they drifted back from most of their places of exile, though 1450 were expelled anew in 1880 under the operation of the Ferry laws. La Trappe itself was repurchased by L'Estrange, and became once more the mother house, while there are fifteen other French monasteries of the order, four Belgian, two English (Mount St. Bernard, Leicestershire, and Stape Hill, Dorset), two in Ireland, one each in Germany, Savoy, and Algiers, two in Italy, two (Gethsemane in Kentucky and New Melleray in Iowa) in the United States, and one originally settled in Pennsylvania, but now at Tracadie in Nova Scotia.[1] An order of Trappistine nuns was founded by Dom Augustin in 1827, and has nine French houses and one English. The total number are computed at 3000 members of both sexes.

The bibliography relating to De Rancé and the Trappists is copious, and the following list is not exhaustive. Savary (Bishop of Séez), *Imago R. P. Dom. Arm. Joan. le Bouthillier de Rancé, Abbatis de Trappa*, 1701; Maupeou, *Vie de M. l'Abbé de la Trappe*, Paris, 1702; Marsollier, *Vie de l'Abbé Bouthillier de Rancé*, Paris, 1702; Le Nain (brother of Tillemont), *Vie de Le Bouthillier de Rancé, Abbé et Réformateur de la Trappe*, Rouen, 1715; Inguimbert, *Genuinus Character D. Arm. Jounnis Buttilieri Rancæi*, Rome, 1718; Charles Butler, "Life of De Rancé," *Miscellanies*, vol. iii., London, 1817; Dubois, *Historie de l'Abbé De Rancé et de sa Réforme*, 2 vols., Paris, 1866; Félibien, *Description de la Trappe*, Paris, 1672; Helyot and Badiche, *Histoire des Ordres Religieux*, art. "La Trappe," Paris, 1859; Wetzer and Welte, *Kirchenlexicon*, art. "Trappisten," Frieburg, 1849.

(R. F. L.)

TRAS-OS-MONTES (*i. e.*, "Behind the Mountains") is the northeast frontier province of Portugal, situated on the other side of the Serra de Marão from Oporto. On the W. it is bounded by Entre Minho e Douro, and on the S. by Beira. The area is 4260 square miles, and the population increased from 393,279 in 1878 to 396,676 in 1881. Physically the province is a mountainous plateau, the most elevated in Portugal, and characterized by the picturesqueness and wildness of its scenery. Monte Zinho reaches a height of 7445 feet. Vast tracts are covered with heath; but in certain parts the soil is fertile, and the rich wine-growing district on the upper Douro (Alto Douro) is the native country of port. Silk-growing is also carried on; and wheat, rye, hemp, and flax appear among the exports. The province is divided into the two administrative districts of Villa Real and Braganza. Besides the two towns thus named, two only, Chaves and Miranda do Douro, are of any considerable size.

TRAVANCORE, a native state in Madras presidency, India, between 8° 4′ and 10° 22′ N. lat. and between 76° 12′ and 77° 38′ E. long., with an area of 6730 square miles. It is bounded on the N. by the native state of Cochin, on the E. by the British districts of Madura and Tinnevelli, and on the S. and W. by the Indian Ocean. This state is described as one of the most picturesque portions of southern India. Its most marked physical feature is furnished by the Western Gháts, which rise to an elevation of 8000 feet and are clothed with magnificent primeval forest; they throw out spurs towards the coast, along which there is a belt of flat country of about 10 miles in width, covered with an almost unbroken mass of cocoa-nut and areca palms, which to a great extent constitute the wealth of the country. The whole surface is undulating, and presents a series of hills and valleys traversed from east to west by many rivers, the floods of which, arrested by the peculiar action of the Arabian Sea on the coast, spread themselves out into lagoons or backwaters, connected here and there by artificial canals, and forming an inland line of smooth-water communication for nearly the whole length of the coast. The chief river is the Periyár, which is navigable for 60 miles; other important rivers are the Pámbai and its tributary the Achinkoil, the Kallada, and the Western Támbraparni. Iron is abundant. Elephants are numerous, and tigers, leopards, bears, bison, elk, and various kinds of deer abound in the forests. The state possesses some good roads, and, on the whole, internal communication is tolerably complete. Travancore has an abundant rainfall, with every variety of climate and temperature.

In 1881 the population of Travancore was found to number 2,401,158 (males 1,197,134, females 1,204,024), of whom 1,755,610 were Hindus, 146,909 Mohammedans, and 498,542 Christians. The chief towns are TRIVANDRUM (*q.v.*), the capital, Aleppi, the commercial centre and chief seaport of the state, and Quilon, another seaport and military headquarters. Among the principal articles which the state produces are rice, cocoa-nut palm, pepper, areca-nut, cardamons, tamarind, coffee, timber, etc. The manufactures comprise cocoa-nut, gingelly, lemon-grass, and laurel oils, jaggery and molasses, salt, arrack, cotton cloths and yarns, pottery, and coir yarn, rope, and matting. Its revenue in 1884-85 was estimated at £640,548 [$3,113,063.28]. Travancore state is in subsidiary alliance with the British Government, to which it pays a tribute of £80,000 [$388,800] a year. It is one of the few states which have never turned against the British. Under the enlightened rule of the late maharajah the country made great progress, and it now stands very high among native states. It is free from debt, and has a surplus of revenue over expenditure. The sovereignty as well as the inheritance of property passes in the female line.

TRAWLING. See FISHERIES.

TREASON. The law which punishes treason is a necessary consequence of the idea of a state, and is essential to the existence of the state. Most, if not all, nations have accordingly, at an early period of their history, made provision by legislation or otherwise for the punishment of those offences against public order which consist in more or less direct attacks upon the safety of the state or its chief. The principle is universal; it is the application of the principle which leads to differences of opinion. What would have been a capital crime at Rome under Tiberius may be no offence at all in England. It is to the advantage of both the state and the citizen that what is treason and what is not should be clearly defined, so that as little as possible discretionary power, apt to be strained in times of popular excitement, should be left to the judicial or executive authorities. The importance of this was seen by Montesquieu. Vagueness in the crime of treason, says he, is sufficient to make the government degenerate into despotism.[1] At the same time, it may be observed that despotic governments have not always left the crime undefined. The object of Henry VIII., for instance, was rather to define it as closely as possible by making certain acts treason which would not have been so without such definition. In both ancient and modern history treason has generally been a crime prosecuted by exceptional procedure, and visited with *afflictive* as distinguished from *simple* punishments (to use the terminology of Bentham).

---

[1] [In 1803 a Trappist colony settled at Pigeon Hill, near Conewago, Pa. This colony removed to Kentucky in 1805, and from there to Tracadie, Nova Scotia, in 1813. The present Trappist house at Gethsemane, Ky., was established in 1848.—AM. ED.]

In Roman law the offences originally falling under the head of treason were almost exclusively those committed in military service, such as in England would be dealt with under the Army Act. The very name *perduellio*, the name of the crime in the older Roman law, is a proof of this. *Perduelles* were, strictly, public enemies who bore arms against the state; and traitors were regarded as having no more rights than public enemies. The Twelve Tables made it punishable with death to communicate with the enemy or to betray a citizen to the enemy. Other kinds of *perduellio* were punished by interdiction of fire and water. The crime was tried before a special tribunal, the *duumviri perduellionis*, perhaps the earliest permanent criminal court existing at Rome. At a later period the name of *perduellio* gave place to that of *læsa majestas*, *deminuta* or *minuta majestas*, or simply *majestas*. The lex Julia majestatis, to which the date of 48 B.C. has been conjecturally assigned, continued to be the basis of the Roman law of treason until the latest period of the empire. The original text of the law appears to have still dealt with what were chiefly military offences, such as sending letters or messages to the enemy, giving up a standard or fortress, and desertion. With the empire the law of *majestas* received an enormous development, mainly in the reign of Tiberius, and led to the rise of a class of professional informers, called *delatores*.[2] The conception of the emperor as divine[3] had much to do with this. It became a maxim that treason was next to sacrilege[4] in gravity. The law as it existed in the time of Justinian is contained chiefly in the titles of the *Digest*[5] and *Code*[6] "*Ad legem Juliam majestatis.*" The definition given in the *Digest* (taken from Ulpian) is this: "majestatis crimen illud est quod adversus populum Romanum vel adversus securitatem ejus committitur." Of treasons other than military offences, some of the more noticeable were the raising of an army or levying war without the command of the emperor, the questioning of the emperor's choice of a successor, the murder of (or conspiracy to murder) hostages or certain magistrates of high rank, the occupation of public places, the meeting within the city of persons hostile to the state with weapons or stones, incitement to sedition or administration of unlawful oaths, release of prisoners justly confined, falsification of public documents, and failure of a provincial governor to quit his province at the expiration of his office or to deliver his army to his successor. The intention (*voluntas*) was punishable as much as an overt act (*effectus*).[7] The reported opinions as to what was not treason show the lengths to which the theory of treason must have been carried by at least some person in authority. It was not treason to repair a statue of the emperor which had decayed from age, to hit such a statue with a stone thrown by chance, to melt down such a statue if unconsecrated, to use mere verbal insults against the emperor, to fail in keeping an oath sworn by the emperor, or to decide a case contrary to an imperial constitution. Treason was one of the "publica judicia," *i.e.*, one of those crimes in which any citizen was entitled to prosecute. The law went further than this, and deprived the accused in a charge of treason of his ordinary remedy for malicious prosecution. It also took from him the privilege (which those accused of other crimes generally possessed) from accusation by women or infamous persons, from liability to be put to the torture, and from having his slaves tortured against him (see TORTURE). The punishment from the time of Tiberius was death (usually by beheading)[8] and confiscation of property, coupled with complete civil disability. A traitor could not make a will or a gift or emancipate a slave. Even the death of the accused, if guilty of treason of the gravest kind, such as levying war against the state, did not extinguish the charge, but the memory of the deceased became infamous, and his property was forfeited as though he had been convicted in his lifetime.

The law of England corresponds to a considerable extent with Roman law; in fact, treason is made by Blackstone the equivalent of the *crimen læsæ majestatis*. The history of the crime in the two systems agrees in this that in both the law was settled by legislation at a comparatively early period, and subsequently developed by judicial construction. In both, too, there were exceptional features distinguishing this crime from other offences.[9] For instance, at common law treason was not bailable (except by the Queen's Bench) or clergyable, could not be cleared by sanctuary, and did not admit of accessories, for all were principals, nor could a married woman plead coercion by her husband. To stand mute and refuse to plead did not save the lands of the accused, as it did in felony, so that the "peine forte et dure" (see TORTURE) was unnecessary in treason. These severities were due to the conception of treason as a breach of the oath of allegiance. Other differences introduced by statute will be mentioned later. In some cases a statute simply affirmed the common law, as did the Statute of Treasons to a great extent, and as did 26 Hen. VIII. c. 13, depriving those accused of treason of the benefit of sanctuary. How far the Roman law was consciously imitated in England it is impossible to determine. It was certainly not adopted to its full extent, for many acts were *majestas* which were never treason, even in the most despotic periods. Treason was the subject of legislation in many of the pre-Conquest codes. The laws of Alfred[10] and Æthelred[11] punished with death any one plotting against the life of the king. Soon after the Conquest the *Leges Henrici Primi*[12] put any one slaying the king's messenger in the king's mercy. The crime was shortly defined by Glanvill[13] and at greater length by Bracton,[14] who follows Roman law closely. He includes under treason sedition and coining. Treason seems to have rested chiefly, if not wholly, upon common law until the year 1352, when the famous Statute of Treasons (25 Edw. III. st. 5, c. 2) was passed. The statute appears to have arisen from a petition of the Commons in 1348, praying for a definition of the offence of accroaching royal power, a charge on which several persons—notably Gaveston and the Despencers—had suffered. The offences made treason by the statute are these: (1) to compass or imagine[15] the death of the king,[1] the queen, or their eldest son and heir; (2) to violate the king's companion, or his eldest daughter unmarried, or the wife of his eldest son and heir; (3) to levy war against the king in his realm, or be adherent to the king's enemies in his realm, giving them aid and comfort in the realm or elsewhere; (4) to counterfeit the king's great or privy seal or his money; (5) to bring false money into the realm, counterfeit to the money of England, as the money called Lushburgh,[2] knowing the money to be false; (6) to slay the chancellor, treasurer, or the king's justices of the one bench or the other, justices in eyre, or justices of assize, and all other justices assigned to hear and determine, being in their places doing their offices. The statute further defined petty treason to be the slaying of a master by his servant, a husband by his wife, or a prelate by a man secular or religious owing him allegiance. In all cases of treason not specified in the statute the justices before whom the case came were to tarry without going to judgment until the cause had been showed and declared before the king and his parliament whether it ought to be judged treason or felony. The statute, so far as it defines the offence, is still law, except the clauses as to counterfeiting the seal, coining and petit treason, repealed respectively, after a considerable amount of intermediate modification by statute, by 11 Geo. IV. and 1 Will. IV. c. 66, 2 and 3 Will. IV. c. 34, 30 Geo. III. c. 48, and 9 Geo. IV. c. 31. Petit treason is now treated as murder, 24 and 25 Vict. c. 100.[3] From the time of the passing of the Statute of Treasons the limits of treason were continually being extended for a time, and again reduced to the bounds fixed by the statute. It protected only the king's life, and its insufficiency was supplemented in periods of danger by legislation, often of a temporary nature. Under Richard II. and Henry VIII. many new offences were made treason,[4] but the Acts creating these new treasons were repealed at the earliest opportunity by the parliaments of their successors and the Statute of Treasons was made the final standard by 1 Mary, sess. 1, c. 1. The reign most prolific in statutory additions to the law of treason was undoubtedly that of Henry VIII. Legislation in this reign was little more than a register of the fluctuating opinions of the monarch. Thus, by 25 Hen. VIII. c. 22 it was treason not to believe Mary illegitimate and Elizabeth legitimate; by 28 Hen. VIII. c. 7 it was treason to believe either legitimate; by 35 Hen. VIII. c. 1 it was treason not to believe both legitimate. An interesting act of this reign, 37 Hen. VIII. c. 10, shows that a class of men like the Roman *delatores* must have been called into existence by all the new legislation. The Act constituted it felony to make anonymous charges of treason without daring to appear in support of them before the king or council. Out of the mass of Henry VIII.'s Acts, only two are still law,—28 Hen. VIII. c. 15 and 35 Hen. VIII. c. 2, giving power to try treasons committed within the jurisdiction of the admiralty and out of the realm. Many other instances of offences of a temporary kind made treason at different times occur among the statutes, especially in those levelled at the papal jurisdiction by the parliaments of Elizabeth. A few of the more interesting of other kinds may be briefly noticed. It was treason by 21 Ric. II. c. 4 to attempt to appeal or annul judgments made by parliament against certain traitors; by 2 Hen. V. st. 1. c. 6, and 29 Hen. VI. c. 2 to break a truce or safe-conduct; by 5 and 6 Edward VI. c. 11 to hold castles, fortresses, or munitions of war against the king; by 17 Car. II. c. 5 to adhere to the United Provinces; by 9 Will. III. c. 1. to return without license if an adherent of the Pretender; by 12 and 13 Will. III. c. 3 to correspond with the Pretender; and by 57 Geo. III. c. 6 to compass or imagine the death of the prince regent. In addition to these, many Acts of attainder were passed at different times. One of the most severe was that against Catherine Howard, 33 Hen. VIII. c. 21, which went as far as to make it treasonable for any queen to conceal her antenuptial incontinence. Other Acts were those against Archbishop Scrope, Owen Glendower, Jack Cade, Lord Seymour, Sir John Fenwick, James Stuart, and Bishop Atterbury. In one case, that of Cromwell, Ireton, and Bradshaw, an Act of attainder was passed after the death of those guilty of the treason, 12 Car. II. c. 30. At times Acts of indemnity were passed to relieve those who had taken part in the suppression of rebellion from any possible liability for illegal proceedings. Three such Acts were passed in the reign of William III.

[2] See Merivale, *Hist. of the Romans under the Empire*, vol. iii. p. 467, vol. v. p. 141.

[3] "Principes instar deorum esse" are the words of Tacitus.

[4] This crime was called *læsa majestas divina* in later law.

[5] xlviii. 4. [6] ix. 8.

[7] A similar provision was contained in the Golden Bull of Charles IV. c. 24. In English law, with the one exception of a statute of Richard II. (21 Ric. II. c. 3) repealed in the first year of Henry IV., an overt act has always been necessary. The difficulty of proving a mere intention is obvious. In French and German law the overt act (*attentat* or *Unternehmen*) is as indispensable as in English.

[8] To harbor a fugitive enemy was punishable only by deportation. *Dig.*, xlviii. 19, 40.

[9] The position of treason as a special crime prosecuted by special procedure is one common to most legal systems at some period of their existence. For instance, in Germany, by a constitution of Henry VII. the procedure was to be summary, *sine strepitu et figura judicii*.

[10] c. 4. [11] v. 30. [12] lxxix. 2. [13] xiv. 1. [14] 118*b*.

[15] These words, according to Luders (*Law Tracts*, note *ad fin.*), mean to attempt or contrive.

The Statute of Treasons, as interpreted by the judges, is still the standard by which an act is determined to be treason or not. The judicial interpretation has been sometimes strained to meet cases scarcely within the contemplation of the framers of the statute: *e.g.*, it became established doctrine that a conspiracy to levy war against the king's person or to imprison or depose him might be given in evidence as an overt act of compassing his death, and that spoken words, though they could not in themselves amount to treason, might constitute an overt act, and so be evidence. Besides decisions on particular cases, the judges at different times came to general resolutions which had an appreciable effect on the law. The principal resolutions were those of 1397 (confirmed by 21 Ric. II. c. 12), of 1557, and those agreed to in the case of the regicides at the Restoration and reported by Sir John Kelyng. A remarkable resolution *in favorem rei* among the latter was that a prisoner ought not to be ironed during trial. The result of judicial decisions on the Statute of Treasons was summed up in Acts passed in 1786, made permanent in 1817 and in 1848 (57 Geo. III. c. 6 and 11 Vict. c. 12, the latter often called the Treason Felony Act). The effect of this legislation, according to Mr. Justice Stephen, is that such of the judicial constructions as extend the imagining of the king's death to imagining his death, destruction, or any bodily harm tending to death or destruction, maim or wounding, imprisonment or restraint, have been adopted, while such of the constructions as make the imagining of his deposition conspiring to levy war against him, and instigating foreigners to invade the realm, have not been abolished, but are left to rest on the authority of decided cases. The present state of the law has been incorporated by skilled lawyers in the draft criminal code, which will no doubt become an Act when parliament has leisure to devote to matters of this kind. The code draws a distinction between treason and treasonable crimes, the former including such acts (omitting those that are obviously obsolete) as by the Statute of Treasons and subsequent legislation are regarded as treason proper, the latter including the crimes contained in the Act of 1848. In the words of the code (§ 76) "treason is (*a*) the act of killing Her Majesty, or doing her any bodily harm tending to death or destruction, maim or wounding, and the act of imprisoning or restraining her; or (*b*) the forming and manifesting by an overt act an intention to kill Her Majesty, or to do her any bodily harm tending to death or destruction, maim or wounding, or to imprison or to restrain her; or (*c*) the act of killing the eldest son and heir-apparent of Her Majesty, or the queen consort of any king of the United Kingdom of Great Britain and Ireland; or (*d*) the forming and manifesting by an overt act an intention to kill the eldest son and heir-apparent of Her Majesty, or the queen consort of any king of the United Kingdom of Great Britain and Ireland; or (*e*) conspiring with any person to kill Her Majesty, or to do her any bodily harm tending to death or destruction, maim or wounding, or conspiring with any person to imprison or restrain her; or (*f*) levying war against Her Majesty either with intent to depose Her Majesty from the style, honor, and royal name of the Imperial crown of the United Kingdom of Great Britain and Ireland or of any other of Her Majesty's dominions or countries; or in order by force or constraint to compel Her Majesty to change her measures or counsels, or in order to intimidate or overawe both Houses or either House of Parliament; or (*g*) conspiring to levy war against Her Majesty with any such intent or for any such purpose as aforesaid; or (*h*) instigating any foreigner with force to invade this realm or any other of the dominions of Her Majesty; or (*i*) assisting any public enemy at war with Her Majesty in such war by any means whatsoever; or (*j*) violating, whether with her consent or not, a queen consort, or the wife of the eldest son and heir-apparent for the time being of the king or queen regnant." There are a few other Acts still in force besides those of 1817 and 1848 which have dealt with substantive law. By 11 Henry VII. c. 1 obedience to the *de facto* sovereign for the time being is not treason. By 1 Anne st. 2, c. 21, it is treason to endeavor to hinder the next successor to the crown from succeeding, and by 6 Anne c. 41 it is treason to maliciously, advisedly, and directly by writing or printing maintain and affirm that any person has a right to the crown otherwise than according to the Acts of Settlement and Union, or that the crown and parliament cannot pass statutes for the limitation of the succession to the crown.

---

[1] This by Mary. sess. 3, c 1 includes a queen regnant.

[2] *i.e.*, Luxemburg.

[3] Since the disappearance of petit treason as a distinct crime, it seems useless to retain the old name of high treason by which what may be called treason proper was formerly known.

[4] One reason for making these offences treason rather than felony was no doubt to give the crown rather than the lord of the fee the right to the real estate of the criminal on forfeiture. Had the offences been felony the king would have had only his year, day, and waste on the estate escheating to the lord, as was the case in treason before the Statute of Treasons (see FELONY).

The Acts dealing with procedure and punishment are more numerous, and are characterized by a slowly increasing favor shown to the accused,—in fact, considerably greater than in felony, for counsel were not allowed to prisoners in charges of felony until 1836, and such prisoners are still not entitled to a copy of the indictment of the names of the witnesses or jury. With respect to the mode of trial, the effect of common law and legislation is that there are now four varieties,—Impeachment (*q.v.*), trial of a peer by the peers, court martial, and trial by a judge of the High Court of Justice and a jury. The offence cannot be tried at quarter sessions. Trial by battle in cases of treason ceased in the 14th century, as far as regards appeals in the common law courts or in parliament, by the effect of several statutes passed between 1332 and 1399. Appeals of treason were finally abolished in 1819 (see Appeal). In the court of the lord high constable an award of battle occurred as lately as 1631 in the case of Lord Rea.[1] Traitors in the reign of Edward IV., and perhaps later, were at times tried by martial law. The issue of commissions of martial law in time of peace was declared illegal by the Petition of Right in 1628. The prerogative of the crown to try traitors by martial law in time of open rebellion still exists, and is recognized by statute. In two Acts, for instance, dealing with Ireland, 43 Geo. III. c. 117 and 3 and 4 Will. IV. c. 4, it was provided that nothing in the Acts was to take away the undoubted prerogative of the crown for the public safety to resort to the exercise of martial law against open enemies and traitors. A peer is tried before the House of Lords, or the court of the lord high steward if the trial be during the recess of parliament. Procedure in such trials is regulated by 7 and 8 Will. III. c. 3, and other Acts. The last trial of a peer for treason was that of Lord Lovat in 1746–47. Persons subject to naval or military law are triable by court martial in certain cases under the powers given by the Naval Discipline Act, 1866, and the Army Act, 1881. The trial of treason committed out of the realm is regulated by 35 Hen. VIII. c. 2, 5 and 6 Edw. VI. c. 11, and 7 Anne c. 21. Lord Macguire was tried by jury in England under 35 Hen. VIII. c. 2 for treason committed in Ireland.[2] Procedure before and at the trial depends upon a large number of Acts, of which the most important is one passed in 1695 (7 and 8 Will. III. c. 3). It enacted that persons indicted for treason are to have a copy of the indictment delivered to them five days before trial. The court is empowered to assign counsel for the prisoner (a power extended to impeachments by 20 Geo. II. c. 30). The oath of two witnesses, or confession in open court, or refusal to plead, or peremptory challenge of more than thirty-five jurors is necessary for conviction. The witnesses must be both to the same overt act or one to one and the other to another overt act of the same treason. If two or more treasons of divers kinds are alleged in one indictment, one witness to prove one treason and another to prove another are not sufficient. No person is to be indicted unless within three years after the offence, except on a charge of attempted assassination of the king. The accused is to have copies of the panel of the jury[3] two days before trial. He is entitled to the same process to compel his witnesses to appear as is usually granted to compel the witnesses for the prosecution. No evidence is to be given of any overt act not expressly laid in the indictment. The Act expressly denied the prisoner the names of the witnesses against him. The law on this point was altered by 7 Anne c. 21, which enacted that a list of such witnesses was to be delivered to him ten days before trial. Such witnesses had previously been made examinable upon oath by 1 Anne st. 2, c. 9. By 5 and 6 Vict. c. 51 (extending the provisions of an Act of 1800) the advantages given by the Act of William III. are not to extend to a prisoner charged with treason in compassing or imagining any bodily harm tending to the death or destruction, maiming or wounding of the queen, where the overt act is an attempt to injure the person of the queen. In such a case the trial is to proceed in every respect and on the like evidence as if it were for murder. By 11 Vict. c. 12 no prosecution for a felony under the Act, in so far as it is expressed by open and advised speaking only, is to be instituted unless information be given to a justice or sheriff within six days and a warrant issued within ten days of the information, and no person is to be convicted of such an offence except on confession in open court or proof by two witnesses. The prisoner is not to be acquitted if the facts amount to treason. There may be accessories to felonies under this Act, which, as has been already stated, there cannot be to treason. The prosecutor and witnesses are not entitled to costs. By a later Act of the same year (11 and 12 Vict. c. 42, § 23) a person charged with treason is not to be admitted to bail except by order of a secretary of state or by the Queen's Bench Division or a judge thereof in vacation.

The punishment of treason at common law was barbarous in the extreme.[4] The sentence was that the offender, if a man, be drawn on a hurdle to the place of execution, that there he be hanged by the neck till he be dead, that his head be severed from his body, and that his body be divided into four quarters, the head and quarters to be at the disposal of the crown. A woman was drawn to the place of execution, and there burned alive. The Acts of 30 Geo. III. c. 48 and 54 Geo. III. c. 146 changed the sentence to hanging in the case of women, and in the case of men enabled the crown, by warrant under the sign manual countersigned by a secretary of state, to change the sentence to beheading or remit it altogether. By the Felony Act, 1870, the punishment is hanging only, but 54 Geo. III. c. 146 appears to be still so far in force that beheading may be substituted by warrant of the crown where the criminal is a man. Attainder and forfeiture are abolished by the Felony Act, 1870, except where the offender has been outlawed.[5] The maximum penalty for a felony under the Act of 1848 is penal servitude for life. In every pardon of treason the offence is to be particularly specified therein (see Pardon).

Trials for treason in Great Britain and Ireland have been very numerous, and occupy a large part of the numerous volumes of the *State Trials*. Some of the more interesting may be mentioned. Before the Statute of Treasons were those of Gaveston and the Despensers in the reign of Edward II. on charges of accroaching the royal power. After the Statute were those (some before the peers by trial or impeachment, most before the ordinary criminal courts) of Empson and Dudley, Fisher, More, the earl of Surrey, the duke of Somerset, Anne Boleyn, Lady Jane Grey, Sir Thomas Wyatt, Cranmer, the queen of Scots, Sir Walter Raleigh, Strafford, Laud, Sir Henry Vane and other regicides, William, Lord Russell, Algernon Sidney, the duke of Monmouth, and those implicated in the Pilgrimage of Grace, the Gunpowder, Popish, Rye House, and other plots. Cases where the proceeding was by bill of attainder have been already mentioned. Occasionally the result of a trial was confirmed by statute. In some of these trials, as is well known, the law was considerably strained in order to insure a conviction. Since the Revolution there have been the cases of those who took part in the risings of 1715 and 1745, Lord George Gordon in 1780, Hardy and Horne Tooke in 1794, the Cato Street conspirators in 1820, Frost in 1840, and the Fenians in 1867. It should be noticed that many cases of proceedings for treason against foreigners occur. Treason committed by them within the realm is a breach of what has been called local allegiance, due to the sovereign of the country in which they reside. Such are the cases of Leslie, bishop of Ross, ambassador to Elizabeth from the queen of Scots, the Marquis de Guiscard in Queen Anne's reign, and Gyllenborg, the ambassador from Sweden to George II. Proceedings against ambassadors for treason have never gone beyond imprisonment, more for safe custody than as a punishment. No amount of residence abroad will suffice to exempt a native-born subject from the penalty of treason if he bear arms against the country of his birth.[1]

---

[1] Shakespeare twice makes effective use of the trial by battle in treason, in *King Lear* and *Richard II*.

[2] 4 *State Trials*, 653.

[3] By the Bill of Rights the jurors in trials for treason must have been freeholders. This provision of the Act was repealed by 9 Geo. IV. c. 50.

[4] The exceptional character of the punishment, like that of the procedure, may be paralleled from Germany. The punishment of traitors by Frederick II. by wrapping them in lead and throwing them into a furnace is alluded to by Dante, *Inferno*, xxiii. 66.

[5] Proceedings after the death of an alleged traitor might at one time have been taken, but only to a very limited extent as compared with what was allowed in Roman and Scots law. Sir E. Coke (4 *Rep.*, 57) states that there might have been forfeiture of the land or goods of one slain in rebellion on view of the body by the lord chief justice of England as supreme coroner.

Misprision (from the old French *mespris*) of treason, in the words of Blackstone, "consists in the bare knowledge and concealment of treason, without any degree of assent thereto, for any assent makes the party a principal traitor." At common law even the concealment was treason, but 5 and 6 Edw. VI. c. 11 and 1 and 2 Ph. and M. c. 10 made concealment a misprision only. The offence was dealt with by many Acts, under some of which rather remarkable crimes were made misprision; *e.g.*, 14 Eliz. c. 3 constituted the counterfeiting of foreign coinage a misprision. The procedure in trials for misprision is in general the same as that followed in trials for treason, most of the Acts regulating procedure including both crimes. The punishment is loss of the profit of the lands of the offender during life, and imprisonment for life.

Cognate Offences.—Under this head may be conveniently grouped certain offences against public order which, though not technically treason or treasonable offences (to use the language of the draft criminal code), are so nearly allied to them as to make it convenient to treat them under the head of treason. The most interesting of these for historical reasons is *præmunire*. The word is derived from *præmunire* or *præmoneri facias*, the introductory words of the writ of summons to the defendant to answer the charge. From this the word came to be used to denote the offences prosecuted by means of such a writ, usually of an ecclesiastical kind. The Statute of Præmunire, specially so called, is 16 Ric. II. c. 5, enacting that the procuring at Rome or elsewhere of any translations, bulls, etc., against the king puts the persons offending out of the king's protection, subjects their goods to forfeiture and themselves to attachment or process of *præmunire facias*. The Act introduced no new principle, but simply continued the antipapal policy visible in the Statutes of Provisors, the earliest of which dated from 1307. At different times many other Acts were passed, extending the penalties of præmunire to other crimes, usually those connected with the supremacy of the pope (2 Hen. IV. c. 4, mentioned under TITHES, is an example), but sometimes of a more distinctly political as distinguished from religious nature. Thus it is præmunire by 13 Car. I. c. 1 to affirm the power of parliament to legislate without the crown, by the Habeas Corpus Act to send a prisoner beyond seas, and to verbally assert the right of a person to the crown contrary to the Acts of Settlement and Union is præmunire by 6 Anne c. 41. To do so by writing or printing is, as has been said, treason. The latest Act constituting a præmunire is the Royal Marriage Act, 12 Geo. III. c. 11, which subjects to the penalties of premunire any one guilty of a breach of the provisions of the Act. A peer charged with præmunire is not entitled to trial by his peers, but is to be tried by a jury. The most famous historical instance of a prosecution on the Statute of Præmunire was that of Wolsey in 1529. Other offences cognate to treason are publishing scandalous stories about the king (the leasing-making of Scotch law), maladministration and sale of public offices, coining, offences against the Foreign Enlistment Act, and the crimes specially provided against by 33 Hen. VIII. c. 12 and 5 and 6 Vict. c. 51. The former Act punished malicious striking in the king's palace by perpetual imprisonment, fine, and loss of the right hand. The minute provisions for the mutilation of the offender are very curious, but not of immediate interest, as that part of the Act which inflicted mutilation was repealed by 9 Geo. IV. c. 31. By 5 and 6 Vict. c. 51 it is a high misdemeanor, punishable by penal servitude for seven years, to wilfully discharge, point, aim, or present at the person of the queen any gun or other arms, loaded or not, or to strike at or attempt to throw anything upon the queen's person, or to produce any firearms or other arms, or any explosive or dangerous matter, near her person, with intent to injure or alarm her, or to commit a breach of the peace. For other offences which are more or less nearly connected with treason reference may be made to the articles LIBEL, OATHS, PETITION, RIOT, and SEDITION.[2]

Scotland.—Treason included treason proper or crimes against the crown or the state, such as rebellion and crimes which, though not technically treasonable, were by legislation punished as treason. Examples of the latter were the remaining in England against the king's will, 1430, c. 19; wilful fire-raising, 1526, c. 10; kidnapping, 1567, c. 27; theft, reset, and stouthrief by banded men, 1587, c. 34. There were also many acts dealing with offences in the nature of resistance to authority, such as unlawful convocations, and with treasons of a merely transitory nature, such as attempting to restore the Ruthvens (1600), taking or owning the Covenants (1685), or corresponding with James, VII. (1698). Acts of forfeiture were sometimes directed against individuals, as 1645, c. 23, against the marquis of Huntly. Scottish procedure was as a rule less favorable to the accused than English. In one matter, however, the opposite was the case. Advocates compellable to act on behalf of the accused were allowed him by 1587, c. 57, more than a century before the concession of a similar indulgence in England. At one time trial in absence and even after death was allowed, as in Roman law. In the case of Robert Leslie, in 1540, a summons after death was held by the estates to be competent, and the bones of the deceased were exhumed and presented at the bar of the court.[3] The Act 1542, c. 13, confined this revolting procedure to certain treasons of the more heinous kind. By 7 Anne c. 21 trial in absence—the last instance of which had occurred in 1698—was abolished. The same Act assimilated the law and practice of treason to that of England in other respects by enacting that no crime should be treason or misprision in Scotland but such as was treason or misprision in England. The Act further provided that the trial was to be by a jury of twelve, not fifteen as in other crimes, before the court of justiciary, or a commission of oyer and terminer containing at least three lords of justiciary. To slay a lord of justiciary or lord of session, or to counterfeit the great seal, was made treason. The Act also contained provisions as to forfeiture,[4] qualification of jurors, and procedure. Outlawry for treason was regulated by 22 Geo. II. c. 48. The punishment still remains the same as it was in England before the Felony Act, 1870, and attainder and forfeiture are still the effects of condemnation for treason, the Act of 1870 not extending to Scotland. One or two other statutory provisions may be briefly noticed. The trial of a peer of Great Britain for treason committed in Scotland is to be by a commission from the crown, on indictment found by a jury of twelve (6 Anne c. 23, 6 Geo. IV. c. 66). Bail in treason-felony is only to be allowed by consent of the public prosecutor or warrant of the high or circuit court (11 Vict. c. 12). The term *lese-majesty* was sometimes used for what was treason proper, *e.g.*, in 1524, c. 4, making it lese-majesty to transport the king out of the realm, sometimes as a synonym of *leasing-making*. This crime (also called verbal sedition) consisted in the engendering discord between king and people by slander of the king.[5] The earliest Act against leasing-making *eo nomine* was in 1524. The reign of James VI. was pre-eminently prolific in legislation against this crime. It is now of no practical interest, as prosecutions for leasing-making have long fallen into desuetude. At one time, however, the powers of the various Acts were put into force with great severity, especially in the trial of the earl of Argyll in 1681. The punishment for leasing-making, once capital, is now, by 6 Geo. IV. c. 47, fine or imprisonment, or both. The offence of præmunire was introduced into Scotland at a comparatively late period. By 6 Anne c. 23 it is præmunire for the peers of Scotland assembled to elect representatives to treat of any other matter.[6]

Ireland.—Numerous Acts, beginning with 18 Hen. VI. c. 2, were passed by the Irish parliament—in many cases mere echoes of previous English legislation. As in England and Scotland, there was a tendency to include under treason crimes of quite another character. Murder was made treason by 10 Hen. VII. c. 21, and arson by 13 Hen. VIII. c. 1. Apparently the law must sometimes have been strained against accused persons, for 3 and 4 Ph. and M. c. 11 enacted that trials for treason were to be according to the common law. Treasons of a temporary nature were often the subject of legislation. An example is 11 Eliz. c. 6, making it treason to assume the name and authority of O'Neill. The provisions of the English Act of William III. as to witnesses, etc., were not extended to Ireland until 1821 by 1 and 2 Geo. IV. c. 24. Many Acts of indemnity were passed both by the parliaments of Ireland and of the United Kingdom. Among the more important were an Irish Act of 1799 (39 Geo. III. c. 3), indemnifying those who had been active in suppressing the treasonable rising of the previous year, and one of the parliament of the United Kingdom (41 Geo. III. c. 104), indemnifying those who had taken part in the suppression of rebellion subsequent to 1799. The law is now practically the same as that of England, unless where exceptional political circumstances have led to exceptional legislation. Thus a series of enactments called the "Whiteboy Acts" (passed by the Irish and the United Kingdom parliaments between 1775 and 1830) was intended to give additional facilities to the executive for the suppression of tumultuous risings. Many Irish Acts dealt with unlicensed possession and manufacture of arms. A similar policy was continued after the Union, and appears in the Peace Preservation Act, 1881, continued in 1887 for five years. Some Acts, such as 3 and 4 Will. IV. c. 4, went as far as to make offenders in a proclaimed district triable by court-martial. By the Prevention of Crime Act, 1882, now expired, the lord-lieutenant was empowered to issue special commissions for the trial without jury of treason and treason-felony. The power was never exercised. The Criminal Law and Procedure (Ireland) Act, 1887, deals with resistance to authority and offences of a treasonable nature, especially "dangerous associations," though treason is not mentioned by name.

---

[1] See Æneas Macdonald's case, 18 *State Trials*, 857.

[2] *Authorities.*—The text-writers on criminal law, such as Hale and Hawkins; Bacon, *Law Tracts*, Cases of Treason; Coke, 3 *Inst.*, 1-39; Sir R. Holbourne, *Reading on the Statute of Treasons*; Luders, *Law Tracts*; Foster, *Discourse of Treason*; Stephen, *Comm.*, vol. iv. bk. vi. ch. vi. The Statute of Treasons is noticed by Hallam, *Const. Hist.*, vol. iii. p. 203; Stubbs, *Const. Hist.*, vol. iii. p. 513. The most valuable modern authorities are Stephen, *Hist. of the Criminal Law*, vol. ii. ch. xxiii., and Willis Bund, *Selection of Cases from the State Trials.*

[3] In the one instance in England—that of Cromwell, Ireton, and Bradshaw—where the bodies of alleged traitors were exhumed after death they were not brought to the bar of a court as in Scotland.

[4] The provisions in the Act as to forfeiture (now repealed) were, according to Blackstone, *Comm.*, vol. iv. p. 384 the result of a compromise between the House of Lords, in favor of its continuance, and the House of Commons, supported by the Scottish nation, struggling to secure a total immunity from this disability.

[5] It is called by Hallam "the old mystery of iniquity in Scots law."

[6] For the existing Scots law of treason see Macdonald, *Criminal Law*, p. 220. For leasing-making see Hume, *Comm.*, vol. i. p. 345.

British Colonies and Dependencies.—The law in the main agrees with that of the mother country, but it is quite competent for a colony to deal with treason by its own legislation which need not necessarily be in accordance with English law, and is sometimes expressed in more definite terms. Thus the Indian penal code makes it punishable with transportation for life to wage war against the Government of any Asiatic power in alliance or at peace with the queen, or to attempt to excite feelings of disaffection to the Government. Numerous temporary Acts were passed about the time of the mutiny, one of the most characteristic being an Act of 1858 making rebellious villages liable to confiscation. By the Cape of Good Hope statutes it is treason to deliver arms or gunpowder to the queen's enemies. Many colonies adopt the English legislation as to procedure, and some, as New South Wales, etc., enact the Treason Felony Act. A striking feature of colonial legislation on this subject is the great number of Acts of indemnity passed after different rebellions. Instances of such Acts occur in the legislation of Canada, Ceylon, the Cape of Good Hope, New Zealand, St. Vincent, and Jamaica. The most important in the history of law is the Jamaica Act of 1866, indemnifying Mr. Eyre for any acts committed during the suppression of the rising in the previous year. It was finally held by the Exchequer Chamber in 1870 that this Act protected Mr. Eyre from being sued successfully in England on a cause of action arising out of his acts during the outbreak ("Phillips *v.* Eyre," *Law Reports*, 6 *Queen's Bench*, 1).

United States.—The law is based upon that of England. By Art. 3 s. 3 of the constitution "treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court. The Congress shall have power to declare the punishment of treason; but no attainder of treason shall work corruption of blood or forfeiture, except during the life of the person attainted." By Art. 2 s. 4 impeachment for and conviction of treason is a ground for removing the president, vice-president, and other civil officers. The punishment by an Act of 1790 was declared to be death by hanging. But during the Civil War a new Act (17 July, 1862) was passed, providing that the punishment should be death, or, at the discretion of the court, imprisonment at hard labor for not less than five years, and a fine of not less than 10,000 dollars to be levied on the real and personal property of the offender, in addition to disability to hold any office under the United States. The Act of 1862 and other Acts also deal with the crimes of inciting or engaging in rebellion or insurrection, criminal correspondence with foreign Governments in relation to any disputes or controversies with the United States or to defeat the measures of the Government of the United States, seditions, conspiracy, recruiting soldiers or sailors and enlistment to serve against the United States. The Act of 1790 further provides for the delivery to the prisoner of a copy of the indictment and a list of the jurors, for defence by counsel, and for the finding of the indictment within three years after the commission of the treason. Misprision of treason is defined to be the crime committed by a person owing allegiance to the United States, and having knowledge of the commission of any crime against them, who conceals and does not as soon as may be disclose and make known the same to the president or to some judge of the United States, or to the governor or to some judge or justice of a particular State. The punishment is imprisonment for not more than seven years and a fine of not more than 1000 dollars (see *Revised Statutes*, §§ 1033, 1034, 1043, 5331–5338; Story, *Constitution of the United States*, §§ 1296–1301, 1796–1802). Treason against the United States cannot be inquired into by any State court, but the States may, and some of them have, their own constitutions and legislation as to treasons committed against themselves, generally following the lines of the constitution and legislation of the United States. In some cases there are differences which are worth notice. Thus the constitution of Massachusetts, § 25, declares that no subject ought in any case or in any time to be declared guilty of treason by the legislature. The same provision is contained in the constitutions of Vermont, Connecticut, Pennsylvania, Alabama, and others. In some States the crime of treason cannot be pardoned; in others, as in New York, it may be pardoned by the legislature, and the governor may suspend the sentence until the end of the session of the legislature next following conviction. In some States a person convicted of treason is disqualified from exercising the franchise. In New York conviction carries with it forfeiture of real estate for the life of the convict and of his goods and chattels. (J. W†.)

TREASURE-TROVE is defined by Blackstone to be money or coin, gold, silver, plate, or bullion found hidden in the earth or other private place, the owner thereof being unknown. This definition is simply an extension of the Roman law definition of *thesaurus inventus* as an ancient deposit of money (*vetus depositio pecuniæ*) found by accident and without actual search. The right to treasure-trove was not, however, the same in Roman and English law. The former at its latest stage divided it between the finder and the owner of the land on which it was found, except where it was found on public or imperial property, when one-half went to the fisc. If a man found treasure on his own land, he had a right to the whole. The rights of the crown, modified by those of the feudal lord, gradually became more extensive in the feudal law of Europe, so much so as to become, in the words of Grotius, "jus commune et quasi gentium." In more recent times there has been a return, at any rate in the case of France, to the division made by the Roman law. In England the common law, which at one time apparently conferred treasure-trove, wherever found, upon the finder, now gives it all to the king, in accordance with the maxim "quod nullius est fit domini regis." This is always provided that the owner cannot be known or discovered. If he can be, he and not the king is entitled to it.

A right to treasure-trove may be granted by the British crown as a FRANCHISE (*q.v.*). It is the duty of one finding treasure to make it known to the coroner. By the statute *De Officio Coronatoris* (4 Edw. I. st. 2), the coroner is to inquire of treasure that is found, who were the finders and likewise who is suspected thereof, and that may be well perceived where one liveth riotously, haunting taverns, and hath done so of long time. Concealment of treasure-trove is a misdemeanor at common law. There can be no larceny of it until it has been found by the coroner to be the property of the crown. The Home Office has recently issued a notification modifying the existing regulations so far as to permit the finders of coins and antiquities coming under the description of treasure-trove to retain articles not actually required for national institutions, and the sum received from such institutions as the antiquarian value of any articles retained, subject to a deduction of 20 per cent. from the antiquarian value of the objects retained and 10 per cent. from the value of other objects. In the United States treasure-trove is usually vested in the State as *bona vacantia*. Louisiana follows the French *Code Civil*, and gives half to the finder and half to the landowner. The importance of treasure-trove in India led to the passing of the Indian Treasure-Trove Act (Act vi. of 1878). It provides that treasure is to be delivered to the finder if no owner appears. If the owner can be found, three-fourths go to the finder and one-fourth to the owner, power being reserved to the Government to acquire it by payment of a sum equal to one-fifth more than the value of the material.

TREATIES. Terminology. 1. A treaty is a contract between two or more states. The term "tractatus," and its derivatives, though of occasional occurrence in this sense from the 13th century onwards, only began to be commonly so employed, in lieu of the older technical terms "conventio publica," or "fœdus," from the end of the 17th century. In the language of modern diplomacy the term "treaty" is restricted to the more important international agreements, especially to those which are the work of a congress, while agreements dealing with subordinate questions are described by the more general term "convention." The present article will disregard this distinction.

Antiquity. 2. The making and the observance of treaties is necessarily a very early phenomenon in the history of civilization, and the theory of treaties was one of the first departments of international law to attract attention. Treaties are recorded on the monuments of Egypt and Assyria; they occur in the Old Testament Scriptures; and questions arising under συνθῆκαι and "fœdera" occupy much space in the Greek and Roman historians.[1]

Classification. 3. Treaties have been classified on many principles, of which it will suffice to mention the more important. A "personal treaty," having reference to dynastic interests, is contrasted with a "real treaty," which binds the nation irrespectively of constitutional changes; treaties creating outstanding obligations are opposed to "transitory conventions," *e.g.*, for cession of territory, recognition of independence, and the like, which operate irrevocably once for all, leaving nothing more to be done by the contracting parties; and treaties in the nature of a definite transaction (*Rechtsgeschäft*) are opposed to those which aim at establishing a general rule of conduct (*Rechtssatz*). With reference to their objects, treaties may perhaps be conveniently classified as (1) political, including treaties of peace, of alliance, of cession, of boundary, for creation of international servitudes, of neutralization, of guarantee, of submission to arbitration; (2) commercial, including consular and fishery conventions, and slave trade and navigation treaties; (3) confederations for special social objects, such as the Zollverein, the Latin monetary union, and the still wider unions with reference to posts, telegraphs, submarine cables, and weights and measures; (4) relating to criminal justice, *e.g.*, to extradition and arrest of fugitive seamen; (5) relating to civil justice, *e.g.*, to the protection of trade-mark and copyright, to the execution of foreign judgments, to the reception of evidence, and to actions by and against foreigners; (6) providing general rules for the conduct of warfare, *e.g.*, the declaration of Paris and the convention of Geneva. It must be remarked that it is not always possible to assign a treaty wholly to one or other of the above classes, since many treaties contain in combination clauses referable to several of them.

Analogies. 4. The analogy between treaty-making and legislation is striking when a congress agrees upon general principles which are afterwards accepted by a large number of states, as, for instance, in the case of the Geneva convention for improving the treatment of the wounded. Many political treaties containing "transitory" conventions, with reference to recognition, boundary, or cession, become, as it were, the title-deeds of the nations to which they relate.[2] But the closest analogy of a treaty is to a contract in private law, as will appear from the immediately following paragraphs.

Requisites. 5. The making of a valid treaty implies several requisites. (1) It must be made between competent parties, *i.e.*, sovereign states. A "concordat," to which the pope, as a spiritual authority, is one of the parties, is therefore not a treaty, nor is a convention between a state and an individual, nor a convention between the rulers of two states with reference to their private affairs. Semi-sovereign states, such as San Marino or Egypt, may make conventions upon topics within their limited competence. It was formerly alleged that an infidel state could not be a party to a treaty. The question where the treaty-making power resides in a given state is answered by the municipal law of that state. It usually resides in the executive, though sometimes, as in the United States, it is shared by the legislature, or by a branch of it.[3] (2) There must be an expression of agreement. This is not (as in private law) rendered voidable by duress; *e.g.*, the cession of a province, though extorted by overwhelming force, is nevertheless unimpeachable. Duress to the individual negotiator would, however, vitiate the effect of his signature. (3) From the nature of the case, the agreement of states, other than those the government of which is autocratic, must be signified by means of agents, whose authority is either express, as in the case of plenipotentiaries, or implied, as in the case of, *e.g.*, military and naval commanders for matters, such as truces, capitulations, and cartels, which are necessarily confided to their discretion. When an agent acts in excess of his implied authority he is said to make no treaty, but a mere "sponsion," which, unless adopted by his Government, does not bind it, *e.g.*, the affair of the Caudine Forks (Livy, ix. 5) and the convention of Closter Seven in 1757. (4) Unlike a contract in private law, a treaty, even though made in pursuance of a full power, is, according to modern views, of no effect till it is ratified. (5) No special form is necessary for a treaty, which in theory may be made without writing. It need not even appear on the face of it to be a contract between the parties, but may take the form of a joint declaration, or of an exchange of notes. Latin was at one time the language usually employed in treaties, and continued to be so employed to a late date by the emperor and the pope. Treaties to which several European powers of different nationalities are parties are now usually drawn up in French (the use of which became general in the time of Louis XIV.), but the final act of the congress of Vienna contains a protest against the use of this language being considered obligatory. A great European treaty usually commences "In the name of the Most Holy and Indivisible Trinity," or, if the Porte is a party, "In the name of Almighty God." (6) It is sometimes said that a treaty must have a lawful object, but the danger of accepting such a statement is apparent from the use which has been made of it by writers who deny the validity of any cession of national territory, or even go so far as to lay down, with Fiore, that "all should be regarded as void which are in any way opposed to the development of the free activity of a nation, or which hinder the exercise of its natural rights." (7) The making of a treaty is sometimes accompanied by acts intended to secure its better performance. The taking of oaths, the assigning of "conservatores pacis," and the giving of hostages are now obsolete, but revenue is mortgaged, territory is pledged, and treaties of guarantee are entered into for this purpose.

---

[1] For the celebrated treaty of 509 B.C. between Rome and Carthage, see Polybius iii. 22; and, on the subject generally, Barbeyrac's full but very uncritical *Histoire des Anciens Traitéz*, 1739; Müller-Jochmus, *Geschichte des Völkerrechts im Alterthum*, 1848; E. Egger, *Études Historiques sur les Traités Publics chez les Grecs et chez les Romains*, new ed., 1866.

[2] *Cf.* Sir Edward Hertslet's very useful collection entitled *The Map of Europe by Treaty*, 1875.

[3] [On the part of the United States, the president and senate constitute the treaty-making power. Treaties drawn up by the executive and submitted to the senate must have the approval of two-thirds of the senators present when they are acted on. No State can form any treaty, compact, confederation, or alliance with another State without the consent of Congress.—AM. ED.]

Duration.

6. A "transitory convention" operates at once, leaving no duties to be subsequently performed, but with reference to conventions of other kinds questions arise as to the duration of the obligation created by them, in other words, as to the moment at which those obligations come to an end. This may occur by the dissolution of one of the contracting states, by the object-matter of the agreement ceasing to exist, by full performance, by performance becoming impossible, by lapse of the time for which the agreement was made, by *contrarius consensus* or mutual release, by "denunciation" by one party under a power reserved in the treaty. By a breach on either side the treaty usually becomes, not void, but voidable. A further cause of the termination of treaty obligations is a total change of circumstances, since a clause "rebus sic stantibus" is said to be a tacit condition in every treaty.[1] Such a contention can only be very cautiously admitted. It has been put forward by Russia in justification of her repudiation of the clauses of the treaty of Paris neutralizing the Black Sea, and of her engagements as to Batoum contained in the treaty of Berlin. The London protocol of 1871, with a view to prevent such abuses, lays down, perhaps a little too broadly, "that it is an essential principle of the law of nations that no power can liberate itself from the engagements of a treaty, nor modify the stipulations thereof, unless with the consent of the contracting powers, by means of an amicable arrangement." Treaties are in most cases suspended, if not terminated, by the outbreak of a war between the contracting parties, and are therefore usually revived in express terms in the treaty of peace.

Interpretation.

7. The rules for the interpretation of treaties are not so different from those appplicable to contracts in private law as to need here a separate discussion.

Collections:

8. Collections of treaties are either (i.) general or (ii.) national.

general;

(i.) The first to publish a general collection of treaties was Leibnitz, whose *Codex Juris Gentium*, containing documents from 1097 to 1497, "ea quæ sola inter liberos populos legum sunt loco," appeared in 1693, and was followed in 1700 by the *Mantissa*. The *Corps Universel Diplomatique du Droit des Gens* of Dumont, continued by Barbeyrac and Rousset in thirteen folio volumes, containing treaties from 315 A. D. to 1730, was published in 1726–39. Wenck's *Corpus Juris Gentium Recentissimi*, 3 vols. 8vo, 1781–95, contains treaties from 1735 to 1772. The 8vo *Recueil* of G. F. de Martens, continued by C. de Martens, Saalfeld, Murhard, Samwer, Hopf, and Stoerk, commenced in 1791 with treaties of 1761, and is still in progress. The series in 1887 extended to sixty-four volumes. See also the following periodical publications: *Das Staatsarchiv, Sammlung der officiellen Actenstücke zur Geschichte der Gegenwart*, Leipsic, commencing in 1861; *Archives Diplomatiques*, Stuttgart, since 1821; *Archives Diplomatiques, Recueil Mensuel de Diplomatie et d'Histoire*, Paris, since 1861; and Hertslet's *British and Foreign State Papers, from the termination of the War of* 1814 *to the latest period, compiled at the Foreign Office by the Librarian and Keeper of the Papers*, London, since 1819, and still in progress.

national.

(ii.) The more important collections of national treaties are those of M. Neumann and M. de Plassan for Austria, 1855–84; Beutner for the German empire, 1883; Calvo for "l'Amérique Latine," 1862–69; De Clercq for France, 1864-86; De Garcia de la Vega for Belgium, 1850–83; Lagemans for the Netherlands, 1858–82; Soutzo for Greece, 1858; Count Solar de la Marguerite for Sardinia, 1836–61; De Castro for Portugal, 1856-79; Rydberg for Sweden, 1877; Kaiser (1861) and Eichmann (1885) for Switzerland; Baron de Testa (1864–82) and Aristarchi Bey (1873–74) for Turkey; F. de Martens for Russia, 1874–85; Mayers for China, 1877. The official publication for Italy begins in 1864, for Spain in 1843, for Denmark in 1871. The treaties of Japan were published by authority in 1884. Those of the United States are contained in the *Statutes at Large* of the United States, and in the collections of J. Elliott (1834) and H. Minot (1844–50); see also Mr. Bancroft Davis's *Notes upon the Treaties of the United States with other Powers, preceded by a List of the Treaties and Conventions with Foreign Powers, chronologically arranged, and followed by an Analytical Index and a Synoptical Index of the Treaties*, 1873. In England no treaties were published before the 17th century, such matters being thought "not fit to be made vulgar." The treaty of 1604 with Spain was, however, published by authority, as were many of the treaties of the Stuart kings. Rymer's *Fœdera* was published, under the orders of the Government, in twenty volumes, from 1704 to 1732. Treaties are officially published at the present day in the *London Gazette*, and are also presented to parliament, but for methodical collections of treaties made by Great Britain we are indebted to private enterprise, which produced three volumes in 1710–13, republished with a fourth volume in 1732. Other three volumes appeared in 1772–81, the collection commonly known as that of C. Jenkinson (3 vols.) in 1785, and that of Chalmers (2 vols.) in 1795. J. Macgregor published (1841–44) eight volumes of commercial treaties but the great collection of the commercial treaties of Great Britain is that of L. Hertslet, librarian of the Foreign Office, continued by his son and successor in office, Sir Edward Hertslet, entitled *A Complete Collection of the Treaties and Conventions and Reciprocal Regulations at present subsisting between Great Britain and Foreign Powers, and of the Laws and Orders in Council concerning the same so far as they relate to Commerce and Navigation, the Slave Trade, Post Office, etc., and to the Privileges and Interests of the Subjects of the Contracting Parties*, 1820–86, 16 vols. Sir Edward Hertslet also commenced in 1875 a series of volumes containing *Treaties and Tariffs regulating the Trade between Britain and Foreign Nations, and Extracts of Treaties between Foreign Powers, containing the Most Favored Nation Clauses applicable to Great Britain*. The treaties affecting British India are officially set out, with historical notes, in *A Collection of Treaties, Engagements, and Sannuds relating to India and Neighboring Countries*, by C. W. Aicheson. This work, with the index, extends to eight volumes, which appeared at Calcutta in 1862–66.

List of important treaties:

9. It may be worth while to add a list of some of the more important treaties, now wholly or partially in force, especially those to which Great Britain is a party, classified according to their objects, in the order suggested in paragraph 3.

political;

(i.) The principal treaties affecting the distribution of territory between the various states of Central Europe are those of Westphalia (Osnabrück and Münster), 1648; Utrecht, 1713; Paris and Hubertsburg, 1763; for the partition of Poland, 1772, 1793; Vienna, 1815; London, for the separation of Belgium from the Netherlands, 1831, 1839; Zurich, for the cession of a portion of Lombardy to Sardinia, 1859; Vienna, as to Schleswig-Holstein, 1864; Prague, whereby the German Confederation was dissolved, Austria recognizing the new North German Confederation, transferring to Prussia her rights over Schleswig-Holstein, and ceding the remainder of Lombardy to Italy, 1866; Frankfort, between France and the new German empire, 1871. The disintegration of the Ottoman empire has been regulated by the great powers, or some of them, in the treaties of London, 1832, 1863, 1864, and of Constantinople, 1881, with reference to Greece; and by the treaties of Paris, 1856; London, 1871; Berlin, 1878; London, 1883, with reference to Montenegro, Roumania, Servia, Bulgaria, and the navigation of the Danube. The encroachments of Russia upon Turkey, previous to the Crimean War, are registered in a series of treaties beginning with that of Kutchuk-Kainardji, 1774, and ending with that of Adrianople in 1829. The independence of the United States of America was acknowledged by Great Britain in the treaty of peace signed at Paris in 1783. The boundary between the United States and the British possessions is regulated in details by the treaties of Washington of 1842, 1846, 1871. Switzerland, Belgium, Corfu and Paxo, and Luxemburg are respectively neutralized by the treaties of Vienna, 1815, and of London, 1839, 1864, 1867. A list of treaties of guarantee to which Great Britain is a party, and which are supposed to be still in force, beginning with a treaty made with Portugal in 1373, was presented to parliament in 1859.

---

[1] *Cf.* Bynkershoek, *Quæst. Jur. Pub.*, ii. c. 10.

commercial; (ii.) For the innumerable conventions to which Great Britain is a party as to commerce, consular jurisdiction, fisheries, and the slave trade, it must suffice to refer to the exhaustive and skilfully devised index to Hertslet's *Commercial Treaties*, forming volume xvi., 1885.

social; (iii.) The social intercourse of the world is facilitated by conventions, such as those establishing the Latin monetary union, 1865; the international telegraphic union, 1865; the universal postal union, 1874; the international bureau of weights and measures, 1875; and providing for the protection of submarine cables in time of peace, 1884. Such treaties are somewhat misleadingly spoken of by recent writers (L. von Stein and F. de Martens) as constituting a "droit administratif international."

as to extradition; (iv.) The following are the now operative treaties of extradition to which Great Britain is a party: with the United States, 1842; Brazil and Germany, 1872; Austria, Denmark, Italy, Norway and Sweden, 1873; Hayti and Netherlands, 1874; Belgium and France, 1876; Spain, Portugal (as to India only), 1878; Tonga, 1879; Luxemburg, Equador, and Switzerland, 1880; Salvador, 1881; Uruguay, 1884; Guatemala, 1885; Russia, 1886. It will be observed that all these, except the treaty with the United States, are subsequent to and governed by the provisions of 33 and 34 Vict. c. 52, "The Extradition Act, 1870." Before the passing of this general Act, it had been necessary to pass a special Act for giving effect to each treaty of extradition. The most complete collection of treaties of extradition is that of F. J. Kirchner, *L'Extradition, Recueil, etc.*, London, 1883.

as to copyright, etc.; (v.) General conventions, to which most of the European states are parties, were signed in 1883 at Paris for the protection of industrial, and in 1886 at Bern for the protection of literary and artistic, property.

as to the conduct of warfare. (vi.) Certain bodies of rules intended to mitigate the horrors of war have received the adhesion of most civilized states. Thus the declaration of Paris, 1856 (to which, however, the United States, Spain, Mexico, Venezuela, Columbia, Bolivia, and Uruguay have declined to accede), prohibits the use of privateers and protects the commerce of neutrals; the Geneva convention, 1864, gives a neutral character to surgeons and hospitals; and the St. Petersburg declaration, 1868, prohibits the employment of explosive bullets weighing less than 400 grammes.

It was greatly to be wished that the official publication of treaties could be rendered more speedy and more methodical than it now is. The labors of the publicist would also be much lightened were it possible to consolidate the various general collections of diplomatic acts into a new *Corps Diplomatique Universel*, well furnished with cross references, and with brief annotations showing how far each treaty is supposed to be still in force.

Literature. 10. In addition to the works already cited in the course of this article the following are for various reasons important: Joh. Lupus, *De Confederatione Principum*, Strasburg, 1511 (the first published monograph upon the subject); Bodinus, *Dissertatio de Contractibus Summarum Potestatum*, Halle, 1696; Neyron, *De Vi Fœderum inter Gentes*, Gött., 1778; Neyron, *Essai Historique et Politique sur les Garanties*, etc , Gött., 1797; Wächter, *De Modis Tollendi Pacta inter Gentes*, Stuttg., 1780; Dresch, *Ueber die Dauer der Völkerverträge*, Landshut, 1808; C. Bergbohm, *Staatsverträge und Gesetze als Quellen des Völkerrechts*, Dorpat, 1877; Jellinek, *Die rechtliche Natur der Statenverlträgen*, Vienna, 1880; Holzendorff, *Handbuch des Völkerrechts*, vol. iii., 1887. On the history of the great European treaties generally, See the *Historie Abrégée des Traités de Paix entre les Puissances de l'Europe*, by Koch, as recast and continued by Schöll, in 1817 and 1818, and again by Count de Garden in 1848–59; as also the *Recueil Manuel* of De Martens and Cussy, now continued by Geffcken. For the peace of Westphalia Pötter's *Geist des westphälischen Friedens*, 1795, is useful; for the congress of Vienna, Klüber's *Acten des Wiener Congresses*, 1815-19, and *Le Congrès de Vienne et les Traités de* 1815, *précédé des Conférences de Dresde, de Prague, et de Chatillon, suivi des Congrés d' Aix-la-Chapelle, Troppau, Laybach, et Vérone*, by Count Angeberg. The last-mentioned writer has also published collections of treaties relating to Poland, 1762–1862; to the Italian question, 1859; to the congress of Paris, 1856, and the revision of its work by the conference of London, 1871; and to the Franco-German War of 1870–71. For the treaties regulating the Eastern question, see *The European Concert in the Eastern Question*, by T. E. Holland, 1885, and *La Turquie et le Tanzimat*, by E. Engelhardt, 1882–84.

(T. E. H.)

TREBIZOND, in Greek **Trapezus**, a city of Asia Minor, situated on the Black Sea, near its southeastern angle, from the time of its foundation as a Greek colony to the present day has always been a considerable emporium of commerce, and at one time was for two centuries and a half the capital of an empire. Its importance is due to its geographical position, because it commands the point where the chief and most direct trade route from Persia and Central Asia to Europe, over the tableland of Armenia by Bayazid and Erzeroum, descends to the sea. Its safety also was secured by the barrier of rugged mountains which separates its district from the rest of Asia Minor, rising to the height of 7000 or 8000 feet above the sea-level. So complete is the watershed that no streams pass through these ranges, and there is hardly any communication in this direction between the interior of Asia Minor and the coast. For the same reason, together with its northern aspect, the climate is humid and temperate, and favorable to the growth of vegetation, unlike that of the inland regions, which are exposed to great extremes of heat in summer and cold in winter. The position which was occupied by the Hellenic and mediæval city is a sloping table of ground (whence the original name of the place, Trapezus, or the "Tableland"), which falls in steep rocky precipices on the two sides, where two deep valleys, descending from the interior, run parallel at no great distance from one another down to the sea. The whole is still inclosed by the Byzantine walls, which follow the line of the cliffs, and are carried along the sea-face; and the upper part of the level, which is separated from the lower by an inner cross wall, forms the castle; while at the highest point, where a sort of neck is formed between the two valleys, is the keep which crowns the whole. The fortifications and their surroundings are singularly picturesque, for the towers, some round, some angular, which project from them are in many cases covered with creepers, and the gardens that occupy the valleys below teem with luxuriant vegetation. On each side, about half way between the keep and the sea, these ravines are crossed by massive bridges, and on the further side of the westernmost of these, away from the city, a large tower and other fortifications remain, which must have served to defend the approach from that quarter. The area of the ancient city is now called the Kaleh, and is inhabited by the Turks; eastward of this is the extensive Christian quarter, and beyond this again a low promontory juts northward into the sea, partly covered with the houses of a well-built suburb, which is the principal centre of commerce. The harbor lies on the eastern side of this promontory, but it is an unsafe roadstead, being unprotected towards the northeast, and having been much silted up, so that vessels cannot approach within a considerable distance of the shore. The neighborhood of this is the liveliest portion of the city, as it is from here that the caravans start for Persia, and at certain periods of the year long trains of camels may be seen, and Persian merchants conspicuous by their high black caps and long robes. The total population of the place is estimated at 32,000, of whom 2000 are Armenians, 7000 or 8000 Greeks, and the rest Turks.

The city of Trapezus was a colony of Sinope, but it first comes into notice at the time of the Retreat of the Ten

Thousand, who found repose there. Notwithstanding its commercial importance, the remoteness of its position prevented it from being much known to fame either in the Hellenic or the early mediæval period; its greatness dates from the time of the fourth crusade (1204), when the Byzantine empire was dismembered and its capital occupied by the Latins. During the confusion that followed that event a scion of the imperial family of the Comneni, called Alexius, escaped into Asia, and, having collected an army of Iberian mercenaries, entered Trebizond, where he was acknowledged as the legitimate sovereign, and assumed the title of Grand Comnenus. Though only twenty-two years of age, Alexius was a man of ability and resolute will, capable of establishing order in a time of anarchy; and thus he succeeded without difficulty in making himself master of the greater part of the southern coast of the Black Sea. The empire that was thus founded continued to exist until 1461, when the city was taken by Mohammed II., eight years after he had captured Constantinople. The cause of this long duration, and at the same time the secret of its history, is to be found in the isolated position of Trebizond and its district, between the mountains and the sea, which has already been described. By this means it was able to defy both the Seljúks and the Ottomans, and to maintain its independence against the emperors of Nicæa and Constantinople. But for the same reason its policy was always narrow, so that it never exercised any beneficial influence on the world at large. It was chiefly in the way of matrimonial alliances that it was brought into contact with other states. The imperial family were renowned for their beauty, and the princesses of this race were sought as brides by Byzantine emperors of the dynasty of the Palæologi, by Western nobles, and by Mohammedan princes; and the connections thus formed originated a variety of diplomatic relations and friendly or offensive alliances. The palace of Trebizond was famed for its magnificence, the court for its luxury and elaborate ceremonial, while at the same time it was frequently a hotbed of intrigue and immorality. The Grand Comneni were also patrons of art and learning, and in consequence of this Trebizond was resorted to by many eminent men, by whose agency the library of the palace was provided with valuable manuscripts and the city was adorned with splendid buildings. The writers of the time speak with enthusiasm of its lofty towers, of the churches and monasteries in the suburbs, and especially of the gardens, orchards, and olive groves. It excited the admiration of Gonzales Clavijo, the Spanish envoy, when he passed through it on his way to visit the court of Timur at Samarkand (Clavijo, *Historia del Gran Tamorlan*, p. 84); and Cardinal Bessarion, who was a native of the place, in the latter part of his life, when the city had passed into the hands of the Mohammedans, and he was himself a dignitary of the Roman Church, so little forgot the impression it had made upon him that he wrote a work entitled "The Praise of Trebizond" (*Εγκώμιον Τραπεζοῦντος*), which exists in manuscript at Venice. Little was known of the history of the empire of Trebizond until the subject was taken in hand by Prof. Fallmerayer of Munich, who discovered the chronicle of Michael Panaretus among the books of Cardinal Bessarion, and from that work, and other sources of information which were chiefly unknown up to that time, compiled his *Geschichte des Kaiserthums von Trapezunt* (Munich, 1827). Finlay's account of the period, in the fourth volume of his *History of Greece*, is based on this. From time to time the emperors of Trebizond paid tribute to the Seljúk sultans of Iconium, to the grand khans of the Mongols, to Timur the Tartar, to the Turcoman chieftains, and to the Ottomans; but by means of skilful negotiations they were enabled practically to secure their independence. We find them also at war with many of these powers, and with the Genoese, who endeavored to monopolize the commerce of the Black Sea. The city was several times besieged, the most formidable attack being that which occurred in the reign of Andronicus I., the second emperor, when the Seljúks, under the command of Melik, the son of the great sultan Ala-ed-din, first assaulted the northern wall in the direction of the sea, and afterwards endeavored to storm the upper citadel by night. They failed, however, in both attempts; and in the latter, owing to the darkness, and to the occurrence of a violent storm which suddenly swelled the torrents in the ravines, their force was thrown into inextricable confusion, and they were compelled to abandon their camp and make the best of their escape from the country. So great was the strength of the fortifications that, when Mohammed II. turned his thoughts towards the subjugation of this state, he might have experienced much difficulty in reducing it, and might have been disposed to offer favorable terms, had it not been for the pusillanimous conduct of David, the last emperor, who surrendered the place almost unconditionally.

Several interesting monuments of this period remain at Trebizond in the form of churches in the Byzantine style of architecture. One of these is within the area of the old city, viz., the church of the Panaghia Chrysokephalos, or Virgin of the Golden Head, a large and massive but excessively plain building, which is now the Orta-hissar mosque. On the further side of the eastern ravine stands a smaller but very well proportioned structure, the church of St. Eugenius, the patron saint of Trebizond, now the Yeni Djuma djami, or New Friday mosque. Still more important is the church of Haghia Sophia, which occupies a conspicuous position overlooking the sea, about two miles to the west of the city. The porches of this are handsomely ornamented, and about a hundred feet from it rises a tall campanile, the inner walls of which have been covered in parts with frescos of religious subjects, though these are now much defaced. But the most remarkable memorial of the Middle Ages that exists in all this district is the monastery of Sumelas, which is situated among the mountains, about 25 miles from Trebizond, at the side of a rocky glen, at a height of 4000 feet above the sea. Its position is most extraordinary, for it occupies a cavern in the middle of the face of a perpendicular cliff a thousand feet high, where the white buildings offer a marked contrast to the brown rock which forms their setting. It is approached by a zigzag path at the side of the cliff, from which a flight of stone steps and a wooden staircase give access to the monastery. The valley below is filled with the richest vegetation, the undergrowth being largely composed of azaleas and rhododendrons. An antiquity of 1500 years is claimed for the foundation of the monastery, but it is certain that the first person who raised it to importance was the emperor Alexius Comnenus III. of Trebizond; he rebuilt it in 1360, and richly endowed it. The golden bull of that emperor, which became thenceforth the charter of its foundation, is still preserved; it is one of the finest specimens of such documents, and contains portraits of Alexius himself and his queen. The monastery also possesses the firman of Mohammed II., by which he accorded his protection to the monks when he became master of the country. (H. F. T.)

TREDEGAR,[1] a town of Monmouthshire, England, is situated on the Sirhowy river, and on the London and North-Western Railway system, 7 miles east-northeast of Merthyr Tydvil and 249 west of London. The town owes its existence to the establishment in the beginning of the century of the works of the Tredegar Iron and Coal Company, who lease the soil and minerals from Lord Tredegar. The iron-works, chiefly for the smelting of iron and the manufacture of iron and steel rails, are of enormous extent, and employ upwards of 4000 men. The town is also surrounded by iron and coal mines, the property of the company. It consists chiefly of workmen's houses, but is built with regularity and neatness, the principal streets diverging from an open space called the Circle, in the centre of the town, where there are a number of good shops. The church of St. George is a tasteful modern building in the Norman style. The temperance hall, union workhouse, and literary institute and library deserve notice. The population of the urban sanitary district (area 7029 acres), a small portion of which is in Brecknockshire, in 1871 was 16,989 and in 1881 it was 18,771.

TREE-CREEPER, one of the smallest of British birds, and, regard being had to its requirements, one very generally distributed. It is the *Certhia familiaris* of ornithology, and remarkable for the stiffened shafts of its long and pointed tail-feathers, aided by which, and by its comparatively large feet, it climbs nimbly, in a succession of jerks, the trunks or branches of trees, invariably proceeding upwards or outwards and generally in a spiral direction, as it seeks the small insects that are hidden in the bark and form its chief food. When in the course of its search it nears the end of a branch or the top of a trunk, it flits to another, always alighting lower down than the place it has left, and so continues its work.

Inconspicuous in color, for its upper plumage is mostly of various shades of brown mottled with white, buff, and tawny, and beneath it is of a silvery white, the Tree-Creeper is far more common than the incurious suppose; but, attention once drawn to it, it can be frequently seen and at times heard, for though a shy singer its song is loud and sweet. The nest is neat, generally placed in a chink formed by a half-detached piece of bark, which secures it from observation, and a considerable mass of material is commonly used to partly stuff up the opening and give a sure foundation for the tiny cup, in which are laid from six to nine eggs of a translucent white, spotted or blotched with rust-color. The Tree-Creeper inhabits almost the whole of Europe as well as Algeria, and has been traced across Asia to Japan. It is now recognized as an inhabitant of the greater part of North America, though for a time examples from that part of the world, which differ slightly in the tinge of the plumage, were accounted a distinct species (*C. americana*), and even those from Mexico and Guatemala (*C. mexicana*), have lately been referred to the same. It therefore occupies an area not exceeded in extent by that of many Passerine birds, and is one of the strongest witnesses to the close alliance of the so-called Nearctic and Palæarctic Regions.

---

[1] [The Tredegar Iron Works, at Richmond, Va., where the armor plates for the iron-clad steamer Merrimack were rolled, derive their name from the English town Tredegar.—AM. ED.]

Allied to the Tree-Creeper, but wanting its lengthened and stiff tail-feathers, is the genus *Tichodroma*, the single member of which is the Wall-Creeper (*T. muraria*) of the Alps and some other mountainous parts of Europe and Asia, and occasionally seen by the fortunate visitor to Switzerland fluttering like a big butterfly against the face of a rock, conspicuous from the scarlet-crimson of its wing-coverts and its white spotted primaries. Its bright hue is hardly visible when the bird is at rest, and it then presents a dingy appearance of gray and black. It is a species of wide range, extending from Spain to China; and, though but seldom leaving its cliffs, it has wandered even so far as England. Merrett (*Pinax*, p. 177) in 1667 included it as a British bird, and the correspondence between Marsham and Gilbert White (*Proc. Norf. and Norw. Nat. Society*, ii. p. 180) proves that an example was shot in Norfolk, 30th October, 1792; while another is reported (*Zoologist*, ser. 2, p. 4839) to have been killed in Lancashire, 8th May, 1872.

The genus *Certhia* as founded by Linnæus contained 25 species, all of which, except the two above mentioned, have now been shown to belong elsewhere; and for a long while so many others were referred to it that it became a most heterogeneous company. At present, so few are the forms left in the Family *Certhiidæ* that systematists are not wanting to unite it with the *Sittidæ* (*cf.* Nuthatch), for the two groups, however much their extreme members may differ, are linked by so many forms which still exist that little violence is done to the imagination by drawing upon the past for others to complete the series of descendants from a common and not very remote ancestor, one that was possibly the ancestor of the Wrens (*q.v.*) as well. One thing, however, has especially to be noticed here. The *Certhiidæ* have not the least affinity to the *Picidæ* (*cf.* Woodpecker, *infra*), but are strictly Passerine, though the Australian genus *Climacteris* may possibly not belong to them. (A. N.)

TREE-FERN. In old and well-grown specimens of some of the familiar ferns of our temperate climates the wide-spreading crown of fronds may be observed to rise at a distance often of a good many inches above the surface of the ground, and from a stem of considerable thickness. The common male fern *Nephrodium* (*Lastræa*) furnishes the commonest instance of this; higher and thicker trunks are, however, occasionally presented by the royal fern (*Osmunda regalis*), in which a height of 2 feet may be attained, and this with very considerable apparent thickness, due, however, to the origin and descent of a new series of adventitious roots from the bases of each annual set of fronds. Some tropical members and allies of these genera become more distinctly tree-like, *e.g.*, *Todea*; *Pteris* also has some sub-arboreal forms. *Oleandra* is branched and shrub-like, while *Angiopteris* and *Marattia* (*Marattiaceæ*) may also rise to 2 feet or more. But the tree-ferns proper are practically included within the family *Cyatheaceæ*. This includes five genera (*Cyathea*, *Alsophila*, *Hemitelia*, *Dicksonia*, *Balantium*) and nearly 200 species, of which a few are herbaceous, but the majority arboreal and palm-like, reaching frequently a height of 50 feet or more, *Alsophila excelsa* of Norfolk Island having sometimes measured 60 to 80 feet. The fronds are rarely simple or simply pinnate, but usually tripinnate or decompound, and may attain a length of 20 feet, thus forming a splendid crown of foliage. The stem may occasionally branch into many crowns. The genera are of wide geographical range, mostly of course within the tropics of the Old and New World; but South Australia, New Zealand, and the Southern Pacific islands all possess their tree-ferns. In Tasmania *Alsophila australis* has been found up to the snow-level, and in the humid and mountainous regions of the tropics tree-ferns are also found to range up to a considerable altitude. The fronds may either contribute to the apparent thickness of the stem by leaving more or less of their bases, which become hardened and persistent, or they may be articulated to the stem and fall off, leaving characteristic scars in spiral series upon the stem. The stem is frequently much increased in apparent thickness by the downgrowth of aerial roots, forming a black coating several inches or even a foot in thickness, but its essential structure differs little in principle from that familiar in the rhizome of the common bracken (*Pteris*). To the ring, or rather netted cylinder of fibro-vascular bundles characteristic of all fern stems, scattered internal as well as external bundles arising from these are superadded; and in a tree-fern these are of course in greater numbers. The outer bundles give off branches to the descending roots from the region where they pass into the leaves.

Tree-ferns are of course cultivated for their beauty alone; a few, however, are of some economic applications, chiefly as sources of starch. Thus the beautiful *Alsophila excelsa* of Norfolk Island is said to be threatened with extinction for the sake of its sago-like pith, which is greedily eaten by hogs; *Cyathea medullaris* also furnishes a kind of sago to the natives of New Zealand, Queensland, and the Pacific islands. A Javanese species of *Dicksonia* (*D. chrysotricha*) furnishes silky hairs, which have been imported as a styptic, and the long silky or rather woolly hairs, so abundant on the stem and frond-leaves in the various species of *Cibotium*, have not only been put to a similar use, but in the Sandwich Islands furnish wool for stuffing mattresses and cushions, which was formerly an article of export. The "Tartarian lamb," or *Agnus scythicus* of old travellers' tales in China and Tartary, is simply the woolly stock of *C. Barometz*, which, when dried and inverted and all save four of its frond-stalks cut away, has a droll resemblance to a toy sheep.

See Fern; J. Smith, *Historia Filicum*; Luerssen, *Med. Pharm. Botanik*; and for the structure of the stem, De Bary's *Vergleich. Anatomie d. Phanerog. u. Farne.*

TREGELLES, Samuel Prideaux (1813–1875), New Testament scholar, was born at Wodehouse Place, near Falmouth, on January 30, 1813. His parents were Quakers, and he himself for many years was in communion with the (Darbyite) Plymouth Brethren, but latterly he became a member of the Church of England. He was educated at Falmouth grammar school, and afterwards, without having attended any university, held various modest educational appointments, but finally devoted himself entirely to a laborious student life, until he was incapacitated for literary work by paralysis in 1870. He died at Plymouth on April 24, 1875.

Most of his numerous publications had reference to his great critical edition of the New Testament (see Bible, vol. iii. p. 561). They include an *Account of the Printed Text of the Greek New Testament* (1854), a new edition of Horne's *Introduction* (1860), and *Canon Muratorianus: Earliest Catalogue of Books of the New Testament* (1868). As early as 1844 he published an edition of the Apocalypse, with the Greek text so revised as to rest almost entirely upon ancient evidence. Tragelles wrote *Heads of Hebrew Grammar* (1852) translated Gesenius's *Hebrew Lexicon*, and was the author of a little work on the *Jansenists* (1851) and of various works in exposition of his special eschatological views (*Remarks on the Prophetic Visions of Daniel*, 1852, new ed. 1864).

TREMATODA, popularly known as "flukes," form one of the three main divisions of the flatworms or

Platyhelminthes. They have been defined thus (Jackson, **1**):[1]

"Unisegmental *Vermes*, with a flattish, leaf-like, more or less cylindrical body provided with organs of adhesion in the shape of suckers and sometimes of chitinoid hooks. The cuticle, so called, appears to be a metamorphosed layer of cells. There is a well-developed nervous system, the ganglia of which are entirely supra-pharyngeal, *i.e.*, dorsal. There is a mouth, and an alimentary canal which is usually forked, but no anus. The excretory system has the form of more or less branching tubes commencing with flame-cells, and either ending in a contractile vesicle or opening by two independent orifices. Hermaphrodite self-impregnation occurs, as well as reciprocal impregnation. The embryo either develops direct into the sexual form (mono-genetic *Trematoda*) or gives origin to a series of intermediate non-sexual dimorphic forms (digenetic *Trematoda*), Parasitic."

Historical Sketch.—Some of the more salient points in the history of our knowledge of these animals have already been alluded to in the article PARASITISM (*q.v.*); a few additional facts must, however, be mentioned here. The *Trematoda* were first formed into a group by Rudolphi (**2**), who included in it the following genera: *Monostoma*, *Amphistoma*, *Distoma*, *Tristoma*, *Pentastoma*, and *Polystoma*; the name had reference to the suckers, which Rudolphi regarded as being for the most part openings into the body (Gr. τρῆμα, an aperture). Some of these forms were soon perceived to have but small connection with the others; and Cuvier (**3**) reduced the whole to one genus, for which he adopted the name *Fasciola*, Linn. The Pentastomes have since been transferred to the ARACHNIDA (*q.v.*).

Our scientific acquaintance with the group may be said to date from 1831, when Mehlis noticed that the eggs of certain Distomes hatched into a minute ciliated body with an eye-speck resembling an Infusorian, an observation which gave the key to the life-history of these forms. Von Siebold in 1835 (**4**) supplemented this discovery by the observation that the ciliated embryo of *Monostomum mutabile* contained, as a "necessary parasite," as it was termed, an organism identical with the "kings-yellow worm" (*Redia*) found by Bojanus in pond-snails, and Von Baer had previously shown (**5**) that these gave rise to free-swimming organisms not unlike tailed Trematodes. The materials were thus ready to hand for a co-ordination of the whole life-history, and Steenstrup recognized it as an instance of the so-called "alternation of generations" (**6**). These researches received important additions at the hands of Pagenstecher (**7**) and others, who showed experimentally that encysted Distomes grow mature directly after their transference from one host to another, and thus that a migration is necessary to the attainment of their maturity. Diesing's great work (**8**) appeared in 1850, and has formed the groundwork of all subsequent treatises on the systematic arrangement of parasitic worms, although it included forms which really belong to quite different groups. In 1861 Van Beneden gained a prize offered by the French Academy by his elaborate memoir on the intestinal worms (**9**), in which he not only described many new and interesting forms, but gave anatomical details regarding others previously known, and entered into detailed comparisons between the Cestodes and Trematodes, both in their adult and immature states. Of recent years the chief additions to our knowledge have been more in the direction of further details regarding the structure and life-history of special forms than the elaboration of new general principles.

Anatomy.—In endeavoring to give a very brief account of the more salient points in the anatomy of the *Trematoda* it has been thought expedient to select some well-known form as a type, and afterwards to indicate the characters in which other species differ from it; for this purpose the common liver-fluke, *Fasciola* (*Distomum*) *hepatica* has been chosen, as it is not unfrequently found in the bile-ducts of sheep and other domestic animals, and constitutes a scourge much dreaded by farmers. The account here given is in the main abstracted from Sommer (**10**).

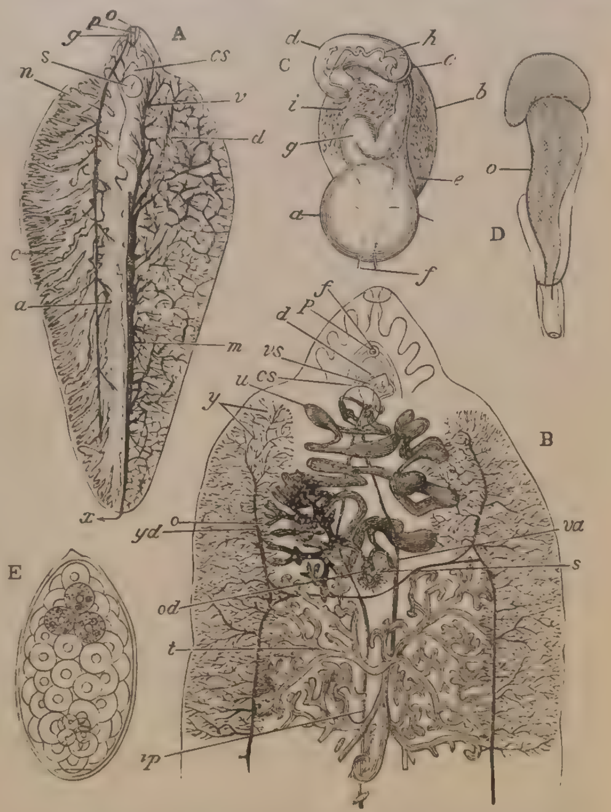

FIG. 1.—A, *Fasciola hepatica*, from the ventral surface (× 2); the alimentary and nervous systems only shown on the left side of the figure, the excretory only on the right. *a*, right main branch of the intestine; *c*, a diverticulum; *g*, lateral ganglion; *n*, lateral nerve; *o*, mouth; *p*, pharynx; *s*, ventral sucker; *cs*, cirrus sac; *d*, left anterior dorsal excretory vessel; *m*, main vessel; *v*, left anterior ventral trunk; *x*, excretory pore. B, Anterior portion more highly magnified (from Marshall and Hurst, after Sommer). *cs*, cirrus sac; *d*, ductus ejaculatorius; *f*, female aperture; *o*, ovary; *od*, oviduct; *p*, penis; *s*, shell-gland; *t*, anterior testis; *u*, uterus; *va*, *vp*, vasa deferentia; *vs*, vesicula seminalis; *y*, yolk-gland; *yd*, its duct. C, Genital sinus and neighboring parts (from Sommer). *a*, ventral sucker; *b*, cirrus sac; *c*, genital pore; *d*, evaginated cirrus sac (? penis; *e*, end of vagina; *f*, vasa deferentia; *g*, vesicula seminalis; *h*, ductus ejaculatorius; *i*, accessory gland. D, A ciliated funnel from the excretory apparatus, highly magnified (from Fraipont). *o*, orifice of the funnel. E, Egg of *Fasciola hepatica*; × 330 (from Thomas).

External Appearance.—The animal has a flattened oval shape, with a sub-triangular process on the broader end, which represents the head. The total length varies from 20 to 35 mm., the breadth from 6 to 12 mm. On superficial examination two narrower lateral areas may generally be distinguished from a broader median one; the former are occasionally of a coarsely granular appearance and reddish-brown or orange in color, and increase in breadth towards the posterior end of the body, where they commonly unite. The median area is commonly grayish-yellow in color, sometimes spotted with black; its anterior portion corresponds to the uterus, the posterior to the testes. Two suckers (Fig. 1, A, *o*, *s*) are in the middle line of the body; one is at the anterior extremity and is directed forwards and somewhat downwards; it is known as the anterior or oral sucker, being perforated by the œsophagus. The posterior or ventral sucker is situated, as its name implies, on the inferior surface of the body, just behind the head-papilla. The suckers measure on an average about 1 mm. in diameter, the ventral being slightly the larger. The internal organs communicate with the outer world by four apertures: (1) the mouth (*o*), situated at the anterior pole of the body and perforating the oral sucker; (2) the excretory pore (*x*), placed at the opposite extremity, and giving exit to the effete products; (3) the porus genitalis (Fig. 1, B, *p*), leading into a sinus into which the ducts of both sets of genital organs open,—it is to be found on the under surface of the head-papilla at or near its centre; (4) the opening of the Laurer-Stieda canal, situated on the dorsal surface of the animal, near the junction of the two portions of the median area,—it is excessively minute and difficult of detection, and leads by a narrow canal into the duct of the yolk-gland.

---

[1] These figures refer to the bibliography at the end of the article.

Internal Structure.—All *Trematoda* have been commonly regarded, like other flat-worms, as devoid of a body-cavity (cœlom), and as consisting of parenchymatous tissue, in which the various organs were embedded. Recent researches of Fraipont (**15**) appear to show, however, that the intercellular spaces in this tissue are to be regarded as the homologue of a cœlom. The body is enclosed by a complex sheath (cortex), which may be resolved into several layers, which will be discussed in order, proceeding from without inwards. (1) The cuticle, which encloses the whole body, is a thin, pellucid, structureless membrane: at the margin of the mouth it is reflected so as to form a lining for the œsophagus, and similarly at the opening of the genital sinus it passes inwards to form a lining to the vagina. The same phenomenon is observed at the excretory aperture. By the application of ammonia the cuticle may be separated from the subjacent tissues and its peculiarities demonstrated; although apparently smooth to the naked eye, it presents under the microscope numerous sharp backwardly directed processes, each of which encloses a hard stylet shaped body. These prominences are closely set over the whole body except immediately around the suckers, extending even into the interior of the sinus genitalis. The cuticle is furthermore perforated by innumerable fine pores, directed outwards and somewhat backwards. With regard to the homology of the cuticle of Trematodes the same uncertainty prevails as in the case of Cestodes (see TAPE-WORMS); the general opinion is that it is not comparable with the chitinous cuticle of *Arthropoda*, but is either a specially developed basement-membrane (Kerbert, **11**) or a layer of modified cells (Ziegler, **12**, and Schwarze, **13**). (2) The outer cellular layer is the matrix of the cuticle. (3) The muscular coat consists of three different layers: (i.) a thin layer of circular fibres; (ii.) the longitudinal muscles, which form a series of separate bundles; (iii.) the oblique muscles, confined to the anterior half or third of the body, and crossing so as to form a rhomboidal lattice-work,—they are especially strong on the anterior ventral aspect of the animal. (4) The inner cellular layer consists of elements which closely resemble those of the outer, but are somewhat larger; they have been mistaken by various observers for cuticular glands. The suckers may be considered as parts of the cortical layer; speaking generally, each has the form of the segment of a sphere, although the anterior one is shallower at the lower than at the upper margin, and is penetrated by the œsophagus. Each consists of three sets of muscles,—a thin outer equatorial layer, a second meridional, and a mass of radially disposed fibres forming the greater part of the substance. It would appear that the function of the first two of these groups is to flatten out the sucker, whilst the radial ones restore its cavity and thus produce a suctorial action. To the ventral sucker are attached a number of muscular fibres belonging to the dorso-ventral system, and in particular a strong bundle, which passes from behind downwards and forwards.

Digestive system.

The digestive system (Fig. 1, A), the presence of which furnishes one of the most characteristic differences between Trematodes and Cestodes, extends throughout the body on a plane between the peripheral nervous and reproductive systems. It has only one aperture, as above mentioned, in the centre of the anterior sucker. The anterior portion or pharynx, although very short, measuring not much more than 1 mm. in length, is again divisible into two sections. The hinder of these is the larger, and is sometimes spheroidal but more commonly fusiform in shape; it has strong muscular walls, which, in conjunction with protractor and retractor muscles, bring about a kind of pumping action whereby nutritive fluids are taken into the stomach, which name may be applied to the larger posterior section of the alimentary tract, since in it the digestive processes are carried on. The canal, which leads from the posterior end of the pharynx, divides almost immediately into two branches, which diverge at first rapidly and then run almost parallel, as far as the hinder end of the body. Each of these gives off from its outer aspect some 16 or 17 lateral branches (*c*), which divide and subdivide till their ramifications fill nearly the whole area of the body. The digestive tract is lined by a layer of simple cells, resembling a cylinder epithelium. These behave towards the blood corpuscles and other contents of the intestine exactly as would a number of *Amœbæ*, putting out processes or pseudopodia, which ingest them,—so that, in common with many of the lower Invertebrates, the liver-fluke lives by "intracellular digestion" (see Metschnikoff, **14**).

Excretory system.

The canals of the excretory system (*m*) may be divided into three groups. (1) The collecting network consists of very fine tubules which anastomose freely with each other; they are situated on the boundary between the cortical and middle layers, and are therefore visible from either side of the body. (2) Conducting vessels (*v*, *d*) receive the contents of this network. Each of these is formed by the union of a larger or smaller number of the delicate canals just described, and after a longer or shorter course opens into the median excretory canal (*m*). On the way, however, it communicates with the neighboring vessels, so that a second network is formed, which is distinguished from that of the collecting tubules by the greater size of its meshes and by the fact that it is specially visible from the dorsal surface of the animal. In the head four of these conducting vessels arise, which are disposed in two pairs, one situated dorsally and one ventrally. As they pass backwards they receive many branches, the dorsal unites with the ventral of its own side, and the two tubes thus formed unite to constitute the last division of the excretory system. (3) The median vessel (*m*) passes along the body for the posterior two-thirds of its length, immediately beneath the dorsal cortical layer. It is widest near the commencement, where it measures about 0.5 mm. in diameter, and finally opens at the posterior extremity of the body. The wall of the excretory apparatus is constituted everywhere by an exceedingly delicate elastic membrane, which exhibits neither a cellular lining nor cilia; furthermore, neither valves nor muscles have been demonstrated in connection with it. It contains a thin colorless fluid in which very small highly refractive drops are suspended.

The details of the termination of the excretory system seem to have been first clearly made out by Fraipont (**15**), who worked upon species in which they are more distinct than in the form now under consideration. The spaces between the round connective-tissue cells of the body are star-shaped in form, and into these the finest excretory tubules, above mentioned, open by funnels (Fig. 1, D), into each of which projects a vibratile cilium, thus constituting the so-called "flame-cells." These researches have given rise to numerous differences of opinion, as regards questions both of fact (**16**) and of priority (**17**).

Reproductive organs.

The liver-fluke contains a complete set of male and female organs, which form the most conspicuous part of its anatomy, and both of which open into the genital sinus which has been described above.

A. The Male Organs. (i.) The testes (Fig. 1, B, *t*) are two in number, situated one behind the other in the hinder division of the median area. They rest upon the ventral cortical layer in the parenchyma of the body, and immediately above them are the ramifications of the digestive tract. Each consists of a large number of ramifying tubes, often with slightly dilated extremities. These unite into three or four, and eventually into two, main excretory ducts (*va*, *vp*), which terminate at the base of the cirrus-pouch. Within the testicular tubules may be found spermatozoa in all stages of development; the first stage appears to consist of small roundish membraneless cells with a single nucleus; the nucleus then divides and the cells become polygonal from mutual pressure. These large cells lie in the middle rather than at the sides of the tube, and among them are a number which, while they possess on one side a smooth evenly rounded contour, are on the other very irregularly and deeply serrated. These serrations elongate until they become the delicate filaments of spermatozoa, the small shining heads of which are still embedded in the protoplasm of the cell. (ii.) The vasa deferentia (*va*, *vp*) are a pair of slender elongated canals, which lie on the two sides of the middle line, and unite at the inner extremity of the cirrus-pouch, which they penetrate in common. Their walls consist of a very delicate homogeneous but resistant membrane, upon which contractile fibres are disposed, close together and parallel to the axis. (iii.) The cirrus-pouch (*c.s.*) is a muscular egg-shaped organ; the upper pole, which receives the united vasa deferentia, is situated above the ventral sucker and separated by only a very slight interval from the dorsal cortical layer, whilst the position of the lower pole is indicated by the porus genitalis (*p*). The muscles are disposed in two layers, of which the inner is thin and composed of circular fibres; the outer longitudinal layer is much thicker, and its fibres are disposed in bundles; furthermore its apex receives a large number of dorso-ventral fibres. Within the cirrus-pouch the two terminal sections of the male conducting apparatus are situated. (iv.) The first of these is the vesicula seminalis (Fig. 1, B, *vs*; C, *g*), a large, spindle-shaped dilatation of the canal usually more or less curved upon itself. Its wall is somewhat more complex than that of the vasa deferentia, consisting of a layer of tissue with many nuclei but no distinct cell-boundaries, succeeded by a delicate layer of circular muscular fibres, which is again followed by a layer of longitudinal ones. (v.) The ductus ejaculatorius (Fig. 1, C, *h*), which immediately succeeds the vesicula seminalis, is a long slender tube, disposed in coils, and usually projecting like a papilla into the base of the sinus genitalis. Its walls are furnished with a number of unicellular glands. *B. The Female Organs.* The female reproductive apparatus may be roughly divided into two portions, that which produces the eggs and that which conveys them to the outside of the body; in the former of these processes three organs take part—one producing the germ, another the secondary or food-yolk, and a third the egg-shell. (i.) The germarium or ovary (Fig. 1, B, *o*) is situated between the anterior testis and the ventral sucker, in about three cases out of four on the right hand side of the body. It has the form of a branching tubular gland, the ramification being dichotomous throughout; in most cases the branches are about as large as the stems which give rise to them. The oviduct passes towards the shell-gland, narrowing as it approaches this, and finally unites with the excretory duct of the yolk-glands. (ii.) The yolk-glands (*y*) of the liver-fluke are paired organs of considerable size; they extend over both lateral areas, to which they impart the opaque appearance and reddish color above alluded to. They are composed of innumerable small acini, spheroidal in shape and situated in groups on minute ductules, which unite to form a longitudinal canal on either side of the body. These canals are on the whole parallel to the margins of the animal and distant from it about one-fifth of its greatest breadth. At the anterior margin of the testicular area each longitudinal canal gives off a transverse branch, which unites with its fellow of the opposite side in the middle line to form a pear-shaped reservoir, situated just behind the posterior margin of the shell-gland. From this reservoir the common yolk-duct passes forwards in the substance of the shell-gland and there unites with the oviduct. Previously to this, however, it gives off a minute canal, which after an upward course opens on the dorsal surface of the animal; it is known as the Laurer-Stieda canal, and its function has been the subject of much discussion. It has been supposed (1) "to serve for copulatory purposes," as has been seen by Zeller (**18**) in *Polystomum*, and as is supported by its structure in *Axine* and *Microcotyle*, and (2) "to act as a safety tube for the escape of over-abundant or altered vitelline products and spermatozoa," the main argument in support of which is that its calibre is too narrow to admit of copulation taking place by its means; compare Sommer (**10**), Kerbert (**11**), Poirier (**19**), Looss (**20**), and Lorenz (**21**). (iii.) The uterus or female conducting apparatus (*u*) originates at the union of the ducts of the germarium and yolk-gland. Its first portion, which lies within the shell-gland, is a delicate narrow canal, except when it is distended either by eggs or by semen. The median section of the organ is by far the largest both in length and breadth; it occupies almost the whole of the anterior part of the median area of the animal, between the ventral sucker and the shell-gland, and forms four or five large coils lying alternately right and left, which as a rule are filled with completely formed eggs. The third section of this organ includes the coils which lie above and anterior to the ventral sucker; it is sometimes called the vagina. When it contains eggs these are generally in a single file, and thus give it a moniliform appearance; it lies entirely on the left side of the body, gradually approaching the middle line as it passes forward, until it ends below the cirrus-pouch at the left and posterior aspect of the genital pore (Fig. 1, C, *e*). (iv.) The shell-gland (Fig. 1, B, *s*), which (as its name implies) furnishes the external coating of the eggs, has been already several times mentioned. In the Trematodes, as in the tape-worms, it forms a kind of central point of the female generative system; it is a spheroidal mass of unicellular glands, each of which opens by its own special duct into the commencement of the uterus. The secretion of the shell-gland is liberated in the form of small pellucid droplets, which unite to form drops; afterwards it becomes thick and viscid and of a mahogany brown color. In this condition the drops are dispersed through the uterus mixed with the secretions of the other genital glands, and they apply themselves to the recently formed eggs, producing a delicate membrane around them. This process is carried on in those coils of the uterus which lie immediately outside the shell-gland, corresponding to the "ootype" described by Van Beneden in other Trematodes.

The eggs undergo a gradual development as they pass along the uterus. The ripe primitive ovum, on entering the female conducting apparatus, becomes coated with a larger or smaller number of spherules of secondary yolk, and then undergoes the process of segmentation which leads to the formation of a morula. At this point it receives the secretion of the shell-gland. The completely formed egg (Fig. 1, E) has a length of 0.13 mm. and is ovoid in shape, with a small lid or operculum at the broader end; its contents consist of a number of roundly polygonal cells, with only a small quantity of secondary yolk remaining among them. All of these but one have a thick granular protoplasm, the exceptional cell having homogeneous and strongly refracting contents. It usually lies immediately under the operculum, and is partly embedded in the other cells. They are often present in the bile-ducts in such quantities as to form a stiff brownish mass resembling wet sand, and the number produced by a single fluke has been estimated at half a million.

The mode of fertilization of the liver-fluke has given rise to much discussion. According to Sommer, the organ which has usually been described as a cirrus or penis is merely the genital sinus evaginated by abnormal pressure (Fig. 1, C, *d*); it is furthermore but ill-adapted to enter either of the canals which could possibly serve as a vagina. He is therefore of opinion that self-impregnation occurs, the external aperture being closed by the oblique muscles, and the semen passing directly from the vas deferens through the genital sinus into the uterus. The whole question of the fertilization of the Trematodes is a matter on which very varied opinions have been expressed, even by authors who have examined the same forms. The assertion of Von Siebold that a direct internal communication exists between the male and female organs has been denied by Stieda (**22**) and by many subsequent writers, but has been restated by Lorenz (**21**) and by Zeller in the case of *Polystomum integerrimum* (**18**); however this may be, there can be no doubt that self-impregnation does occur in certain cases. The structure of the organs renders it more than probable in some species (see Poirier, **19**, p. 582); Zaddach has observed it actually taking place in *Distomum cirrigerum* encysted in *Astacus* (**23**), and a single *Polystomum integerrimum* has been found in a frog's bladder with sperm in the female passages. Reciprocal fertilization, in which two individuals act both as male and female simultaneously, has been recorded by Zeller in *Polystomum integerrimum*, by Looss (**20**) in *Distomum clavigerum*, and by Cobbold in *Distomum campula*.

The nervous system consists of a commissure passing round the œsophagus very obliquely, and swelling out into ganglia at three points. *Tristomum molæ* possesses eyes of an extremely simple type, the retina being merely a ganglion cell (Lang, **24**).

Nervous system.

Life-History and Development.—The life-history of *Fasciola hepatica* was worked out independently by Thomas (**25**) and Leuckart (**26**); regarding the question of priority see Jackson (**27**).

The development of the embryo can only take place outside the body of the host and at a lower temperature, the most favorable being from 23° to 26° C. [73° to 79° F.], at which the process occupies two or three weeks. The free embryo (Fig. 2, A) is conical in shape, with a rounded apex, its average length being 0.13 mm. At the broader anterior end is a retractile head papilla, with the exception of which the body is ciliated all over. The interior of the body is composed of granular nucleated cells, and it contains a double eye-spot, composed of two crescentic masses of pigment. There are also two ciliated funnels forming the rudiments of the excretory system and a granular mass behind the head-papilla, probably representing the digestive tract. The embryo swims actively about, but if it does not succeed in meeting the appropriate host for its next stage of development (*Limnæus truncatulus*, a small pond snail) its period of vitality seems to be limited to about eight hours. If it should meet with one of these snails it applies the head-papilla to some part of its surface and begins to bore, twisting round and round on its axis by means of its cilia, the head-papilla becoming pointed and elongated to four or five times its original length. Eventually the tissues of the snail are separated as if by a wedge, and a gap is formed through which the embryo forces an entrance into its body. Here it undergoes a metamorphosis, losing its organs of locomotion and becoming what is termed a "sporocyst" (Fig. 2, B). This is an elliptical sac, which commonly attains a length of 0.7 mm. Its wall consists of a structureless cuticle, beneath which are external, circular, and internal longitudinal muscle-fibres. These are succeeded by an epithelium, the elements of which vary greatly in size. These sporocysts may be produced by a process of transverse fission. Within the sporocyst rounded masses of cells are formed (morulæ), which undergo a process of invagination, producing a gastrula, which again develops by the formation of a digestive tract into what is known as a "redia" (Fig. 2, C, D). This forces its way through the wall of the sporocyst, which heals up immediately, and then wanders through the tissue of the snail, most commonly finding its way to the liver. If many rediæ are present the snail usually perishes. The adult redia may attain a length of 1.6 mm. It has an elongated cylindrical form, and near its posterior extremity are two processes directed backwards, which probably serve as aids to locomotion. At the anterior extremity is the mouth, leading into a muscular pharynx, followed by a saccular digestive tract. A ring-shaped thickening is seen a little way behind the mouth, and immediately posterior to this a special aperture for the exit of the germs formed within the redia. About a score of these are usually to be found in all stages of development, the earliest being a rounded mass of cells (morula), which elongates, one end at the same time becoming more attenuated than the other, and gradually forming an elongated tail, while the body becomes oval and depressed (Fig. 2, E). Two suckers and the rudiment of the future digestive tract make their appearance. As soon as the "cercaria," this being the name given to the present organism, has attained this stage of development it emerges from the redia, and by the aid of its suckers and tail wriggles its way out of the host, swimming freely about in the water. Like other cercariæ developed in rediæ this one has no head-spine, but in mature examples the anterior of the body often exhibits a number of very minute spines. An interesting feature in the animal is the presence of the "cystogenous cells," two lobate masses arranged one on each side of the body. These cells contain small rod-like bodies, whence they have been termed "cellules à batonnets," and similar bodies have been found in the protective cyst which they excrete; Sonsino (**28**) has suggested that they may assist in imparting stiffness to this structure, and has noticed that they are more abundant in those forms which encyst in the open air. When the cercaria has swum about for a short time it finds its way to the water-plants, and encysts itself on their stems and leaves. During this process the tail is swung vigorously about, until finally a more violent motion detaches it; at the same time the cells just mentioned throw out a gummy secretion, which rapidly hardens and encloses the cercaria in a kind of case. It is in this condition that the larvæ are swallowed by the grazing sheep to form sexually mature flukes in their livers.

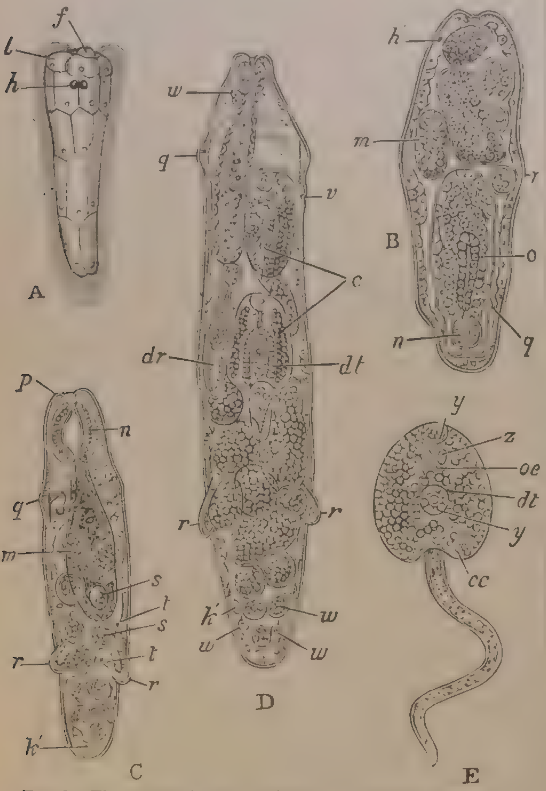

FIG. 2.—Five stages in the life-history of *Fasciola hepatica;* all highly magnified. A, The free-swimming embryo. B, A sporocyst containing young rediæ. C. A young redia, the digestive tract shaded. D, An adult redia, containing a daughter-redia, two almost mature cercariæ, and germs. E, A free cercaria. The letters have the same significance throughout. *c*, nearly ripe cercariæ; *cc*, cystogenous cells; *dr*, daughter-redia; *dt*, limbs of the digestive tract; *f*, head-papilla; *h*, eye-spots; *h′*, same degenerating; *k′*, germinal cell; *l*, cells of the anterior row; *m*, embryo in optical section, gastrula stage; *n*, pharynx of redia; *o*, digestive sac; *oe*, œsophagus; *p*, lips of redia; *q*, collar; *r*, processes serving as rudimentary feet; *s*, embryos; *t*, trabeculæ crossing body-cavity of redia; *u*, glandular cells (?); *v*, birth-opening; *w*, *w′*, morulæ; *y*, oral sucker; *y′*, ventral sucker; *z*, pharynx. (All from Marshall and Hurst after Thomas.)

The life-history of a typical digenetic Trematode may be summed up as follows: (1) the *egg*, produced sexually; (2) the *ciliated embryo;* (3) the *sporocyst;* (4) the *redia*, produced asexually; (5) the *cercaria*, produced asexually; (6) the *adult Trematode*. Hence it would appear that the digenetic forms have at least one, usually many, asexual generations before the sexual one appears. The embryo may form either a sporocyst or a redia, these two forms being distinguished by the presence of a digestive tract and of a special birth-opening in the latter. Within these parent forms the germs may arise from two sources,—the cells which occupy the central region of the young sporocyst or redia, or the epithelium lining the body-walls. "The germs to which a sporocyst gives origin may develop in some instances into sporocysts, in others into rediæ or into cercariæ. And it does not seem certain that there is any limit to the possible number of successive generations of rediæ. Both cercariæ and rediæ may occur side by side in the same nurse. The last term in the series is, however, invariably a cercaria."

Pagenstecher, Ercolani (**29**), and others have stated that the tail of a cercaria may become a sporocyst and produce germs, but this has not met with general acceptance, and the supposition is not supported by the structure of the tail, which consists of a "contractile substance, occupying the axis and periphery, with large vesicular cells between" (Schwarze, **13**). Ercolani (**29**) has also published striking statements to the effect that the structure of these entozoa is so profoundly modified by their habitat that what have been hitherto described as distinct species may be only "local varieties"; thus he finds that *Cercaria armata* develops in *Tropidonotus* into *Distomum signatum*, whilst in *Mus musculus* and *M. decumanus* it becomes a distinct dwarfed form, *D. muris*.

Pathological and Economic Relations.—Although the number of Trematodes which have been recorded from the human body is about equal to that of the Cestodes, the medical significance of the former is much less than that of the latter, because as a rule they occur in smaller numbers and are less apt to invade organs of vital importance. The Trematodes which have been found in man are:

Fasciola hepatica, Linn., . . .	in the liver.
Distomum lanceolatum, Mehlis, .	" liver.
D. ophthalmobium, Diesing, . .	" lens of the eye.
D. heterophyes, Bilharz, . . .	" small intestine.
D. crassum, Busk = *D. buskii*, Wedl,	" intestine.
D. capense, Harley, ...	" eggs in the blood.
D. spatulatum, Leuckart, . .	" liver.
D. endemicum, Baelz, . . .	" liver.
D. hepatis innocuum, Baelz, . .	" liver.
D. rathouisi, Poirier (42), . .	" liver.
Bilharzia hæmatobia, Cobbold, .	" veins of bladder, etc.
Monostomum lentis, Nordmann, .	" lens of the eye.
Hexathyridium pinguicola, Treutler,	" ovary.
H. venarum, Treutler, . . .	" veins.

For the general principles which govern the pathological effects of Trematodes in common with other entozoa, reference may be made to the article TAPE-WORMS; only a few special cases need be alluded to here. The occurrence of most of the forms in the above list has only been recorded a very few times, and in many cases the effects produced were very inadequately studied, so that we can hardly be said to possess a knowledge of their individual pathology. In a case of *Distomum lanceolatum* which occurred in Bohemia, the liver was enormously enlarged and the contracted gall-bladder contained eight calculi and forty-seven flukes; the symptoms during life were emaciation, pain over the liver, and distension of the abdomen.

The effects produced by *Bilharzia hæmatobia* are very well defined and exceedingly disastrous. The mature worms in couples inhabit the veins, especially those of the urinary bladder and mesentery; extravasations of blood and villous growths or ulcerations of the mucous membrane of the bladder present themselves, and thus the eggs of the parasite find their way into the urine, in which they are evacuated, and can be detected by microscopic examination. With the characteristic presence of the eggs are associated colic, anæmia, and great prostration of the vital powers, more particularly in the later stages; the disease when once fairly established is almost always fatal; see Cobbold (**1**).

From a practical point of view by far the most important Trematode is *Fasciola* (*Distomum*) *hepatica*, which gives rise to the disease known as "liver rot" in sheep. It is always more or less abundant in certain districts, and it is estimated that in the United Kingdom the annual loss of sheep due to it is not less than 1,000,000. The symptoms are said to be emaciation, tenderness in the loins, harshness and dryness of the wool, and a scaly condition of the skin. On post-mortem examination fluid is found in the peritoneal cavity and the viscera have a blanched appearance; the liver is dark chocolate or sometimes pale in color, nodular, and uneven, the ducts are thickened and Distomes are found within them. Dead flukes have been known to furnish the nuclei of gall-stones in the gall-bladder. Briefly stated, the principal preventive measures seem to be as follows: (1) destruction of the eggs, and especially abstention from putting manure of rotten sheep on damp ground; (2) slaughter of sheep which are badly fluked; (3) adequate drainage of pastures; (4) an allowance of salt and a little dry food to the sheep; and (5) dressings of lime or salt on the ground to destroy the embryos (Thomas, **25**). A series of wet seasons increases the prevalence of the malady, and animals which have been allowed to graze in low-lying ill-drained lands are specially liable to infection—facts which are readily explicable on a consideration of the life-history given above.

Systematic Arrangement.—The *Trematoda* may be classified as follows:

I. MONOGENEA, Van Beneden; development direct, that is, without the mediation of nurse forms.

- (i.) TRISTOMEÆ, Leuckart; body roundish or elongate; posterior extremity never specially developed. Two adoral suckers often present; a large ventral sucker often armed with chitinoid structures. Sexual apertures on the left side or admedian. Laurer-Stieda canal single or double. Ova with a filament at one pole only.
  1. Tristomidæ, Van Beneden.—1. *Tristomum*, Cuvier; about a dozen genera of previous writers are here included; over 14 species are known, all parasitic on fishes; Taschenberg (**30**).
  2. Monocotylidæ, Taschenberg.—1. *Calicotyle*, Diesing; only species *C. Kröyeri* (**31**). 2. *Pseudocotyle*, Taschenberg. 3. *Monocotyle*, Taschenberg; only one species, *M. myliobatis*, on the gills of the eagle-ray (*Myliobatis aquila*).
  3. Udonellidæ, Johnston.—1. *Udonella*, Jhnst.; five species, the type being *U. caligorum*, parasitic on a crustacean (*Caligus*), which in its turn infests the holibut (*Hippoglossus vulgaris*).
- (ii.) POLYSTOMEÆ, Leuckart; body elongate, pointed and narrow anteriorly; broad behind and generally provided with special organs of adhesion in the shape of suckers or chitinoid hooks, of suckers or claspers with chitinoid structures. Two adoral suckers in some instances. Sexual apertures median. Laurer-Stieda canal single or double. Male sexual aperture often armed with chitinoid hooks. Ova frequently provided with two long appendages.
  1. Octobothriidæ, Taschenberg.—1. *Octobothrium*, Nordmann; about a dozen genera of various authors are here included by Taschenberg (**30**), containing fourteen species, parasitic on fishes, and almost invariably on the gills. 2. *Anthocotyle*, Hesse and Van Beneden; one species (*A. merlucii*), found in the hake. 3. *Phyllocotyle*, Hesse and Van Beneden; one species, from the gurnard. 4. *Platycotyle*, Hesse and Van Beneden; one species, from the gurnard. 5. *Pleurocotyle*, Gervais and Van Beneden (= *Grubea cochlear*, Dies.); one species, from the gills of the mackerel. 6. *Diplozoon*, Nordmann (see below). 7. *Hexacotyle*, Blainville; one species, from *Thynnus brachypterus*. 8. *Plectanocotyle*, Dies.; from the gills of *Labrax mucronatus*.
  2. Polystomidæ, Van Beneden.—1. *Polystomum*, Zeder; two species, best known *P. integerrimum* (see below). *Hexathyridium* is probably a synonym. 2. *Onchocotyle*, Dies.; five species, from the gills of sharks and rays. 3. *Erpocotyle*, Hesse and Van Beneden; one species, from the gills of *Mustelus lævis*. 4. *Diplobothrium*, F. S. Leuckart; one species, from the gills of a sturgeon.
  3. Microcotylidæ, Taschenberg.—1. *Axine*, Abildgaard; two species. 2. *Microcotyle*, Van Beneden; about half a dozen species, all parasitic on the gills of fishes (see below). 3. *Gastrocotyle*, Hesse and Van Beneden; one species, from the gills of *Caranx trachurus*. 4. *Aspidogaster*, Von Baer (see below). 5. *Cotylaspis*, Leidy; one species, occurring in *Anodonta*. 6. *Aspidocotyle*, Dies.
  4. Gyrodactylidæ, Van Beneden.—1. *Gyrodactylus*, Nordmann (see below). 2. *Dactylogyrus*, Dies.; about twenty species all parasitic on fishes, mostly on the gills. 3. *Tetraonchus*, Dies.; three species, on the gills of fresh-water fishes. 4. *Diplectanum*, Dies. 5. *Calceostomum*, Van Beneden; one species, on the gills of *Sciæna aquila*. 6. *Sphyranura*, Wright (**34**, **45**); one species, from the mouth of *Menobranchus lateralis*.

II. DIGENEA, Van Beneden; one or more non-sexual forms intervene between two successive sexual forms.

- (i.) MONOSTOMIDÆ, Van Beneden; elongate, oval, or rounded in shape; one oral sucker.—1. *Monostomum*, Zeder; fifty to sixty species in mammals, birds, and fishes; type, *M. mutabile*, Zeder, found in the body-cavity and eye of water-birds. 2. *Notocotyle*, Dies.; *N. triseriale*, Dies. (= *Monostomum verrucosum*).
- (ii.) DISTOMIDÆ, Van Beneden; body flattish, more or less leaf-like or elongate; an oral and a ventral sub-median or posterior sucker.—1. *Distomum*, Retzius (see below). 2. *Fasciola*, Linn.; three species are known; *F. hepatica* is described above; *F. gigantea* inhabits the liver of the giraffe. 3. *Bilharzia*, Cobbold (= *Gynæcophorus*, Dies.); one species (see below). 4. *Echinostomum*, Dujardin; *E. gadorum*, Van Beneden, in the intestine of *Gadus carbonarius* (the coal-fish), and twenty-five other species in the alimentary canal of mammals, birds, and fishes. 5. *Amphistomum*, Rudolphi; about twenty species in different Vertebrates; *A. subclavatum* (Göze) in the rectum of the frog. 6. *Gastrodiscus* (?), Leuckart (see also **37**). 7. *Homalogaster*, Poirier (**38**). 8. *Gastrothylax*, Poirier. 9. *Eurycœlium*, Brock (**44**), has the excretory vessels dilated into wide chambers (? cœlom).
- (iii.) GASTEROSTOMIDÆ, Von Siebold; oral sucker sub-median and ventral; also an anterior sucker.—1. *Gasterostomum*, Von Siebold; eight species, all in fishes; larval form *Bucephalus* (see below).
- (iv.) HOLOSTOMIDÆ, Claus (**43**); body flattened, and divided into an anterior and posterior part, the former bearing an anterior and ventral sucker; two adoral lobes with glands in connection, or a circumoral fold with lobes.—1. *Holostomum*, Nitzsche; twenty-three species, most in water-birds; *H. variabile*, in various raptorial birds; larval forms *Tetracotyle* and *Diplostomum*. 2. *Hemistomum*, Dies.; three species, one in the wild-cat, two in birds. 3. *Eustemma*, Dies.

The true position of the following is doubtful: *Nematobothrium*, Van Beneden (**9**); *Didymozoon*, Von Linstow (**30**); *Stichocotyle*, Cunningham (**39**).

Diplozoon paradoxum (**18**) infests the gill of the minnow in large numbers. The eggs hatch in the water, continuing to be attached to the gill by a filament at one extremity. The embryo is elongated oval in shape, and ciliated all over; on its back are two eyes, consisting of a cup-shaped mass of pigment, with a spheroidal lenticular body. It presents also the mouth with two peculiar suckers, the œsophagus and intestine, and the two claspers of the *Diporpa*. The embryo swims vigorously about until it finds its way to the gill of a minnow, failing which it dies in about six hours. Attached to its host it may live isolated for a considerable time, increasing in size; usually, however, it unites with another individual in a kind of reciprocal copulation (Fig. 3, A). One individual by means of its ventral sucker seizes the dorsal papilla of another, and then the two twist across each

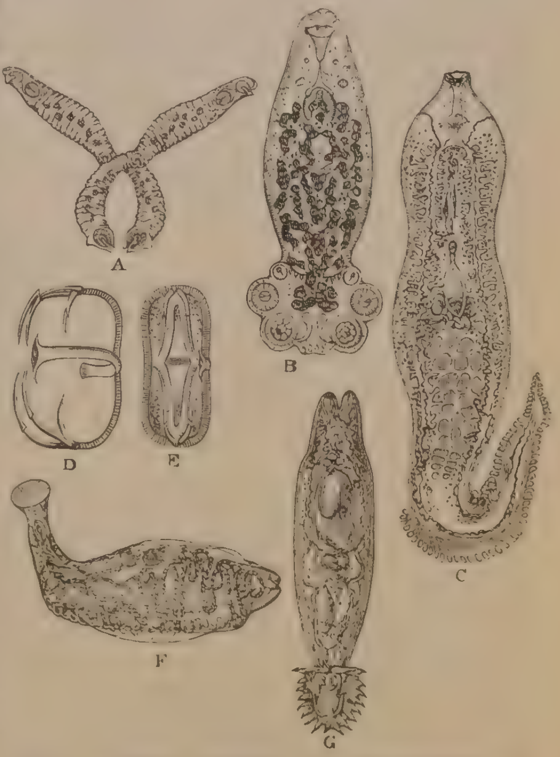

FIG. 3.—A, *Diplozoon paradoxum;* two united specimens. B, *Polystomum integerrimum;* × about 100 (after Zeller). C, *Microcotyle mormyri;* × 7. D, E, two views of the chitinous framework of a sucker of *Axine belones;* highly magnified (after Lorenz). F, *Aspidogaster conchicola;* × about 25 (after Aubert). G, *Gyrodactylus elegans;* × about 80 (after Wagener).

other so that the sucker of the second seizes the papilla of the first. After this a complete fusion of the individuals takes place, the papillæ and suckers growing together so firmly as to be anatomically inseparable. Both individuals continue to grow and develop a second, third, and sometimes a fourth pair of claspers.

In *Polystomum integerrimum* (**18**), which inhabits the bladder of the frog, the eggs are developed during the winter and are laid in the spring, when the frogs resort to the water. It appears probable that the worm protrudes its body from the frog and thus deposits the egg directly in the water. The young worm, as it escapes from the egg, which takes place after a lapse of six or eight weeks, measures about 0.3 mm. in length, and swims vigorously about by the aid of a coating of cilia. At its posterior extremity is a rounded disk (Fig. 3, B), round the margin of which sixteen delicate hooks are placed at equal intervals. Above the four hindmost of these are two others still smaller and more delicate. Upon the back are situated four eyes disposed in pairs. The mouth is wide and leads into a pharynx, and this into the intestine; two excretory vessels are present, but there is no trace of generative organs. The hindermost pair of suckers is the first to be developed, and they enclose those two hooks which lie at the outer side of the very delicate ones mentioned above, which eventually become the strong terminal hooks of the adult. The other two pairs of suckers are formed in a similar manner, the development of all three being usually completed during the month of July. The young *Polystomum* attacks not the full-grown frog but the tad-pole, entering the gill-cavity and subsequently proceeding to the bladder. Like the frog it requires four or five years to attain sexual maturity. In certain cases the *Polystomum* does not migrate; it then becomes prematurely sexual and dies when the tadpole undergoes metamorphosis; under these circumstances the sexual organs are simpler than usual; the testis is simple; the germarium is long and coiled; there is neither prostate nor Laurer-Stieda canal; and the oviduct has no dilated anterior portion.

Microcotyle mormyri, Lorenz (**21**) (Fig. 3, C), has no penis, the semen issuing by an opening posterior to the spiked birth-opening; the vagina opens medially, not marginally. The posterior extremity is pointed. *Axine belones*, Abildg., resembles it, but is broad and obliquely truncated behind, this margin bearing a row of fifty to seventy peculiar attaching organs, which are of the form of a hand-satchel (Fig. 3, D, E), the metal clasp being represented by a complicated chitinous framework. There are four groups of hooks and one ring of the same round the genital opening. The mouth has a sucker at either side, and above it an oval body which can be evaginated like the proboscis of a Dendrocele Planarian.

Aspidogaster conchicola (**32**) is found in the pericardial cavity of the freshwater mussel; it is conical anteriorly with a terminal oral sucker; the ventral sucker is very large and divided into rectangular areas; the excretory pore is at the posterior extremity of the body, and the genital organs open on the left side of the fore-part of the animal (Fig. 3, F).

Gyrodactylus elegans (**33**) is found on the fins and surface of the body of the pike, stickleback, and other freshwater fishes, and measures about 0.5 mm. in length; it is flattened in form and tapers towards either end (Fig. 3, G). At the anterior extremity are two lappets, while the posterior is furnished with a sub-triangular plate, which bears the organs of attachment in the shape of two large curved hooks in its centre and sixteen smaller ones on its circumference. The most interesting peculiarity, however, of this form is to be found in the fact that each embryo before it is extruded (the animal is viviparous) contains another embryo, and this in its turn another, so that three embryonic generations are present simultaneously.

The genus *Distomum* is by far the most extensive in the group, containing at the present time over 300 species, which occur almost exclusively in Vertebrates; the most important are perhaps *D. lanceolatum*, which inhabits the same situations as *Fasciola hepatica*, *D. clavigerum*, from the frog, and *D. militare*, Van Beneden, from the intestine of the duck. The name *Fasciola* (Linn.) has the priority over *Distomum* (*Distoma*) of Retzius, which, however, has obtained extensive currency. The name *Fasciola* may appropriately be used in a restricted sense for forms which have a branched digestive tract, *F. hepatica* above described being taken as the type. This separation has not met with general recognition, although supported by Blanchard and Cobbold (**1**). Weinland has proposed to substitute the term *Dicrocœlium*, used by Dujardin, for *Distomum*, retaining *Fasciola* for the type-species, but this proposal has not met with acceptance. The Distomes vary in size from forms almost microscopic to those which, like *D. ingens*, Moniez (**35**), measure 6 cm. long in alcohol, or even 12.5 cm. in the fresh condition (*D. gigas*, Nardo). *Distomum halosauri*, Bell (**36**), is parasitic upon a deep-sea fish taken in 1090 fathoms. *Distomum macrostomum* (Fig. 4, B) of the woodpecker (*Apternus tridactylus*) has a remarkable larval form known as *Leucochloridium paradoxum*, which is parasitic on *Succinea putris*, and consists of a number of branching threads, from which are developed one or two contractile sacs (Fig. 4, C, D). Their growth distends the tentacle until it bursts and the sac hangs outwards. The threads within the *Succinea* contain only granular cells, whilst the contractile sac is occupied by an organism ovoid in form, with a thick clear border, the rudiments of two suckers, a digestive tract, and excretory system.

Bilharzia hæmatobia, Cobbold (**1**), is one of the most dangerous human parasites, and occurs in the blood of the portal vein and in the veins of the mesentery and bladder. The sexes are distinct, the female being from 16 to 20 mm. in length, and somewhat resembling a Nematode on superficial examination. The male is only from 10 to 14 mm. in length, but much thicker. The surface of the female is covered with fine spines most distinct towards the tail; at the anterior pointed extremity is the oral sucker, from which a narrow opening leads into a wide pharynx, followed by the intestine, which at first forms two branches, these again uniting posteriorly to the generative organs. The ventral sucker is placed only 0.2 mm. behind the oral one, and it is immediately succeeded by a long narrow groove, which extends down the ventral surface and corresponds to the canalis gynæcophorus of the male (see Fig. 4, A).

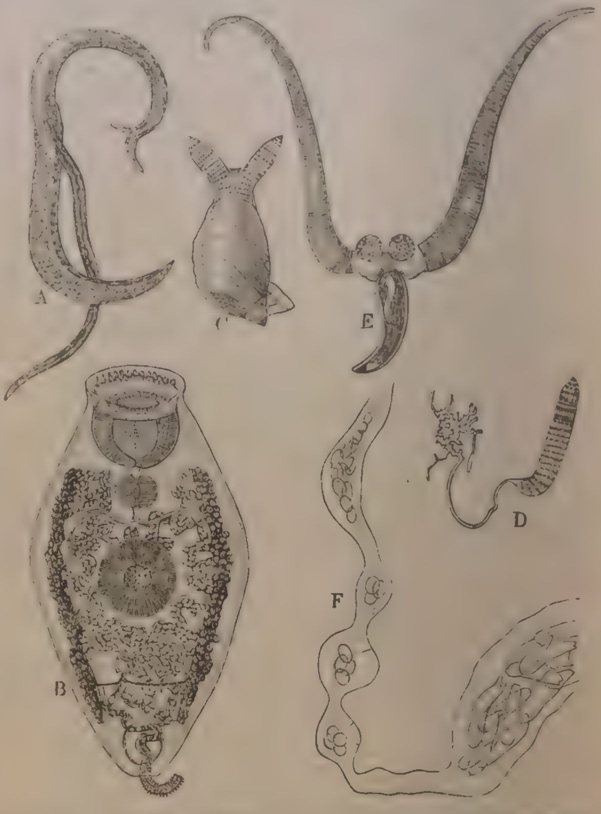

FIG. 4.—A, *Bilharzia hæmatobia*, the thin female in the gynæcophoric canal of the stouter male; × 15 (after Leuckart). B, *Distomum macrostomum*, showing the digestive and the greater part of the genital apparatus with the cirrus protruded; × 30. C, Snail (*Succinea*), the tentacles deformed by *Leucochloridium*; natural size. D, *Leucochloridium* removed from the tentacle; natural size (after Zeller). E, *Bucephalus polymorphus*; highly magnified (after Ziegler). F, Portion of a sporocyst containing *Bucephali* in process of development; × about 50 (after Lacaze-Duthiers).

The stages in the life-history of *Gasterostomum* are so remarkable that a short account of them must be given. From the egg there escapes (1) a club-shaped embryo, which in a manner hitherto unobserved enters the freshwater mussel, *Anodonta* or *Unio*, where it forms (2) the sporocyst (Fig. 4, F); this is several centimetres long and provided with lateral branches; it occurs chiefly in the liver and ovary, and it is best developed near the skin. The wall of the sporocyst consists of cells, muscles, and perhaps a cuticle; the extremities are pointed and filled with cells, and it is here that growth takes place. Within moniliform dilatations of these ramified tubes are formed balls of cells, each of which develops into (3) a "bucephalus." This organism (Fig. 4, E) consists of a small oval body about 0.25 mm. in length with a double tail. At one extremity is a mass of glands with an invagination of the integument, which has been mistaken by many observers for the alimentary canal. This, however, opens about the middle of the body, and consists of a muscular pharynx, a forwardly directed œsophagus, and a simple saccular intestine. The excretory system terminates in an S-shaped vesicle, which opens posteriorly in such a way that its contraction drives the fluid into the tail, whence it probably finds its exit by osmosis. Traces of genital organs are found in the form of an elongated plug of cells in the hinder fourth of the body, and two rounded masses of undifferentiated cells situated dorsally. The tail is double, and from about 0.5 to 2.5 mm. long according to its state of contraction. Each half consists of a spheroidal basal portion, and an elongated tapering filament. These caudal appendages contain many nucleated connective-tissue cells with fine protoplasmic processes. The larvæ swim freely in the water, but sink and perish after about twelve hours, unless they enter the mouth of certain fishes (*e.g.*, *Leuciscus erythrophthalmus*), when (4) they lose their tails and become encapsuled under the skin. The generative organs now become further developed; cuticular spines and the anterior sucker are formed. If the fish thus infected be swallowed by a pike or perch the cyst is dissolved, and the worms (5) become adult, continue to live in the intestine, and produce eggs. For further details, see Ziegler (**12**).

Phylogenetic Relations.—The detailed comparisons of Van Beneden (**9**) and the subsequent researches of others leave no doubt that the *Trematoda* are closely related to the *Cestoda*. A consideration of their peculiarities leads moreover to the opinion that the former are more primitive than the latter; that is to say, the common ancestors of the two groups resembled Trematodes rather than Cestodes. The ancestry of the *Trematoda* is probably to be sought in types such as the Planarians rather than the Leeches; characters uniting them with the former are the possession of a commonly branched alimentary canal without an anus, but with a powerful pharynx; the generative system is hermaphrodite, and similar arrangements obtain in the excretory vessels, nerves, and muscles, while histological agreements also are not wanting. Furthermore, certain forms are known which help to fill up the gap between the two groups: *Monocelis caudatus* has a discoid posterior organ of attachment, and *M. protractilis* a true sucker. Such forms as these could scarcely be distinguished from ectoparasitic Trematodes except for their ciliated epithelium (Leuckart, **1**). In this connection, however, it is worth while to call attention to the researches of Fewkes (**40**) on a marine cercaria, which had a tail distinctly annelid in character, with bundles of bristles disposed at intervals along it. Compare also Schauinsland (**41**).

TRENCH, RICHARD CHENEVIX (1807–1886), archbishop of Dublin, poet, scholar, and divine, was born at Dublin, September 9, 1807, and graduated at Trinity College, Cambridge, in 1829. While incumbent of Curdridge Chapel, near Bishop Waltham in Hampshire, he published (1835) *The Story of Justin Martyr and other Poems*, which, having been very favorably received, was followed in 1838 by *Sabbation, Honor Neale, and other Poems*, and in 1842 by *Poems from Eastern Sources*. These volumes revealed the author as decidedly the most gifted of the immediate disciples of Wordsworth, with a warmer coloring and more pronounced ecclesiastical sympathies than the master, and strong affinities to Tennyson, Keble, and Milnes. In 1841 he resigned his living to become curate to Samuel Wilberforce, then rector of Alverstoke, and upon Wilberforce's promotion to the deanery of Westminster, in 1845, he was presented to the rectory of Itchenstoke. In 1845 and 1846 he preached the Hulsean lecture, and in the former year was made examining chaplain to Wilberforce, now bishop of Oxford. He was shortly afterwards appointed theological professor and examiner at King's College, London. In 1851 he established his fame as a philologist by his charming little work on *The Study of Words*, originally delivered as lectures to the pupils of the Diocesan Training School, Winchester. His purpose, as stated by himself, was to show that in words, even taken singly, "there are boundless stores of moral and historic truth, and no less of passion and imagination laid up"—a truth enforced by a number of most apposite illustrations. The book may be regarded as a comment on the saying that "language is fossil poetry." It was followed by two equally delightful little volumes of similar character—*English Past and Present* (1855), and *A Select Glossary of English Words* (1859). All have gone through numerous editions, and they have probably contributed more than all the labors of severer but less cultured and tasteful philologists to promote the historical study of the English tongue. Yet Trench did little more than indicate the existence of a vast region of research extending over all literary languages. Another great service to English philology was rendered by his paper, read before the Philological Society, "On some Deficiencies in our English Dictionaries" (1857), which gave the first impulse to the great enterprise now proceeding under the auspices of Dr. Murray. His advocacy of a revised translation of the New Testament (1858) powerfully aided to promote another great national undertaking. In 1856 he published a valuable essay on Calderon, with a translation of a portion of *Life is a Dream* in the original metre. He had not, meanwhile, been forgetful of professional claims upon his pen. In 1841 he had published his *Notes on the Parables*, and in 1846 his *Notes on the Miracles*, works which, containing much to gratify every school of thought, and little to offend any, obtained the most extensive popularity, and have been resorted to by English theologians of all persuasions, who have turned the author to the same account as he has turned his patristic, Romanist, and Lutheran predecessors. There is, in fact, very little originality in these volumes, but they are treasuries of erudite and acute illustrations, selected from various quarters with admirable judgment, and displayed with consummate taste.

In 1856 Trench was raised to the deanery of Westminster, probably the position in the whole church which suited him best. In January, 1864, he was advanced to the more dignified but less congenial post of archbishop of Dublin. Stanley had been named, but rejected by the Irish Church, and, according to Bishop Wilberforce's correspondence, Trench's appointment was favored neither by the prime minister nor the lord lieutenant. It was, moreover, unpopular in Ireland, and a blow to English literature; yet the course of events soon proved it to have been most fortunate. Trench, indeed, could do nothing to prevent the disestablishment of the Irish Church, though he resisted with dignity, and repelled the insidious proposal that she should do execution upon herself. But, when the disestablished communion had to be reconstituted under the greatest difficulties, it was found of the highest importance that the occupant of his position should be a man of a liberal and genial spirit, able to ward off the narrowness which would have alienated the sympathies of English churchmen, and sown the seeds of schism in a body beyond all others in need of amity and unity. This was the work of the remainder of Trench's life; and, if less personally agreeable and of less general utility than the literary performances which might have been expected from him if he had remained at Westminster, it was much more weighty and important. It exposed him at times to considerable misconstruction and obloquy, but he came to be appreciated, and, when in November, 1884, he resigned his archbishopric from infirmity, clergy and laity unanimously recorded their sense of his "wisdom, learning, diligence, and munificence." He had found time for *Lectures on Mediæval Church History* (1878); his poetical works were rearranged and collected in two volumes (last edition 1885). He died in London, after a lingering illness, on March 28, 1886.

As a man Trench was universally beloved and esteemed. He was remarkable for a high spirit, munificence, and general elevation of sentiment. As a prose author he ranks among the most useful and agreeable of his generation, and may almost be said to gain in both respects by his deficiency in originality. Both as biblical commentator and philologist, he has done far more by popularizing the researches of more exact scholars and more profound thinkers than he could have done by striving to make discoveries of his own. For durable fame as a poet originality is indispensable, and here Trench fails. The style of his poems is frequently admirable, but even when not obviously derived from some other writer it wants the stamp of strong individuality. He has written little beyond the reach of any man uniting exquisite culture to the accomplishment of verse: the pieces where poetry seems a natural language with him are chiefly to be found among his elegiac poems, which express real personal experience, and appeal movingly to the heart. (R. G.)

TRENCK, the name of two barons of old German extraction, who, endowed with exceptional physical powers, and each blending to a singular if not to an insane degree the hero and the Bobadil, have left startling records of not wholly dissimilar adventures and misfortunes.

1. **Franz, Baron von der Trenck** (1711–1749), was born at Reggio, Calabria, where his father was lieutenant-colonel in the Austrian service. After his rough early training in the camp, he made himself so unendurable at the college of Vienna that he was speedily removed, and entered in 1727 as ensign in the Palfy regiment, from which, however, after a brief but riotous course of duelling, gambling, and love-making, he received a new dismissal. He returned to his father, and, on the outbreak of war between the Russians and Turks, raised a corps of 300 men at his own expense and joined the Russian army on the Hungarian frontier. His brilliant exploits won him the favor of his commander, but a breach of orders followed by an assault on his colonel, brought him under sentence of death, from which a daring feat of arms alone saved him. A sentence of exile to Siberia, incurred soon after by a second affray with a superior officer, was commuted to imprisonment at Kieff and expulsion from the country. His term of imprisonment having expired, he retired to his estate, where he armed and drilled his vassals, and in a series of encounters compelled the Slavonian brigands to seek refuge in Turkish territory. From these marauders he recruited in 1740 the formidable body of pandours with which he joined the levies in aid of Maria Theresa. Repulsing the French near Linz, he penetrated into Bavaria, took Deckendorf and Reichenhall, and destroyed Cham,—the conduct of his troops being marked not less by atrocity than by desperate courage. Recalled to Vienna to render account for the cruelties practiced, he refused to defend himself, and, being set at liberty, rejoined his men, opened in 1743 a passage across the Rhine for the army, and became as much the terror of Alsace as he had been of Bavaria. On the retreat of the army to Bohemia he covered the rear and took several towns, but had his right foot crushed by a cannon-ball. Maria Theresa sent him a surgeon, and, having made a species of triumphal entry into Vienna, he resumed his command. But in September, 1745, after having boldly penetrated with his pandours to the tent of Frederick II., he suffered the king to escape him while his followers were stopping to plunder, and he was thereupon accused of having been bribed by that monarch to release him. He was condemned on inquiry to pay an indemnity for peremptory dismissal to the officers accusing him, but he refused to acknowledge the sentence, and, raising new troops, added to the list of his exploits. His conduct leading to a renewal of the inquiry, he laid hands on the president of the court-martial and was thrown into prison, but was enabled to escape by the baroness Lestock, with whom he fled to Holland. He was brought back to Vienna, and condemned to perpetual imprisonment in the Spielberg, where, finding escape impossible, he poisoned himself, October, 1749, at the age of 38.

See his autobiography—*Merkwürdiges Leben und Thaten des Freiherrn Franz von der Trenck*, Vienna, 1770; also, *Franz von der Trenck*, by E. F. Hübner, with preface by Schubart, 3 vols., 1788.

2. **Friedrich, Freiherr von der Trenck** (1726–1794), cousin of the preceding, born at Königsberg, 16th February, 1726. His precocious abilities won him the favor of Frederick the Great, in whose guards he was enrolled at an early age as cadet, and by whom he was made cornet in 1743 and aide-de-camp for his gallantry in 1744. An intrigue with the princess Amelia, sister of the king, led to his temporary confinement until the campaign of 1745 recalled him to the army. He was again thrown into prison, however, on the discovery of a correspondence between him and his cousin, then fighting with his pandours in the service of Maria Theresa, but in December, 1746, after many failures, he succeeded in escaping from the fortress of Glatz. He went to Vienna, was involved in several duels by his cousin, who was too closely confined to give expression to his animosities except by proxy, and finally accepted a company in the service of the czar. On the declaration of peace the empress Elizabeth bestowed on him a diamond-hilted sword, and a Russian princess left him a fortune, which was still further increased by the death of his cousin, who, on condition of his entering none but the Austrian service, made him his heir. The latter inheritance being heavily burdened, he spent the next three years in a series of lawsuits, and then, after a journey to Italy, became a captain in an Austrian regiment of cuirassiers. At the death of his mother he revisited Germany, but was promptly seized by the unforgetful king and closely imprisoned in the fortress of Magdeburg, his efforts to escape securing him the honor of a specially constructed cell, a heavy burden of chains, and the additional punishment of being roused every quarter of an hour by the sentries. Still unsubdued, he found means to remove his chains in the brief intervals afforded him, and occupied himself with French and German composition. In the meantime the princess Amelia had not ceased to move in favor of his release, and Trenck, having been set free in 1763, returned to Vienna only to be reconfined there as a lunatic. He was speedily released by the intervention of the king, and raised to the rank of major by way of compensation; but, being by this time satiated with royal patronage and prisons, he retired to Aix-la-Chapelle, commenced business as a wine merchant, and devoted his leisure to literature and politics, publishing, among other works, a gazette entitled the *Friend of Man* and an attack on Frederick II. as the "Macedonian hero." His commercial experiences, however, were not encouraging, and, after spending three years (1774–1777) in England, he returned to Vienna, became the secret agent of Maria Theresa, and at her death withdrew to his castle of Zwerbach, where he gave himself to agriculture and wrote his famous autobiography. Not until 1787 was he permitted to return to his own country, where he is said to have had an affecting interview with the princess Amelia a few days before her death. The publication of his memoirs (*Lebensgeschichte*) in 1786, translated into French by himself in 1789, gave him immediate and wide notoriety, and wax effigies of the illustrious prisoner in his chains were exhibited on the Parisian boulevards *à deux sous en sortant*. Despite the grounds which the memoirs undoubtedly furnish for Carlyle's terse characterization of him as an "extensively fabulous blockhead," they took a strong hold of the popular imagination, and obliterated for a time the fame of his more darkly passionate pandour cousin. The tragic elements in the story were, however, to be emphasized by a still more tragic close. His ready advocacy of the French Revolution involved him in disgrace with the Austrian authorities, and, after deprivation of his pension and further imprisonment, he set out towards the close of 1791 for Paris. In place of an enthusias-

tic reception, he was arrested by order of the Committee of Public Safety as a secret emissary of the king of Prussia, and, after confinement in the St. Lazarus prison, was literally dragged to the guillotine on 25th July, 1794. His *Sämmtliche Gedichte und Schriften* were published at Leipsic in 1786.

TRENDELENBURG, FRIEDRICH ADOLF (1802–1872), one of the chief revivers of Aristotelian study in the present century, was born on November 30, 1802, at Eutin, near Lübeck. He received his education at the gymnasium of his native town and at the universities of Kiel, Leipsic, and Berlin, displaying from his earliest years an extraordinary industry and thirst for knowledge. He was introduced to philosophy by König, the rector of the gymnasium, a Kantian; and at Kiel he came under the influence of Reinhold and Von Berger, to the latter of whom, a follower of Schelling, some of his own most characteristic views may be traced. At Berlin he heard Hegel and Schleiermacher; but his university studies lay chiefly in the direction of classics and classical philology under Wachsmuth, Hermann, and Boeckh. The combination of the philosopher and the philologist, together with a definitely historical turn of mind, is what is most distinctive of all Trendelenburg's work. He became more and more attached to the study of Plato and Aristotle, and his doctor's dissertation, published in 1826, was an attempt to reach through Aristotle's criticisms a more accurate knowledge of the Platonic philosophy (*Platonis de Ideis et Numeris Doctrina ex Aristotele Illustrata*). Recognizing the sphere in which his best life-work could be done, he declined the offer of a classical chair at Kiel, and accepted instead a post as tutor to the son of Herr von Nagler, postmaster-general, and an intimate friend of Altenstein, the enlightened minister of education in Prussia. He held this position for seven years (1826–33) occupying his leisure time with the preparation of a critical edition of Aristotle's *De Anima*, and conscientiously extended his knowledge in all directions. His acquaintance with Karl Ferdinand Becker, the philologist and scientific grammarian, was of importance for his own views on the origin of the logical categories and the relation of thought to language. In 1833 Trendelenburg was appointed extraordinary professor in Berlin, and four years later he was advanced to an ordinary professorship. During nearly forty years he proved himself markedly successful as an academical teacher, treating in turn all the usual philosophical disciplines, besides holding more select classes for the study of Aristotle with advanced students. During the greater part of that time he had also to examine in philosophy and pedagogics all candidates for the scholastic profession in Prussia. He died on the 24th of January, 1872.

It was with a view to the philosophical preparation in the gymnasia that he published (1836) his *Elementa Logices Aristoteliceæ*. This useful little book contains a selection of passages from the *Organon*, giving in a connected form the substance of Aristotle's logical doctrine. The Greek text is furnished with a Latin translation and notes, and at a later date Trendelenburg supplemented this book with further explanations for the use of teachers (*Erläuterungen zu den Elementen der aristotelischen Logik*, 1842). The *Elementa* has passed through eight editions, and the *Erläuterungen* through three. In 1840 appeared the first of his important works, which, under the modest title of *Logische Untersuchungen*, develops a coherent philosophical theory, besides acutely criticising other standpoints, and in particular the then dominant Hegelian system. The *Logische Untersuchungen* were, indeed, an important factor in the reaction against Hegel which set in about that time in Germany. Two articles written by Trendelenburg in the controversy which ensued were republished separately, under the title *Die logische Frage in Hegel's System* (1843). A second and enlarged edition of the *Logische Untersuchungen* appeared in 1862, and a third in 1870. In 1846 he published the first volume of his "Historical Contributions to Philosophy" (*Historische Beiträge zur Philosophie*), containing a history of the doctrine of the categories, which forms a pendant to his own elaboration of the same subject in the *Logische Untersuchungen*. A second volume of the "Historical Contributions" appeared in 1855, and a third in 1867, consisting of detached essays on points of interest in the history of philosophy. A number of these are papers originally read before the Prussian Academy of the Sciences, of which Trendelenburg was made a member in 1846. He was secretary of the philosophico-historical section from 1847 till 1871, and devoted much of his valuable time to the duties devolving upon him. A number of his papers dealing with non-philosophical—mainly with national and educational—subjects have been collected in his *Kleine Schriften* (2 vols., 1871). In 1860 the second of his larger works appeared, *Naturrecht auf dem Grunde der Ethik* (second enlarged edition, 1868). In 1865 Trendelenburg became involved in a controversy with Kuno Fischer on the interpretation of Kant's doctrine of space, which was carried on with no little acrimony for a number of years. The war of 1870 drew from him a short treatise on the defects of international law,—*Lücken im Völkerrecht*. He had always had a deeply patriotic interest in the political development of Prussia, and through Prussia of Germany, and in the stormy times after 1848 had even acted for a short period as deputy to the Prussian chamber.

Trendelenburg's philosophizing is conditioned throughout by his loving study of Plato and Aristotle, whom he regards not as opponents but as building jointly on the broad basis of idealism. His own standpoint may almost be called a modern version of Aristotle thus interpreted. While denying the possibility of an absolute method and an absolute philosophy, as contended for by Hegel and others, Trendelenburg was emphatically an idealist in the ancient or Platonic sense; his whole work was devoted to the demonstration of the ideal in the real. But he maintained that the procedure of philosophy must be analytic, rising from the particular facts to the universal in which we find them explained. We divine the system of the whole from the part we know, just as from a torso we may reconstruct a work of art; but the process of reconstruction must, in the case of philosophy, remain approximative. Our position forbids the possibility of a final system. Instead, therefore, of constantly beginning afresh in speculation, it should be our duty to attach ourselves to what may be considered the permanent results of historic development. The classical expression of these results Trendelenburg finds mainly in the Platonico-Aristotelian system. The philosophical question is stated thus —How are thought and being united in knowledge? how does thought get at being? and how does being enter into thought? Proceeding on the principle that like can only be known by like, Trendelenburg next reaches a doctrine peculiar to himself (though based upon Aristotle) which plays a central part in his speculations. Motion is the fundamental fact common to being and thought; the actual motion of the external world has its counterpart in the constructive motion which is involved in every instance of perception or thought. From motion he proceeds to deduce time, space, and the categories of mechanics and natural science. These, being thus derived, are at once subjective and objective in their scope. It is true matter can never be completely resolved into motion, but the irreducible remainder may be treated like the πρώτη ὕλη of Aristotle as an abstraction which we asymptotically approach but never reach. The facts of existence, however, are not adequately explained by the mechanical categories. The ultimate interpretation of the universe can only be found in the higher category of End or final cause. Here Trendelenburg finds the dividing line between philosophical systems. On the one side stand those which acknowledge none but efficient causes,—which make force prior to thought, and explain the universe, as it were, *a tergo*. This may be called, typically, Democritism. On the other side stands the "organic" or teleological view of the world, which interprets the parts through the idea of the whole, and sees in the efficient causes only the vehicle of ideal ends. This may be called in a wide sense Platonism. Systems like Spinozism, which seem to form a third class, neither sacrificing force to thought nor thought to force, yet by their denial of final causes inevitably fall back into the Democritic or essentially materialistic standpoint, leaving us with the great antagonism of the mechanical and the organic systems of philosophy. The latter view, which receives its first support in the facts of life, or organic nature as such, finds its culmination and ultimate verification in the ethical world, which essentially consists in the realization of ends. Trendelenburg's *Naturrecht* may, therefore, be taken as in a manner the completion of his system, his working out of the ideal as present in the real. The ethical end is taken to be the idea of humanity, not in the abstract as formulated by Kant, but in the context of the state and of history. Law is treated throughout as the vehicle of ethical requirements. In Trendelenburg's treatment of the state, as the ethical organism in which the individual (the potential man) may be said first to emerge into actuality, we may trace his nurture on the best ideas of Hellenic antiquity. (A. SE.)

TRENT (*Tridentum;* Ital. *Trento;* Germ. *Trient*), a city of the Austrian empire, capital of Italian or "Welsch" Tyrol, stands on the left bank of the Adige, where it is joined by the Fersina, on the Brenner Railway, 35 miles below Botzen and 60 miles above Verona. It has a very picturesque appearance, especially when approached from the north, with its embattled walls and towers filling the whole breadth of the valley, a conspicuous feature being the rocky citadel of Dos Trento (the Roman *Verruca*) on the right bank of the river. Of the old walls some massive remains are attributed by local tradition to Theodoric the Goth. Notwithstanding many symptoms of decay, Trent, with its numerous palaces, substantial houses, broad streets, and spacious squares, still retains the aspect of a flourishing Cisalpine town. In appearance it is quite Italian, and the inhabitants speak Italian only. The cathedral, on the south side of the spacious Piazza del Duomo, was begun in its present form in 1212, and finished about the beginning of the 15th century. It preserves, however, some Lombardic features of ornamentation in the portals and elsewhere which possibly date from the 7th or 8th century. The church of St. Maria Maggiore, a simple but good example of the Italian style of the 15th century, was the meeting place of the famous council (see below), and possesses a picture containing portraits of the members. Trent is the seat of a prince-archbishop, and has all the public offices according with its administrative rank. It has a museum and library, a gymnasium, a "lyceum," a seminary, and a deaf and dumb institute. The chief industries are silk-spinning and weaving, tanning, sugar-refining, and glass-blowing; and there is considerable trade in wine, grain, and fruit, as also in marble from the extensive quarries in the neighborhood. The population in 1880 was 19,585.

Tridentum is mentioned by the geographers as capital of the Tridentini, and seems ultimately to have been made a Roman colony. It suffered much during the period of barbaric invasion, but was resuscitated by Theodoric, becoming the seat successively of Gothic and Lombard dukes and Frankish counts. In 1027 it passed under the rule of its bishops, with whom it had frequent disputes, in which it sought the favor and alliance of the lords of Tyrol. The Venetians made repeated efforts to set up the lion of St. Mark within the walls of Trent, but were decisively and finally repulsed in 1487.

TRENT, THE COUNCIL OF, which may be described as the watershed of Roman Catholicism and Protestantism, is the most important occurrence in post-mediæval church history. It is the culminating event in a long series of similar assemblies, convoked to remedy the evils occasioned during and by the great schism of the papacy, and by the dissolution of lay and clerical morals to which the pagan temper of the Renaissance had largely contributed. But the councils of Pisa, Constance, Basel, Ferrara-Florence, and the Lateran had met and parted without attempting to deal effectually with any of the practical scandals and abuses in the church which were sapping the loyalty and affection it had formerly enjoyed; and these repeated failures by destroying all hope of redress at the hands of the constituted authorities, precipitated the crash of the Reformation, which was in its inception scarcely concerned with doctrinal issues directly, but aimed mainly at faults of administration and morals.

Consequently a largely new problem presented itself for solution, and necessitated a fundamental change in the attitude of those concerned. Hitherto, whatever may have been the fierceness and bitterness of the disputes which the 15th century councils had attempted to allay, they were, so to speak, family quarrels between members of the same great household, accustomed to the same mode of looking at religious questions, acknowledging the same hierarchy, and accepting the same standards, and thus with a vast body of agreement to go upon as a basis of reconciliation, leaving only comparatively minor details to be adjusted. But the German and Swiss Reformation had generated new communions, novel alike in their polity and much of their theology, and in active revolt, not merely against this or that detail or abuse, but against the Roman Catholic Church in its entirety, hierarchical, doctrinal, and political. The movement had not been confined long to its earlier limits, but had spread over all western Europe, had virtually conquered Holland and Scandinavia, was making great strides in France and England, and was beginning to threaten even Italy and Spain. Thus, the task was no longer the comparatively simple one of satisfying the demands of friendly remonstrants, but of winning back alienated nations, and, if that were too much to hope for, at least of saving the remnant of the Roman obedience from further disintegration. And for this purpose it was no longer sufficient, as it would have been a few years earlier, to discuss administrative details alone, but a review of the whole theological fabric of Latin Christianity, no part of which had been left wholly unimpeached, became a necessary factor in any possible scheme of reconciliation. True, a precedent had been set in the theological discussions at the council of Ferrara-Florence, with its abortive effort to reunite Oriental and Latin Christendom, but the area and number of differences to be reconciled upon that occasion were incomparably smaller than those which had subsequently arisen, and the situation was thus one of extreme difficulty and delicacy, since there was always the danger of alienating many who had continued loyal so far, if very large concessions were made to the revolted Protestants, not a few of whom, besides, had already passed beyond the possibility of reconciliation. But, on the other hand, Luther had himself appealed to a general council from the bull "Exsurge Domine" launched at him by Leo X. in 1520, and his demand was taken up by the emperor and the princes of Germany, whether Catholics or Protestants, as the only conceivable means of terminating a crisis whose religious and political results might prove far more serious than even the least hopeful ventured to forecast. There was thus steady pressure from one side put upon the Roman curia to obtain the convocation of such a council, while scarcely less resistance to the proposal was offered by two very unlike parties in the Roman Church itself. For not only did those oppose it who were interested in the maintenance of the principal abuses complained of, and who feared that sweeping measures might be taken for their abolition, but some of the ablest champions of internal reforms, such as Cardinals Sadolet, Contarini, and Reginald Pole, were equally hostile to it, for the very different reason that they believed any such council likely to contain a majority determined on making it as abortive as those great synods had been which were fresh in the memory of all. Accordingly, this section gave its voice for the alternative scheme of proceeding by way of less formal conferences, at which mutual explanations and concessions might be made by Catholics and Protestants, whereby a *modus vivendi* could be established, with less chance of the whole effort being wrecked by the intrigues of those who desired nothing less than practical reforms. A fresh difficulty was presented by the opposition of the German princes to the assemblage of the council at Rome or anywhere outside Germany, as they distrusted the probable action of the Italian element, certain to preponderate in that event; and, as the curia was equally bent on holding it within the sphere of direct papal influence, this dispute made it impracticable to agree even on the preliminaries during the pontificates of Hadrian VI. and Clement VII. The diet of Spires in 1529 renewed the demand for a general council, to be held in some large German city; and the diet of Augsburg in 1530 summoned the Lutherans to return into Catholic communion at once and unconditionally, leaving their doctrines (formulated in the Confession of Augsburg that very year) to be judged of in a future council, which the emperor Charles V. pledged himself to obtain within a brief space. Clement VII., then pope, was displeased at this initiative on the emperor's part, but offered to convoke a council in some Italian city, such as Mantua or Milan, belonging to the empire, and outside the States of the Church,—expressing his wish that Charles V. should personally attend it. But he hampered this proposal with conditions which made it valueless for the main object of such an assembly, by declaring that no theological questions upon which the church had spoken could be reopened, and that, if Protestants were to be admitted to the council at all, it must be, not as disputants, but as on their trial, and pledged beforehand to submit to the decisions of the council. No result, consequently, followed upon this step, nor was an embassy which Clement sent in 1533 to the German princes and to the kings of France and England with very similar provisions more successful, for it merely drew out a peremptory rejection of the scheme from the Protestants assembled at Schmalkald, by the emperor's desire, for the purpose of discussing it. So the matter rested till the accession of Alexander Farnese to the papal throne as Paul III. in 1534. A much abler man than his predecessor, he was also more alive to the imperative need of at least appearing to approve some measure of reform, if the church was to be saved from impending dangers (indeed, a report on this subject, drawn up at his desire by a committee of cardinals in 1536, is one of the most important documents of the era), and he was thought to be favorable to the project of a council, whereas there is little doubt that Clement VII. had weighted his acceptance of the plan with impossible conditions, in order to avoid its realization, yet so as to let the responsibility of refusal rest with others than himself. Paul III. sent Vergerio as envoy into Germany, to confer with the emperor and the princes, offering to convoke a council at Mantua, and urging the danger of attempting to hold it in Germany, by reason of the violent lengths to which the Anabaptists were then proceeding. But, while the Catholic princes were content with this offer, it was refused by the Protestants, and the embassadors of France and England supported them in their attitude. Vergerio, who had also a fruitless interview with Luther, returned to Rome early in 1536, but Paul III. was not discouraged by his failure, and proposed, in a consistory on April 8, to convoke a council at Mantua. This plan was in turn upset, not only by the continued resistance of the Protestants, but by the refusal of the duke of Mantua to permit the use of his city for such a purpose, unless upon conditions which the pope was unwilling to accept. Notice was accordingly given of a council to be opened at Vicenza on May 1, 1538, and legates were despatched thither to make the preliminary arrangements, and to preside so soon as the members should assemble. But when the appointed time was only five days off not one bishop had arrived, and the pope was forced to prorogue the council again and again. Meanwhile, the method which Contarini and Sadolet had recommended, that of conferences between the Catholics and Protestants, was being acted on in Germany, and meetings of this nature were convened successively at Haguenau, Worms, and Ratisbon, at the last of which, in 1541, Contarini was present as legate of the pope, and showed so much tact, moderation, and sympathy that he succeeded in securing a large measure of agreement upon the controversies in dispute, notably on the vexed question of Justification. But, as his concessions and explanations were promptly repudiated at Rome, no practical result followed. In 1542, Paul III. sent Morone as his envoy to the diet of Spires to offer Trent as his final concession of the place of assembly, on the ground that its position in Tyrol, and its being part of the dominions of the king of the Romans, ought to meet all the reasonable requirements of the German princes. Ferdinand, king of the Romans, who presided at the diet, was content with this offer, as were the Catholic princes generally, but the Protestants continued to object, and refused any council which should not be completely free from papal influence and authority. However, the pope issued, on May 22, 1542, a bull appointing the meeting of the council for November 1 following. He sent three legates to Trent to make preparations,—Morone, Parisio, and Reginald Pole; but they did not reach the city till three weeks later than the appointed date for opening the council, and so few bishops arrived during seven months from that time that it was necessary to prorogue the assembly. In fact, the idea of the council was distasteful to a very large proportion of the Latin clergy, especially such as apprehended danger to their private interests from the reforming plans of the pope, and also such as were alarmed lest serious religious innovations might be made in order to conciliate the Protestants. While this delay continued, another diet at Spires in 1544 resulted in great advantages to the Lutherans, who availed themselves of the political straits of Charles V. to extort several important concessions from him. The obnoxious edicts passed against them at Worms and Augsburg were rescinded; they were permitted to retain such ecclesiastical property as they had seized; they were made eligible for such civil and ecclesiastical offices as had been previously barred against them; and general toleration for the time being was established. This policy was extremely distasteful to the pope, who addressed a brief to the emperor, strongly remonstrating against it, and renewing his offer of a council. Charles V., who had not been a free agent in the matter, was much of the pope's mind, and proceeded to relieve himself of one difficulty in the way of reversing his action, by concluding peace with Francis I. of France on September 8, 1544. Hereupon Paul III. directed public thanksgivings to be offered throughout the whole Latin Church, and issued a bull removing the suspension of the council, and summoning it to meet at Trent on March 15, 1545. Unable from age and illness to be present himself, as he had wished, he named Giammaria del Monte, bishop of Palestrina (afterwards Pope Julius III.), Marcello Cervini (afterwards Pope Marcellus II.), and Reginald Pole as his legates. The experience of former abortive openings was repeated, for they found but one bishop awaiting them, and so few continued to arrive that a fresh prorogation was forced upon the legates, and the pope, in the bull authorizing this action, added a proviso that no proxies should be received, but that all bishops summoned should attend in person, under severe penalties for contumacy. On November 7, 1545, the legates received final instructions to open the council upon December 13, and did so with solemn ceremonial, but only as a formal initiative of the proceedings, for the first session was postponed till January 7, 1546. When that time arrived, no more than some five and twenty archbishops and bishops, five generals of religious orders, and the ambassadors of King Ferdinand had assembled, and none of the conciliar officers had yet been nominated, nor any programme of procedure sketched out. The most important question arising under this last head was whether the voting should be taken by nations, as at the council of Constance, or by individuals, and the matter was referred to the pope, who gave his decision for the latter, as at once the more ancient (since Constance and Basel were the only precedents for the national vote) and the more convenient. Moreover, this ruling secured from the outset a working majority of Italian bishops in the assembly, at once by reason of the small size of the average Italian diocese, and of the greater ease with which Trent could be reached from Italy than from any other country which sent representatives thither, besides enabling the pope to swell the majority (as in the Vatican council three centuries later) with bishops *in partibus*, having no dioceses or jurisdiction, thus amply justifying the objection taken all along by the German Protestants to the assemblage of the council anywhere outside Germany.

Some preliminaries had to be settled before the second session, and the plan of holding private "general congregations," where theologians of non-episcopal rank could sit and share in the discussion and preparation of the decrees to be proposed and voted on in public session, was at once adopted and observed thenceforward. And first, the question was raised whether any persons except bishops should be allowed to vote upon matters of doctrine. The decision was that the vote should be allowed to the generals of religious orders also, and that the right of the proxies of absent bishops to vote should be referred to the pope. The title to be given to the council at the head of the decrees in each session was then discussed, and a proposal to add the words "representing the church universal" (as at Basel and Constance) to the usual formula "general and œcumenical" was rejected at the instance of the legates, as indirectly menacing to papal autocracy. The legates, also privately informed the pope that the majority of the members desired to take up the question of practical reforms before that of doctrine, and that it might be necessary to yield the point to avoid scandal or the imputation of sympathy with abuses, but that they would insist, in that case, on making the measures of reform apply all round, to princes and laymen as well as to ecclesiastics which would probably damp the ardor of its advocates.

The actual business of the second session (January 7, 1546) was confined to the promulgation of a decree touching the discipline to be observed by the members of the council during its progress, as well in the matters of their private devotion and their food as in the conduct of the debates. The congregations which preceded the third session were mainly occupied with debating the thorny question of the order in which the discussion of faith and of discipline was to come, and it was at last agreed to take them simultaneously.

So few additional bishops had arrived up to this time that it was judged inexpedient to promulgate any decrees in the third session (February 4, 1548), and little was done except the public recitation of the Niceno-Constantinopolitan creed as the authoritative confession of the Roman Church, and as the council worded it, "that firm and only foundation against which the gates of hell shall not prevail." A fortnight after this third session Martin Luther died (February 18, 1546) just as the situation in Germany was becoming more strained, and the emperor, alarmed at the rapid advance of Reformed opinions and practices (notably in the Palatinate, where the elector had made large concessions), was taking measures for suppressing the religious revolt by force of arms. The canon of Scripture was proposed in the congregations before the fourth session as the subject for discussion, and the three following questions were raised: (1) Were all the books of both Testaments to be approved and received? (2) Was there to be a fresh inquiry into their canonical character before giving such approval? (3) Should there be any distinction drawn between the books, as being some of them read merely for moral instruction, and others for proving the doctrines of Christian belief? The first of these questions was decided affirmatively. The second led to much debate; the conclusion arrived at was that a secret examination of the evidence should be made, but not suffered to appear in the public acts of the council. The third question was decided negatively. These congregations were the first wherein theological experts and canonists, not being members of the council, were admitted to a share in the discussions. The nature and function of tradition was also debated at this time, and the legates informed the pope that there was a strong tendency in the council to set it aside altogether, and to make Scripture the sole standard of appeal. Another burning question debated was that of vernacular translation and lay study of Scripture. The result, in the fourth session (April 8, 1546), was the promulgation of two decrees, the first of which enacts, under anathema, that Scripture and tradition are to be received and venerated equally, and that the deutero-canonical books are part of the canon of Scripture. The second decree declared the Vulgate to be the sole authentic and standard Latin version, and gave it such authority as to supersede the original texts; forbade the interpretation of Scripture contrary to the sense received by the church, "or even contrary to the unanimous consent of the fathers;" imposed various restrictions upon printers and vendors of Bibles; made licenses to read any Biblical manuscript or publication compulsory; and prohibited the application of Scripture language to profane and superstitious purposes. The subjects next taken up were the doctrine of original sin and the reformation of abuses concerned with preachers and lecturers, which were made the matter of two decrees in the fifth session (June 17, 1546). The most noticeable point in the former is the saving clause, whereby the tenet of the Immaculate Conception of the Blessed Virgin is excepted from decision, and left open; the latter enjoins the erection of a lectureship of Scripture in all cathedrals, collegiate churches, and monasteries, imposes the duty of preaching upon all bishops and persons with cure of souls, lays down stringent rules as to preaching licenses, and forbids the "questors" (that is, the collectors of alms commissioned by the mendicant orders) to preach anywhere. There was a treaty concluded between the pope and the emperor a few days after this session, to make war against the German Protestants on the express ground of their refusal to submit to the council, and from this may be dated the end of any serious effort in the council itself to deal with the question of reconciliation, although the original motive for its convocation. Moreover, so little interest was felt even by the Roman episcopate in the proceedings at Trent that, instead of fresh accessions coming to recruit the small numbers present, constant defections took place, and a proposal to stop this by forbidding any bishop to quit Trent without formal permission was carried. The doctrine of Justification, made a burning question by the prominence given to it in Lutheran theology, was next taken up, and, this being, so to speak, a new controversy, with few precedents to guide the council, the discussion was proportionably protracted. It is noteworthy that Luther's views found some supporters, and the resignation of the legateship at this time by Reginald Pole, and his departure from the council, never to return, is attributed to his dissatisfaction with the conclusions arrived at upon this subject in its decree. The disciplinary question discussed at this time was that of the obligation of residence, especially as regards bishops; and decrees upon both these subjects were promulgated in the sixth session (January 13, 1547),—that on Justification being a formal dogmatic treatise in sixteen chapters, thirty-three canons; that on residence reviving former canons, and imposing new penalties, but avoiding the solution of a question hotly debated in the council, whether the residence of bishops was obligatory *jure divino*, or merely by ecclesiastical precept. Meanwhile, Charles V. was victorious in his war with the Protestants, and had all Germany in his power, but, instead of using the opportunity, as the pope expected, to put down the Reformers, he alleged that the recent war had not been one of religion, and assumed an attitude of toleration. Hereupon Paul III., in order to break up this truce, sent instructions to the legates to press on decrees displeasing to the Protestants, judging that the emperor's well-known interest in the council would cause him to be accounted responsible for its measures, and thus lose all credit for his recent forbearance. In the seventh session, held on March 3, 1547, two decrees were promulgated,—one defining the sacraments as seven in number, and as being all channels of grace, also adding special canons concerning baptism and confirmation; the other dealing with pluralities, unions of benefices, repair of churches, and kindred matters, but with no great stringency. A more important part of the business of this session was the open declaration of a measure which the pope and the legates had been privately planning for some time, the transference of the council from Trent to some city more directly under papal control: for, while Trent sufficed for headquarters as against Protestants, yet it was found that a virtual coalition between the Spanish, French, and German bishops to resist the Italian interfered with the intentions of the papal court, and could be most effectively broken up by a change of place. Occasion was accordingly taken from an outbreak of disease, alleged to be infectious, at Trent to issue a bull transferring the council to Bologna, which was read in the seventh session, while the promulgation of a decree in accordance with it formed the whole business of the eighth session (March 11, 1547). When it had been passed, the legates produced a brief which they had obtained more than two years before, empowering them to transfer the council as they pleased. But, while they themselves quitted Trent the next day, and were followed by the majority of the bishops, those of the emperor's party continued in session at Trent, and refused to leave it without the permission of their sovereign, though they abstained from all conciliar action, in order to avoid the charge of schism. Charles V., incensed at the pope's action, sent a mandate approving and confirming their conduct. The ninth session, held at Bologna (April 21, 1547), and the tenth also (June 2, 1547), were merely formal, nothing being done save to prorogue the council. The practical result of this split in the council was to relieve the Protestants from imminent peril; for, while the emperor's successes enabled him to put severe pressure upon them to submit to its decrees, it was itself incapacitated for valid action, as neither the bishops at Bologna nor those at Trent could claim to be the whole council, nor demand acceptance of their acts as binding. Hence Charles V. was urgent for the return of the entire body to Trent, and threatened, in case of refusal, to go to Rome, and hold the council there himself. And he took an even more peremptory step by constituting himself arbiter of the whole controversy, appointing Julius Pflug, bishop of Naumburg, a prelate known to be friendly to the Lutherans, Michael Holding, called Sidonius, afterwards bishop of Merseburg, and John Agricola, a Lutheran writer of some mark, to draft an eirenicon upon the points in dispute, which was published under the title of the "Interim," by the emperor's authority, at the diet of Augsburg, May 15, 1548. It proved, however, inefficacious, and was formally repudiated and answered by the Catholic princes and states of the empire, and yet more peremptorily by the Protestants, its only result being the "Interimistic controversy." It was succeeded by another formulary concerning reformation, accepted by the diet. While the emperor was endeavoring to force the "Interim" upon his dominions, the pope, on his part, strove to remove the dead-lock of the divided council, and convoked a committee to consist of members of both the Bolognese and the Tridentine sections to confer upon ecclesiastical reforms. But the bishops at Trent, having communicated with the emperor, and waited three weeks for his sanction, refused to leave that city, and the pope was compelled to direct the legates at Bologna to dismiss the bishops assembled there, and to announce the suspension of the council, which was accordingly done upon September 17, 1549. Paul III. died on November 10, 1549, and was succeeded on February 7, 1550, by Cardinal del Monte, the chief legate at the council, who took the title of Julius III. The break in the continuity of the council occasioned by these proceedings lasted till May 1, 1551, when the eleventh session was held at Trent under the presidency of Cardinal Crescenzio, sole legate in title, but with two nuncios, Pighini and Lippomani, as co-ordinate assessors. It was merely formal, as was also the twelfth session, on September 1, 1551. Just at this time Henry II., king of France, having quarrelled with the pope about the duchy of Parma, sent an envoy to the council at Trent, with letters styling it a "convention," denying its œcumenical character, declaring that it was not accessible to himself or to the French bishops, and notifying a protest against the validity of its proceedings, which he desired might be registered, and a copy of the register returned to him. No reply was made to this demand; so Henry dismissed the papal nuncio from his court, and published a manifesto to justify himself, at the same time that, in order to repel any charge of sympathy with the Protestants, he promulgated a severe edict against them. But the absence of French bishops, and the comparatively scanty attendance from Germany, threw matters more than ever into the hands of the Italian majority, as appeared from the decrees promulgated in the thirteenth session (October 11, 1551), and indeed from the attitude taken up by the legates just before it. For the obstinate refusal of the Protestants to attend or even recognize the council was on the point of giving way, and the imperial ambassadors demanded a safe-conduct for such as might present themselves, with some warranty that it should be really safe. They also desired the postponement of any decision on the doctrine of the Eucharist, and especially as regards the communion of the laity in the chalice. The pope expressed himself willing to grant both these demands, but no real attention was paid to either of them. As respects the attendance of the Protestants, the letters of Francis Vargas, fiscal (attorney-general) in Spain to Charles V., and his agent at the council, state plainly that the legates merely pretended to desire it, and were secretly doing everything to prevent it, while the very points as to which delay had been promised were made the subject of the decrees in the above-named session. The decree on the Eucharist was especially directed against Lutheran and Zwinglian opinions then recently broached, and was couched in eight chapters with eleven canons appended. It reasserted the doctrine of Transubstantiation, already defined by the fourth Lateran council in 1216, while, by the third of the canons, which declares that the whole sacrament is entire in each kind, it indirectly, though effectively, ruled against the grant of the chalice to the laity; and in fact the Reformed thesis that they were entitled to it by divine right, and could not be debarred from it without sin, was unanimously condemned in the previous congregation. Some unimportant decrees affecting the criminal jurisdiction of bishops, and for referring the trials of bishops themselves to the pope, were enacted at the same time; but more noteworthy was a decree for postponing the decision upon lay and infant communion, and for granting a safe-conduct to the Protestants, which was the last business transacted upon this occasion. But the safe-conduct was worded so as to excite general and reasonable suspicion on the part of those to whom it was offered, and Vargas, who was no friend to their opinions, comments freely upon its deceptive ambiguity. In the fourteenth session (November 25, 1551) decrees upon penance and extreme unction, prepared in the congregations, and embodied in twelve chapters upon the former and three on the latter topic, followed severally by fifteen and four canons, were promulgated. Some disciplinary enactments affecting the clergy, and corrective of minor abuses, were enacted at the same time, the most important provisions being the abolition of the papal dispensations exempting their holders from the jurisdiction of the ordinary, and the restriction of the action of titular bishops. But the reforming party in the council was much discontented with the inadequacy of these measures, which added little to the very small progress made so far in the revival of discipline. Although no Protestant theologians had yet presented themselves at Trent, representatives of the duke of Würtemberg arrived at this time, who were instructed to lay the Würtemberg Confession before the council, and to say that Protestant divines who could give explanations of it were waiting some forty miles from Trent, and were prepared to attend the council so soon as a safe-conduct exactly conformable with that granted to the Bohemians by the council of Basel was issued, and on the further conditions that the discussions actually going on should be suspended and all the matters so far decided be reopened, that the pope should cease to preside by legates or otherwise, but declare his own submission to the decrees of the council, and absolve the bishops from their oath of allegiance to himself in order to secure their liberty of action. The envoys refused to treat with the legates at all, and conducted their negotiations through the imperial ambassadors. Crescenzio was very angry, and refused all concession, even going so far as to abstract the conciliar seal, lest the safe-conduct might be granted; but pressure was put upon him by the imperial embassadors, and he was forced to consent to the admission of the Protestant envoys at a private congregation to be held in his own house, though he resisted the demand for introducing them to a public session. And, when the safe-conduct was recast, it was found to differ seriously from that proposed as its model, especially by failing to give the Protestants the rights of session and suffrage, of observing their own religion in their houses, and of being guaranteed against insults to their creed. To the remonstrances made in consequence the legate returned a peremptory reply, refusing to make any further change, and only the instances of the emperor, then at Innsbruck, but three days' journey from Trent, induced the Protestant envoys to remain a little longer, to find if any better terms could be obtained. Some more Protestant envoys from Strasburg and other cities, and from Maurice of Saxony, arrived early in 1552, and were admitted to a congregation held on January 24, where they renewed the demands already mentioned, and required also that the decrees of Constance and Basel, declaring the pope inferior and subject to a general council, should be reaffirmed. They were promised an answer in due time, and the fifteenth session was held the next day (January 25, 1552), wherein the council was prorogued, and a safe-conduct more in accordance with the Protestant demands was drawn up and published. It is remarkable, however, for one omission, and for one significant clause. The omission is that of toleration for the private exercise of their religion; the insertion is a proviso pledging the council not to avail itself, "for this one occasion," of any laws or canons whatever, "especially those of Constance and Siena," as against the Protestants. The reference is to the canon of Constance by means of which John Huss was tried and burnt, declaring a safe-conduct no protection against trial for heresy, even if the accused has come in reliance on the safe-conduct, and would not have come without it, which canon was reaffirmed at the council of Siena in 1423. While the negotiations occasioned by these proceedings were in course, war broke out anew in Germany, and Maurice of Saxony obtained considerable successes over the emperor, took Augsburg, and was marching down upon Tyrol, so that Charles V. fled in haste from Innsbruck, and the legate convened the sixteenth session (April 28, 1552) of the council, wherein a decree was promulgated suspending it for two years in consequence of the perils of war. There was a general stampede from Trent at once, and the legate Crescenzio, then very ill, had just strength to reach Verona, where he died three days after his arrival.

So ended what is styled by some historians, and correctly, the first council of Trent, for, although the usual computation recognizes only one such council, yet an interruption of ten years, a widely changed personality, and a marked alteration in tone make the resumed synod virtually another assembly, and one by no means entitled to the degree of respect which the ability and learning of many members of that first convoked won for it. When the council dispersed, Julius III. at once in consistory repeated the policy of Paul III., and nominated a committee to prepare a scheme of reform, but it never took action of any kind; and at the close of the two years' suspension of the council the question was put in consistory as to the resumption of the sessions, and decided, with the pope's approval, in the negative. Julius III. died on March 23, 1555, and was succeeded on April 11, 1555, by Cardinal Marcello Cervini, one of the former legates at the council, a man of high reputation for personal devoutness and freedom from that sympathy with abuses which marked too many of the dignitaries of the time. He took the title of Marcellus II., and his first public utterance was to intimate his purpose of reassembling the council, and of carrying out a plan of thorough reform in discipline, particularly directed to abating the pomp and luxury of the prelacy. But he was in feeble health when elected, and the fatigues of his new position brought on an attack of apoplexy which carried him off three weeks after his accession. In his room was chosen, on May 23, 1555, Cardinal Giovanni Pietro Caraffa, who took the title of Paul IV. He was known to profess great austerity of life, to have actually founded the Theatines, an ascetic community, and to be a stern and implacable advocate for several measures of repression against innovators in matters of religion or impugners of papal prerogative, as he quickly showed by setting up the Inquisition in Rome, and taking care that it should not be idle. His election consequently caused much alarm, and was especially displeasing to the emperor; and the earlier acts of his pontificate seemed to justify the estimate formed of his character and the fears of those who apprehended that he would proceed to reform discipline in a swifter and more drastic fashion than had hitherto been essayed. For in fact he pledged himself to this effect in the first bull published after his accession, following it up with a show of activity by at once setting some minor reforms on foot.

During these three years important events had taken place in Germany. By the peace of Passau in 1552, the Protestants of the Augsburg Confession were secured from all molestation, and in the free exercise of their religion and of their civil rights, and this was followed up by a decree of the diet of Augsburg, on September 25, 1555, that, failing a national council to settle the religious disputes, the emperor, the king of the Romans, and the other Catholic princes should not interfere in any way with the religious liberties of the Lutherans holding to the Confession of Augsburg, provided they in their turn would exhibit equal tolerance towards Catholics; that no penalty, save the loss of benefices, should be imposed on any Catholic ecclesiastics joining the Lutheran body; and that such benefices as the Protestants had already annexed for the support of their schools and ministers should remain in their possession. Paul IV. was much incensed at these proceedings, and used all efforts to procure their repeal, on the failure of which he openly broke with the emperor, formed an alliance with the French king against him, and imprisoned the cardinals and other personages of the imperial party on whom he could lay hands, confiscating the property of such as saved themselves by flight. He continued for a time in the measures of reform with which he began his reign, striking against jobbery, pluralities, dispensations, and laxity of clerical manners; but all this short-lived zeal was speedily neutralized by his nepotism, surpassing that of any of his predecessors, and throwing the government of the States of the Church into the hands of his dissolute nephews, upon whom he rained all the wealth, honors, and authority in his power to bestow. And, as was to be expected, he set himself steadily to oppose every one of the class of reforms which touched doctrinal questions, just those for which the Protestants were urgent, encouraging only such as promoted the unity and discipline of the Roman Church itself, and made it more capable of effective resistance to the Reformation. He was not favorable to the reassembling of the council, not merely because of his experience of its languid action, nor even his dislike of the struggles of the non-Italian minority to assert some measure of independence against the coercive tutelage exerted by the several papal legates from the very first, but because he regarded himself as the sole and proper person to consider such matters at all, and a bull of his own promulgation a better mode of procedure, at once in fulness of authority and swiftness of formulation, than any conciliar decree. Consequently, no step for the resumption of the council was taken during his reign, which ended on August 18, 1559. After a longer interregnum than usual, Giovanni Angelo de' Medici (not a member of the great Florentine house, but of humble Milanese extraction) was elected on December 26, 1559, as Pius IV. Markedly unlike his predecessor in almost every personal quality, he was much his superior in practical shrewdness and tact, and had none of that dislike to a council which Paul IV. had shown. So great, too, had been the strides made by the Reformation during his predecessor's reign that he might well think Paul IV.'s policy undesirable, and he had this special motive for reversing it, that a movement was going on in France for the convocation of a national council there to consider the whole religious situation, which might very conceivably result in a revolt like that of England from the Roman obedience. Accordingly, Pius IV. determined on the resumption of the council of Trent, and issued a bull on November 29, 1560, convoking it anew.

But the whole face of Western Christendom, the whole religious situation, had materially changed since the original assemblage of the synod in 1545. First, the imposing personality of Charles V. was removed from the scene, and Ferdinand I., his successor, enjoyed neither his personal ascendency nor his political power, and could not be accounted as a possible competitor with the pope for the first place in the Catholic world, nor even as an ally with means for crushing the Reformation. Next, the Reformation itself was by this time an accomplished fact, a consummated revolt from mediæval Christianity. It had taken definite shape in various countries; it had its own theological systems and traditions; besides that a whole generation had now grown up under its influence, never having had any personal associations with Latin Christianity. And, on the other hand, the very lengths to which some of the Reformers had gone in their revolt generated a corresponding reaction in the Roman Church, so that many influential persons who had been in favor of moderate reforms and of explaining disputed points of theology were convinced that no limits could be logically or practically set to concessions in this direction, and therefore that it was necessary to make a stand against any concessions at all. And, what is more, one noticeable effect of the wave of controversy which had swept over western Europe was to accentuate points of difference, to close questions previously open, to make the current beliefs more incisive and, so to speak, legal in form, to diminish seriously the neutral area between the competing religious systems, and thus to bring them face to face as irreconcilable foes. One factor more, of greater importance at the time than any other, contributed to the revolution which is marked by the second council of Trent. As Spain took the political lead in the earlier half of the 16th century, so it took also the lead in theology. The Spanish divines were abler and more learned than all save the very foremost in any other country, and their influence was throughout the greatest at the council of Trent on purely theological issues. Now, the political and the theological genius of Spain had both just found their highest exponent in one person and the organization which he devised, Ignatius Loyola and the Company of the Jesuits. Two of his immediate disciples and recruits, Salmeron and Laynez, were chosen to be the pope's theologians at the council of Trent, and exercised a greater influence than any other divines there in the formulation of its dogmatic decrees. But the Jesuits were to do more than this. The militant spirit of their founder had nothing in common with the alarm and vacillation which had for the most part marked the action of the Roman Church in dealing with the Lutheran and Calvinist revolt; and, instead of being content with devising schemes for standing on the defensive, and saving the remnant yet left to the Roman obedience, he conceived the bolder and safer plan of vigorous aggression, to reconquer all that had been lost, and to add fresh acquisitions thereto. The Counter-Reformation which he initiated was in full operation when the second council of Trent assembled, and it was by this spirit that it was guided in its deliberations and decrees. The very thought of compromise was abandoned in fact, if not in open expression, and the only reforms thenceforward taken into consideration were such as would remove causes of weakness and scandal in the Latin Church, enabling it, without sacrificing one of its claims, to overcome by superior mass and discipline, by closer unity and more organized enthusiasm, the heterogeneous, disordered, and already dissociated forces of Protestantism. The most obvious effect of these principles upon the second council of Trent was that the diminution, the all but disappearance, of variety of opinion amongst its members, and the resolution to crush Protestantism rather than to parley with it in any scheme of mutual concession or accommodation, tended to shorten the preliminary discussions in a marked degree, so that little is to be noted of the long and animated debates of the earlier period, and the last few sessions exhibit even tokens of actual hurry to end the matter anyhow.

There was no intention on the pope's part to proclaim the Counter-Reformation as the policy of the council, even if it may be safely assumed that he could predict its action, and he sent nuncios to the Protestant sovereigns as well as to the Catholics to signify the approaching resumption of its sittings. Francis II. of France had died between the promalgation of the bull and its notification in France, but the young king Charles IX., by the advice of the parlement of Paris, directed all the bishops of the kingdom to be in readiness for journeying to Trent. Three nuncios were despatched to Germany, but the princes assembled in diet at Naumburg received them unfavorably, asserting anew their determination to recognize no council which did not avow Scripture as its standard of appeal and give right of free discussion to Protestants, denying the right of any one save the emperor to convene a general council at all, and inveighing strongly against the papacy. The king of Denmark declined to admit the nuncio on any terms, declaring that neither he nor his father had ever had any dealings with the pope; and Martinenghi, the nuncio commissioned to Elizabeth of England, was stopped by a messenger while still on the Continental side of the Channel, and informed that he would not be permitted to land on the English coast. The free cities of the empire also refused the summons, as did five of the Swiss cantons; and even a large number of Roman Catholic prelates, while professing unqualified obedience to the pope's commands, showed much unwillingness to act upon them, and pleaded age, illness, or diocesan business as excuses for absenting themselves from the council. In this unpromising posture of affairs the preparations for the council were pressed on, and Cardinals Ercole Gonzaga, bishop of Mantua, Seripando, Hosius, Simoneta, and (later on) Altemps, the pope's nephew, were named as legates, being directed to open the session of the council upon Easter Day, April 6, 1561. But they did not even arrive in Trent until April 16, and found no more than nine bishops awaiting them. Several causes conduced to this disappointment: the king of Spain had not yet accepted the bull convoking the council; the French bishops were more than fully occupied with the rapid advances of the Reformation in their midst; and the Germans had no great inclination for the repetition of their experience ten years before. It was thus necessary to postpone the assemblage till January 1 and then to January 18, 1562. That there might be a sufficient number of Italian bishops present to outvote any possible combination of others, the pope collected a large number of prelates, appointed them salaries for maintenance, and sent them off to Trent. Two questions of the highest practical importance came up for discussion in the preliminary congregation, wherein ninety-two bishops were present: (1) Was the council to be styled a "continuation" of the previous one, or to be reckoned as a new synod? (2) Should the unprecedented clause in the papal decree for opening the council (but not found in the bull of convocation), "proponentibus legatis ac præsidentibus," be accepted and acted on, or rescinded? To declare the council a "continuation" of its precursor was to accept and ratify all which had been done therein; to treat it as a new one was to make every decree of the earlier sessions merely provisional and alterable. To adopt the novel clause embodied in the papal decree was to gag the council from the outset and deprive it of freedom by concentrating the initiative in the hands of the legates; and Guerrero, archbishop of Granada, pressed this objection with much urgency. On the other hand, this same prelate, acting on the orders of Philip II., demanded that the council should be plainly declared a continuation of its precursor, for Philip had already introduced some of the regulations of that synod into his dominions, and would lose credit if they were rescinded, or even treated as lacking full sanction. Contrariwise, the bishops of other nations present held that there was no prospect of inducing the Germans, English, and other partly alienated nationalities to send representatives, unless the proceedings so far should be regarded as capable of reconsideration and alteration at the hands of the actual assembly. The authorities at Rome were not unprepared for some difficulty on this head, and had endeavored to evade it by using the indeterminate word "celebrated," which might be taken either way, and the Spanish remonstrants were privately told that it was understood that business should be taken up just where it had left off under Julius III., thus making the synod a continuation of the former one, but that any express statement to that effect had been carefully avoided, lest the Protestants should take offence, and thus one aim of the council might be defeated. The Spaniards were partly contented with this reply, but urged that nothing which could be interpreted as the convocation of a new council should be suffered to appear in the wording of the decree about to be publicly read, which was conceded.

The seventeenth session was held (January 18, 1562) in the presence of the legates,—106 bishops, 4 abbots, 4 generals of orders, and the duke of Mantua, nephew of the chief legate, being present. Four Spanish bishops lodged a protest against the proposing clause—two of them unreservedly, two in a more qualified manner—and they particularly objected to the novelty of the clause, and to the manner in which it had been sprung upon the council, the archbishop of Granada and the bishop of Orense pointing out that it was not in the original bull, with which the subsequent decree ought to be in complete agreement, and the former adding that it was not even in the copy of the decree shown to him. But the Italian majority was too strong, and the protest was overruled,—the prorogation of the council to February 26, 1562, being the only further business transacted. But a very important question was laid before the congregations which followed this session, that of providing some remedy for the injury done to the Roman Catholic Church by the circulation of more or less hostile books, a difficulty made incomparably greater from the middle of the 15th century onwards than at any previous time in history, by reason of the invention of printing. The council of Lateran in 1515 had made a license from the ecclesiastical authorities requisite before any book could be printed, under pain of excommunication, but this penalty did not affect Protestant printers, and the issue of a catalogue of books forbidden to Catholics became a necessary addition. Such a catalogue was issued by Paul IV. in 1559, but some machinery for supplementing it as fresh books poured from the press could alone meet the permanent danger. Another matter debated in these congregations was the invitation of Protestants to attend, and in what character. In the eighteenth session (February 26, 1562) two decrees on these subjects were promulgated,—one appointing a committee to report to the council on the whole question of heretical books; the other publishing a safe-conduct to the German Protestants, extended by a rider to those of other nations. The congregations held after this session were busied chiefly with the questions of residence and the abuse of indulgences, besides several less important details of reform. A warm debate arose as to the nature of the obligation to reside,—the Spaniards holding it to be of divine right, the Italians to be of no more than ecclesiastical precept. So powerful a body in the council took the Spanish view that the legates were alarmed, especially as ominous speeches were made to the effect that the Roman curia must be reformed on the basis of the report of cardinals to Paul III. before anything of moment could be done in the way of real improvement. Accordingly, they sent a messenger to the pope, bringing with him a schedule of the proposed reforms, and asking for advice in the crisis. The pope desired them to counteract the opposition bishops, to postpone the question of residence, if they could not suppress it altogether, and despatched Visconti, bishop of Ventimiglia, as extra nuncio to the council, to report accurately to him everything said or done there, and with him sent also all the bishops who could be collected at Rome to swell the Italian vote, and thus defeat the opposition indirectly. There was much debate also on the scope of the safe-conduct, as the Spaniards were anxious that it should not protect those against whom the Inquisition had taken action, while others desired to see its terms enlarged sufficiently to meet the requirements of the Protestants, who objected to its suspicious silence on several weighty particulars. As the French ambassadors were expected, nothing was done in the nineteenth session (May 14, 1562) save to prorogue the council. On May 26, 1562, De Lanssac (who had been lately French envoy at Rome), Du Ferrier, and De Pibrac, envoys from Charles IX., were admitted to audience, and demanded, amongst other matters, that the council should be formally declared a new one, wherein the imperial ambassadors supported them, while Philip II. of Spain, contrariwise, insisted that it should be declared a continuation of the former synod. The legates strove to satisfy both parties, and received contradictory directions from Rome, at first ordering them to announce the continuation of the former council, and afterwards leaving the matter to their discretion. So little agreement could be arrived at that the twentieth session (June 4, 1562) was held merely to prorogue the council. The question of communion in both kinds was the next to come up for consideration. It was such a capital one, if any hope of winning back the Protestants was to be entertained, that the imperial and French ambassadors had special injunctions to forward by all means in their power an affirmative decision. The Frenchmen saw little prospect of carrying this matter in the temper of the Italian majority, and were for opposing the discussion which the legates had announced, but the imperial ambassadors were more hopeful, and persuaded them to give way. While the question was being debated in the congregations, the Venetian and Bavarian ambassadors arrived, the latter armed with a formidable schedule of complaints against prevalent abuses, and of demands for correspondingly drastic reforms, beginning with the pope and the curia, and making havoc amongst cardinals, dispensations, exemptions, pluralities, office-books, exclusively Latin services, and other like matters, thus threatening all manner of vested interests and long-rooted customs. The legates put them off, alleging the pressure of other business, notably the question of communion in both kinds, which was, in fact, being discussed and decided in accordance with the views of the Italians and Spaniards, and against those of the French and Germans. In the twenty-first session (July 16, 1562) a decree couched in four dogmatic chapters and four canons was promulgated upon it, to the following purport: laymen, and priests other than the actual celebrant, are not bound by divine right to communicate in both kinds; the church has full power to make what changes it pleases in the mode of administering sacraments; the whole sacrament of the Eucharist is received entire under either kind singly; and little children are not bound to communicate. The canons pronounce anathemas against maintainers of the contrary propositions. At the same time a decree upon reformation was enacted, most of the clauses dealing with the duties of bishops in the matters of ordination, patronage, division, and union of benefices, discipline of ineffective parish priests, and visitation of monasteries, but a more permanent interest attaches to the ninth and concluding chapter of the decree, whereby the name and office of the "questors of alms," that is to say, the vendors of indulgences, are abolished on the ground of the impossibility of otherwise putting a stop to the abuses and depravity of their proceedings. All privileges and customs to the contrary, even if of time immemorial, are rescinded; the publication of indulgences is confined thenceforth to the ordinaries of each place, assisted by two members of the chapter; and these same officers are directed to collect the alms and charitable donations of the people, but forbidden to receive any commission or payment for so doing. This decree is a virtual confession of the justice of the agitation against Tetzel and his fellows which served as the signal for beginning the great religious strife of the 16th century; and it is noticeable that it was the pope's own voice against the system which decided the action of the council, wherein a powerful minority was found to defend it. Several weighty matters then came before the congregations, that of residence again being pressed by the Spaniards, while the imperial and Bavarian ambassadors renewed their requisition for permissive communion in both kinds (for the decree on that subject had gone no further than to declare it unnecessary, and had not explicitly forbidden it), and the French ambassador not only supported them in their demand, but added on his own part that in France they desired vernacular services, the abolition of image-worship, and permission for the clergy to marry. The nuncio Visconti wrote to the pope in great alarm, expressing apprehensions at the very free language employed by the fathers of the council on these matters, the probability of their conceding the emperor's demands, and of similar ones being advanced thereupon, all making in the same direction. An intrigue to compel the resignation of Cardinal Gonzaga, who was not thought sufficiently opposed to these measures, and who was far less peremptory in his presidency of the council and use of the closure than Crescenzio had been, was set on foot, and defeated only by the strong representations made at Rome by the archbishop of Lanciano, who said that there was already so much division in the council that it could but just hold together, and would almost certainly be broken up by any step of the kind. The next subject which was brought on for consideration was the sacrifice of the Mass, and the debates thereon were very animated, disclosing considerable variety of opinion amongst the theologians,—no fewer than five clearly distinct views of the tenet, apart from mere verbal or minor differences, being adduced and argued for. As sixty French bishops, to be accompanied by twelve theologians, and headed by Charles de Guise, cardinal of Lorraine, were under orders to repair to Trent, the French ambassador pressed the legates to postpone the next session till their arrival, as De l'Isle, ambassador at Rome, did the pope; but each replied evasively, referring the applicant to the other. The question of communion in both kinds was also very warmly discussed, and the council was warned that a negative decision would lead to the secession of multitudes who had not yet broken with the Roman Church; but the Jesuit Laynez, who was the chief advocate for refusal, replied that to diminish the church would not destroy it, and that anything was better than concession in the matter. The numbers in the division taken on the question were as follows: 29 were in favor of granting communion in both kinds; 31 agreed thereto, but desired the execution of the decree to be left to the pope's discretion; 38 were for total refusal; 24 strove to evade responsibility by referring the matter to the pope entirely; 19

were willing to make the concession to the Bohemians and Hungarians, but would refuse it to all others; 14 asked for a postponement; and 11 remained neutral, declining to vote any way—being a total of 166 suffrages, so split up as to make it impracticable to frame a decree. In this difficulty, the legate seized the opportunity of persuading the council to refer the matter to the pope's decision, thereby at once checkmating the reforming section, and indirectly ruling the vexed point of the relative superiority of pope and council in favor of the former, and so virtually reversing those decrees of Constance and Basel which had long been thorns in the side of the Roman curia. In point of fact, the pope had written some time before to the legates, recommending them to yield to the emperor's demand of the chalice for the laity, but they had replied that it would be impolitic to make it a conciliar act, and that it would be more expedient to frame a mere general declaration that it might be proper to make the concession in certain cases, but that the pope should be the sole judge of them. In the twenty-second session (September 17, 1562) the decree on the sacrifice of the Mass was promulgated in nine chapters and as many canons, directed for the most part against current Protestant objections to the doctrine and ceremonial of the Missal. Rules to secure greater order and reverence in the celebration of Mass, and for the suppression of sundry superstitious observances connected therewith, were also enacted,—besides some minor reforms of little note, and a decree referring to the pope the whole question of the concession of the chalice. The meagreness and insignificance of the reforms enacted thus far caused much displeasure in France, and the king directed his ambassador to press once more for delay till the arrival of the French, German, and Polish bishops who were expected at Trent, as the emperor also instructed his envoy. But the pope was busy in recruiting the Italian majority, and was unfavorable to this request, lest the Italians should be outvoted by the new-comers; yet so contentious were the debates on the sacrament of orders, and on the nature and ,extent of the rights of bishops—notably whether they were inherently above priests, and whether they were necessarily subject to the pope, deriving their jurisdiction and other powers solely through delegation from him, or if they were not of Divine institution, and his colleagues rather than his deputies (which latter thesis was steadily maintained by the Spaniards)—that it proved impossible to frame the decrees and hold the session before the arrival of the cardinal of Lorraine, who reached Trent on November 13, 1562, accompanied by fourteen bishops, three abbots, and eighteen theologians. The discussions, further complicated with the question of residence, were renewed hereupon, and long before any signs of agreement were visible the French ambassadors laid before the legates a schedule of reform in thirty-four articles, requiring, not only the removal of various abuses in patronage, and the punishment of negligence on the part of the parochial and monastic clergy, but also that vernacular services should be permitted, and communion in both kinds enjoined, while all abuses and superstitions connected with image-worship, indulgences, pilgrimages, and relics should be summarily abolished. Lorraine, on being asked how far he agreed with these demands, said that he disapproved of some of them, but that if he had not consented to take charge of them in their actual form, they would have been made still more drastic. No definite action was taken upon them either at Trent or at Rome, and the proceedings dragged on ineffectively for some months longer. On March 2, 1563, Cardinal Gonzaga, first legate, died, and was speedily followed by Cardinal Seripando. The imperial and French ambassadors endeavored to get the cardinal of Lorraine named as first legate and president, but he was not acceptable at Rome, and the post was given to Cardinal Morone, with whom Cardinal Navagero was associated, to fill the place of Seripando. All these events delayed the twenty-third session until July 15, 1563, nearly ten months later than the preceding one. A decree on the sacrament of orders, in four chapters and eight canons, laid down that there is a sacrificial priesthood of the New Testament, instituted by Christ; that there have been seven orders in the Christian ministry from the earliest times; that holy order is a sacrament; that orders are indelible; that bishops are superior to priests; that a call from the laity, or from any secular authority, is unnecessary as a title to ordination, and that a merely lay call is invalid, while bishops appointed solely by the pope, without the intervention of any other persons, are validly created. A decree of eighteen chapters on reformation, enacting, amongst much else, penalties for non-residence on the part of beneficiaries, and providing for the erection of those theological seminaries which have ever since been the nurseries of the Latin clergy, was also promulgated in this session. The congregations which followed it were occupied chiefly with the question of matrimony, which had been mooted earlier, but with no definite result, and with framing a scheme to repress the encroachments of the civil power upon the church in most countries, one clause of which proposed to exempt all ecclesiastics from civil jurisdiction in all cases whatever, and from the payment of taxes, with penalty of excommunication upon such civil authorities as contravened this ruling. This was never pushed to the stage of promulgation, but it was successful as a manifestation against the reforming party in the council, and actually drove the French ambassadors away, since they judged their further presence useless in such a temper of the assembly. Yet it was itself by no means agreed or harmonious. The old disputes about the claim of the council to represent the church universal, about the proposing clause, limiting the initiative to the legates, and about the need of reform in the Roman curia itself were renewed, and that with much acrimony, but with no practical result. In the twenty-fourth session (November 11, 1563) a decree on matrimony, couched in ten chapters and eleven canons, was promulgated, the most noticeable points of which are the assertion that the church can constitute other impediments to matrimony besides the forbidden degrees of the Levitical code, and can dispense with such impediments; that clerks in holy orders and regulars vowed to celibacy cannot contract valid marriage; and that celibacy is superior to matrimony. The simultaneous decree on reformation lays down rules for the creation of bishops and cardinals, so as to avoid unfit promotions; directs that diocesan synods shall be held yearly, and provincial synods triennially; lays down rules for episcopal visitations, and for the qualifications to be exacted of persons promoted to cathedral dignities and canonries; appoints the provincial synod the judge of minor causes against bishops, referring graver causes to the pope's decision; and enacts various other technical regulations. By this time all concerned were thoroughly weary of the council, and the remaining matters for discussion were hurriedly discussed, resulting, in the twenty-fifth and last session (December 3 and 4, 1563), in a decree, very cautiously worded, upon purgatory, the cultus of saints, and that of relics and images. In this same session was also enacted a decree in twenty-two chapters, regulating several matters affecting the discipline of convents of monks and nuns; and another decree on reformation, in twenty-one chapters, the most important of which enjoin all cardinals and bishops to keep modest households, and not to enrich their kindred with church property; that all prelates shall receive and publish the decrees of the council; that duelling shall be prohibited under severe penalties; and that the authority of the Holy See both is, and is to be understood to be, untouched by any decrees of the council touching the reform of morals and discipline. On the last day of the session was passed a somewhat indefinite decree upon indulgences, forbidding all evil gains connected therewith, and directing that, wherever abuses or superstitions are prevalent concerning them, the bishops shall collect the facts, lay them before the provincial synod, and after discussion there refer them to the pope for ultimate decision. The distinction of meats, and the due observance of festivals and fasts, were also enjoined; and a formal statement was made that the committees which had been engaged upon the index of prohibited books, on the draft of a catechism, and on the revision of the Missal and Breviary, thinking that the synod could not deal with them conveniently, had determined to lay their reports before the pope to ratify and publish at his pleasure. Formal acclamations, and an anathema against all heretics, closed the session; and the legates, after forbidding any bishop, under pain of excommunication, to leave Trent till he had either signed his assent to the decrees, or left documentary proof of such assent, gave the blessing and dissolved the assembly.

Two hundred and fifty-five signatures were attached to the decrees, and also those of the ambassadors still remaining at Trent. The bull of confirmation was issued at Rome on January 26, 1564, and followed by another fixing May 1, 1564, as the date from which the decrees should be held binding. The bull of confirmation forbade all persons whatsoever, whether ecclesiastics or laymen, to gloss or interpret the decrees upon any pretext whatever, without papal authority for the purpose. The republic of Venice was the first power to signify its reception of the decrees, followed speedily by the other Italian states (except Naples) and by Portugal; but the king of Spain, though receiving the decrees, issued them at first in his own name, and not in that of the pope; the emperor and the king of Bohemia demanded the lay use of the chalice and the marriage of priests as the terms on which they would accept the council, and obtained a partial concession of the former demand, but were refused the latter; and in France, while the dogmatic decrees were accepted, the disciplinary ones were not, and have never, in spite of efforts many times renewed, made part of French ecclesiastical law. The provision referring the explanation of the council to the pope was given shape by Sixtus V., who erected in 1588 a Congregation of the Council of Trent to sit permanently at Rome, where it has ever since continued to be included amongst those standing committees which divide among them the administration of the pontifical government.

Two questions remain to be considered in relation to this great synod: how far was it free, and representative of the mind of Latin Christianity at that time? and what have been its effects upon dogma and discipline? Ample materials exist for answering the first question, in the form of contemporary letters, either separately published, as those of Vargas, or included in the great collection of documents made by Le Plat, and in the official acts of the council itself, drawn up by the secretaries Paleotto and Massarelli. From these it is perfectly clear that the council was never free for a moment, but was hampered and fettered, not merely by the permanent fact of a large Italian majority, subsidized by the pope,[1] but by the method of procedure in the congregations, since by a skilful distribution of the members into groups or classes, so as to prevent combined action, and by careful packing of the subcommittees to which the preparation of business for debate was entrusted, little could be done save when and how the majority pleased; and, above all, the vigilant supervision exercised by the legates, their constant reference to Rome of every point of any importance before they would permit it to come on for regular discussion (so that Lanssac, one of the French envoys, somewhat profanely said that the Holy Spirit was brought to the council in a carpet-bag from Rome), and their uncompromising use of their presidential authority to interrupt or silence unacceptable speakers (as frequently appears in the Acts) effectually bound the council hand and foot; and thus its decisions, as a whole, represent little more than the Italian and, to some extent, Spanish opinions of the time, and not those of German, French, or Hungarian Catholics. The demeanor of the legates differed much, and there is a wide interval between the open browbeating employed by Crescenzio and the high-bred dignity of Gonzaga or the diplomatic subtlety of Morone; but the policy was alike in all cases, and its results the same. As to the dogmatic effect of the council, it went much further than merely restating the current Catholic theology of the pre-Reformation era; for it marks a new departure, closing many questions previously left open (nothing is more noteworthy in the debates than the manner in which several divines of unquestioned ability and loyalty delivered themselves of opinions closely allied to those advocated by leading Reformers, and then still tenable within the Roman obedience), rewording old propositions, or framing new ones, in an incisive fashion. It recovered for papal authority all it had lost, or was likely to lose, through the action of Basel and Constance; and, above all, it unified Roman teaching for the first time, and crystallized it into rigid compactness. Thus it made concessions and explanations for the reconciliation of the revolted Protestants, although the primary cause of the council, practically impossible thenceforward, since the Roman Catholic system, thus hastily consolidated out of a former condition of partial flux, became like a "Prince Rupert's drop," from which, if the smallest fragment be broken, the mass is at once resolved into disintegrated powder. In the matter of disciplinary reform the council enacted but little of an effective nature, except in the abolition of the traffic in indulgences, and the establishment of theological seminaries, which has proved the most effectual agency for creating that doctrinal uniformity which now prevails throughout the Roman obedience; and the real honors of the Counter-Reformation rest with the Jesuits, to whose unremitting diligence, powerful organization, and ceaseless precept and example must be attributed by far the larger part of the abatement of ecclesiastical abuses and scandals which marks the succeeding era. Doubtless, the Tridentine decrees, in strong and resolute hands, proved most useful subsidiary weapons to compel local reforms; but decrees of little less stringency had been enacted by previous synods, and had rusted unused, because there was no one able and willing to put them in operation against the passive resistance of powerful vested interests.

The bibliography of the council of Trent is very extensive, but a comparatively small number of volumes really suffices the student. The first work of importance is F. Paolo Sarpi's *Istoria del Concilio Tridentino*, originally published in London (1619) by Antonio de Dominis, archbishop of Spalato, under the pseudonym of Pietro Soave Polano (an imperfect anagram of Paolo Sarpi Veneto), but better studied in the French version by Père Le Courayer, with valuable notes (see SARPI). The rival work of Sforza Palavicino, *Istoria del Concilio di Trento* (1656–57), written to order as a refutation of Sarpi's work, is also indispensable. He had free access to many official documents which Sarpi could not consult, and often corrects him upon points of detail, but a careful reader will find that he confirms him far oftener than he refutes him. It is not enough, as Ranke points out, to compare those two, and take the mean statement as a guide, for they are sometimes in blank contradiction, and other witnesses must be called in to decide the matter. The Acts of the council, so far as they were drafted by Paleotto, were first published by Mendham in 1842; the complete Acts, by both Paleotto and Massarelli, were not accessible till published as *Acta Genuina Œcumenici Concilii Tridentini* by Theiner in 1874. The vast compilation of Jodocus Le Plat, *Monumentorum ad Historiam Concilii Tridentini Amplissima Collectio* (7 vols. 4to, 1781–87), is full of valuable and interesting matter. The speeches of the Jesuit Laynez, which had such a powerful effect upon the council, have been recently published under the title of Lainez, *Disputationes Tridentinæ*, 2 vols., 1886. Vargas, *Lettres et Mémoires concernant le Concile de Trent* (1700, partly translated in Geddes, *The Council of Trent no Free Assembly*, 1714), is of much value. The canons and decrees of the council have been many times published, and are readily accessible; the best edition is that by Richter and Schulte (1853). There is a convenient abridgment of Palavicino's history prefixed to the Rev. James Waterworth's English version of the *Decrees and Canons of Trent* (1848), but it is not trustworthy, for the translator has suppressed many statements of the original which tell in various ways against the freedom of the action of the council. To these may be added Sickel, *Aktenstücke zur Geschichte des Konzils zu Trient*, 1872; Calenzio, *Documenti Inediti e Nuovi Lavori Letterarii sul Concilio di Trento*, 1874; Döllinger, *Sammlung von Urkunden zur Geschichte des Concils von Trient*, 1876; and the article on the council in Wetzer and Welte's *Kirchenlexicon*. (R. F. L.)

TRENTON, a city of the United States, county seat of Mercer county, New Jersey, and capital of the State, is situated in 40° 14′ N. lat. and 74° 45′ W. long., 33 miles northeast of Philadelphia and 57 southwest of New York. It lies very near sea-level (under 45 feet), upon the left (eastern) bank of the Delaware river, at the head of navigation. The city is irregularly built, the streets of different sections running in various directions, without any appearance of system; this is doubtless due to the fact that different portions of the city were originally settled as independent villages. Till recently Trenton was rather backward in the matter of municipal improvements, but an extensive system of paving and sewerage has now been entered on. The water supply is obtained by pumping into a reservoir. Street cars run upon one or two of the principal streets; and the city is traversed by the main line of the New York division of the Pennsylvania Railroad. Manufactures are the leading industry, the capital invested in 1880 having been $6,966,830 and the production $12,712,762. In iron and steel manufactures over $2,000,000 were invested, the industry next in importance being the manufacture of stone- and earthenware, for which this city has a national reputation. Rubber goods, watches, and woollen cloths are also made. The population, 22,874 in 1870, was 29,910 in 1880.

---

[1] The Italian character of the council of Trent can best be exhibited by a classified table, showing the nationality of the bishops present in the later sessions: Italians, 189; Spaniards, 31; French, 26; Greeks (titulars), 6; Portuguese, 3; Illyrians, 3; Irish, 3; Germans, 2; Flemish, 2; Polish, 2; Croatian, 1; Moravian, 1; English, 1.

Trenton was formed by a consolidation under one charter of several independent villages, known as Falls of the Delaware (settled in 1680), Kingsborough, Bloomsburg, and Lamberton. The name Trenton was given to the settlements about 1720. Its early growth was slow. In 1790 it was selected as the State capital, and two years later it received a city charter. Its growth since that time has been steady, and during the past thirty years has been very rapid.

TREPANG. See Bêche-de-Mer.

TRESPASS, in law, is any transgression of the law less than treason, felony, or misprision of either. The term includes a great variety of torts committed to land, goods, or person, distinguished generally by names drawn from the writs once used as appropriate to the particular transgression, such as *vi et armis*, *quare clausum fregit*, *de bonis asportatis*, *de uxore abducta cum bonis viri*, *quare filium et heredem rapuit*, etc. Up to 1694 the trespasser was regarded, nominally at any rate, as a criminal, and was liable to a fine for the breach of the peace, commuted for a small sum of money, for which 5 W. and M. c. 12 substituted a fee of 6s. 8d. [$1.62] recoverable as costs against the defendant. Trespass is not now criminal except by special statutory enactment, *e.g.*, the old statutes against forcible entry, the Game Acts, and the private Acts of many railway companies. When, however, trespass is carried sufficiently far it may become criminal, and be prosecuted as assault if to the person, as nuisance if to the land. At one time an important distinction was drawn between trespass general and trespass special or trespass on the case, for which see Tort. The difference between trespass and case was sometimes a very narrow one; the general rule was that where the injury was directly caused by the act of the defendant the proper remedy was trespass, where indirectly, case. The difference is illustrated by the action for false imprisonment: if the defendant himself imprisoned the plaintiff the action was trespass; if a third person did so on the information of the defendant it was case. A close parallel is found in Roman law in the *actio directa* under the lex Aquilia for injury caused directly, the *actio utilis* for that caused indirectly. One of the reasons for the rapid extension of the action on the case, especially that form of it called *assumpsit*, was no doubt the fact that in the action on the case the defendant was not allowed to wage his law (see Wager).

In its more restricted sense, trespass is generally used for entry on land without lawful authority by either a man, his servants, or his cattle. To maintain an action for such trespass the plaintiff must have possession of the premises. The quantum of possession necessary to enable him to bring the action is often a question difficult to decide. In most instances the tenant can bring trespass, the reversioner only case. By the Judicature Act, 1873, a mortgagor in possession can sue for trespass in his own name. Remedies for trespass are either judicial or extrajudicial. The most minute invasion of private right is trespass, though the damages may be nominal if the injury was trivial. On the other hand, they may be exemplary if circumstances of aggravation were present. Pleading in the old action of trespass was of a very technical nature, but the old-fashioned terms *alia enormia*, replication *de injuria*, new assignment, etc., once of such frequent occurrence in the reports, are of merely historical interest since the introduction of a simpler system of pleading, unless in those American States where the old pleading has not been reformed. The Venue (*q.v.*) in trespass was formerly local, in case transitory. In addition to damages for trespass, an injunction may be granted by the court. The power to grant injunctions against threatened or apprehended trespass has been considerably enlarged by the Judicature Act, 1873. The principal instances of extra-judicial remedies are distress damage feasant of cattle trespassing, and removal of a trespasser without unnecessary violence, expressed in the terms of Latin pleading by *molliter manus imposuit*.

Trespass may be justified by exercise of a legal right, as to serve the process of the law, or by invitation or license of the owner, or may be excused by accident or inevitable necessity, as deviation from a highway out of repair. Where a man abuses an authority given by the law, his wrongful act relates back to his entry, and he becomes a trespasser *ab initio*, that is, liable to be treated as a trespasser for the whole time of his being on the land. Mere breach of contract, such as refusal to pay for wine in a tavern which a person has lawfully entered, does not constitute him a trespasser *ab initio*. A trespass of a permanent nature is called a continuing trespass; such would be the permitting of one's cattle to feed on another's land without authority.

In Scots law trespass is used only for torts to land. By the Trespass (Scotland) Act, 1865, trespassers are liable on summary conviction to fine and imprisonment for encamping, lighting fires, etc., on land without the consent and permission of the owner.

TREVES (French, *Trèves*; German, *Trier*), formerly the capital of an archbishopric and spiritual electorate of the empire, and now the seat of a Roman Catholic bishop and the chief town of a governmental district in the Prussian province of the Rhine, is situated on the right bank of the Moselle, pleasantly surrounded by low vine-clad hills, 60 miles southwest of Coblentz and 86 miles south of Cologne. It lies in the midst of a carefully cultivated and fertile plain, the rich vegetation of which forms a pleasing setting to its red sandstone walls and venerable towers. Most of the old streets of the town are quaint and irregular; but much of the space enclosed within the circuits of the walls is now occupied by orchards and gardens. The population of Treves in 1885 was 26,125, five-sixths of whom were Roman Catholics. Their chief occupations are fruit-growing and vine-dressing; the industries of the place, including the manufacture of cotton and linen, dyeing, and tanning, are not very extensive. A specialty of Treves is the preparation of stones for Gothic churches, which are sent off ready to be at once placed in position. A river traffic is carried on in wine, cattle, and wood.

Treves claims to be the oldest town in Germany, and it contains more important Roman remains than any other place in northern Europe. The most remarkable of these is the Porta Nigra, a huge fortified gateway, 115 feet long, 70 to 95 feet high, and 30 feet deep. It is formed of uncemented blocks of sandstone, held together by clamps of iron, and now blackened with time; the details are very rude. Opinions vary widely as to the date of its erection, but recent authorities refer it to the 1st century of the Christian era. During the Middle Ages the structure was converted into two churches, one above the other; all additions have, however, now been removed, except the apse at the east end. The basilica, long used as the archiepiscopal palace and now consecrated as a Protestant church, probably dates from the reign of Constantine. The so-called Roman baths are in all probability the relics of an extensive imperial palace. Just outside the town are the remains of an amphitheatre, capable of accommodating 30,000 spectators, where Constantine caused several thousand Franks and Bructeri to be butchered for the public amusement. Perhaps the oldest Roman remains in Treves are some of the piers of the bridge over the Moselle, dating from about 28 B.C. This bridge, which is at one corner of modern Treves, lay near the middle of the much more extensive Roman city. There are also numerous Roman antiquities in the neighborhood of Treves, the most important of which are the Igel column, a sepulchral monument of the 2d century, and the mosaic pavements at Nennig and Fliessem.

Another group of interesting buildings belongs to the second period of prosperity enjoyed by Treves under the rule of its mediæval prelates. The cathedral, described by Lübke as the most important example of pre-Carlovingian building in Germany, mirrors the entire history of the town. Its kernel consists of part of a Roman basilica of the 4th century, which seems to have been converted into a Christian church at a very early period. It was restored by Bishop Nicetius about 550, and in the 11th and 12th centuries it was again restored and greatly extended by Archbishop Poppo and his successors, who added an apse at each end and left it substantially in its present form. The cathedral is connected by beautiful cloisters of the 13th century with the circular Liebfrauenkirche, one of the most interesting early Gothic churches in Germany (1227–43), catching up the architectural thread at the point dropped by the cathedral. Among the treasures of the latter is the "holy coat of Treves," believed by the devout to be the seamless garment worn by our Saviour at the crucifixion, and said to have been presented to the town by the empress Helena, the central figure in Treveran Christian legend. Its exhibition in 1844 attracted a million and a half of pilgrims to Treves. According to recent authorities, the earliest churches in Treves were those of Sts. Eucharius, Maximin, Matthew, and Paul, all without the walls, now rebuilt or converted to secular purposes. Of the modern buildings none call for special remark. The town library contains about 100,000 volumes, including several valuable specimens of early printing. Its greatest treasure is the *Codex Aureus*, a manuscript of the Gospels presented to the abbey of St. Maximin by Ada, sister of Charlemagne. The same building also contains an interesting collection of Roman and mediæval antiquities.

A mediæval legend, preserved in an inscription on the old Rothes Haus inn, places the foundation of Treves 1300 years before that of Rome, and ascribes it to Thebetas, son of Ninus, king of Assyria. But, fable apart, we must still allow that Treves has good claim to call itself the oldest town in Germany. It is a little doubtful whether the Treviri were of Teutonic or Celtic stock. St. Jerome records that the language of the Treviri of the 4th century resembled that of the Gauls of Asia; but, even if we admit this evidence as conclusive of their Celtic origin, we must recognize the fact that they were Celts who were long under Teutonic influence. Their authentic history begins with the story of their subjection by Julius Cæsar (56 B.C.), who describes them as a warlike race with the best cavalry in Gaul. The Roman town, *Colonia Augusta Trevirorum* (or *Treverorum*), was probably founded by the emperor Claudius, and rapidly obtained a wealth and importance which justified the poet Ausonius (4th century) in describing it as the second metropolis of the empire, or "Rome beyond the Alps." It became the capital of Belgica Prima, and during the 4th century was a favorite residence of Constantine and other Roman emperors. Most of the palaces and public buildings, of which the remains are still extant, were built at this period, while the surrounding hills were covered with villas. Treves was laid in ruins by Attila in 451, and about 465 was permanently taken possession of by the Franks. It was included in the kingdom of Austrasia, and became a German city in 870. Like its prototype Rome, it attained a second era of prosperity and importance as an ecclesiastical capital (see below), and in the Middle Ages the "Sancta Civitas Trevirorum" swarmed with "religious" of all kinds and grades. Unlike most of the German episcopal cities, however, it did not succeed in shaking off the ecclesiastical yoke, nor did it attain, except transitorily, the position of a free imperial city. Wars and sieges occasionally checked but did not stop its growth. Art and science were sedulously fostered in the monastic schools, and a university, founded in 1473, existed down to 1798. The importance of Treves departed with the overthrow of the ecclesiastical principality. In 1786 the last elector shifted his residence to Coblentz, and from 1794 to 1814 Treves was capital of the French department of the Sarre. Since the latter date it has belonged to Prussia.

The archbishopric and ecclesiastical electorate of Treves, bounded by Nassau, Cologne, Luxemburg, Lorraine, the Rhenish Palatinate, Hesse-Rheinfels, and Katzenelnbogen, had an area of about 3200 square miles and a population of 250,000 to 300,000. Its suffragan bishops were those of Metz, Toul, and Verdun, and after 1777 also those of Nancy and St. Dié. As elector of the German empire the archbishop took the second place, and bore the style of arch-chancellor of Gaul or Burgundy. Legend places the foundation of the bishopric of Treves in the 1st century of the Christian era, but the first bishop known to history is Agricius, who flourished about 314. The see appears as an archbishopric in the 9th century, and in the Middle Ages the archbishops obtained considerable temporal power. Among the most prominent were Baldwin of Luxemburg (1307–1354), brother of the emperor Henry VII., who may be regarded as the founder of the territorial greatness of the see, and Richard von Greiffenklau (1511–1531), who distinguished himself by his successful opposition to the Reformation. The last archbishop was Clemens Wenceslaus (1768–1802) of Saxony. The part of the archbishopric on the left bank of the Rhine was taken by France in 1801, and the rest was secularized in favor of the prince of Nassau-Weilburg in 1803. After the fall of Napoleon the archbishopric was incorporated with Prussia. A new bishopric of Treves was instituted in 1821, the boundaries of which are almost conterminous with those of the old archbishopric; the bishop is a suffragan to the archbishop of Cologne.

See "Augusta Treverorum," an article by E. A. Freeman in the *British Quarterly Review* for July, 1875.

TREVIRANUS, GOTTFRIED REINHOLD (1776–1837), German naturalist, was born at Bremen, February 4, 1776, studied medicine at Göttingen, in 1797 became a professor of mathematics in the Bremen lyceum, and died at Bremen, February 16, 1837.

He made numerous important contributions to comparative anatomy, especially in regard to birds and spiders. Though noted for his learning and acute observation, his studies in geographical distribution cannot be said to have led to any very definite results. It is rather on account of his contributions to ætiology that he deserves to be remembered, though his work in this department has been to a great extent overlooked. In the first of his larger works, *Biologie oder Philosophie der lebenden Natur*, which appeared from 1802–1805, he gave clear expression to the theory of "descent with modification." He believed that simple forms (Protists), which he termed "zoophytes," were "the primitive types from which all the organisms of the higher classes had arisen by gradual development." "Every living creature has a potentiality of endless modification of adapting its structure to the changes in the external world." He also maintained that each species has its day or period, at the end of which it does not become extinct, but has simply ceased to be, because it has become something else. That he stated the theory of descent with much clearness, and with a sufficient background of actual knowledge of forms, must be acknowledged by all; the only difficulty relates to the question of priority. The first volume of his biology was published in 1802, but he states that this had been written about 1796. Now it was not till 1801 that Lamarck first began to free himself from the traditional dogma of the immutability of species, and to publish his views of evolution. Neither Goethe nor Oken can be said to have done much more than follow up the ironical insinuations of Buffon (1753–56) and the ingenious suggestions of Erasmus Darwin, whose *Zoonomia* was translated into German between 1795 and 1797, while both Treviranus and Lamarck tackled the problem not merely of the theory of descent but of the mechanism of evolution. On this point the merits of Lamarck certainly outweigh those of his contemporary. Treviranus laid down as a fundamental proposition "that all living forms are the results of physical influences which are still in operation, and vary only in degree and direction." Like many after him, he directed attention to the influence of the male elements in fertilization as a source of variation, but laid emphasis only on the intra-organismal power of adaptation to surroundings. Whatever opinion be entertained in regard to the priority and the importance of the contribution made by Treviranus to the theory of evolution, it is at least certain that he was a learned naturalist and an acute thinker. His most important later work of a synthetic nature was entitled *Erscheinungen und Gesetze des organischen Lebens* (1831).

See EVOLUTION; E. Haeckel's *Schöpfungsgeschichte*, pp. 83–5; Carus, *Geschichte der Zoologie*, p. 610.

TREVISO, a town of Italy, in the province of the same name, lies in the midst of a district of great fertility, at the confluence of the Piavesella with the Sile, which is here navigable for large boats and communicates by canals with the lagoons of Venice (17 miles distant). It is an old town, with narrow irregular colonnaded streets and some good squares. The cathedral of San Pietro, dating from 1141 and restored and enlarged in the 15th century by Pietro Lombardo, but still unfinished, contains a fine Annunciation by Titian (1519), an Adoration of the Shepherds, the masterpiece of Paris Bordone (born at Treviso in 1500), and frescos by Pordenone. There are numerous statues and reliefs by Pietro, Tullio, Martino Lombardo, and by Sansovino. The Gothic church of San Niccolò (1310–52) contains a fine tomb by Tullio Lombardo, frescos by Giovanni Bellini, and a large altarpiece by Fra Marco Pensabene and others; in the adjoining chapter-house are forty portraits of celebrated

Dominicans by Tommaso da Modena (1352). The Monte di Pietà contains an Entombment by Pordenone (according to others by Giorgione). The churches of S. Leonardo, S. Andrea, S. Maria Maggiore, and S. Maria Maddalena also contain precious art treasures, and the town is enriched besides by various open-air frescos. The town-hall and theatre are also conspicuous buildings. Silk and cotton goods, cutlery, majolica, and paper are the chief manufactures of the place and an active trade is also carried on in corn, fruit, and cattle. The population in 1881 was 31,249.[1]

Treviso, the ancient *Tarvisium*, is not mentioned by any of the ancient geographers, though Pliny speaks of the Silis as flowing "ex montibus Tarvisanis." In the 6th century it appears as an important place. From 1318 it was for a short time the seat of a university (see UNIVERSITIES). In 1339 it came under the Venetian sway. In the 15th century its walls and ramparts were renewed under the direction of Fra Giocondo, two of the gates being built by the Lombardi. Treviso was taken in 1797 by the French under Mortier (duke of Treviso). In March, 1848, the Austrian garrison was driven from the town by the revolutionary party, but in the following June the town was bombarded and compelled to capitulate.

TREVITHICK, RICHARD (1771–1833), inventor of the locomotive, was descended from a family of great antiquity in the county of Cornwall, and was born 13th April, 1771, in the parish of Illogan. Shortly afterwards the family removed to Penponds, near Camborne, where the boy attended his first and only school, his attainments being limited to reading, writing, and arithmetic. Though slow and obstinate as a scholar, he spent much time drawing lines and figures on his slate, and possessed such instinctive skill in mechanics that while still a youth he was able to solve a difficulty in the correction of underground levels which had puzzled some of the mine agents. He inherited more than the average strength for which his family were famous, standing 6 feet 2 inches in height, while his frame was the very model of an athlete. His feats in wrestling and lifting and throwing weights were unexampled in the district. At the age of eighteen he began to assist his father as mine manager, and, manifesting great fertility of mechanical invention, was soon recognized as the great rival of Watt in improvements on the steam-engine (see vol. xxii. p. 494). On the death of his father in 1797, he succeeded him as leading engineer in Cornish mining. He married the same year. His earliest invention of importance was his improved plunger pole pump (1797), which has superseded all others for deep mining. In 1798 he applied the principle of the plunger pole pump to the construction of the water-pressure engine, which he subsequently improved in various ways. About this time he also perfected a high-pressure non-conducting steam-engine, which became a successful rival of the low-pressure steam-vacuum engine of Watt. At an early period he had begun experiments in the construction of locomotives, and a model constructed by him before 1800 is now in the South Kensington Museum. On Christmas eve 1801 his common road locomotive carried the first load of passengers ever conveyed by steam, and on 24th March, 1802, he and Andrew Vivian applied for a patent for steam-engines in propelling carriages. In 1803 his locomotive was run in the streets of London, from Leather Lane by Gray's Inn Lane and along Oxford Street to Paddington, the return journey being made by Islington. The cost was, however, found too great, and his thoughts were now directed to the construction of a steam locomotive for tramways, with such success that in February, 1804, he worked a tramroad locomotive in Wales, running with facility up and down inclines of 1 in 50. In 1808 he constructed a circular railway in London near Euston Square, on which the public were carried at the rate of twelve or fifteen miles an hour round curves of 50 or 100 feet radius. The ideas of Trevithick were successfully developed by Stephenson so as to revolutionize the system of modern travelling, but Trevithick had made considerable progress towards this before Stephenson had begun his experiments. Trevithick applied his high-pressure engine with great success to rock boring and breaking, as well as to dredging. In 1806 he entered into a twenty-one years' engagement with the board of Trinity House, London, to lift ballast from the bottom of the Thames, at the rate of 500,000 tons a year, for a payment of 6d. [12 c.] a ton. The following year he was appointed along with Vazie to execute the Thames driftway, but the work was abandoned owing to disputes about payment when unexpected difficulties had occurred. He then set up workshops at 72 Fore Street, Limehouse, for the construction of iron tanks and buoys and model iron ships. He was the first to recognize the importance of iron in the construction of large ships, and in various ways his ideas have also influenced the construction of steamboats. In the application of steam to agriculture the name of Trevithick occupies one of the chief places. A high-pressure steam threshing engine was erected by him in 1812 at Trewithen, the property of Sir Charles Hawkins, while, in the same year, in a letter to the Board of Agriculture, he stated his belief that every part of agriculture might be performed by steam, and that such a use of the steam-engine would "double the population of the kingdom and make our markets the cheapest in the world." In 1814 he entered on an agreement for the construction of engines for the Peruvian mines, and to superintend their working removed to Peru in 1816. Thence he went in 1822 to Costa Rica. He returned to England in 1827, and in 1828 petitioned parliament for a reward for his inventions, but without success. He was equally unsuccessful in his endeavors to induce the lords commissioners of the Admiralty to afford him facilities for demonstrating the value of certain improvements he claimed to have made in steam navigation. He died 22d April, 1833.

See *Life of Richard Trevithick, with an Account of his Inventions*, by Francis Trevithick, C.E., 2 vols., 1872.

TRIAL, in law, is the examination of a cause before a court of justice. It is the stage in the cause next after PLEADING (*q.v.*). Advance in legal development is generally marked by difference in the mode of trial. This was especially the case in the history of Roman law, and it has been the same in England (see ACTION). Many forms of trial, notably those by ORDEAL (*q.v.*), by wager of battle or of law (see WAGER), and by grand assize, have become obsolete, and new forms have been created by legislation in order to meet altered circumstances of society. Up to a very recent date the tendency of the Roman and English systems was in opposite directions. In the former and in systems founded on it, such as the Scotch, trial by the judge became the rule, in the latter trial by judge and jury. But the Judicature and Summary Jurisdiction Acts have recently made considerable innovations upon the old common-law right to trial by JURY (*q.v.*) or *per pais*, as it was also called. The modes of trial in England are very numerous, as to a certain extent each COURT (*q.v.*) has its own procedure. Certain broad rules of justice are observed by all courts, such as that both sides are to be heard, or to have an opportunity of being heard, before decision, and that (unless in very exceptional cases) the trial is to be in public.

For purposes of convenience rather than as a scientific division trials may be divided into civil and criminal. An ordinary trial in a civil case may be either in a court of appellate jurisdiction (in which case it is perhaps more properly called a hearing), in the High Court of Justice before a judge or referee, or in an inferior court. Where the trial is in a court of first instance, it may be either with or without a jury. In Chancery and Admiralty proceedings a jury is not used, and the right to a jury in the Queen's Bench Division has been considerably restricted by the Rules of the Supreme Court, 1883, Order xxxvi. Before these rules either party had an absolute right to have issues of fact in an action in that division tried by jury. Now, unless in certain actions, mainly of tort, in which a jury is as of right, a jury can only be obtained by application of a party to the action, subject to the power of the court to direct trial without a jury of any issue requiring prolonged examination of documents or accounts or scientific or local investigation. The question of VENUE (*q.v.*) in civil actions has ceased to be of importance since the Judicature Acts. Most courts are entitled in proper cases to the assistance of assessors. Trial with assessors is in frequent use in the Admiralty Division. A trial whether by jury or not may be by affidavit or on *viva voce* evidence. The latter is the rule where the trial is by jury. In a county court a jury of five is allowed in certain cases on application. In other inferior courts of local jurisdiction a jury is sometimes the rule, as in the (London) Lord Mayor's Court, sometimes not, as in the Chancellor's Court at Oxford or Cambridge. In criminal cases the trial is by jury, except where a court of SUMMARY JURISDICTION (*q.v.*) is empowered to try offences of a comparatively unimportant nature. The right to trial by due process of law before condemnation is secured to the subject by sec. 29 of Magna Charta. A new trial may be ordered in civil actions and in misdemeanors (in the latter case only after conviction of the defendant) on various grounds, the most usual of which are misdirection by the judge, improper admission or rejection of evidence, and the finding of a verdict against the weight of evidence. In actions in the High Court new trials are less liberally granted than was the case before the Judicature Acts, Order xxxix. considerably restricting the right. An application for a new trial of an action is no longer made by *ex parte* motion in the first instance, as was the course before 1883, but upon notice of motion. Besides the ordinary modes of trial, there are others of an exceptional nature or of rare occurrence. In a trial by arbitration, the tribunal is chosen by the parties themselves, and they are not entitled to object to the trial as conducted by the arbitrator as long as it conforms to rules of ordinary justice. Peers are tried for treason or felony before the House of Lords, or the court of the Lord High Steward if the trial takes place during the recess of parliament. A trial at bar—a survival of the universal mode of trial before the writ of NISI PRIUS (*q.v.*) was given by the Statute of Westminster the Second—takes place before three or four judges of the Queen's Bench Division, and is in use as of right where the crown is interested in the litigation, or at the discretion of the court in other cases where questions of unusual importance or difficulty are raised. The trial of a petition of right (see PETITION, vol. xviii. p. 718) is now assimilated to that in civil actions. Trials by record, by certificate, and by inspection, though not expressly abolished, appear to have become obsolete., IMPEACHMENT (*q.v.*) is still a right of the House of Commons, but has not recently been exercised. COURT-MARTIAL (*q.v.*) is the mode of trial for offences committed by persons in the naval or military service of the crown.

---

[1] [In 1886 the population was returned as 18,301.—AM. ED.]

In Scotland and the United States trials are either with or without a jury. The most usual trials in Scotland are those before a judge of the Court of Session or the High Court of Justiciary or in a sheriff court. In the United States trials are either in a United States or a State court; in the latter case they are regulated by State legislation.

TRIBONIAN, the famous jurist and minister of Justinian, was born in Pamphylia in the latter part of the 5th century. Adopting the profession of an advocate, he came to Constantinople and practiced in the prefectural courts there, reaching such eminence as to attract the notice of the emperor Justinian, who appointed him in 528 one of the ten commissioners directed to prepare the first *Codex* of imperial constitutions. In the edict creating this commission (known as *Hæc Quæ*) Tribonian is named sixth, and is called "virum magnificum, magisteria dignitate inter agentes decoratum" (see *Hæc Quæ* and *Summa Reipublicæ*, prefixed to the *Codex*). When the commission of sixteen eminent lawyers was created in 530 for the far more laborious and difficult duty of compiling a collection of extracts from the writings of the great jurists of the earlier empire, Tribonian was made president and no doubt general director of this board. He had already been raised to the office of quæstor, which at that time was a sort of ministry of law and justice, its holder being the assessor of the emperor and his organ for judicial purposes, something like the English lord chancellor of the later Middle Ages. The instructions given to these sixteen commissioners may be found in the constitution *Deo Auctore* (*Cod.*, i. 17, 1), and the method in which the work was dealt with in the constitution *Tanta* (*Cod.*, i. 17, 2), great praise being awarded to Tribonian, who is therein called ex-quæstor and ex-consul, and also as magister officiorum. This last constitution was issued in December, 533, when the *Digest* was promulgated as a law-book. During the progress of the work, in January 532, there broke out in Constantinople a disturbance in the hippodrome, which speedily turned to a terrible insurrection, that which goes in history by the name of Nika, the watchword of the insurgents. Tribonian was accused of having prostituted his office for the purposes of gain, and the mob searched for him to put him to death (Procop., *Pers.*, i. 24–26). Justinian, yielding for the moment, removed him from office, and appointed a certain Basilides in his place. After the suppression of the insurrection the work of codification was resumed. A little earlier than the publication of the *Digest*, or *Pandects*, there had been published another but much smaller law-book, the *Institutes*, prepared under Justinian's orders by Tribonian, with Theophilus and Dorotheus, professors of law (see Preface to *Institutes*). About the same time the emperor placed Tribonian at the head of a fourth commission, consisting of himself as chief and four others,—Dorotheus, professor at Beyrut, and three practicing advocates, who were directed to revise and re-edit the first *Codex* of imperial constitutions. The new *Codex* was published in November, 534 (see constitution *Cordi Nobis* prefixed to the *Codex*). With it Tribonian's work of codification was completed. But he remained Justinian's chief legal minister. He was re-instated as quæstor some time after 534 (Procop., *Pers.*, i. 25; *Anecd.*, 20), and seems to have held the office as long as he lived. He was evidently the prime mover in the various changes effected in the law by the novels of Justinian (*Novellæ Constitutiones*), which became much less frequent and less important after death had removed the great jurist. The date of his death has been variously assigned to 545, 546, and 547. Procopius says (*Anecd.*, 20) that, although he left a son and many grandchildren, Justinian confiscated part of the inheritance.

The above facts, which are all that we know about Tribonian, rest on the authority of his contemporary Procopius and of the various imperial constitutions already cited. There, are, however, two articles in the *Lexicon* of Suidas under the name "Tribonianos." They appear to be different articles, purporting to refer to different persons and have been generally so received by the editors of Suidas and by modern legal historians. Some authorities, however, as for instance Gibbon, have supposed them to refer to the same person. The first article is unquestionably meant for the jurist. It is based on Procopius, whose very words are to some extent copied, and indeed it adds nothing to what the latter tells us, except the statement that Tribonian was the son of Macedonianus, was ἀπὸ δικηγόρων τῶν ὑπάρχων, and was a heathen and atheist, wholly averse to the Christian faith. The second article says that the Tribonian to whom it refers was of Side (in Pamphylia), was also ἀπὸ δικηγόρων τῶν ὑπάρχων was a man of learning, and wrote various books, among which are mentioned certain astronomical treatises, a dialogue *On Happiness*, and two addresses to Justinian. None of these books relate to law; and the better opinion seems to be that there were two Tribonians, apparently contemporaries, though possibly some of the attributes of the jurist have been, by a mistake of the compilers or transcribers of the *Lexicon* of Suidas, extended to the man of letters of the same name.

The character which Procopius gives to the jurist. even if touched by personal spite, is entitled to some credence, because it is contained in the *Histories* and not in the scandalous and secret *Anecdota*. It is as follows: "Tribonian was a man of great natural powers, and had attained as high a culture as any one of his time; but he was greedy of money, capable of selling justice for gain, and every day he repealed or enacted some law at the instance of people who purchased this from him according to their several needs. . . . He was pleasant in manner and generally agreeable, and able by the abundance of his accomplishments to cast into the shade his faults of avarice" (*Pers.*, i. 24, 25). In the *Anecdota* Procopius adds as an illustration of Justinian's vanity the story that he took in good faith an observation made to him by Tribonian while sitting as assessor, that he (Tribonian) greatly feared that the emperor might some day, on account of his piety, be suddenly carried up into heaven. This agrees with the character for flattery which the minister seems to have enjoyed. The charge of heathenism we find in Suidas is probable enough; that is to say, Tribonian may well have been a crypto-pagan, like many other eminent courtiers and litterateurs of the time (including Procopius himself), a person who, while professing Christianity, was at least indifferent to its dogmas and rites, cherishing a sentimental recollection of the older and more glorious days of the empire.

In modern times Tribonian has been, as the master workman of Justinian's codification and legislation, charged with three offences,—bad Latinity, a defective arrangement of the legal matter in the *Code* and *Digest*, and a too free handling of the extracts from the older jurists included in the latter compilation. The first of these charges cannot be denied; but it is hard to see why a lawyer of the 6th century, himself born in a Greek-speaking part of the empire, should be expected to write Latin as pure as that of the age of Cicero, or even of the age of Gaius and the Antonines. To the second charge also a plea of guilty must be entered. The *Code* and *Digest* are badly arranged according to our notions of scientific arrangement. These, however, are modern notions. The ancients generally cared but little for what we call a philosophic distribution of topics, and Tribonian seems to have merely followed the order of the Perpetual Edict which custom had already established, and from which custom would perhaps have refused to permit him to depart. He may more fairly be blamed for not having arranged the extracts in each title of the *Digest* according to some rational principle; for this would have been easy, and would have spared much trouble to students and practitioners ever since. As to the third complaint, that the compilers of the *Digest* altered the extracts they collected, cutting out and inserting words and sentences at their own pleasure, this was a process absolutely necessary according to the instructions given them, which were to prepare a compilation representing the existing law, and to be used for the actual administration of justice in the tribunals. The so-called *Emblemata* (insertions) of Tribonian were therefore indispensable, though, of course, we cannot say whether they were always made in the best way. Upon the whole subject of the codification and legislation in which Tribonian bore a part, see JUSTINIAN.

Tribonian, from the little we know of him, would seem to have been a remarkable man, and in the front rank of the great ones of his time. There is nothing to show that he was a profound and philosophical jurist, like Papinian or Ulpian. But he was an energetic clear-headed man, of great practical force and skill, cultivated, accomplished, agreeable, flexible, possibly unscrupulous, just the sort of person whom a restless despot like Justinian finds useful. His interest in legal learning is proved by the fact that he had collected a vast legal library, which the compilers of the *Digest* found valuable (see const. *Tanta*).

The usual criticisms on Tribonian may be found in the *Anti-Tribonianus* (1567) of Francis Hotman, the aim of which is shown by its alternative title, *Sive discursus in quo jurisprudentiæ Tribonianeæ sterilitas et legum patriarum excellentia exhibetur*; and an answer to them in J. P. von Ludewig, *Vita Justiniani et Theodoræ, nec non Triboniani.* (J. BR.)

TRIBUNE (*tribunus*) was a name assigned to officers of several different descriptions in the constitution of ancient Rome. The connection of the word with *tribus*, "tribe," is obvious. The original tribunes were no doubt the commanders of the several contingents of cavalry and infantry which were supplied to the Roman army by the early gentilician tribes,—the Ramnes, the Tities, and the Luceres. In the historical period the infantry in each legion were commanded by six tribunes, and the number six is probably to be traced to the doubling of the three tribes by the incorporation of the new elements which received the names of *Ramnes secundi*, *Tities secundi*, *Luceres secundi*. The *tribuni celerum* or commanders of the cavalry no longer existed in the later times of the republic, having died out with the decay of the genuine Roman cavalry.[1] So long as the monarchy lasted these tribunes were doubtless nominated by the commander-in-chief, the king; and the nomination passed over on the establishment of the republic to his successors, the consuls. But, as the army increased, the popular assembly insisted on having a voice in the appointments, and from 362 B.C. six tribunes were annually nominated by popular vote, while in 311 the number was raised to sixteen, and in 207 to twenty-four, at which figure it remained. The tribunes thus elected ranked as magistrates of the Roman people, and were designated *tribuni militum a populo*, while those who owed their office to the consuls bore the curious title of *tribuni rufuli*. The rights of the assembly passed on to the emperors, and "the military tribunes of Augustus" were still contrasted with those nominated in the camp by the actual commanders. The obscure designation *tribunus ærarius*, "tribune of the treasury," had also, in all probability, a connection with the early organization of the army. The officer thus designated was at any rate the paymaster of the troops, and the soldier who was defrauded of his pay was allowed to exact it from this tribune by a very summary process. There was still another and important class of tribunes who owed their existence to the army. In the long struggle between the patrician and plebeian sections of the population, the first distinctions in the public service to which the plebeians forced their way were military, and the contest for admission to the consulate was in large part a contest for admission to the supreme command of the national forces. In 445 B.C., the year in which mixed marriages of patricians and plebeians were for the first time permitted, power was given to the senate (then wholly patrician) of determining from year to year whether consuls or military tribunes with consular authority (*tribuni militares consulari potestate* or *imperio*) should be appointed. But, even when the senate decided in favor of electing tribunes, no election was valid without the express sanction of the senate superadded to the vote of the centuriate assembly. If it happened to be too invidious for the senate openly to cancel the election, it was possible for the patricians to obtain a decision from the sacred authorities to the effect that some religious practice had not been duly observed, and that in consequence the appointment was invalid. According to tradition, recourse was had to this device at the first election, a plebeian having been successful. Forty-five years elapsed after the creation of the office before any plebeian was permitted to fill it, and it was held by very few down to the time at which it was abolished (367 B.C.) and the plebeians were fully admitted to the consulate. The number of consular tribunes elected on each occasion varied from three to six; there was no year without a patrician, and to the patrician members were probably confined the most highly esteemed duties, those relating to the administration of the law and to religion.

But by far the most important tribunes who ever existed in the Roman community were the tribunes of the commons (*tribuni plebis*). These, as has been explained in ROME (vol. xx. p. 755 *sq.*), were the most characteristic outcome of the long struggle between the two orders, the patrician and the plebeian. When in 494 B.C. the plebeian legionaries met on the Sacred Mount and bound themselves to stand by each other to the end, it was determined that the plebeians should by themselves annually appoint executive officers to stand over against the patrician officers,—two tribunes (the very name commemorated the military nature of the revolt) to confront the two consuls, and two helpers called ædiles to balance the two patrician helpers, the quæstors. The name ædile is obviously connected with *ædes*, "a temple," and is an indication of the fact that there was a religious core to the insurrection, just as there was a religious core to the patrician opposition. The temple of Diana and Ceres on the Aventine Hill became for a time to the plebeians what the temple of Saturn was to the patricians,—their official centre and their record office. The insurgent leaders also pressed religion into their service in another way. The masses assembled on the Sacred Mount bound themselves by a solemn oath to regard the persons of their tribunes and ædiles as inviolable, and to treat as forfeited to Diana and Ceres the lives and property of those who offered them insult. That this purely plebeian oath was the real ultimate basis of the sanctity which attached to the tribunate during the whole time of its existence can hardly be believed, though this view has had powerful support both in ancient and in recent times. The revolution must have ended in something which was deemed by both the contending bodies to be a binding compact, although the lapse of time has blotted out its terms. The historian Dionysius may have been only technically wrong in supposing that peace was concluded between the two parties by the fetial priests, with the forms adopted by Rome in making treaties with a foreign state. If this were fact, the "sacrosanctity" of the tribunes would be adequately explained, because all such formal *fœdera* were "sacrosanct." But, notwithstanding that the plebeians may safely be assumed to have been conscious of having to a large extent sprung from another race than the patricians and their retainers, it is not likely that the feeling was sufficiently strong to permit of the compact taking the form of a treaty between alien powers. Yet there must have been a formal acceptance by the patricians of the plebeian conditions; and most probably the oath which was first sworn by the insurgents was afterwards taken by the whole community, and the "sacrosanctity" of the plebeian officials became a part of the constitution. There must also have been some constitutional definition of the powers of the tribunes. These rested at first on an extension of the power of veto which the republic had introduced. Just as one consul could annul an act or order of his colleague, so a tribune could annul an act or order of a consul, or of any officer inferior to him. There was no doubt a vague understanding that only acts or orders which sinned against the just and established practice of the constitution should be annulled, and then only in cases affecting definite individuals. The tribune was to give his help against illegality in concrete instances. The cases which arose most commonly concerned the administration of justice and the levying of troops.

---

[1] In the legends of the foundation of the republic Brutus is represented as having exercised authority, when the king was banished, merely by virtue of holding the office of *tribunus celerum*.

Although the revolution of 494 gave the tribunes a foothold in the constitution, it left them with no very definite resources against breaches of compact by the patricians. The traditional history of the tribunate from 494 to 451 B.C. is obscure, and, so far as details are concerned, nearly worthless; but there is a thread running through it which may well be truth. We hear of attacks by patricians on the newly won privileges, even of the assassination of a tribune, and of attempts on the part of the plebeians to bring patrician offenders to justice. The assembled plebeians attempt to set up a criminal jurisdiction for their own assembly parallel to that practiced by the older centuriate assembly, in which the nobles possess a preponderating influence. Nay, more, the plebs attempts something like legislation; it passes resolutions which it hopes to force the patrician body to accept as valid. As to details, only a few are worth notice. In the first place, the number of tribunes is raised to ten, how we do not know; but apparently some constitutional recognition of the increase is obtained. Then an alteration is made in the mode of election. As to the original mode, the ancient authorities are hopelessly at variance. Some of them gravely assert that the appointment lay with the assembly of the curiæ—the most ancient and certainly the most patrician in Rome, even if we allow the view, which, in spite of great names, is more than doubtful—that the plebeians were members of it at any time when it still possessed political importance. The opinion of Mommsen about the method of election is more plausible than the others. It was in accordance with the Roman spirit of order that the tribunes, in summoning their assemblies, should not ask the plebeians to come *en masse* as individuals, and vote by heads, but should organize their supporters in bands. The *curia* was certainly a territorial district, and the tribunes may have originally used it as the basis of their organization. If tribunes were elected by plebeians massed *curiatim*, such a meeting would easily be mistaken in later times for the *comitia curiata*. At any rate, a change was introduced in 471 by the Publilian Law of Volero, which directed that the tribunes should be chosen in an assembly organized on the basis of the Servian or local tribe, instead of the *curia*. This assembly was the germ of the *comitia tributa*. The question by what authority the Law of Volero was sanctioned is difficult to answer. Possibly the law was a mere resolution of the plebeians with which the patricians did not interfere, because they did not consider that the mode of election was any concern of theirs. In the first period of the tribunate the tribunes almost certainly agitated to obtain for their supporters a share in the benefits of the state domain. And, whatever view may be taken of the movement which led to the decemvirate, an important element in it was of a certainty the agitation carried on by the tribunes for the reduction of the law of Rome to a written code. Until they obtained this, it was impossible for them effectually to protect those who appealed against harsh treatment by the consuls in their capacity of judges.

During the decemvirate the tribunate was in abeyance. It was called into life again by the revolution of 449, which gave the tribunes a considerably stronger position. Their personal privileges and those of the ædiles were renewed, while sacrosanctity was attached to a body of men called *judices decemviri*, who seem to have been the legal assistants of the tribunes. The road was opened up to valid legislation by the tribunes through the assembly of the tribes, but in this respect they were submitted to the control of the senate. The growth of the influence of the tribe assembly over legislation belongs rather to the history of the COMITIA (*q.v.*) than to that of the tribunate. After the Hortensian Law of 287 B.C. down to the end of the republic nearly all the legislation of Rome was in the hands of the tribunes. The details of the history of the tribunate in its second period, from 449 to 367 B.C., are hardly less obscure than those which belong to the earlier time. There was, however, on the whole, undoubtedly an advance in dignity and importance. Gradually a right was acquired of watching and interfering with the proceedings of the senate, and even with legislation. Whether the absolute right of veto had been achieved before 367 may well be doubted. But the original *auxilium*, or right of protecting individuals, was, during this period, undergoing a very remarkable expansion. From forbidding a single act of a magistrate in relation to a single person, the tribunes advanced to forbidding by anticipation all acts of a certain class, whoever the persons affected by them might prove to be. It therefore became useless for the senate or the comitia to pass ordinances if a tribune was ready to forbid the magistrates to carry them out. Ultimately the mere announcement of such an intention by a tribune was sufficient to cause the obnoxious project to drop: that is to say, the tribunes acquired a right to stop all business both in the deliberative assembly, the senate, and in the legislative assemblies, the *comitia*. The technical name for this right of veto is *intercessio*. To what extent the tribunes during the time from 449 to 367 took part in criminal prosecutions is matter of doubt. The XII. Tables had settled that offenders could only be punished in person by the centuries, but tradition speaks of prosecutions by tribunes before the tribes where the penalty sought was pecuniary. The two main objects of the tribunes, however, at the time of which we are speaking were the opening of the consulate to plebeians and the regulation of the state domain in the interests of the whole community. Both were attained by the Licinio-Sextian Laws of 367.

Then a considerable change came over the tribunate. From being an opposition weapon it became an important wheel in the regular machine of state. The senate became more and more plebeian, and a new body of nobility was evolved which comprised both orders in the state. The tribunes at first belonged to the same notable plebeian families which attained to the consulate. The old friction between senate and tribunes disappeared. It was found that the tribunate served to fill some gaps in the constitution, and its power was placed by common consent on a solid constitutional basis. From 357 to 134 B.C. (when Tiberius Gracchus became tribune) the tribunate was for the most part a mere organ of senatorial government. As the change made by the Gracchi was rather in the practice than in the theory of the tribunate, it will be convenient at this point to give a definite sketch of the conditions and privileges attaching to the office.

Even after the difference between patrician and plebeian birth had ceased to be of much practical consequence in other directions, the plebeian character was a necessity for the tribune. When the patricians P. Sulpicius Rufus and, later, P. Clodius (the antagonist of Cicero) desired to enter on a demagogic course, they were compelled to divest themselves of their patrician quality by a peculiar legal process. Even the patricians who became so by mere fiat of the emperors were excluded from the tribunate. The other necessary qualifications were for the most part such as attached to the other Roman magistracies,—complete citizenship, absence of certain conditions regarded as disgraceful, fulfilment of military duties. The minimum age required for the office was, as in the case of the quæstorship, twenty-seven. The tribunate stood outside the round of magistracies the conditions of which were regulated by the Villian Law of 180 B.C. The election took place in a purely plebeian assembly, ranged by tribes, under the presidency of a tribune selected by lot. The tribune was bound by law to see a complete set of ten tribunes appointed. Technically, the tribunes were reckoned, not as magistrates of the Roman people, but as magistrates of the Roman plebs; they therefore had no special robe of office, no lictors, but only messengers (*viatores*), no official chair, like the curule seat, but only benches (*subsellia*). Their right to summon the plebs together, whether for the purpose of listening to a speech (in which case the meeting was a *contio*) or for passing ordinances (*comitia tributa*), was rendered absolute by the "laws under sacred sanction" (*leges sacratæ*), which had been incorporated with the constitution on the abolition of the decemvirate. The right to summon the senate and to lay business before it was acquired soon after 367, but was seldom exercised, as the tribunes had abundant means of securing what they wanted by pressure applied to the ordinary presidents,—the consuls or the urban prætor. When an *interregnum* came about and there were no "magistrates of the Roman people," the plebeian tribunes became the proper presidents of the senate and conductors of ordinary state business. At the end of the republic there were *interregna* of several months' duration, when the tribunes held a position of more than usual importance. A tenure of the tribunate did not, until a comparatively late period (probably about the time of the Second Punic War), confer a claim to a permanent seat in the senate. The candidates for the office were mainly young men of good family who were at the beginning of their political career, but the office was often filled by older men of ambition who were struggling upwards with few advantages. The plebeian ædiles very soon after 367 became dissociated from the tribunes and associated with the curule ædiles, so that in the political hierarchy they really ranked higher than those who were originally their superior officers.

The real kernel of the tribune's power consisted in his *intercessio* or right of annulling ordinances, whether framed by the senate or proposed by a magistrate to the *comitia*, or issued by a magistrate in pursuance of his office. From 367 B.C. down to the time of the Gracchi the power of veto in public matters was on the whole used in the interest of the aristocratic governing families to check opposition arising in their own ranks. A recalcitrant consul was most readily brought to obedience by an exercise of tribunician power. But, although modern readers of the ancient historians are apt to carry away the idea that the tribunate was an intensely political office, it is safe to say that the occasions on which tribunes found it possible to play a prominent part in politics were extremely few, even in the late republic. On the other hand, the tribunes found a field for constant activity in watching the administration of justice and in rendering assistance to those who had received harsh treatment from the magistrates. The tribunes were in fact primarily legal functionaries, and constituted in a way the only court of appeal in republican Rome. It was to this end that they were forbidden to pass a whole night away from the city, except during the Latin festival on the Alban Mount, and that they were expected to keep their doors open to suppliants by night as well as by day. They held court by day in the Forum close by the Porcian basilica, and frequently made elaborate legal inquiries into cases where their help was sought. Naturally this ordinary humdrum work of the tribunes has left little mark on the pages of the historians, but we hear of it not unfrequently in Cicero's speeches and in other writings which deal with legal matters. According to the general principle of the constitution, magistrates could forbid the acts of magistrates equal to or inferior to themselves. For this purpose the tribunes were deemed superior to all other officers. If a tribune exercised his veto no other tribune could annul it, for the veto could not be itself vetoed, but it was possible for another tribune to protect a definite individual from the consequences of disobedience. The number of the tribunes (ten) made it always possible that one might balk the action of another, except at times when popular feeling was strongly roused. In any case it was of little use for a tribune to move in any important matter unless he had secured the co-operation or at least the neutrality of all his colleagues. The veto was not, however, absolute in all directions. In some it was limited by statute; thus the law passed by Gaius Gracchus about the consular provinces did not permit a tribune to veto the annual decree of the senate concerning them. When there was a dictator at the head of the state, the veto was of no avail against him. One of the important political functions of the tribunes was to conduct prosecutions of state offenders, particularly ex-magistrates. These prosecutions began with a sentence pronounced by the tribune upon the culprit, whereupon, exercising the right given him by the XII. Tables, the culprit appealed. If the tribune sought to inflict punishment on the culprit's person, the appeal was to the assembly of the centuries; if he wished for a large fine, the appeal was to the assembly of the tribes. As the tribune had no right to summon the centuries, he had to obtain the necessary meetings through the urban prætor. In the other event he himself called together the tribute assembly and proposed a bill for fining the culprit. But the forms of trial gone through were very similar in both cases.

It is commonly stated that a great change passed over the tribunate at the time of the Gracchi, and that from their day to the end of the republic it was used as an instrument for setting on foot political agitation and for inducing revolutionary changes. This view is an inversion of the facts. The tribunate did not create the agitation and the revolutions, but these found vent through the tribunate, which gave to the democratic leaders the hope that acknowledged evils might be cured by constitutional means, and in the desperate struggle to realize it the best democratic tribunes strained the theoretic powers of their office to their ruin. For the bad tribunes did not hesitate to use for bad ends the powers which had been strained in the attempt to secure what was good. But herein the tribunate only fared like all other parts of the republican constitution in its last period. The consuls and the senate were at least as guilty as the tribunes. After a severe restriction of its powers by Sulla and a restoration by Pompey, which gave a twenty years' respite, the tribunate was merged into the imperial constitution, of which indeed it became the chief corner-stone. The emperors did not become tribunes, but took up into their privileges the essence of the office, the "tribunician authority." This distinction between the essential principle of the office and the actual tenure of the office was a creation of the late republic. Pompey, for example, when he went to the East, was not made proconsul of all the Eastern provinces, but he exercised in them a "proconsular authority" which was superior to that of the actual proconsuls,—an authority which was the prototype of the imperial authority on its military side. Similarly the emperor, as civil governor, without being tribune, exercised powers of like quality with the powers of the tribune, though of superior force. By virtue of his tribunician authority he acquired a veto on legislation, he became the supreme court of appeal for the empire, and to his person was attached the ancient sacrosanctity. Augustus showed the highest statesmanship in founding his power upon a metamorphosed tribunate, rather than upon a metamorphosed dictatorship, upon traditions which were democratic rather than upon traditions which were patrician and optimate. The tribunes continued to exist till a late period, with gradually vanishing dignity and rights; but it is not necessary here to trace their decay in detail.

The name "tribune" was once again illuminated by a passing glory when assumed by Cola di Rienzi. The movement which he headed was in many respects extremely like the early movements of the plebeians against the patricians, and his scheme for uniting Italy in one free republic was strangely parallel with the greatest dream of the Gracchi. See ROME, vol. xx. p. 817 *sq.*

The history of the tribunate is interwoven with that of Rome, and must, to a large extent, be sought for in the same sources.

The principles attaching to the office are profoundly analyzed by Mommsen in his *Staatsrecht*, and are clearly set forth by E. Herzog in his *Geschichte u. System der römischen Staatsverfassung* (Leipsic, 1884). (J. S. R.)

TRICHINA, TRICHINOSIS. See NEMATOIDEA, and PARASITISM, vol. xviii. p. 275.

TRICHINOPOLI, a district of British India, in the Madras presidency, lying between 10° 37′ and 11° 30′ N. lat. and 78° 12′ and 79° 30′ E. long. Its area is 3561 square miles. It is bounded on the north and northwest by Salem, on the north and northeast by South Arcot, on the east and southeast by Tanjore, on the south by Pudukottai state and Madura, and on the west by Coimbatore. The surface is generally flat, though diversified by masses of crystalline rock, of which the Trichinopoli rock in the fort is a well-known example. The district is well wooded, though nothing worthy of the name of forest is to be found in it. The only mountains are the Pachaimalais, which rise to 2500 feet and extend into Salem district. The KABERI (*q.v.*) and its branch the Colerun are the only rivers of any importance. Trichinopoli has numerous roads, and the South Indian Railway traverses it from east to west. The climate is very hot, and not liable to great variations; the annual average rainfall is about 38 inches.

In 1881 the population of the district was 1,215,033 (males 586,434, females 628,599), of whom Hindus numbered 1,119,434, Modammedans 34,104, and Christians 58,809. The only town with a population exceeding 10,000 is Trichinopoli, the capital, with 84,449 inhabitants. This city is chiefly noticeable for its strong fort, perched on a granite peak, 500 feet high, and the group of temples and temple buildings situated on and around it. The town next in importance is SRIRANGAM (*q.v.*). The chief crops of the district are rice, cotton, tobacco, indigo, sugar-cane, cocoa-nut, plantain, areca-nut, and chillies; and the most important local industries are weaving and the manufacture of cigars. The principal exports are grain of all kinds, especially rice; the imports, tobacco and salt. In 1885–86 the gross revenue of the district was £225,896 [$1,097,854.56], the land-tax yielding £185,889 [$903,420.54]. Trichinopoli district, along with the rest of the Carnatic, of which it formed part, passed to the British by treaty in 1801.

TRIC TRAC. See BACKGAMMON, vol. iii. p. 173.

TRICYCLE. Though velocipedes were made and used more than one hundred years ago, none were practically successful until the brothers Starley constructed in 1876 the Coventry tricycle. One of the earliest descriptions of a cycle occurs in the *Journal de Paris* of 17th July, 1779. Somewhat later M. Richard invented a machine driven by mechanism almost identical with that of the modern omnicycle, but without the expanding segments. Early in the 19th century the cranked axle worked by treadles and levers came into fashion; then the heavy four-wheelers were preferred. All these machines, however, labored under three fatal defects: it was almost impossible to drive them up-hill, to check them in going down-hill, and to prevent their overturning in rounding a corner.

It was the success of the early bicycle (see BICYCLE) which suggested the belief that a serviceable tricycle could be made. One of these bicycles was specially constructed for ladies, the hind wheel being placed well on one side; but though it could be ridden, it was not a commercial success. The brothers Starley, by putting a second small wheel in front of the large driving wheel and on the same side as the small hind wheel, gave stability to the machine; it was steered by turning the small wheels opposite ways, and driven by the large wheel by means of cranks and connecting rods. The same machine with chain driving—the Coventry rotary—is still very largely used. In 1877 James Starley, it is believed without any knowledge of the gear used by Fowler for traction engines, re-invented the same differential gear for tricycles. By this the same force is, under all circumstances, applied to each of two equal driving wheels, and the evil effects of driving a single wheel are done away with. This gear was used in the original Salvo tricycle, which is the type of the surest machine at the present day. In the early days of the modern tricycle, other designs were carried out, which have now become practically obsolete. In one form the hind wheel of a bicycle was replaced by a pair of equal wheels, one on each side, but the instability of such a construction was fatal. In another, the Challenge, the two wheels were placed in front of the large driver and turned together to steer the machine; stability was obtained by putting the rider in front of the large wheel and lower down, the power being communicated by cranks and connecting rods. But the weight of this machine and the small proportion of the load on the driving wheel were serious defects.

Single-driving rear-steerers were at this time very common, and, though highly objectionable, are still to be seen. Rear-steerers were improved by making both front wheels drivers and allowing for the overrunning of one or the other by clutch, as in the Cheylesmore, or by ratchet driving; but steering by the hind wheel is essentially wrong, and these machines are avoided by experienced riders. Rear-steerers have, however, lately been made with a through axle and differential gear (Rover), the rider being placed further back so as to increase the load on the steering wheel; but the evil of rear-steering is only reduced, not removed. The clutch is also employed on some front-steerers; and, though in certain respects it has an advantage over the differential gear, for general use it is not so suitable. The differential gear is an essential feature of the modern tricycle.

In 1878 Messrs Doubleday and Humber patented the Humber machine, which is both driven and steered by the two front wheels, the rider being seated on a trailing backbone and hind wheel as in the bicycle. This machine requires skill to manage; the steering is at first difficult to control and a spill over the handles is quite possible; under a skilful rider, however, the Humber is generally recognized as one of the fastest machines. It is steered by a cross handle, like the bicycle, and this method of steering, in spite of the fact that it boxes the rider into the machine, is becoming very general in front steerers in place of the rack and pinion steering hitherto in use. The Cripper is a very popular example. The brake is an important feature in roadster tricycles. It is always made to act on the box of the differential gear where that is used; but in clutch or single-driven machines one or two independent band-brakes or spoon-brakes are used.

In early days the steering wheel was made small to save weight; the drivers were often 50 inches or more in diameter; and the machine was as short as possible. Owing to the discomfort attending a small wheel and a short base the tendency at present is to increase the size of the steering wheel and the length of the base, and to diminish the diameter of the drivers,—two notable examples being the Quadrant and the Crescent. It is usual, especially when small driving wheels are used, to gear the machine up, just as in the old days they were commonly geared down; that is, the chain wheel on the crank axle has more or fewer teeth than that on the wheel axle, and thus the wheels turn faster or slower than the cranks, or are equivalent to larger or smaller wheels. Two-speed gears are becoming general, among which may be especially mentioned the Cryptodynamic. By means of these it is possible to change the gear of the machine so as to have a high gear under favorable conditions and a low gear when mud, wind, or an ascent make travelling difficult. Although chain gearing is used in nearly every machine made, connecting rods, wheels, or bands are fitted instead to some machines. The necessity for such mechanism has been avoided by making the wheel axle also the treadle axle; but great instability is the result.

Machines in which the arms instead of the legs supply the power are made, and are of immense service to those who have lost the use of their legs.

Owing to the inconvenience caused by doorways being often too narrow to allow a tricycle to pass through, many machines are made to fold up into a narrower space or to shut up like a telescope.

It is important that the rider should be so placed that he can, without leaning forward, put most of his weight on the treadles, and this is more than ever needed as the steepness of an ascent increases, because the slope of the machine has a contrary effect. Sliding seats were arranged for this purpose; but Mr. Warner Jones has made use of a swinging frame which the rider can lock in any position he pleases. It is the same swinging frame which gives such comfort to the rider of the Otto bicycle, placing him at all times in the position most suitable for the occasion.

Carrier tricycles, in which due provision is made for the proper distribution of the load, are largely used by the post-office and by tradesmen in their business. The "Coventry chair" is a kind of bath chair driven as a tricycle by a rider behind. When invalids have overcome a certain prejudice as to the danger of this kind of vehicle, it will no doubt be more generally used.

In machines for two riders the riders sit side by side (*sociables*) or one is placed before the other (*tandems*). Sociable machines are both front-steering and rear-steering. Rear-steerers with each rider driving the wheel on his side only are nearly as objectionable as the single-driving rear-steerer. Front-steering sociables with differential gear are safe and comfortable; but all sociables are slow machines. For nearly every make of single tricycle there is a corresponding tandem. The Coventry rotary in the tandem form suffers more from the single-side driving than in the single form, the rear-steering machines not so much, owing to the greater weight which the steering wheel has to bear. The Humber is less sensitive in the steering, owing to the greater moment of inertia of the frame and the front rider. The front-steerer cannot be made safer, but an excellent tandem is formed by placing the rear-rider on a trailing tail as in the Humber. Tandems have an advantage over sociables and perhaps over single tricycles in the matter of speed; they are, however, not quite so safe, and their appearance alone prevents many from riding them. Many sociables and tandems are convertible into single machines with but little trouble.

The following tables of quickest times which have been accomplished up to the end of 1886 (certified by the National Cyclists' Union) will show the comparative value of the bicycle and tricycle as racing machines.

On a prepared racing path.

Distances.	Time, tricycle.	Time, bicycle.
1 mile...	2 min. 46.8 sec.	2 min. 32.4 sec.
5 miles..	14 " 27.6 "	14 " 18 "
20 "	59 " 10.6 "	59 " 6.6 "
100 "	6 hrs. 43 min. 32.5 sec.	5 hrs. 50 min. 5.4 sec.

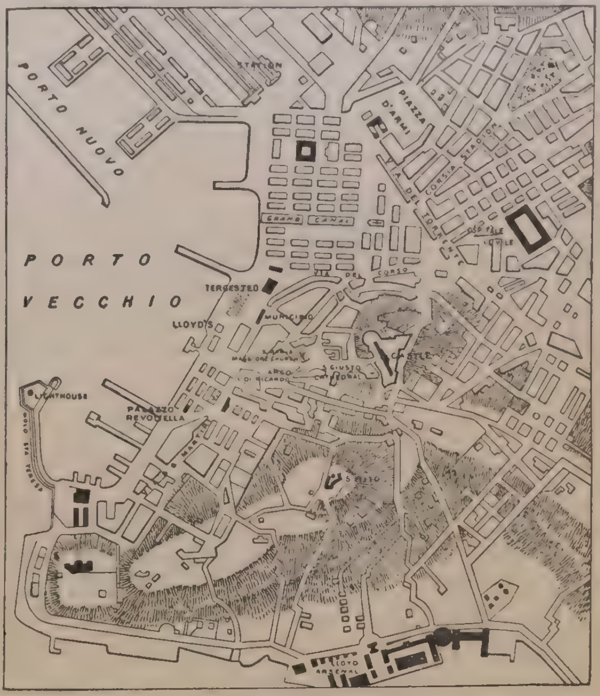
Greatest distance in one hour	20 miles 460 yds., tricycle. 20 " 560 " bicycle.

On a public road.

Land's End to John o' Groats[1] (about 870 miles)	5 days 10 hrs., tricycle. 5 " 1 " 45 min., bicycle.
Greatest distance in 24 hours	250½ miles, tricycle. 295 " bicycle.

(C. V. B.)

TRIESTE (Germ. *Triest*, Slav. *Trst*, Lat. *Tergeste*), the principal seaport of the Austrian-Hungarian empire, is picturesquely situated at the northeast angle of the Adriatic Sea, in the Gulf of Trieste and at the foot of the barren Karst Hills. The old town, nestling round the hill on which the castle stands, consists of narrow, steep, and irregular streets. It is connected by the broad and handsome Corso with the well-built new town, which lies on the flat expanse adjoining the crescent-shaped bay, partly on ground that has been reclaimed from the sea. The prevailing air of the town is Italian rather than German. The castle, built in 1680, is believed to occupy the site of the Roman capitol (see below). Near it is the cathedral of S. Giusto, an unimposing but interesting building, mainly of the 14th century, and incorporating fragments of a Roman temple and early Christian churches. Don Carlos of Spain (d. 1855) is interred in the south aisle, and Fouché, Napoleon's minister of police, in front of the church, while the churchyard contains the grave and monument of Winckelmann, the archæologist, who was murdered at Trieste in 1768. The Arco di Riccardo, also in the old town, derives its name from a popular delusion that it was connected with Richard Cœur-de-Lion, but is probably an arch of a Roman aqueduct. A collection of Roman antiquities found in or near the town has been formed near the castle. The most prominent building in the new town is the Tergesteo, a huge edifice containing the exchange and numerous shops and offices. The new municipal buildings, with the handsome hall of the provincial diet, the Palazzo Revoltella, the offices of the Austrian Lloyd's, and the handsome old exchange are also noteworthy. The church of S. Maria Maggiore is a characteristic specimen of Jesuit architecture, and the new Greek Church is one of the handsomest Byzantine structures in the empire. The city hospital has accommodation for 2000 patients. The huge Politeama is the largest theatre. In front of the Palazzo Revoltella is a monument to the emperor Maximilian of Mexico, who had been an admiral in the Austrian service. His sumptuous château of Miramar is one of the lions of the neighborhood. The capacious harbor, consisting of two parts, the old and the new, is protected by extensive moles and breakwaters, and has been greatly improved within the last ten or fifteen years. From the harbor the Canal Grande extends into the town, allowing large vessels to unload at the warehouses. At the end of the Molo Sta Teresa is a lighthouse upwards of 100 feet high. The population of the town (6424 in 1758) and district of Trieste in 1880 was 144,844, of whom 74,544 belonged to the town proper and 133,019 to the town and suburbs. The town population is very heterogeneous, but the Italian element far exceeds all the rest. There are about 5000 Germans and also numerous Greeks, English, and French. The population includes 26,000 Slavs, most of whom live in the country districts and are engaged in agriculture.



Plan of Trieste.

---

[1] These two by the same rider.

Trieste has been a free imperial port since 1719. It may be said to nearly monopolize the trade of the Adriatic, and has long eclipsed its ancient rival Venice. The annual value of its exports and imports is about 30 millions sterling [$145,800,000]. Among the chief imports are coffee, wine, fruit, grain, tobacco, petroleum, cotton, coals, and manufactured goods of various kinds; the exports include spirits, liqueurs, sugar, meal, timber, glass, and machinery. Large quantities of fish are sent to Vienna. In 1885 the port was entered by 6971 vessels with an aggregate burden of 1,267,946 tons. The trading fleet of Trieste numbers about 500 ships of 100,000 tons burden. The chief shipping company is the Austrian Lloyd's, founded in 1836, the steamers of which ply to the Mediterranean ports, Alexandria, Constantinople, the Black Sea, etc. The extensive wharves and dockyards of the company lie to the south of the town. The chief branches of industry practiced at Trieste are shipbuilding, soap-boiling, machine-making (especially marine engines), tanning, brewing, rope-making, and the manufacture of liqueurs (rosoglio). Trieste is the seat of government for the so-called Küstenland or Coast district, and is the seat of naval and military commanders and other officials. The town council, presided over by the podestá, is also the diet of the crownland of Trieste (35 square miles). Trieste is the seat of the bishop of Capo d'Istria.

History.—At the time of the foundation of Aquileia by the Romans, the district which now includes Trieste was occupied by Celtic and Illyrian tribes; and the Roman colony of Tergeste does not seem to have been established till the reign of Vespasian. After the break-up of the Roman dominion Trieste shared the general fortunes of Istria and passed through various hands. From the emperor Lothaire it received an independent existence under its count-bishops, and it maintained this position down to its capture by Venice in 1203. For the next 180 years its history consists chiefly of a series of conflicts with this city, which were finally put an end to by Trieste placing itself in 1382 under the protection of Leopold III. of Austria. The overlordship thus established insensibly developed into actual possession; and except in the Napoleonic period (1797–1805 and 1809–1813) Trieste has since remained an integral part of the Austrian dominions.

TRIGGER-FISH. See FILE-FISH.

TRIGONOMETRY.

TRIGONOMETRY is primarily the science which is concerned with the measurement of plane and spherical triangles, that is, with the determination of three of the parts of such triangles when the numerical values of the other three parts are given. Since any plane triangle can be divided into right-angled triangles, the solution of all plane triangles can be reduced to that of right-angled triangles; moreover, according to the theory of similar triangles, the ratios between pairs of sides of a right-angled triangle depend only upon the magnitude of the acute angles of the triangle, and may therefore be regarded as functions of either of these angles. The primary object of trigonometry, therefore, requires a classification and numerical tabulation of these functions of an angular magnitude; the science is, however, now understood to include the complete investigation not only of such of the properties of these functions as are necessary for the theoretical and practical solution of triangles but also of all their analytical properties. It appears that the solution of spherical triangles is effected by means of the same functions as are required in the case of plane triangles. The trigonometrical functions are employed in many branches of mathematical and physical science not directly concerned with the measurement of angles, and hence arises the importance of analytical trigonometry. The solution of triangles of which the sides are geodesic lines on a spheroidal surface requires the introduction of other functions than those required for the solution of triangles on a plane or spherical surface, and therefore gives rise to a new branch of science, which is from analogy frequently called spheroidal trigonometry. Every new class of surfaces which may be considered would have in this extended sense a trigonometry of its own, which would consist in an investigation of the nature and properties of the functions necessary for the measurement of the sides and angles of triangles bounded by geodesics drawn on such surfaces.

HISTORY.

Greek. An account of Greek trigonometry is given under PTOLEMY (*q.v.*).

Indian. The Indians, who were much more apt calculators than the Greeks, availed themselves of the Greek geometry which came from Alexandria, and made it the basis of trigonometrical calculations. The principal improvement which they introduced consists in the formation of tables of half-chords or sines instead of chords. Like the Greeks, they divided the circumference of the circle into 360 degrees or 21,600 minutes, and they found the length in minutes of the arc which can be straightened out into the radius to be 3438′. The value of the ratio of the circumference of the circle to the diameter used to make this determination is 62832 : 20000, or $\pi = 3.1416$, which value was given by the astronomer Âryabhaṭa (476–550; see SANSKRIT, vol. xxi. p. 309) in a work called *Âryabhatîya*, written in verse, which was republished[1] in Sanskrit by Dr. Kern at Leyden, in 1874. The relations between the sines and cosines of the same and of complementary arcs were known, and the formula $\sin \frac{1}{2}a = \sqrt{1719(3438 - \cos a)}$ was applied to the determination of the sine of a half angle when the sine and cosine of the whole angle were known. In the *Sûrya-Siddhânta*, an astronomical treatise which has been translated by Ebenezer Burgess in vol. vi. of the *Journal* of the American Oriental Society (New Haven, 1860), the sines of angles at an interval of 3° 45′ up to 90° are given; these were probably obtained from the sines of 60° and 45° by continual application of the dimidiary formula given above and by the use of the complementary angle. The values $\sin 15° = 890'$, $\sin 7° 30' = 449'$, $\sin 3° 45' = 225'$, were thus obtained. Now the angle 3° 45′ is itself 225′; thus the arc and the sine of $\frac{1}{96}$th of the circumference were found to be the same, and consequently special importance was attached to this arc, which was called the right sine. From the tables of sines of angles at intervals of 3° 45′ the law expressed by the equation

$$\sin(\overline{n+1}\,.\,225') - \sin(n\,.\,225') = \sin(n\,.\,225') - \sin(\overline{n-1}\,.\,225') - \sin\frac{(n\,.\,225')}{225}$$

was discovered empirically, and used for the purpose of recalculation. Bhâskara (*fl.* 1150) used the method, to which we have now returned, of expressing sines and cosines as fractions of the radius; he obtained the more correct values $\sin 3° 45' = 100/1529$, $\cos 3° 45' = 466/467$, and showed how to form a table, according to degrees, from the values $\sin 1° = 10/573$, $\cos 1° = 6568/6569$, which are much more accurate than Ptolemy's values. The Indians did not apply their trigonometrical knowledge to the solution of triangles; for astronomical purposes they solved right-angled plane and spherical triangles by geometry.

Arabian. The Arabs were acquainted with Ptolemy's *Almagest*, and they probably learned from the Indians the use of the sine. The celebrated astronomer of Batnæ, Abú 'Abdallah Mohammed b. Jābir al-Battání (Bategnius),[2] who died in 929/930

---

[2] [See ALBATEGNI, vol. i. p. 397.—AM. ED.]

A.D., and whose *Tables* were translated in the 12th century by Plato of Tivoli into Latin under the title *De scientia stellarum*, employed the sine regularly, and was fully conscious of the advantage of the sine over the chord; indeed, he remarks that the continual doubling is saved by the use of the former. He was the first to calculate $\sin\phi$ from the equation $\sin\phi/\cos\phi = k$, and he also made a table of the lengths of shadows of a vertical object of height 12 for altitudes 1°, 2°, . . . of the sun; this is a sort of cotangent table. He was acquainted, not only with the triangle formulæ in the *Almagest*,, but also with the formula $\cos a = \cos b \cos c + \sin b \sin c \cos A$ for a spherical triangle ABC. Abú 'l-Wafá of Baghdad (b. 940) was the first to introduce the tangent as an independent function: his "umbra" is the half of the tangent of the double arc, and the secant he defines as the "diameter umbræ." He employed the umbra to find the angle from a table and not merely as an abbreviation for sin/cos; this improvement was, however, afterwards forgotten, and the tangent was re-invented in the 15th century. Ibn Yúnos of Cairo, who died in 1008, showed even more skill than Al-Battání in the solution of problems in spherical trigonometry and gave improved approximate formulæ for the calculation of sines. Among the West Arabs, Abú Mohammed Jābir b. Aflaḥ, known as Geber b. Aflaḥ, who lived at Seville in the 11th century, wrote an astronomy in nine books, which was translated into Latin in the 12th century by Gerard of Cremona and was published in 1534. The first book contains a trigonometry which is a considerable improvement on that in the *Almagest*. He gave proofs of the formulæ for right-angled spherical triangles, depending on a rule of four quantities, instead of Ptolemy's rule of six quantities. The formulæ $\cos B = \cos b \sin A$, $\cos c = \cot A \cot B$, in a triangle of which C is a right angle had escaped the notice of Ptolemy and were given for the first time by Geber. Strangely enough, he made no progress in plane trigonometry. Arrachel, a Spanish Arab who lived in the 12th century, wrote a work of which we have an analysis by Purbach, in which, like the Indians, he made the sine and the arc for the value 3° 45′ coincide.

Modern.

Purbach (1423–1461), professor of mathematics at Vienna, wrote a work entitled *Tractatus super propositiones Ptolemæi de sinubus et chordis* (Nuremberg, 1541). This treatise consists of a development of Arrachel's method of interpolation for the calculation of tables of sines, and was published by Regiomontanus at the end of one of his works. Johannes Müller (1436–1476), known as REGIOMONTANUS (*q.v.*), was a pupil of Purbach and taught astronomy at Padua; he wrote an exposition of the *Almagest* and a more important work *De triangulis planis et sphericis cum tabulis sinuum*, which was published in 1533, a later edition appearing in 1561. He re-invented the tangent and calculated a table of tangents for each degree, but did not make any practical applications of this table, and did not use formulæ involving the tangent. His work was the first complete European treatise on trigonometry, and contains a number of interesting problems; but his methods were in some respects behind those of the Arabs. Copernicus (1473–1543) gave the first simple demonstration of the fundamental formula of spherical trigonometry; the *Trigonometria Copernici* was published by Rheticus in 1542. George Joachim (1514–1576), known as RHETICUS (*q.v.*), wrote *Opus Palatinum de triangulis* (see TABLES. p. 9 above), which contains tables of sines, tangents, and secants of arcs at intervals of 10″ from 0° to 90°. His method of calculation depends upon the formulæ which gives $\sin na$ and $\cos na$ in terms of the sines and cosines of $(n-1)a$ and $(n-2)a$; thus these formulæ may be regarded as due to him. Rheticus found the formulæ for the sines of the half and third of an angle in terms of the sine of the whole angle. In 1599 there appeared an important work by Pitiscus (1561–1613), entitled *Trigonometriæ seu de dimensione triangulorum*; this contained several important theorems on the trigonometrical functions of two angles, some of which had been given before by Finck, Landsberg, and Adriaan van Roomen. François Viète or VIETA (*q.v.*) (1540–1603) employed the equation $(2\cos\frac{1}{2}\phi)^3 - 3(2\cos\frac{1}{2}\phi) = 2\cos\phi$ to solve the cubic $x^3 - 3a^2x = a^2b\,(a > \frac{1}{2}b)$; he obtained, however, only one root of the cubic. In 1593 Van Roomen proposed, as a problem for all mathematicians, to solve the equation

$$45y - 3795y^3 + 95634y^5 - \ldots + 945y^{41} - 45y^{43} + y^{45} = C.$$

Viète gave $y = 2\sin\frac{1}{45}\phi$, where $C = 2\sin\phi$, as a solution, and also twenty-two of the other solutions, but he failed to obtain the negative roots. In his work *Ad angulares sectiones* Viète gave formulæ for the chords of multiples of a given arc in terms of the chord of the simple arc.

A new stage in the development of the science was commenced after Napier's invention of logarithms in 1614. Napier also simplified the solution of spherical triangles by his well-known analogies and by his rules for the solution of right-angled triangles. The first tables of logarithmic sines and tangents were constructed by Edmund Gunter (1581–1626), professor of astronomy at Gresham College, London; he was also the first to employ the expressions cosine, cotangent, and cosecant for the sine, tangent, and secant of the complement of an arc. A treatise by Albert Girard (1590–1634), published at The Hague in 1626, contains the theorems which give areas of spherical triangles and polygons, and applications of the properties of the supplementary triangles to the reduction of the number of different cases in the solution of spherical triangles. He used the notation sin, tan, sec for the sine, tangent, and secant of an arc. In the second half of the 17th century the theory of infinite series was developed by Wallis, Gregory, Mercator, and afterwards by Newton and Leibnitz. In the *Analysis per æquationes numero terminorum infinitas*, which was written before 1669, Newton gave the series for the arc in powers of its sine; from this he obtained the series for the sine and cosine in powers of the arc; but these series were given in such a form that the law of the formation of the coefficients was hidden. James Gregory discovered in 1670 the series for the arc in powers of the tangent and for the tangent and secant in powers of the arc. The first of these series was also discovered independently by Leibnitz in 1673, and published without proof in the *Acta eruditorum* for 1682. The series for the sine in powers of the arc he published in 1693; this he obtained by differentiation of a series with undetermined coefficients.

In the 18th century the science began to take a more analytical form; evidence of this is given in the works of Kresa in 1720 and Mayer in 1727. Oppel's *Analysis triangulorum* (1746) was the first complete work on analytical trigonometry. None of these mathematicians used the notation sin, cos, tan, which is the more surprising in the case of Oppel, since Euler had in 1744 employed it in the memoir in the *Acta eruditorum*. John Bernoulli was the first to obtain real results by the use of the symbol $\sqrt{-1}$; he published in 1712 the general formula for $\tan n\phi$ in terms of $\tan\phi$, which he obtained by means of transformation of the arc into imaginary logarithms. The greatest advance was, however, made by Euler, who brought the science in all essential respects into the state in which it is at present. He introduced the present notation into general use, whereas until his time the trigonometrical functions had been, except by Girard, indicated by special letters, and had been regarded as certain straight lines the absolute lengths of which depended on the radius of the circle in which they were drawn. Euler's great improvement consisted in his regarding the sine, cosine, etc., as functions of the angle only, thereby giving to equations connecting these functions a purely analytical interpretation, instead of a geometrical one as heretofore. The exponential values of the sine and cosine, De Moivre's theorem, and a great number of other analytical properties of the trigonometrical functions are due to Euler, most of whose writings are to be found in the *Memoirs* of the St. Petersburg Academy.

Plane Trigonometry.

Conception of angles of any magnitude.

Imagine a straight line terminated at a fixed point O, and initially coincident with a fixed straight line OA, to revolve round O, and finally to take up any position OB. We shall suppose that, when this revolving straight line is turning in one direction, say that opposite to that in which the hands of a clock turn, it is describing a positive angle, and when it is turning in the other direction it is describing a negative angle. Before finally taking up the position OB the straight line may have passed any number of times through the position OB, making any number of complete revolutions round O in either direction. Each time that the straight line makes a complete revolution round O we consider it to have described four right angles, taken with the positive or negative sign according to the direction in which it has revolved; thus, when it stops in the position OB, it may have revolved through any one of an infinite number of positive or negative angles any two of which differ from one another by a positive or negative multiple of four right angles, and all of which have the same bounding lines OA and OB. If OB' is the final position of the revolving line, the smallest positive angle which can have been described is that described by the revolving line making more than one-half and less than the whole of a complete revolution, so that in this case we have a positive angle greater than two and less than four right angles. We have thus shown how we may conceive an angle not restricted to less than two right angles, but of any positive or negative magnitude, to be generated.

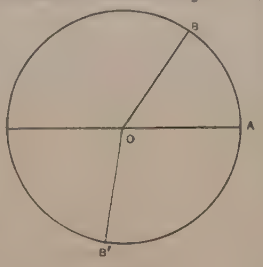

FIG. 1.

Numerical measurement of angular magnitudes.

Two systems of numerical measurement of angular magnitudes are in ordinary use. For practical measurements the sexagesimal system is the one employed: the ninetieth part of a right angle is taken as the unit and is called a degree; the degree is divided into sixty equal parts called minutes; and the minute into sixty equal parts called seconds; angles smaller than a second are usually measured as decimals of a second, the "thirds," "fourths," etc., not being in ordinary use. In the common notation an angle, for example, of 120 degrees, 17 minutes, and 14.36 seconds is written 120° 17′ 14.36.″ The decimal system measurement of angles has never come into ordinary use. In analytical trigonometry the circular measure of an angle is employed. In this system the unit angle is the angle subtended at the centre of a circle by an arc equal in length to the radius. The constancy of this angle follows from the geometrical propositions—(1) the circumferences of different circles vary as their radii; (2) in the same circle angles at the centre are proportional to the arcs which subtend them. It thus follows that the unit mentioned above is an angle independent of the particular circle used in defining it. The constant ratio of the circumference of a circle to its diameter is a quantity incommensurable with unity, usually denoted by π. We shall indicate later on (p. 607 *sq.*) some of the methods which have been employed to approximate to the value of this quantity. Its value to 20 places is 3.14159265358979323846; its reciprocal to the same number of places is .31830988618379067153. In circular measure every angle is measured by the ratio which it bears to the unit angle. Two right angles are measured by the quantity π, and since the same angle is 180°, we see that the number of degrees in in an angle of circular measure θ is obtained from the formula $180 \times \theta/\pi$. The value of the unit of circular measure has been found to 41 places of decimals by Glaisher (*Proc. London Math. Soc.*, vol. iv.); the value of $\frac{1}{\pi}$, from which the unit can be easily calculated, is given to 140 places of decimals in *Grunert's Archiv*, vol. i., 1841. To 10 decimal places the value of the unit angle is 57° 17′ 44″ .8062470964. The unit of circular measure is too large to be convenient for practical purposes, but its use introduces a simplification into the series in analytical trigonometry, owing to the fact that the sine of an angle and the angle itself in this measure, when the magnitude of the angle is indefinitely diminished, are ultimately in a ratio of equality.

Sign of portions of an infinite straight line.

If a point moves from a position A to another position B on a straight line, it has described a length AB of the straight line. It is convenient to have a simple mode of indicating in which direction on the straight line the length AB has been described; this may be done by supposing that a point moving in one specified direction is describing a positive length, and when moving in the opposite direction a negative length. Thus, if a point moving from A to B is moving in the positive direction, we consider the length AB as positive; and, since a point moving from B to A is moving in the negative direction, we consider the length BA as negative. Hence any portion of an infinite straight line is considered to be positive or negative according to the direction in which we suppose this portion to be described by a moving point; which direction is the positive one is, of course, a matter of convention.

Projections of straight lines on each other.

If perpendiculars AL, BM be drawn from two points A, B on any straight line, not necessarily in the same plane with AB, the length LM, taken with the positive or negative sign according to the convention as stated above, is called the projection of AB on the given straight line; the projection of BA being ML has the opposite sign to the projection of AB. If two points A, B be joined by a number of lines in any manner, the algebraical sum of the projections of all these lines is LM,—that is, the same as the projection of AB. Hence the sum of the projections of all the sides of any closed polygon, not necessarily plane, on any straight line, is zero. This principle of projections we shall apply below to obtain some of the most important propositions in trigonometry.

Definition of trigonometrical functions.

Let us now return to the conception of the generation of an angle as in Fig. 1. Draw BOB' at right angles to and equal to AA'. We shall suppose that the direction from A' to A is the positive one for the straight line AOA', and that from B' to B for BOB'. Suppose OP of fixed length, equal to OA, and let PM, PN be drawn perpendicular to $A'A$, $B'B$ respectively; then OM and ON, taken with their proper signs, are the projections of OP on $A'A$ and $B'B$. The ratio of the projection of OP on $B'B$ to the absolute length of OP is dependent only on the magnitude of the angle POA, and is called the sine of that angle; the ratio of the projection of OP on $A'A$ to the length OP is called the cosine of the angle POA. The ratio of the sine of an angle to its cosine is called the tangent of the angle, and that of the cosine to the sine the cotangent of the angle; the reciprocal of the cosine is called the secant, and that of the sine the cosecant of the angle. These functions of an angle of magnitude α are denoted by $\sin\alpha$, $\cos\alpha$, $\tan\alpha$, $\cot\alpha$, $\sec\alpha$, $\operatorname{cosec}\alpha$ respectively. If any straight line RS be drawn parallel to OP, the projection of RS on either of the straight lines $A'A$, $B'B$ can be easily seen to bear to RS the same ratios which the corresponding projections of OP bear to OP: thus, if α be the angle which RS makes with $A'A$, the projections of RS on $A'A$, $B'B$ are $RS\cos\alpha$ and $RS\sin\alpha$ respectively, where RS denotes the absolute length RS. It must be observed that the line SR is to be considered as parallel not to OP but to OP'', and therefore makes an angle $\pi+\alpha$ with $A'A$; this is consistent with the fact that the projections of SR are of opposite sign to those of RS. By observing the signs of the projections of OP for the positions P, P', P'', P''' of P we see that the sine and cosine of the angle POA are both positive; the sine of the angle $P'OA$ is positive and its cosine is negative; both the sine and the cosine of the angle $P''OA$ are negative; and the sine of the angle $P'''OA$ is negative and its cosine positive. If α be the numerical value of the smallest angle of which OP and OA are boundaries, we see that, since these straight lines also bound all the angles

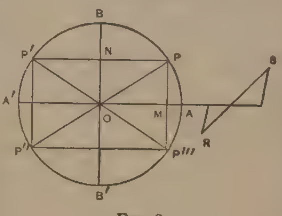

FIG. 2.

$2n\pi + a$, where n is any positive or negative integer, the sines and cosines of all these angles are the same as the sine and cosine of a. Hence the sine of any angle $2n\pi + a$ is positive if a is between 0 and π and negative if a is between π and 2π, and the cosine of the same angle is positive if a is between 0 and $\frac{1}{2}\pi$ or $\frac{3}{2}\pi$ and 2π and negative if a is between $\frac{1}{2}\pi$ and $\frac{3}{2}\pi$.

In Fig. 2 if the angle POA is a, the angle $P'''OA$ is $-a$, $P'OA$ is $\pi - a$, $P''OA$ is $\pi + a$, POB is $\frac{\pi}{2} - a$. By observing the signs of the projections we see that

$$\sin(-a) = -\sin a, \sin(\pi - a) = \sin a, \sin(\pi + a) = -\sin a,$$
$$\cos(-a) = \cos a, \cos)\pi - a) = -\cos a, \cos(\pi + a) = -\cos a,$$
$$\sin(\tfrac{1}{2}\pi - a) = \cos a, \cos(\tfrac{1}{2}\pi - a) = \sin a.$$

Also

$$\sin(\tfrac{1}{2}\pi + a) = \sin(\pi - \tfrac{1}{2}\pi - a) = \sin(\tfrac{1}{2}\pi - a) = \cos a,$$
$$\cos(\tfrac{1}{2}\pi + a) = \cos(\pi - \tfrac{1}{2}\pi - a) = -\cos(\tfrac{1}{2}\pi - a) = -\sin a.$$

From these equations we have $\tan(-a) = -\tan a$, $\tan(\pi - a) = -\tan a$, $\tan(\pi + a) = -\tan a$, $\tan(\frac{1}{2}\pi - a) = \cot a$, $\tan(\frac{1}{2}\pi + a) = -\cot a$, with corresponding equations for the cotangent.

The only angles for which the projection of OP on $B'B$ is the same as for the given angle POA ($= a$) are the two sets of angles bounded by OP, OA and OP', OA; these angles are $2n\pi + a$ and $2n\pi + \pi - a$, and are all included in the formula $r\pi + (-1)^r a$, where r is any integer; this therefore is the formula for all angles having the same sine as a. The only angles which have the same cosine as a are those bounded by OA, OP and OA, OP''', and these are all included in the formula $2n\pi \pm a$. Similarly it can be shown that $n\pi + a$ includes all the angles which have the same tangent as a.

Relations between trigonometrical functions.

From the Pythagorean theorem, the sum of the squares of the projections of any straight line upon two straight lines at right angles to one another is equal to the square on the projected line, we get $\sin^2 a + \cos^2 a = 1$, and from this by the help of the definitions of the other functions we deduce the relations $1 + \tan^2 a = \sec^2 a$, $1 + \cot^2 a = \operatorname{cosec}^2 a$. We have now six relations between the six functions; these enable us to express any five of these functions in terms of the sixth. The following table shows the values of the trigonometrical functions of the angles 0, $\frac{1}{2}\pi$, π, $\frac{3}{2}\pi$, 2π, and the signs of the functions of angles between these values; I denotes numerical increase and D numerical decrease.

Angle	0	0 ... $\frac{1}{2}\pi$	$\frac{1}{2}\pi$	$\frac{1}{2}\pi$ ... π	π	π ... $\frac{3}{2}\pi$	$\frac{3}{2}\pi$	$\frac{3}{2}\pi$ ... 2π	2π
Sine.........	0	$+I$	1	$+D$	0	$-I$	-1	$-D$	0
Cosine.....	1	$+D$	0	$-I$	-1	$-D$	0	$+I$	1
Tangent ..	0	$+I$	$\pm\infty$	$-D$	0	$+I$	$\pm\infty$	$-D$	0
Cotang'nt	$\pm\infty$	$+D$	0	$-I$	$\pm\infty$	$+D$	0	$-I$	$\pm\infty$
Secant.....	1	$+I$	$\pm\infty$	$-D$	-1	$-I$	$\pm\infty$	$+D$	1
Cosecant..	$\pm\infty$	$+D$	1	$+I$	$\pm\infty$	$-D$	-1	$-I$	$\pm\infty$

The correctness of the table may be verified from the figure by considering the magnitudes of the projections of OP for different positions.

Value of trigonometrical functions for some angles.

The following table shows the sine and cosine of some angles for which the values of the functions may be obtained geometrically:

		sine	cosine		
$\frac{\pi}{12}$	15°	$\frac{\sqrt{6}-\sqrt{2}}{4}$	$\frac{\sqrt{6}+\sqrt{2}}{4}$	75°	$\frac{5}{12}\pi$
$\frac{\pi}{10}$	18°	$\frac{\sqrt{5}-1}{4}$	$\frac{\sqrt{10+2\sqrt{5}}}{4}$	72°	$\frac{2}{5}\pi$
$\frac{\pi}{6}$	30°	$\frac{1}{2}$	$\frac{\sqrt{3}}{2}$	60°	$\frac{1}{3}\pi$
$\frac{\pi}{5}$	36°	$\frac{\sqrt{10-2\sqrt{5}}}{4}$	$\frac{\sqrt{5}+1}{4}$	54	$\frac{3}{10}\pi$
$\frac{\pi}{4}$	45°	$\frac{1}{\sqrt{2}}$ cosine	$\frac{1}{\sqrt{2}}$ sine	45°	$\frac{1}{4}\pi$

These are obtained as follows. (1) $\frac{\pi}{4}$. The sine and cosine of this angle are equal to one another, since $\sin\frac{\pi}{4} = \cos\left(\frac{\pi}{2} - \frac{\pi}{4}\right)$; and since the sum of the squares of the sine and cosine is unity each is $\frac{1}{\sqrt{2}}$. (2) $\frac{\pi}{6}$ and $\frac{\pi}{3}$. Consider an equilateral triangle: the projection of one side on another is obviously half a side; hence the cosine of an angle of the triangle is $\frac{1}{2}$ or $\cos\frac{\pi}{3} = \frac{1}{2}$, and from this the sine is found. (3) $\frac{\pi}{10}, \frac{\pi}{5}, \frac{2\pi}{5}, \frac{3\pi}{10}$. In the triangle constructed in Euc. iv. 10 each angle at the base is $\frac{2\pi}{5}$, and the vertical angle is $\frac{\pi}{5}$. If a be a side and b the base, we have by the construction $a(a-b) = b^2$; hence $2b = a(\sqrt{5} - 1)$; the sine of $\frac{\pi}{10}$ is $\frac{b}{2a}$ or $\frac{\sqrt{5}-1}{4}$, and $\cos\frac{\pi}{5}$ is $\frac{a}{2b} = \frac{\sqrt{5}+1}{4}$. (4) $\frac{\pi}{12}, \frac{5\pi}{12}$. Consider a right-angled triangle, having an angle $\frac{1}{6}\pi$. Bisect this angle, then the opposite side is cut by the bisector in the ratio of $\sqrt{3}$ to 2; hence the length of the smaller segment is to that of the whole in the ratio of $\sqrt{3}$ to $\sqrt{3} + 2$, therefore $\tan\frac{1}{12}\pi = \frac{\sqrt{3}}{\sqrt{3}+2}\tan\frac{1}{6}\pi$ or $\tan\frac{1}{12}\pi = 2 - \sqrt{3}$, and from this we can obtain $\sin\frac{1}{12}\pi$ and $\cos\frac{1}{12}\pi$.

Formulæ for sine and cosine of sum and difference of two angles.

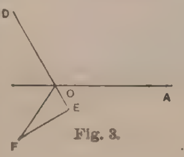

Fig. 3.

Draw a straight line OD making any angle A with a fixed straight line OA, and draw OF making an angle B with OD, this angle being measured positively in the same direction as A; draw FE a perpendicular on DO (produced if necessary). The projection of OF on OA is the sum of the projections of OE and EF on OA. Now OE is the projection of OF on DO, and is therefore equal to $OF \cos B$, and EF is the projection of OF on a straight line making an angle $+\frac{1}{2}\pi$ with OD, and is therefore equal to $OF \sin B$; hence

$$OF\cos(A+B) = OE\cos A + EF\cos(\tfrac{1}{2}\pi + A)$$
$$= OF(\cos A\cos B - \sin A\sin B),$$

or $$\cos(A+B) = \cos A\cos B - \sin A\sin B.$$

The angles A, B are absolutely unrestricted in magnitude, and thus this formula is perfectly general. We may change the sign of B, thus

$$\cos(A-B) = \cos A\cos(-B) - \sin A\sin(-B),$$

or $$\cos(A-B) = \cos A\cos B + \sin A\sin B.$$

If we projected the sides of the triangle OEF on a straight line making an angle $+\frac{1}{2}\pi$ with OA we should obtain the formulæ

$$\sin(A \pm B) = \sin A\cos B \pm \cos A\sin B,$$

which are really contained in the cosine formula, since we may put $\frac{1}{2}\pi - B$ for B. The formulæ

$$\tan(A \pm B) = \frac{\tan A \pm \tan B}{1 \mp \tan A\tan B},$$

$$\cot(A \pm B) = \frac{\cot A\cot B \mp 1}{\cot B \pm \cot A}$$

are immediately deducible from the above formulæ. The equations

$$\sin C + \sin D = 2\sin\tfrac{1}{2}(C+D)\cos\tfrac{1}{2}(C-D),$$
$$\sin C - \sin D = 2\sin\tfrac{1}{2}(C-D)\cos\tfrac{1}{2}(C+D),$$
$$\cos D + \cos C = 2\cos\tfrac{1}{2}(C+D)\cos\tfrac{1}{2}(C-D),$$
$$\cos D - \cos C = 2\sin\tfrac{1}{2}(C+D)\sin\tfrac{1}{2}(C-D),$$

may be obtained directly by the method of projections. Take two equal straight lines OC, OD, making angles C, D with OA, and draw OE perpendicular to CD. The angle which OE makes with OA is $\frac{1}{2}(C+D)$ and that which DC makes is $\frac{1}{2}(\pi + C + D)$; the angle COE is $\frac{1}{2}(C-D)$. The sum of the projections of OD and DE on OA is equal to that of OE, and the sum of the projections of OD and DE is equal to that of OC; hence the sum of the projections of OC and OD is twice that of OE, or $\cos C + \cos D = 2\cos\frac{1}{2}(C+D)\cos\frac{1}{2}(C-D)$. The difference of the projections of OD and OC on OA is equal to that of ED, hence we have the formula $\cos D - \cos C = 2\sin\frac{1}{2}(C+D)\sin\frac{1}{2}(C-D)$. The other two formulæ will be obtained by projecting on a straight line inclined at an angle $+\frac{1}{2}\pi$ to OA.

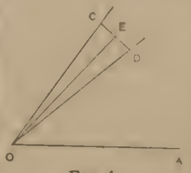

FIG. 4.

Sum of series of cosines in arithmetical progression.

As another example of the use of projections, we will find the sum of the series $\cos a + \cos(a+\beta) + \cos(a+2\beta) + \ldots + \cos(a + \overline{n-1}\,\beta)$. Suppose an unclosed polygon each angle of which is $\pi - \beta$ to be inscribed in a circle, and let $A_1, A_2, A_3, \ldots, A_n$ be $n+1$ consecutive angular points; let D be the diameter of the circle; and suppose a straight line drawn making an angle α with AA_1, then $\alpha+\beta$, $\alpha+2\beta, \dots$ are the angles it makes with A_1A_2, $A_2A_3, \dots$; we have by projections.

$$AA_n \cos\left(\alpha + \frac{\overline{n-1}\,\beta}{2}\right) = AA_1(\cos\alpha + \cos\overline{\alpha+\beta} + \dots + \cos\overline{\alpha + n-1\,\beta}),$$

also
$$AA_1 = D\sin\frac{\beta}{2}, \quad AA_n = D\sin\frac{n\beta}{2};$$

hence the sum of the series of cosines is $\cos\left(\alpha + \frac{\overline{n-1}\,\beta}{2}\right)$
$$\sin\frac{n\beta}{2}\operatorname{cosec}\frac{\beta}{2}.$$

Formulæ for sine and cosine of sum of angles.

By a double application of the addition formulæ we may obtain the formulæ

$$\sin(A_1+A_2+A_3) = \sin A_1\cos A_2\cos A_3 + \cos A_1\sin A_2\cos A_3 + \cos A_1\cos A_2\sin A_3 - \sin A_1\sin A_2\sin A_3;$$
$$\cos(A_1+A_2+A_3) = \cos A_1\cos A_2\cos A_3 - \cos A_1\sin A_2\sin A_3 - \sin A_1\cos A_2\sin A_3 - \sin A_1\sin A_2\cos A_3.$$

We can by induction extend these formulæ to the case of n angles. Assume
$$\sin(A_1+A_2+\dots+A_n) = S_1 - S_3 + S_5 - \dots$$
$$\cos(A_1+A_2+\dots+A_n) = S_0 - S_2 + S_4 - \dots$$
where S_r denotes the sum of the products of the sines of r of the angles and the cosines of the remaining $n-r$ angles; then we have
$$\sin(A_1+A_2+\dots+A_n+A_{n+1}) = \cos A_{n+1}(S_1 - S_3 + S_5 - \dots) + \sin A_{n+1}(S_0 - S_2 + S_4 - \dots).$$
The right-hand side of this equation may be written
$$(S_1\cos A_{n+1} + S_0\sin A_{n+1}) - (S_3\cos A_{n+1} + S_2\sin A_{n+1}) + \dots,$$
or
$$S'_1 - S'_3 + \dots$$
where S'_r denotes the quantity which corresponds for $n+1$ angles to S_r for n angles; similarly we may proceed with the the cosine formula. The theorems are true for $n=2$ and $n=3$; thus they are true generally.

Formulæ for multiple and sub-multiple angles.

The formulæ
$$\cos 2A = \cos^2 A - \sin^2 A = 2\cos^2 A - 1 = 1 - 2\sin^2 A,$$
$$\sin 2A = 2\sin A\cos A, \qquad \tan 2A = \frac{2\tan A}{1-\tan^2 A},$$
$$\sin 3A = 3\sin A - 4\sin^3 A, \qquad \cos 3A = 4\cos^3 A - 3\cos A,$$
$$\sin nA = n\cos^{n-1}A\sin A - \frac{n(n-1)(n-2)}{\underline{|3}}\cos^{n+3}A\sin^3 A + \dots + (-1)^r\frac{n(n-1)\dots(n-2r)}{\underline{|2r+1}}\cos^{n-2r-1}A\sin^{2r+1}A,$$
$$\cos nA = \cos^n A - \frac{n(n-1)}{\underline{|2}}\cos^{n-2}A\sin^2 A + \dots + (1-)^r\frac{n(n-1)\dots(n-2r+1)}{\underline{|2r}}\cos^{n-2r}A\sin^{2r}A + \dots$$
may all be deduced from the addition formulæ by making the angles all equal. From the last two formulæ we obtain by division

$$\tan nA = \frac{n\tan A - \frac{n(n-1)(n-2)}{\underline{|3}}\tan^3 A + \dots + (-1)^r\frac{n(n-1)\dots(n-2r)}{\underline{|2r+1}}\tan^{2r+1}A + \dots}{1 - \frac{n(n-1)}{\underline{|2}}\tan^2 A + \dots + (-1)^r\frac{n(n-1)\dots(n-2r+1)}{\underline{|2r}}\tan^{2r}A + \dots}$$

In the particular case of $n=3$ we have $\tan 3A$
$$= \frac{3\tan A - \tan^3 A}{1 - 3\tan^2 A}.$$

The values of $\sin\frac{1}{2}A$, $\cos\frac{1}{2}A$, $\tan\frac{1}{2}A$ are given in terms of $\cos A$ by the formulæ
$$\sin\tfrac{1}{2}A = (-1)^p\left(\frac{1-\cos A}{2}\right)^{\frac{1}{2}}, \quad \cos\tfrac{1}{2}A = (-1)^q\left(\frac{1+\cos A}{2}\right)^{\frac{1}{2}},$$
$$\tan\tfrac{1}{2}A = (-1)^r\left(\frac{1-\cos A}{1+\cos A}\right)^{\frac{1}{2}},$$
where p is the integral part of $\frac{A}{2\pi}$, q the integral part of $\frac{A}{2\pi} + \frac{1}{2}$, and r the integral part of $\frac{A}{\pi}$.

Sin $\frac{1}{2}A$, $\cos\frac{1}{2}A$ are given in terms of $\sin A$ by the formulæ
$$2\sin\tfrac{1}{2}A = (-1)^{p'}(1+\sin A)^{\frac{1}{2}} + (-1)^{q'}(1-\sin A)^{\frac{1}{2}},$$
$$2\cos\tfrac{1}{2}A = (-1)^{p'}(1+\sin A)^{\frac{1}{2}} - (-1)^{q'}(1-\sin A)^{\frac{1}{2}},$$
where p' is the integral part of $\frac{A}{2\pi} + \frac{1}{4}$ and q' the integral part of $\frac{A}{2\pi} - \frac{1}{4}$.

Properties of triangles.

In any plane triangle ABC we will denote the lengths of the sides BC, CA, AB by a, b, c respectively, and the angles BAC, ABC, ACB by A, B, C respectively. The fact that the projections of b and c on a straight line perpendicular to the side a are equal to one another is expressed by the equation $b\sin C = c\sin B$; this equation and the one obtained by projecting c and a on a straight line perpendicular to a may be written $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$. The equation $a = b\cos c + C\cos B$ expresses the fact that the side a is equal to the sum of the projections of the sides b and c on itself; thus we obtain the equations
$$\left.\begin{aligned} a &= b\cos C + c\cos B \\ b &= c\cos A + a\cos C \\ c &= a\cos B + b\cos A \end{aligned}\right\}.$$
If we multiply the first of these equations by $-a$, the second by b, and the third by c, and add the resulting equations, we obtain the formula $b^2 + c^2 - a^2 = 2bc\cos A$ or $\cos A = \frac{b^2+c^2-a^2}{2bc}$, which gives the cosine of an angle in terms of the sides. From this expression for $\cos A$ the formulæ
$$\sin\tfrac{1}{2}A = \left\{\frac{(s-b)(s-c)}{bc}\right\}^{\frac{1}{2}}, \quad \cos\tfrac{1}{2}A = \left\{\frac{s(s-a}{bc}\right\}^{\frac{1}{2}}, \quad \tan\tfrac{1}{2}A = \left\{\frac{(s-b)(s-c)}{s(s-a)}\right\}^{\frac{1}{2}}, \quad \sin A = \frac{2}{bc}\left\{s(s-a)(s-b)(s-c)\right\}^{\frac{1}{2}},$$
where s denotes $\frac{1}{2}(a+b+c)$, can be deduced by means of the dimidiary formula.

From any general relation between the sides and angles of a triangle other relations may be deduced by various methods of transformation, of which we give two examples.

(α) In any general relation between the sines and cosines of the angles A, B, C of a triangle we may substitute $pA+qB+rC$, $rA+pB+qC$, $qA+rB+pC$ for A, B, C respectively, where p, q, r are any quantities such that $p+q+r+1$ is a positive or negative multiple of 6, provided that we change the signs of all the sines. Suppose $p+q+r+1=6n$, then the sum of the three angles $2n\pi-(pA+qB+rC)$, $2n\pi-(rA+pB+qC)$, $2n\pi-(qA+rB+pC)$ is π; and, since the given relation follows from the condition $A+B+C=\pi$, we may substitute for A, B, C respectively any angles of which the sum is π; thus the transformation is admissible.

(β) It may easily be shown that the sides and angles of the triangle formed by joining the feet of the perpendiculars from the angular points A, B, C on the opposite sides of the triangle ABC are respectively $a\cos A$, $b\cos B$, $c\cos C$, $\pi-2A$, $\pi-2B$, $\pi-2C$; we may therefore substitute these expressions for a, b, c, A, B, C respectively in any general formula. By drawing the perpendiculars of this second triangle and joining their feet as before, we obtain a triangle of which the sides are $-a\cos A\cos 2A$, $-b\cos B\cos 2B$, $-c\cos C\cos 2C$ and the angles are $4A-\pi$, $4B-\pi$, $4C-\pi$; we may therefore substitute these expressions for the sides and angles of the original triangle; for example, we obtain thus the formula
$$\cos 4A = \frac{a^2\cos^2 A\cos^2 2A - b^2\cos^2 B\cos^2 2B - c^2\cos^2 C\cos^2 2C}{2bc\cos B\cos C\cos 2B\cos 2C}.$$
This transformation obviously admits of further extension.

Solution of triangles.

(1) The three sides of a triangle ABC being given, the angles can be determined by the formula
$$L\tan\frac{A}{2} = 10 + \tfrac{1}{2}\log(s-b) + \tfrac{1}{2}\log(s-c) - \tfrac{1}{2}\log s - \tfrac{1}{2}\log(s-a)$$
and two corresponding formulæ for the other angles.

(2) The two sides a, b and the included angle C being given, the angles A, B can be determined from the formulæ
$$A+B = \pi - C,$$
$$L\tan\tfrac{1}{2}(A-B) = \log(a-b)\log-(a+b) + L\cot\tfrac{1}{2}C,$$
and the side c is then obtained from the formula
$$\log c = \log a + L\sin C - L\sin A.$$

(3) The two sides a, b and the angle A being given, the value of $\sin B$ may be found by means of the formula
$$L\sin B = L\sin A + \log b - \log a;$$
this gives two supplementary values of the angle B, if $b\sin A < a$. If $b\sin A > a$ there is no solution, and if $b\sin A = a$ there is one solution. In the case $b\sin A < a$, both values of B give solutions provided $b > a$, but the acute value only of B is admissible if $b < a$.

The other side c can then be determined as in case (2).

(4) If two angles A, B and a side a are given, the angle C is determined from the formula $C = \pi - A - B$ and the side b from the formula $\log b = \log a + L\sin B - L\sin A$.

Areas of triangles and quadrilaterals.

The area of a triangle is half the product of a side into the perpendicular from the opposite angle on that side; thus we obtain the expressions $\frac12 bc \sin A$, $\{ s(s-a)(s-b)(s-c) \}^{\frac12}$ for the area of a triangle. A large collection of formulæ for the area of a triangle are given in the *Annals of Mathematics* for 1885 by M. Baker.

Let a, b, c, d denote the lengths of the sides AB, BC, CD, DA respectively of any plane quadrilateral and $A+C=2\alpha$; we may obtain an expression for the area S of the quadrilateral in terms of the sides and the angle α.

We have $\quad 2S=ad\sin A+bc\sin(2\alpha-A)$

and $\quad \frac12(a^2+d^2-b^2-c^2)=ad\cos A-bc\cos(2\alpha-A)$;

hence $4S^2+\frac14(a^2+d^2-b^2-c^2)^2=a^2d^2+b^2c^2-2abcd\cos 2\alpha$.

If $2s=a+b+c+d$, the value of S may be written in the form $S=\{ s(s-a)(s-b)(s-c)(s-d)-abcd\cos^2\alpha \}^{\frac12}$.

Radii of circumscribed, inscribed, and escribed circles of a triangle.

Let R denote the radius of the circumscribed circle, r of the inscribed, and r_1, r_2, r_3, of the escribed circles of a triangle ABC; the values of these radii are given by the following formulæ.

$$R=\frac{abc}{4S}=\frac{a}{2\sin A},$$

$$r=\frac{S}{s}=(s-a)\tan\tfrac12 A=4R\sin\tfrac12 A\sin\tfrac12 B\sin\tfrac12 C,$$

$$r_1=\frac{S}{s-a}=s\tan\tfrac12 A=4R\sin\tfrac12 A\cos\tfrac12 B\cos\tfrac12 C.$$

Spherical Trigonometry.

We shall throughout assume such elementary propositions in spherical geometry as are required for the purpose of the investigation of formulæ given below.

Definition of spherical triangle.

A spherical triangle is the portion of the surface of a sphere bounded by three arcs of great circles of the sphere. If BC, CA, AB denote these arcs, the circular measure of the angles subtended by these arcs respectively at the centre of the sphere are the sides a, b, c of the spherical triangle ABC; and if the portions of planes passing through these arcs and the centre of the sphere be drawn, the angles between the portions of planes intersecting at A, B, C respectively are the angles A, B, C of the spherical triangle. It is not necessary to consider triangles in which a side is greater than π, since we may replace such a side by the remaining arc of the great circle to which it belongs.

Associated triangles.

Since two great circles intersect each other in two points, there are eight triangles of which the sides are arcs of the same three great circles. If we consider one of these triangles ABC as the fundamental one, then one of the others is equal in all respects to ABC, and the remaining six have each one side equal to, or common with, a side of the triangle ABC, the opposite angle equal to the corresponding angle of ABC, and the other sides and angles supplementary to the corresponding sides and angles of ABC. These triangles may be called the associated triangles of the fundamental one ABC.

Transformation.

It follows that from any general formula containing the sides and angles of a spherical triangle we may obtain other formulæ by replacing two sides and the two angles opposite to them by their supplements, the remaining side and the remaining angle being unaltered, for such formulæ are obtained by applying the given formulæ to the associated triangles.

If A', B', C' are those poles of the arcs BC, CA, AB respectively which lie upon the same sides of them as the opposite angles A, B, C, then the triangle $A'B'C'$ is called the polar triangle of the triangle ABC. The sides of the polar triangle are $\pi-A$, $\pi-B$, $\pi-C$, and the angles $\pi-a$, $\pi-b$, $\pi-c$. Hence, from any general formula connecting the sides and angles of a spherical triangle we may obtain another formula by changing each side into the supplement of the opposite angle and each angle into the supplement of the opposite side.

Fundamental equations between sides and angles.

Let O be the centre of the sphere on which is the spherical triangle ABC. Draw AL perpendicular to OC and AM perpendicular to the plane OBC. Then the projection of OA on OB is the sum of the projections of OL, LM, MA on the same straight line. Since AM has no projection on any straight line in the plane OBC, this gives

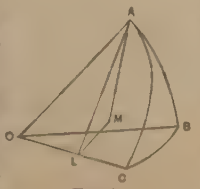

FIG. 5.

$$OA\cos c=OL\cos a+LM\sin a.$$

Now $\quad OL=OA\cos b,\ LM=AL\cos C=OA\sin b\cos C$;

therefore $\quad \cos c=\cos a\cos b+\sin a\sin b\cos C.$

We may obtain similar formulæ by interchanging the letters a, b, c,

thus
$$\left.\begin{aligned}\cos a&=\cos b\cos c+\sin b\sin c\cos A\\ \cos b&=\cos c\cos a+\sin c\sin a\cos B\\ \cos c&=\cos a\cos b+\sin a\sin b\cos C\end{aligned}\right\}\ldots\ldots\ldots(1).$$

These formulæ (1) may be regarded as the fundamental equations connecting the sides and angles of a spherical triangle; all the other relations which we shall give below may be deduced analytically from them; we shall, however, in most cases give independent proofs. By using the polar triangle transformation we have the formulæ

$$\left.\begin{aligned}\cos A&=-\cos B\cos C+\sin B\sin C\cos a\\ \cos B&=-\cos C\cos A+\sin C\sin A\cos b\\ \cos C&=-\cos A\cos B+\sin A\sin B\cos c\end{aligned}\right\}\ldots\ldots\ldots(2).$$

In the figure we have $AM=AL\sin C=r\sin b\sin C$, where r denotes the radius of the sphere. By drawing a perpendicular from A on OB, we may in a similar manner show that $AM=r\sin c\sin B$,

therefore $\quad \sin B\sin c=\sin C\sin b.$

By interchanging the sides we have the equation

$$\frac{\sin A}{\sin a}=\frac{\sin B}{\sin b}=\frac{\sin C}{\sin c}=k\ \ldots\ldots\ldots\ldots\ldots\ldots(3);$$

we shall find below a symmetrical form for k.

If we eliminate $\cos b$ between the first two formulæ of (1) we have

$$\cos a\sin^2 c=\sin b\sin c\cos A+\sin c\cos c\sin a\cos B;$$

therefore
$$\begin{aligned}\cot a\sin c&=\frac{\sin b}{\sin a}\cos A+\cos c\cos B\\ &=\sin B\cot A+\cos c\cos B.\end{aligned}$$

We thus have the six equations

$$\left.\begin{aligned}\cot a\sin b&=\cot A\sin C+\cos b\cos C\\ \cot b\sin a&=\cot B\sin C+\cos a\cos C\\ \cot b\sin c&=\cot B\sin A+\cos c\cos A\\ \cot c\sin b&=\cot C\sin A+\cos b\cos A\\ \cot c\sin a&=\cot C\sin B+\cos a\cos B\\ \cot a\sin c&=\cot A\sin B+\cos c\cos B\end{aligned}\right\}\ldots\ldots\ldots(4).$$

When $C=\frac{\pi}{2}$ formula (1) gives $\quad \cos c=\cos a\cos b\ldots\ldots\ldots(\alpha)$,

and (3) gives $\quad \left.\begin{aligned}\sin b&=\sin B\sin c\\ \sin a&=\sin A\sin c\end{aligned}\right\}\ldots\ldots\ldots(\beta)$;

from (4) we get $\quad \left.\begin{aligned}\tan a&=\tan A\sin b=\tan c\cos B\\ \tan b&=\tan B\sin a=\tan c\cos A\end{aligned}\right\}\ldots\ldots\ldots(\gamma)$.

The formulæ $\quad \cos c=\cot A\cot B\ldots\ldots\ldots(\epsilon)$

and $\quad \left.\begin{aligned}\cos A&=\cos a\sin B\\ \cos B&=\cos b\sin A\end{aligned}\right\}\ldots\ldots(\zeta)$

follow at once from (α), (β), (γ). These are the formulæ which are used for the solution of right-angled triangles. Napier gives mnemonical rules for remembering them.

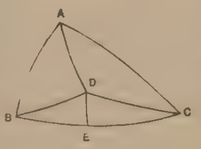

FIG. 6.

The following proposition follows easily from the theorem in equation (3): If AD, BE, CF are three arcs drawn through A, B, C to meet the opposite sides in D, E, F respectively, and if these arcs pass through a point, the segments of the sides satisfy the relation $\sin BD\sin CE\sin AF=\sin CD\sin AE\sin BF$; and conversely if this relation is satisfied the arcs pass through a point. From this theorem it follows that the three perpendiculars from the angles on the opposite sides, the three bisectors of the angles, and the three arcs from the angles to the middle points of the opposite sides, each pass through a point.

Formulæ for sine and cosine of half angles;

If D be the point of intersection of the three bisectors of the angles A, B, C, and if DE be drawn perpendicular to BC, it may be shown that $BE=\frac12(a+c-b)$ and $CE=\frac12(a+b-c)$, and that the angles BDE, ADC are supplementary. We have also

$$\frac{\sin c}{\sin BD}=\frac{\sin ADB}{\sin\frac{A}{2}},\ \frac{\sin b}{\sin CD}=\frac{\sin ADC}{\sin\frac{A}{2}};\ \text{therefore}\ \sin^2\frac{A}{2}$$

$$=\frac{\sin BD\sin CD\sin CDE\sin BDE}{\sin b\sin c}.\ \text{But}\ \sin BD\sin BDE=\sin BE$$

$$=\sin\frac{(a+c-b)}{2},\ \text{and}\ \sin CD\sin CDE=\sin CE=\sin\frac{a+b-c}{2};$$

therefore
$$\sin\frac{A}{2}=\left\{\frac{\sin\frac{a+c-b}{2}\sin\frac{a+b-c}{2}}{\sin b\sin c}\right\}^{\frac12}\ \ldots\ (5).$$

Apply this formula to the associated triangle of which

$\pi-A$, $\pi-B$, C are the angles and $\pi-a$, $\pi-b$, c are the sides; we obtain the formula

$$\cos\frac{A}{2}=\left\{\frac{\sin\frac{b+c-a}{2}\sin\frac{a+b+c}{2}}{\sin b\sin c}\right\}^{\frac{1}{2}}\quad\ldots\ldots\ldots(6).$$

By division we have

$$\mathrm{n}\,\frac{A}{2}=\left\{\frac{\sin\frac{a+c-b}{2}\sin\frac{a+b-c}{2}}{\sin\frac{b+c-a}{2}\sin\frac{a+b+c}{2}}\right\}^{\frac{1}{2}}\quad\ldots\ldots\ldots\ldots(7),$$

and by multiplication

$$\sin A=\frac{2}{\sin b\sin c}\left\{\sin\frac{a+b+c}{2}\sin\frac{b+c-a}{2}\sin\frac{c+a-b}{2}\sin\frac{a+b-c}{2}\right\}^{\frac{1}{2}}=\frac{1}{\sin b\sin c}\{1-\cos^2a-\cos^2b-\cos^2c+2\cos a\cos b\cos c\}^{\frac{1}{2}}.$$

Hence the quantity k in (3) is

$$\frac{1}{\sin a\sin b\sin c}\{1-\cos^2a-\cos^2b-\cos^2c+2\cos a\cos b\cos c\}^{\frac{1}{2}}\quad\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots(8).$$

Of half-sides.

Apply the polar triangle transformation to the formulæ (5), (6), (7), (8) and we obtain

$$\cos\frac{a}{2}=\left\{\frac{\cos\frac{A+C-B}{2}\cos\frac{A+B-C}{2}}{\sin B\sin C}\right\}^{\frac{1}{2}}\quad\ldots\ldots(9);$$

$$\sin\frac{a}{2}=\left\{\frac{-\cos\frac{B+C-A}{2}\cos\frac{A+B+C}{2}}{\sin B\sin C}\right\}^{\frac{1}{2}}\quad\ldots(10);$$

$$\tan\frac{a}{2}=\left\{\frac{-\cos\frac{B+C-A}{2}\cos\frac{A+B+C}{2}}{\cos\frac{A+C-B}{2}\cos\frac{A+B-C}{2}}\right\}^{\frac{1}{2}}\quad\ldots(11).$$

If $k'=\frac{1}{\sin A\sin B\sin C}\{1-\cos^2A-\cos^2B-\cos^2C-2\cos A\cos B\cos C\}^{\frac{1}{2}}$, we have $kk'=1\ldots\ldots\ldots\ldots\ldots\ldots(12)$.

Delambre's formulæ.

Let E be the middle point of AB; draw ED at right angles to AB to meet AC in D; then DE bisects the angle ADB. Let CF bisect the angle DCB and draw FG perpendicular to BC, then

$$CG=\frac{a-b}{2},\ <FBE=\frac{A+B}{2},$$

$$<FCG=90°-\frac{C}{2}.$$

From the triangle CFG we have $\cos CFG=\cos CG\sin FCG$, and from the triangle FEB $\cos EFB=\cos EB\sin FBE$. Now the angles CFG, EFB are each supplementary to the angle DFB, therefore

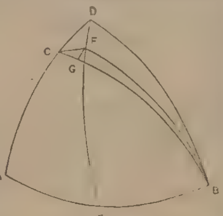

FIG. 7.

$$\cos\frac{a-b}{2}\cos\frac{C}{2}=\sin\frac{A+B}{2}\cos\frac{c}{2}\quad\ldots\ldots\ldots\ldots(13).$$

Also $\sin CG=\sin CF\sin CFG$ and $\sin EB=\sin BF\sin EFB$; therefore

$$\sin\frac{a-b}{2}\cos\frac{C}{2}=\sin\frac{A-B}{2}\cos\frac{c}{2}\quad\ldots\ldots(14).$$

Apply the formulæ (13), (14) to the associated triangle of which a, $\pi-b$, $\pi-c$, A, $\pi-B$, $\pi-C$ are the sides and angles, we then have

$$\sin\frac{a+b}{2}\sin\frac{C}{2}=\cos\frac{A-B}{2}\sin\frac{c}{2}\quad\ldots\ldots\ldots(15).$$

$$\cos\frac{a+b}{2}\sin\frac{C}{2}=\cos\frac{A+B}{2}\cos\frac{c}{2}\quad\ldots\ldots\ldots(16).$$

The four formulæ (13), (14), (15), (16) were first given by Delambre in the *Connaissance des Temps* for 1808. Formulæ equivalent to these were given by Mollweide in Zach's *Monatliche Correspondenz* for November, 1808. They were also given by Gauss (*Theoria motus*, 1809), and are usually called after him.

Napier's analogies.

From the same figure we have

$$\tan FG=\tan FCG\sin CG=\tan FBG\sin BG;$$

therefore

$$\cot\frac{C}{2}\sin\frac{a-b}{2}=\tan\frac{A-B}{2}\sin\frac{a+b}{2},$$

or

$$\tan\frac{A-B}{2}=\frac{\sin\frac{a-b}{2}}{\sin\frac{a+b}{2}}\cot\frac{C}{2}\quad\ldots\ldots\ldots\ldots\ldots(17).$$

Apply this formula to the associated triangle ($\pi-a$, b, $\pi-c$, $\pi-A$, B, $\pi-C$), and we have

$$\cot\frac{A+B}{2}=\frac{\cos\frac{a+b}{2}}{\cos\frac{a-b}{2}}\tan\frac{C}{2},$$

or

$$\tan\frac{A+B}{2}=\frac{\cos\frac{a-b}{2}}{\cos\frac{a+b}{2}}\cot\frac{C}{2}\quad\ldots\ldots\ldots\ldots(18).$$

If we apply these formulæ (17), (18) to the polar triangle, we have

$$\tan\frac{a-b}{2}=\frac{\sin\frac{A-B}{2}}{\sin\frac{A+B}{2}}\tan\frac{c}{2}\quad\ldots\ldots\ldots\ldots(19);$$

$$\tan\frac{a+b}{2}=\frac{\cos\frac{A-B}{2}}{\cos\frac{A+B}{2}}\tan\frac{c}{2}\quad\ldots\ldots\ldots\ldots(20).$$

The formulæ (17), (18), (19), (20) are called Napier's "Analogies"; they were given in the *Mirif. logar. canonis descriptio.*

Schmeisser's formulæ.

If we use the values of $\sin\frac{a}{2}$, $\sin\frac{b}{2}$, $\sin\frac{c}{2}$, $\cos\frac{a}{2}$, $\cos\frac{b}{2}$, $\cos\frac{c}{2}$ given by (9), (10) and the analagous formulæ obtained by interchanging the letters, we obtain by multiplication

$$\left.\begin{aligned}\sin\frac{a}{2}\cos\frac{b}{2}\sin C&=\sin\frac{c}{2}\cos\frac{B+C-A}{2}\\ \cos\frac{a}{2}\cos\frac{b}{2}\sin C&=\cos\frac{c}{2}\cos\frac{A+B-C}{2}\\ \sin\frac{a}{2}\sin\frac{b}{2}\sin C&=\cos\frac{c}{2}\cos\frac{A+B+C}{2}\end{aligned}\right\}.$$

These formulæ were given by Schmeisser in *Crelle's Journ.*, vol. x.

Cagnoli's formulæ.

The relation $\sin b\sin c+\cos b\cos c\cos A=\sin B\sin C-\cos B\cos C\cos a$ was given by Cagnoli in his *Trigonometry* (1786), and was rediscovered by Cayley (*Phil. Mag.*, 1859). It follows from (1), (2), and (3) thus: the right-hand side of the equation equals $\sin B\sin C+\cos a(\cos A-\sin B\sin C\cos a)=\sin B\sin C\sin^2a+\cos a\cos A$, and this is equal to $\sin b\sin c+\cos A(\cos a-\sin b\sin c\cos A)$ or $\sin b\sin c+\cos b\cos c\cos A$.

Solution of triangles;

The formulæ we have given are sufficient to determine three parts of a triangle when the other three parts are given; moreover such formulæ may always be chosen as are adapted to logarithmic calculation. The solutions will be unique except in the two cases (1) where two sides and the angle opposite one of them are the given parts, and (2) where two angles and the side opposite one of them are given.

Ambiguous cases.

Suppose a, b, A are the given parts. We determine B from the formula $\sin B=\frac{\sin b}{\sin a}\sin A$; this gives two supplementary values of B, one acute and the other obtuse. Then C and c are determined from the equations $\tan\frac{C}{2}=\frac{\sin\frac{a-b}{2}}{\sin\frac{a+b}{2}}\cot\frac{A-B}{2}$, $\tan\frac{c}{2}=\frac{\sin\frac{A+B}{2}}{\frac{A-B}{2}}\tan\frac{a-b}{2}$. Now $\tan\frac{C}{2}$, $\tan\frac{c}{2}$ must both be positive; hence $A-B$ and $a-b$ must have the same sign. We shall distinguish three cases. First, suppose $\sin b<\sin a$; then we have $\sin B<\sin A$. Hence A lies between the two values of B, and therefore only one of these values is admissible, the acute or the obtuse value according as a is greater or less than b: there is therefore in this case always one solution. Secondly, if $\sin b>\sin a$, there is no solution when $\sin b\sin A>\sin a$; but if $\sin b\sin A<\sin a$ there are two values of B both greater or both less than A. If a is acute $a-b$, and therefore $A-B$, is negative; hence there are two solutions if A is acute and none if A is obtuse. These two solutions fall together if $\sin b\sin A=\sin a$. If a is obtuse there is no solution unless A is obtuse, and in that case there are two, which coincide as before if $\sin b\sin A=\sin a$. Hence in this case there are two solutions if $\sin b \sin A < \sin a$ and the two parts A, a are both acute or both obtuse, these being coincident in case $\sin b \sin A \equiv \sin a$; and there is no solution if one of the two A, a is acute and the other obtuse, or if $\sin b \sin A > \sin a$. Thirdly, if $\sin b = \sin a$ then $B = A$ or $\pi - A$. If a is acute, $a - b$ is zero or negative, hence $A - B$ is zero or negative; thus there is no solution unless A is acute, and then there is one. Similarly, if a is obtuse, A must be so too in order that there may be a solution. If $a = b = \frac{\pi}{2}$, there is no solution unless $A = \frac{\pi}{2}$, and then there are an infinite number of solutions, since the values of C and c become indeterminate.

The other case of ambiguity may be discussed in a similar manner, or the different cases may be deduced from the above by the use of the polar triangle transformation. The method of classification according to the three cases $\sin b \gtreqless \sin a$ was given by Professor Lloyd Tanner (*Messenger of Math.*, vol. xiv.).

Radii of circles related to triangles.

If r is the angular radius of the small circle inscribed in the triangle ABC, we have at once $\tan r = \tan \frac{A}{2} \sin (s - a)$, where $2s = a + b + c$; from this we can derive the formulæ $\tan r = n \operatorname{cosec} s = \frac{N}{2} \sec \frac{A}{2} \sec \frac{B}{2} \sec \frac{C}{2} = \sin a \sin \frac{B}{2} \sin \frac{C}{2} \sec \frac{A}{2}$ (21), where n, N denote the expressions

$$\{ \sin s \sin (s - a) \sin (s - b) \sin (s - c) \}^{\frac{1}{2}},$$
$$\{ - \cos S \cos (S - A) \cos (S - B) \cos (S - C) \}^{\frac{1}{2}}.$$

The escribed circles are the small circles inscribed in three of the associated triangles; thus, applying the above formulæ to the triangle $(a, \pi - b, \pi - c, A, \pi - B, \pi - C)$, we have for r_1, the radius of the escribed circle opposite to the angle A, the following formulæ

$$\tan r_1 = \tan \frac{A}{2} \sin s = n \operatorname{cosec} (s - a) = \frac{N}{2} \sec \frac{A}{2} \operatorname{cosec} \frac{B}{2} \operatorname{cosec} \frac{C}{2} = \sin a \cos \frac{B}{2} \cos \frac{C}{2} \sec \frac{A}{2} \quad \ldots\ldots\ldots\ldots (22).$$

The pole of the circle circumscribing a triangle is that of the circle inscribed in the polar triangle, and the radii of the two circles are complementary; hence, if R be the radius of the circumscribed circle of the triangle, and R_1, R_2, R_3 the radii of the circles circumscribing the associated triangles, we have by writing $\frac{\pi}{2} - R$ for r, $\frac{\pi}{2} - R_1$ for r_1, $\pi - a$ for A, etc., in the above formulæ

$$\cot R = \cot \frac{a}{2} \cos (S - A) = \frac{n}{2} \operatorname{cosec} \frac{a}{2} \operatorname{cosec} \frac{b}{2} \operatorname{cosec} \frac{c}{2} = - N \sec S$$
$$= \sin A \cos \frac{b}{2} \cos \frac{c}{2} \operatorname{cosec} \frac{a}{2} \quad \ldots\ldots\ldots\ldots (23);$$

$$\cot R_1 = - \cot \frac{a}{2} \cos S = \frac{n}{2} \operatorname{cosec} \frac{a}{2} \sec \frac{b}{2} \sec \frac{c}{2} = N \sec (S - A)$$
$$= \sin A \sin \frac{b}{2} \sin \frac{c}{2} \operatorname{cosec} \frac{a}{2} \quad \ldots\ldots\ldots\ldots (24).$$

The following relations follow from the formulæ just given:

$$2 \tan R = \cot r_1 + \cot r_2 + \cot r_3 - \cot r,$$
$$2 \tan R_1 = \cot r + \cot r_2 + \cot r_3 - \cot r_1,$$
$$\tan r \tan r_1 \tan r_2 \tan r_3 = n^2, \quad \sin^2 s = \cot r \tan r_1 \tan r_2 \tan r_3,$$
$$\sin^2 (s - a) = \tan r \cot r_1 \tan r_2 \tan r_3.$$

Formulæ for spherical excess.

If $E = A + B + C - \pi$, it may be shown that E multiplied by the square of the radius is the area of the triangle. We give some of the more important expressions for the quantity E, which is called the spherical excess.

We have
$$\frac{\cos \frac{A + B}{2}}{\sin \frac{C}{2}} = \frac{\cos \frac{a + b}{2}}{\cos \frac{c}{2}} \text{ and } \frac{\sin \frac{A + B}{2}}{\cos \frac{C}{2}} = \frac{\cos \frac{a - b}{2}}{\cos \frac{c}{2}},$$

or
$$\frac{\sin \left(\frac{C}{2} - \frac{E}{2} \right)}{\sin \frac{C}{2}} = \frac{\cos \frac{a + b}{2}}{\cos \frac{c}{2}} \text{ and } \frac{\cos \left(\frac{C}{2} - \frac{E}{2} \right)}{\cos \frac{C}{2}} = \frac{\cos \frac{a - b}{2}}{\cos \frac{c}{2}};$$

hence
$$\frac{\sin \frac{C}{2} - \sin \left(\frac{C - E}{2} \right)}{\sin \frac{C}{2} + \sin \left(\frac{C - E}{2} \right)} = \frac{\cos \frac{c}{2} - \cos \frac{a + b}{2}}{\cos \frac{c}{2} + \cos \frac{a + b}{2}};$$

therefore
$$\frac{\tan \frac{E}{4}}{\tan^2 \frac{C - E}{4}} = \tan \frac{s}{2} \tan \frac{s - c}{2}.$$

Similarly
$$\tan \frac{E}{4} \tan^2 \frac{C - E}{4} = \tan \frac{s - a}{2} \tan \frac{s - b}{2};$$

therefore
$$\tan \frac{E}{4} = \left\{ \tan \frac{s}{2} \tan \frac{s - a}{2} \tan \frac{s - b}{2} \tan \frac{s - c}{2} \right\}^{\frac{1}{2}} (25).$$

This formula was given by L'Huillier.

Also
$$\sin \frac{C}{2} \cos \frac{E}{2} - \cos \frac{C}{2} \sin \frac{E}{2} = \frac{\cos \frac{a + b}{2}}{\cos \frac{c}{2}} \sin \frac{C}{2};$$

$$\cos \frac{C}{2} \cos \frac{E}{2} + \sin \frac{C}{2} \sin \frac{E}{2} = \frac{\cos \frac{a + b}{2}}{\cos \frac{c}{2}} \cos \frac{C}{2};$$

whence, solving for $\cos \frac{E}{2}$, we get

$$\cos \frac{E}{2} = \frac{1 + \cos a + \cos b + \cos c}{4 \cos \frac{a}{2} \cos \frac{b}{2} \cos \frac{c}{2}} \quad \ldots\ldots (26).$$

This formula was given by Euler (*Nova acta*, vol. x.). If we find $\sin \frac{E}{2}$ from this formula, we obtain after reduction

$$\sin \frac{E}{2} = \frac{n}{2 \cos \frac{a}{2} \cos \frac{b}{2} \cos \frac{c}{2}},$$

a formula given by Lescell (*Acta Petrop.*, 1782).

From the equations (21), (22), (23), (24) we obtain the following formulæ for the spherical excess:

$$\sin^2 \frac{E}{2} = \tan R \cot R_1 \cot R_2 \cot R_3$$
$$= \frac{4 (\cot r_1 + \cot r_2 + \cot r_3)}{(\cot r - \cot r_1 + \cot r_2 + \cot r_3)(\cot r + \cot r_1 - \cot r_2 + \cot r_3)(\cot r + \cot r_1 + \cot r_2 - \cot r_3)}.$$

The formula (26) may be expressed geometrically. Let M, N be the middle points of the sides AB, AC. Then we find $\cos MN$
$= \frac{1 + \cos a + \cos b + \cos c}{4 \cos \frac{b}{2} \cos \frac{c}{2}}$; hence $\cos \frac{E}{2} = \cos MN \sec \frac{a}{2}$.

A geometrical construction has been given for E by Gudermann (in *Crelle's Journ.*, vi. and viii.). It has been shown by Cornelius Keogh that the volume of the parallelepiped of which the radii of the sphere passing through the middle points of the sides of the triangle are edges is $\sin \frac{E}{2}$.

Properties of spherical quadrilateral inscribed in small circle.

Let $ABCD$ be a spherical quadrilateral inscribed in a small circle; let a, b, c, d denote the sides AB, BC, CD, DA respectively, and x, y the diagonals AC, BD. It can easily be shown by joining the angular points of the quadrilateral to the pole of the circle that $A + C = B + D$. If we use the last expression in (23) for the radii of the circles circumscribing the triangles BAD, BCD, we have

$$\sin A \cos \frac{a}{2} \cos \frac{d}{2} \operatorname{cosec} \frac{y}{2} = \sin C \cos \frac{b}{2} \cos \frac{C}{2} \operatorname{cosec} \frac{y}{2};$$

whence
$$\frac{\sin A}{\cos \frac{b}{2} \cos \frac{c}{2}} = \frac{\sin C}{\cos \frac{a}{2} \cos \frac{d}{2}}.$$

This is the proposition corresponding to the relation $A + C = \pi$ for a plane quadrilateral. Also we obtain in a similar manner the theorem

$$\frac{\sin \frac{x}{2}}{\sin B \cos \frac{b}{2}} = \frac{\sin \frac{y}{2}}{\sin A \cos \frac{d}{2}},$$

analogous to the theorem for a plane quadrilateral, that the diagonals are proportional to the sines of the angles opposite to them. Also the chords AB, BC, CD, DA are equal to $2 \sin \frac{a}{2}$, $2 \sin \frac{b}{2}$, $2 \sin \frac{c}{2}$, $2 \sin \frac{d}{2}$ respectively, and the plane quadrilateral formed by these chords is inscribed in the same circle as the spherical quadrilateral; hence by Ptolemy's theorem for a plane quadrilateral we obtain the analogous theorem for a spherical one

$$\sin\frac{x}{2}\sin\frac{y}{2}=\sin\frac{a}{2}\sin\frac{c}{2}+\sin\frac{b}{2}\sin\frac{d}{2}.$$

It has been shown by Remy (in *Crelle's Journ.*, vol. iii.) that for any quadrilateral, if z be the spherical distance between the middle points of the diagonals,

$$\cos a+\cos b+\cos c+\cos d=4\cos\tfrac{1}{2}x\cos\tfrac{1}{2}y\cos\tfrac{1}{2}z.$$

This theorem is analogous to the theorem for any plane quadrilateral, that the sum of the squares of the sides is equal to the sum of the squares of the diagonals, together with twice the square on the straight line joining the middle points of the diagonals.

A theorem for a right-angled spherical triangle, analogous to the Pythagorean theorem, has been given by Gudermann (in *Crelle's Journ.*, vol. xlii.).

Analytical Trigonometry.

Periodicity of functions.

Analytical trigonometry is that branch of mathematical analysis in which the analytical properties of the trigonometrical functions are investigated. These functions derive their importance in analysis from the fact that they are the simplest singly periodic functions, and are therefore adapted to the representation of undulating magnitude. The sine, cosine, secant, and cosecant have the single real period 2π; *i.e.*, each is unaltered in value by the addition of 2π to the variable. The tangent and cotangent have the period π. The sine, tangent, cosecant, and cotangent belong to the class of odd functions; that is, they change sign when the sign of the variable is changed. The cosine and secant are even functions, since they remain unaltered when the sign of the variable is reversed.

Connection with theory of complex quantities.

The theory of the trigonometrical functions is intimately connected with that of complex quantities,—that is, of quantities of the form $x+\iota y$ $(\iota=\sqrt{-1})$. Suppose we multiply together, by the rules of ordinary algebra, two such quantities, we have

$$(x_1+\iota y_1)(x_2+\iota y_2)=(x_1x_2-y_1y_2)+\iota(x_1y_2+x_2y_1).$$

We observe that the real part and the real factor of the imaginary part of the expression on the right-hand side of this equation are similar in form to the expressions which occur in the addition formulæ for the cosine and sine of the sum of two angles; in fact, if we put $x_1=r_1\cos\theta_1$, $y_1=r_1\sin\theta_1$, $x_2=r_2\cos\theta_2$, $y_2=r_2\sin\theta_2$, the above equation becomes

$$r_1(\cos\theta_1+\iota\sin\theta_1)\times r_2(\cos\theta_2+\iota\sin\theta_2)=r_1r_2(\cos\overline{\theta_1+\theta_2}+\iota\sin\overline{\theta_1+\theta_2}).$$

We may now, in accordance with the usual mode of representing complex quantities, give a geometrical interpretation of the meaning of this equation. Let P_1 be the point whose co-ordinates referred to rectangular axes Ox, Oy are x_1, y_1; then the point P_1 is employed to represent the quantity $x_1+\iota y_1$. In this mode of representation real quantities are measured along the axis of x and imaginary ones along the axis of y, additions being performed according to the parallelogram law. The points A, A_1 represent the magnitudes ± 1, the points a, a_1 the magnitudes $\pm\iota$. Let P_2 represent the expression $x_2+\iota y_2$ and P the expression $(x_1+\iota y_1)(x_2+\iota y_2)$. The quantities $r_1, \theta_1, r_2, \theta_2$ are the polar co-ordinates of P_1 and P_2 respectively referred to O as origin and Ox as initial line; the above equation shows that r_1r_2 and $\theta_1+\theta_2$ are the polar co-ordinates of P; hence $OA : OP_1 :: OP_2 : OP$ and the angle POP_2 is equal to the angle P_1OA. Thus we have the preceding geometrical construction for the determination of the point P. On OP_2 draw a triangle similar to the triangle OAP_1 so that the sides OP_2, OP are homologous to the sides OA, OP, and so that the angle POP_2 is positive; then the vertex P represents the product of the expressions represented by P_1, P_2. If $x_2+\iota y_2$ were to be divided by $x_1+\iota y_1$, the triangle $OP'P_2$ would be drawn on the negative side of P_2, similar to the triangle OAP_1 and having the sides OP', OP_2 homologous to OA, OP, and P' would represent the quotient.

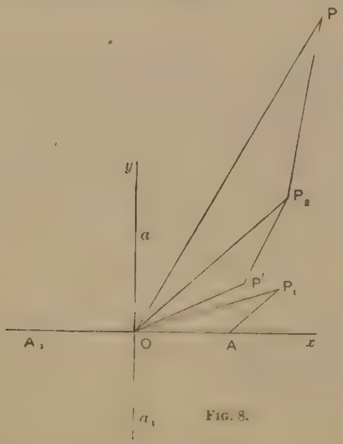

FIG. 8.

De Moivre's theorem.

If we extend the above to n complex quantities by continual repetition of a similar operation, we have—

$$(\cos\theta_1+\iota\sin\theta_1)(\cos\theta_2+\iota\sin\theta_2)\ldots\cos(\theta_n+\iota\sin\theta_n)$$
$$=\cos(\theta_1+\theta_2+\ldots+\theta_n)+\iota\sin(\theta_1+\theta_2+\ldots+\theta_n).$$

If $\theta_1=\theta_2=\ldots=\theta_n=\theta_1$, this equation becomes $(\cos\theta+\iota\sin\theta)^n=\cos n\theta+\iota\sin n\theta$; this shows that $\cos\theta+\iota\sin\theta$ is a value of $(\cos n\theta+\iota\sin n\theta)^{\frac{1}{n}}$. If now we change θ into $\frac{\theta}{n}$, we see that $\cos\frac{\theta}{n}+\iota\sin\frac{\theta}{n}$ is a value of $(\cos\theta+\iota\sin\theta)^{\frac{1}{n}}$; raising each of these quantities to any positive integral power m, $\cos\frac{m\theta}{n}+\iota\sin\frac{m\theta}{n}$ is one value of $(\cos\theta+\iota\sin\theta)^{\frac{m}{n}}$. Also

$$\cos\left(-\frac{m}{n}\right)\theta+\iota\sin\left(-\frac{m}{n}\theta\right)=\frac{1}{\cos\frac{m}{n}\theta+\iota\sin\frac{m}{n}\theta};$$

hence the expression of the left-hand side is one value of $\frac{1}{(\cos\theta+\iota\sin\theta)^{m/n}}$ or of $(\cos\theta+\iota\sin\theta)^{-\frac{m}{n}}$. We have thus De Moivre's theorem that $\cos k\theta+\iota\sin k\theta$ is always one value of $(\cos\theta+\iota\sin\theta)^k$, where k is any real quantity.

The n roots of a complex quantity.

The principal object of De Moivre's theorem is to enable us to find all the values of an expression of the form $(a+\iota b)^{\frac{m}{n}}$, where m and n are positive integers prime to each other. If $a=r\cos\theta$, $b=r\sin\theta$, we require the values of $r^{\frac{m}{n}}(\cos\theta+\iota\sin\theta)^{\frac{m}{n}}$. One value is immediately furnished by the theorem; but we observe that, since the expression $\cos\theta+\iota\sin\theta$ is unaltered by adding any multiple of 2π to θ, the $\frac{n}{m}$th power of $r^{\frac{m}{n}}\left(\cos\frac{m.\overline{\theta+2s\pi}}{n}+\iota\sin\frac{m.\overline{\theta+2s\pi}}{n}\right)$ is $a+\iota b$, if s is any integer; hence this expression is one of the values required. Suppose that for two values s_1 and s_2 of s the values of this expression are the same; then we must have $\frac{m.\overline{\theta+2s_1\pi}}{n}-\frac{m.\overline{\theta+2s_2\pi}}{n}$; a multiple of 2π or s_1-s_2 must be a multiple of n. Therefore, if we give s the values $0, 1, 2, \ldots n-1$ successively, we shall get n different values of $(a+\iota b)^{\frac{m}{n}}$, and these will be repeated if we give s other values; hence all the values of $(a+\iota b)^{\frac{m}{n}}$

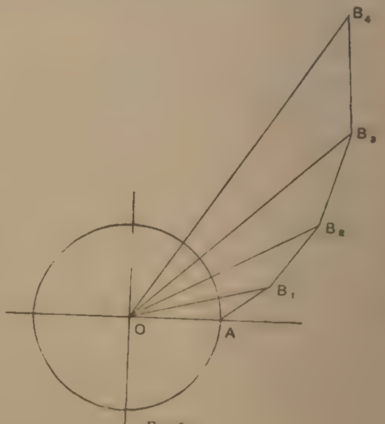

FIG. 9.

are obtained by giving s the values $0, 1, 2, \dots n-1$ in the expression $r^{\frac{m}{n}}\left(\cos\frac{m.\theta+2s\pi}{n}+\iota\sin\frac{m.\theta+2s\pi}{n}\right)$, where $r=(a^2+b^2)^{\frac{1}{2}}$ and $\theta=\text{arc tan}\,\frac{b}{a}$.

We now return to the geometrical representation of the complex quantities. If the points $B_1, B_2, B_3, \dots B_n$ represent the expression $x+\iota y\ (x+\iota y)^2, (x+\iota y)^3, \dots (x+\iota y)^n$ respectively, the triangle $OAB_1, OB_1B_2, \dots OB_{n-1}B_n$ are all similar. Let $(x+\iota y)^n=a+\iota b$, then the converse problem of finding the nth root of $a+\iota b$ is equivalent to the geometrical problem of describing such a series of triangles that OA is the first side of the first triangle and OB_n the second side of the nth. Now it is obvious that this geometrical problem has more solutions than one, since any number of complete revolutions round O may be made in travelling from B_1 to B_n. The first solution is that in which the vertical angle of each triangle is $\frac{1}{n}B_nOA$; the second is that in which each is $\frac{1}{n}(B_nOA+2\pi)$, in this case one complete revolution being made round O; the third has $\frac{1}{n}(B_nOA+4\pi)$ for the vertical angle of each triangle; and so on. There are n sets of triangles which satisfy the required conditions. For simplicity we will take the case of the determination of the values of $(\cos\theta+\iota\sin\theta)^{\frac{1}{3}}$. Suppose B to represent the expression $\cos\theta+\iota\sin\theta$. If the angle AOP_1 is $\frac{1}{3}\theta$, P_1 represents the root $\cos\frac{\theta}{3}+\iota\sin\frac{\theta}{3}$. the angle AOB is filled up by the angles of the three similar triangles AOP_1, P_1Op_1, p_1OB. Also, if P_2, P_3 be such that the angles P_1OP_2, P_1OP_3, are $\frac{2\pi}{3}$, $\frac{4\pi}{3}$ respectively, the two sets of triangles AOP_2, P_2Op_3, p_3OB and AOP_3, P_3Op_2, p_2OB satisfy the conditions of similarity and of having OA, OB for the bounding sides; thus P_2, P_3 represent the roots $\cos\frac{\theta+2\pi}{3}+\iota\sin\frac{\theta+2\pi}{3}$, $\cos\frac{\theta+4\pi}{3}+\iota\sin\frac{\theta+4\pi}{3}$ respectively. If B coincides with A, the problem is reduced to that of finding the three cube roots of unity. One will be represented by A and the others by the two angular points of an equilateral triangle, with A as one angular point, inscribed in the circle.

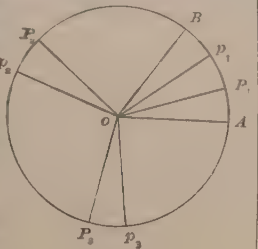

FIG. 10.

The nth roots of unity.

The problem of determining the values of the nth roots of unity is equivalent to the geometrical problem of inscribing a regular polygon of n sides in a circle. Gauss has shown in his *Disquisitiones arithmeticæ* that this can always be done by the compass and ruler only when n is a prime of the form 2^p+1. The determination of the nth root of any complex quantity requires in addition, for its geometrical solution, the division of an angle into n equal parts.

Factorizations.

We are now in a position to factorize an expression of the form $x^n-(a+\iota b)$. Using the values which we have obtained above for $(a+\iota b)^{\frac{1}{n}}$, we have

$$x^n-(a+\iota b)=\underset{s=0}{\overset{s=n-1}{P}}\left[x-r^{\frac{1}{n}}\left(\cos\frac{\theta+2s\pi}{n}+\iota\sin\frac{\theta+2s\pi}{n}\right)\right] \quad \dots(1).$$

If $b=0$, $a=1$, this becomes

$$x^n-1=\underset{s=0}{\overset{s=n-1}{P}}\left[x-\cos\frac{2s\pi}{n}-\iota\sin\frac{2s\pi}{n}\right]$$

$$=(x-1)(x+1)\underset{s=1}{\overset{s=\frac{n}{2}-1}{P}}\left(x-\cos\frac{2s\pi}{n}\pm\iota\sin\frac{2s\pi}{n}\right)$$

$$=(x-1)(x+1)\underset{s=1}{\overset{s=\frac{n}{2}-1}{P}}\left(x^2-2x\cos\frac{2s\pi}{n}+1\right)(n\text{ even})\ (2).$$

$$x^n-1=(x-1)\underset{s=1}{\overset{s=\frac{n-1}{2}}{P}}\left(x^2-2x\cos\frac{2s\pi}{n}+1\right)\ (n\text{ odd}) \quad \dots(3).$$

If in (1) we put $a=-1$, $b=0$, and therefore $\theta=\pi$, we have

$$x^n+1=\underset{s=0}{\overset{s=n-1}{P}}\left[x-\cos\frac{\overline{2s+1}\,\pi}{n}-\iota\sin\frac{\overline{2s+1}\,\pi}{n}\right]$$

$$=\underset{s=0}{\overset{s=\frac{n-2}{2}}{P}}\left[x^2-2x\cos\frac{\overline{2s+1}\,\pi}{n}+1\right]\ (n\text{ even}) \quad \dots\dots\dots\dots(4).$$

$$x^n+1=(x+1)\underset{s=0}{\overset{s=\frac{n-8}{2}}{P}}\left[x^2-2x\cos\frac{\overline{2s+1}\,\pi}{n}+1\right]\ (n\text{ odd})\ (5).$$

Also $x^{2n}-2x^ny^n\cos n\theta+y^{2n}$

$$=(x^n-y^n\cos n\theta+\iota\sin n\theta)(x^n-y^n\cos n\theta-\iota\sin n\theta)$$

$$=\underset{s=0}{\overset{s=n-1}{P}}\left(x-y\cos\frac{\theta+2s\pi}{n}\pm\iota\sin\frac{\theta+2s\pi}{n}\right)$$

$$=\underset{s=0}{\overset{s=n-1}{P}}\left[x^2-2xy\cos\overline{\theta+\frac{2s\pi}{n}}+y^2\right] \quad \dots\dots\dots\dots\dots(6).$$

Airy and Adams have given proofs of this theorem which do not involve the use of the symbol ι (see *Camb. Phil. Trans.*, vol. xi.).

A large number of interesting theorems may be derived from De Moivre's theorem and the factorizations which we have deduced from it: we shall notice one of them.

Example of De Moivre's theorem.

In equation (6) put $y=\frac{1}{x}$, take logarithms, and then differentiate each side with respect to x, and we get

$$\frac{2n(x^{2n-1}-x^{-2n-1})}{x^{2n}-2\cos n\theta+x^{-2n}}=\sum_{s=0}^{s=n-1}\frac{2(x-x^{-3}}{x^2-2\cos\overline{\theta+\frac{2s\pi}{n}}+{}^{-2}}.$$

Put $x^2=\frac{a}{b}$, then we have the expression

$$\frac{n(a^{2n}-b^{2n})}{(a^2-b^2)(a^{2n}-2a^nb^n\cos n\theta+b^{2n})}$$

for the sum of the series

$$\sum_{s=0}^{s=n-1}\frac{1}{a^2-2ab\cos\overline{\theta+\frac{2s\pi}{n}}+b^2}.$$

Complex quantities as exponentials.

We shall now consider what meaning can be assigned to the symbol $e^{x+\iota y}$. The quantity e is defined as the limit of $\left(1+\frac{1}{n}\right)^n$, where n is a positive quantity, and is increased indefinitely; then, for a real value of x, e^x is the limit of $\left(1+\frac{1}{n}\right)^{nx}$ or of $\left(1+\frac{x}{m}\right)^m$, where $m=nx$, when m is increased indefinitely. We may define $e^{x+\iota y}$ as the limit of $\left(1+\frac{x+\iota y}{m}\right)^m$ when m is increased indefinitely. To determine the value of this limit put $1+\frac{x}{m}=r\cos\theta$, $\frac{y}{m}=r\sin\theta$; then $e^{x+\iota y}$ is the limit of $r^m(\cos m\theta+\iota\sin m\theta)$, and r^m is equal to $\left\{1+\frac{2x}{m}+\frac{x^2+y^2}{m^2}\right\}^{\frac{m}{2}}$ or ultimately to $\left(1+\frac{2x}{n}\right)^{\frac{m}{2}}$, which has e^x for its limiting value, Also θ is arc tan $\frac{y}{x+m}$ or $\frac{y}{x+m}$ in the limit; hence $m\theta$ is ultimately equal to y, and thus the equation $e^{x+\iota y}=e^x(\cos y+\iota\sin y)$ follows from our definition. It may be shown at once that $e^{x+\iota y}\times e^{x^1+\iota y^1}=e^{x+x_1+\iota(y+y_1)}$, and, if we suppose that $a^{x+\iota y}$ denotes $e^{(x+\iota y)\log a}$, we may show that complex exponents defined thus obey the same laws as real ones.

Exponential values of sine and cosine.

When the exponent is entirely imaginary we have, in accordance with the above definition, $e^{\iota y}=\cos y+\iota\sin y$ and $e^{-\iota y}=\cos(-y)+\iota\sin(-y)=\cos y-\iota\sin y$; we thus obtain the exponential values of the sine and cosine—

$$\sin y=\frac{1}{2\iota}(e^{\iota y}-e^{-\iota y}),\ \cos y=\frac{1}{2}e^{\iota y}+e^{-\iota y}).$$

Expansions of sines and cosines and their powers.

If we give imaginary or complex values to the variables in algebraical expansions we obtain analogous trigonometrical theorems; it is, however, necessary to consider the convergency of the series so obtained in order to determine within what limits the values of the variables must lie. If we expand $e^{\iota y}$ and $e^{-\iota y}$ by putting ιy and $-\iota y$ in the series $1+y+\frac{y^2}{1.2}+\frac{y^3}{1.2.3}+\dots$ we obtain the series $\sin y=y-\frac{y^3}{\underline{|3}}+\frac{y^5}{\underline{|5}}-\frac{y^7}{\underline{|7}}+\dots$;

$$\cos y=1-\frac{y^2}{\underline{|2}}+\frac{y^4}{\underline{|4}}-\frac{y^6}{\underline{|6}}+\dots$$

These series are convergent for all finite values of y. They may also be got from the expressions which we have obtained for the cosine and sine of a multiple of an angle in terms of the cosine and sine of the angle, and would thus be made to rest upon a basis independent of the symbol ι.

Expansion of powers of sines and cosines in series of sines and cosines of multiple arc.

Consider the binominal theorem

$$(a+b)^n - a^n + na^{n-1}b + \frac{n(n-1)}{\underline{|2}}a^{n-2}b^2 + \ldots\ldots$$
$$+\frac{n(n-1)\ldots\ldots(n-r+1)}{\underline{|r}}a^{n-r}b^r + \ldots\ldots + b^n.$$

Putting $a=e^{\iota\theta}$, $b=e^{-\iota\theta}$, we obtain

$$(2\cos\theta)^n = 2\cos n\theta + n2\cos n-2\theta$$
$$+\frac{n(n-1)}{2}2\cos\overline{n-4}\theta + \ldots\ldots$$
$$+\frac{n(n-1)\ldots\ldots(n-r+1)}{\underline{|r}}\cos(n-2r)\theta + \ldots\ldots$$

When n is odd the last term is $2\dfrac{n(n-1)\ldots\ldots\frac{1}{2}(n+3)}{\underline{|\tfrac{1}{2}(n-1)}}\cos\theta$,

and when n is even it is $\dfrac{n(n-1)\ldots\ldots(\frac{1}{2}n+1)}{\underline{|\tfrac{1}{2}n}}$.

If we put $a=e^{\iota\theta}$, $b=-e^{-\iota\theta}$, we obtain the formula

$$(-1)^{\frac{n}{2}}(2\sin\theta)^n = 2\cos n\theta - 2n\cos(n-2)\theta + \frac{n(n-1)}{1.2}$$
$$2\cos(n-4)\theta - \ldots\ldots + (-1)^{n-r}\frac{n(n-1)\ldots\ldots(n-r+1)}{\underline{|r}}+$$
$$2\cos(n-2r)\theta\ldots\ldots + (-1)^{\frac{n}{2}}\frac{n(n-1)\ldots\ldots(\frac{1}{2}n+1)}{\underline{|\tfrac{1}{2}n}}$$

when n is even, and

$$(-1)^{\frac{n-1}{2}}(2\sin\theta)^n = 2\sin n\theta - n\,.\,2\sin(n-2)\theta$$
$$+\frac{n(n-1)}{1.2}2\sin(n-4)\theta\ldots\ldots$$
$$+(-1)^{\frac{n-1}{2}}\frac{n(n-1)\ldots\ldots\frac{1}{2}(n+3)}{\underline{|\tfrac{1}{2}(n-1)}}\sin\theta$$

when n is odd. These formulæ enable us to express any positive integral power of the sine or cosine in terms of sines or cosines of multiples of the argument. There are corresponding formulæ when n is not a positive integer.

Expansion of sines and cosines of multiple arcs in powers of sines and cosines of arc.

Consider the identity $\log(1-px)+\log(1-qx)=\log(1-(p+q)x+pqx^2)$. Expand both sides of this equation in powers of x, and equate the coefficients of x^n, we then get

$$p^n+q^n = (p+q)^n - n(p+q)^{n-2}pq$$
$$+\frac{n(n-3)}{2}(p+q)^{n-4}p^2q^2 + \ldots + (-1)^r$$
$$\frac{n(n-r-1)(n-r-2)\ldots(n-2r+1)}{\underline{|r}}$$
$$(p+q)^{n-2r}p^rq^r + \ldots$$

If we write this series in the reverse order, we have

$$p^n+q^n = 2(-1)^{\frac{n}{2}}\Bigg[(pq)^{\frac{n}{2}} - \frac{n^2}{\underline{|2}}(pq)^{\frac{n}{2}-1}\left(\frac{p+q}{2}\right)^2 + \frac{n^2(n^2-2^2)}{\underline{|4}}$$
$$(pq)^{\frac{n}{2}-2}\left(\frac{p+q}{2}\right)^4 - \frac{n^2(n^2-2^2)(n^2-4^2)}{\underline{|6}}(pq)^{\frac{n}{2}-3}\left(\frac{p+q}{2}\right)^6 +$$
$$\ldots + (-1)^{\frac{n}{2}}\tfrac{1}{2}(p+q)^n\Bigg]$$

when n is even, and

$$p^n+q^n = 2(-1)^{\frac{n-1}{2}}\Bigg[n(pq)^{\frac{n-1}{2}}\left(\frac{p+q}{2}\right) - \frac{n(n^2-1^2)}{\underline{|3}}(pq)^{\frac{n-3}{2}}$$
$$\left(\frac{p+q}{2}\right)^3 + \frac{n(n^2-1^2)(n^2-3^2)}{\underline{|5}}(pq)^{\frac{n-5}{2}}\left(\frac{p+2}{2}\right)^5 + \ldots$$
$$+(-1)^{\frac{n-1}{2}}\tfrac{1}{2}(p+q)^n\Bigg]$$

when n is odd. If in these three formulæ we put $p=e^{\iota\theta}$, $q=e^{-\iota\theta}$, we obtain the following series for $\cos n\theta$:

$$2\cos n\theta = (2\cos\theta)^n - n(2\cos\theta)^{n-2} + \frac{n(n-3)}{\underline{|2}}(2\cos\theta)^{n-4}$$
$$-\ldots + (-1)^r\frac{n(n-r-1)(n-r-2)\ldots(n-2r+1)}{\underline{|r}}$$
$$(2\cos\theta)^{n-2r} + \ldots\ldots\ldots\ldots\ldots\ldots(7)$$

when n is any positive integer;

$$(-1)^{\frac{n}{2}}\cos n\theta = 1 - \frac{n^2}{2}\cos^2\theta + \frac{n^2(n^2-2^2)}{\underline{|4}}\cos^4\theta$$
$$-\frac{n^2(n^2-2^2)(n^2-4^2)}{\underline{|6}}\cos^6\theta + \ldots + (-1)^{\frac{n}{2}}2^{n-1}\cos^n\theta\ldots\ldots(8)$$

when n is an even positive integer;

$$(-1)^{\frac{n-1}{2}}\cos n\theta = n\cos n\theta - \frac{n(n^2-1^2)}{\underline{|3}}\cos^3\theta +$$
$$\frac{n(n^2-1^2)(n^2-3^2)}{\underline{|5}}\cos^5\theta - \ldots + (-1)^{\frac{n-1}{2}}2^{n-1}\cos^n\theta\ldots\ldots(9)$$

when n is odd. If in the same three formulæ we put $p=e^{\iota\theta}$, $q=-e^{-\iota\theta}$, we obtain the following four formulæ:

$$(-1)^{\frac{n}{2}}2\cos n\theta = (2\sin\theta)^n - n(2\sin\theta)^{n-2} + \frac{n(n-3)}{\underline{|2}}$$
$$(2\sin\theta)^{n-4} - \ldots + (-1)^r\frac{n(n-r-1)\ldots(n-2r-1)}{\underline{|r}}$$
$$(2\sin\theta)^{n-2r} + \ldots\ (n\text{ even})\ldots\ldots\ldots\ldots\ldots\ldots(10);$$

$$(-1)^{\frac{n-1}{2}}2\sin n\theta = \text{the same series } (n\text{ odd})\ \ldots\ldots\ \ldots\ (11);$$

$$\cos n\theta = 1 - \frac{n^2}{\underline{|2}}\sin^2\theta + \frac{n^2(n^2-2^2)}{\underline{|4}}\sin^4\theta - \frac{n^2(n^2-2^2)(n^2-4^2)}{\underline{|6}}$$
$$\sin^6\theta + \ldots + 2^{n-1}\sin^n\theta\ (n\text{ even})\ldots\ldots\ldots\ldots\ldots\ldots(12);$$

$$\sin n\theta = n\sin\theta - \frac{n(n^2-1^2)}{\underline{|3}}\sin^3\theta + \frac{n(n^2-1^2)(n^2-3^2)}{\underline{|5}}\sin^5\theta$$
$$-\ldots + (-1)^{\frac{n-1}{2}}2^{n-1}\sin^n\theta\ (n\text{ odd})\ldots\ldots\ldots\ldots\ldots\ldots(13).$$

Next consider the identity $\dfrac{p}{1-px}-\dfrac{q}{1-qx}$ $=\dfrac{p-q}{1-(p+q)x+pqx^2}$. Expand both sides of this equation in powers of x, and equate the coefficients of x^{n-1}, then we obtain the equation

$$\frac{p^n-q^n}{p-q} = (p+q)^{n-1} - (n-2)(p+q)^{n-3}pq + \frac{(n-3)(n-4)}{\underline{|2}}$$
$$(p+q)^{n-5}p^2q^2 - \ldots + (-1)^r$$
$$\frac{(n-r-1)(n-r-2)\ldots(n-2r)}{\underline{|r}}(p+q)^{n-2r-1}p^rq^r + \ldots$$

If, as before, we write this in the reverse order, we have the series

$$(-1)^{\frac{n}{2}-1}\Bigg[n\left(\frac{p+q}{2}\right)(pq)^{\frac{n}{2}-1} - \frac{n(n^2-2^2)}{\underline{|3}}\left(\frac{p+q}{2}\right)^3(pq)^{\frac{n}{2}-3}$$
$$+\frac{n(n^2-2^2)(n^2-4^2)}{\underline{|5}}\left(\frac{p+q}{2}\right)^5(pq)^{\frac{n}{2}-5} + \ldots + (-1)^{\frac{n}{2}-1}$$
$$(p+q)^{n-1}\Bigg]$$

when n is even, and

$$(-1)^{\frac{n-1}{2}}\Bigg[(pq)^{\frac{n-1}{2}} - \frac{n^2-1^2}{\underline{|2}}\left(\frac{p+q}{2}\right)^2(pq)^{\frac{n-3}{2}}$$
$$+\frac{(n^2-1^2)(n^2-3^2)}{\underline{|4}}\left(\frac{p+q}{2}\right)^4(pq)^{\frac{n-5}{2}} + \ldots$$
$$+(-1)^{\frac{n-1}{2}}(p+q)^{n-1}\Bigg]$$

when n is odd.

If we put $p=e^{\iota\theta}$, $q=e^{-\iota\theta}$, we obtain the formulæ

$$\sin n\theta = \sin\theta\Big\{(2\cos\theta)^{n-1} - (n-2)(2\cos\theta)^{n-3}$$
$$+\frac{(n-3)(n-4)}{\underline{|2}}(2\cos\theta)^{n-5} + (-1)^r$$
$$\frac{(n-r-1)(n-r-2)\ldots(n-2r)}{\underline{|r}}(2\cos\theta)^{n-2r-1} + \ldots\Big\}\ (14),$$

where n is any positive integer;

$$(-1)^{\frac{n}{2}-1}\sin n\theta = \sin\theta\Big\{n\cos\theta - \frac{n(n^2-2^2)}{\underline{|3}}\cos^3\theta$$
$$+\frac{n(n^2-2^2)(n^2-4^2)}{\underline{|5}}\cos^5\theta - \ldots + (-1)^{\frac{n}{2}-1}(2\cos\theta)^{n-1}\Big\}$$
$$(n\text{ even})\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots(15);$$

$$(-1)^{\frac{n-1}{2}}\sin n\theta = \sin\theta\Big\{1 - \frac{n^2-1^2}{\underline{|2}}\cos^2\theta + \frac{(n^2-1^2)(n^2-3^2)}{\underline{|4}}$$

$$\cos^4\theta - \ldots + (-1)^{\frac{n}{2}-1}(2\cos\theta)^{n-1}\Big\}\ (n \text{ odd}) \ldots\ldots\ldots (16).$$

If we put in the same three formulæ $p = e^{\iota\theta}$, $q = -e^{-\iota\theta}$, we obtain the series

$$(-1)^{\frac{n-2}{2}} \sin n\theta = \cos\theta\Big[\sin^{n-1}\theta - (n-2)\sin^{n-3}\theta$$
$$+ \frac{(n-3)(n-4)}{2}\sin^{n-5}\theta - \ldots + (-1)^r$$
$$\frac{(n-r-1)(n-r-2)\ldots(n-2r)}{\underline{|r}}\sin^{n-2r-1}\theta + \ldots\Big]$$
$$(n \text{ even}) \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (17);$$

$$(-1)^{\frac{n-1}{2}} \cos n\theta = \text{the same series } (n \text{ odd}) \ldots\ldots\ldots\ldots (18);$$

$$\sin n\theta = \cos\theta\Big\{n\sin\theta - \frac{n(n^2-2^2)}{\underline{|3}}\sin^3\theta + \frac{n(n^2-2^2)(n^2-4^2)}{\underline{|4}}$$
$$\sin^5\theta + \ldots + (-1)^{\frac{n}{2}-1}(2\sin\theta)^{n-1}\Big\}\ (n \text{ even}) \ldots\ldots\ldots (19);$$

$$\cos n\theta = \cos\theta\Big\{1 - \frac{n^2-1^2}{\underline{|2}}\sin^2\theta + \frac{(n^2-1^2)(n^2-3^2)}{\underline{|4}}\sin^4\theta - \ldots$$
$$+ (2\sin\theta)^{n-1}\Big\}\ (n \text{ odd}) \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (20).$$

We have thus obtained formulæ for cos $n\theta$ and sin $n\theta$ both in ascending and in descending powers of cos θ and sin θ. Viète obtained formulæ for chords of multiple arcs in powers of chords of the simple or complementary arcs equivalent to the formulæ (13) and (19) above. These are contained in his work *Theoremata ad angulares sectiones*. James Bernoulli found formulæ equivalent to (12) and (13) (*Mém. de l'Académie des Sciences*, 1702), and transformed these series into a form equivalent to (10) and (11). John Bernoulli published in the *Acta eruditorum* for 1701, among other formulæ already found by Viète, one equivalent to (17). These formulæ have been extended to cases in which n is fractional, negative, or irrational; see a paper by D. F. Gregory in *Camb. Math. Journ.*, vol. iv., in which the series for cos $n\theta$, sin $n\theta$ in ascending powers of cos θ and sin θ are extended to the case of a fractional value of n. These series have been considered by Euler in a memoir in the *Nova acta*, vol. ix., by Lagrange in his *Calcul des fonctions* (1806), and by Poinsot in *Recherches sur l'analyse des sections angulaires* (1825).

Theory of logarithms.

The general definition of Napierian logarithms is that, if $e^{x+\iota y} = a + \iota b$, then $x + \iota y = \log(a + \iota b)$. Now we know that $e^{x+\iota y} = e^x\cos y + \iota e^x \sin y$; hence $e^x \cos y = a$, $e^x \sin y = b$, or $e^x = (a^2 + b^2)^{\frac{1}{2}}$, $y = \text{arc tan}\,\frac{b}{a} \pm m\pi$, where m is an integer. If $b = 0$, then m must be even or odd according as a is positive or negative; hence

$$\log_e(a + \iota b) = \log_e(a^2 + b^2)^{\frac{1}{2}} + \iota\left(\text{arc tan}\,\frac{b}{a} \pm 2n\pi\right)$$

$$\text{or } \log_e(a + \iota b) = \log_e(a^2 + b^2)^{\frac{1}{2}} + \iota\left(\text{arc tan}\,\frac{b}{a} \pm \overline{2n + \pi}\right),$$

according as a is positive or negative. Thus the logarithm of any complex or real quantity is a multiple-valued function, the difference between successive values being $2\pi\iota$; in particular, the most general form of the logarithm of a real positive quantity is obtained by adding positive or negative multiples of $2\pi\iota$ to the arithmetical logarithm. On this subject, see De Morgan's *Trigonometry and Double Algebra*, chap. iv., and a paper by Prof. Cayley in vol. ii. of *Proc. London Math. Soc.*

Hyperbolic trigonometry.

We may suppose the exponential values of the sine and cosine extended to the case of complex arguments; thus we accept $\frac{e^{\iota(x+\iota y)} + e^{-\iota(x+\iota y)}}{2}$ and $\frac{e^{\iota(x+\iota y)} - e^{-\iota(x+\iota y)}}{2\iota}$, as the definitions of the functions cos $(x+\iota y)$, sin $(x+\iota y)$ respectively. If $x = 0$, we have $\cos \iota y = \frac{e^y + e^{-y}}{2}$ and $\sin \iota y = \frac{\iota}{2}(e^y - e^{-y})$. The quantities $\frac{e^y + e^{-y}}{2}$, $\frac{e^y - e^{-y}}{2}$ are called the hyperbolic cosine and sine of y and are written cosh y, sinh y; thus cosh $y = \cos \iota y$, sinh $y = -\iota \sin \iota y$. The functions cosh y, sinh y are connected with the rectangular hyperbola in a manner analogous to that in which the cosine and sine are connected with the circle. We may easily show from the definitions that

$$\cos^2(x + \iota y) + \sin^2(x + \iota y) = 1,$$
$$\cosh^2 y - \sinh^2 y = 1;$$
$$\cos(x + \iota y) = \cos x \cosh y - \iota \sin x \sinh y,$$
$$\sin(x + \iota y) = \sin x \cosh y + \iota \cos x \sinh y,$$
$$\cosh(\alpha + \beta) = \cosh\alpha\cosh\beta + \sinh\alpha\sinh\beta,$$
$$\sinh(\alpha + \beta) = \sinh\alpha\cosh\beta - \cosh\alpha\sinh\beta.$$

These formulæ are the basis of a complete hyperbolic trigonometry. The connection of these functions with the hyperbola was first pointed out by Lambert.

Expansion of an angle in powers of its sine.

If we equate the coefficients of n on both sides of equation (13), we get

$$\theta = \sin\theta + \frac{1}{2}\frac{\sin^3\theta}{3} + \frac{1\,.\,3}{2\,.\,4}\frac{\sin^5\theta}{5} + \frac{1\,.\,3\,.\,5}{2\,.\,4\,.\,6}\frac{\sin^7\theta}{7} + \ldots (21);$$

θ must lie between the values $\pm\frac{\pi}{2}$. This equation may also be written in the form

$$\text{arc sin}\,x = x + \frac{1}{2}\frac{x^3}{3} + \frac{1\,.\,3}{2\,.\,4}\frac{x^5}{5} + \frac{1\,.\,3\,.\,5}{2\,.\,4\,.\,6}\frac{x^7}{7} + \ldots$$

when x lies between ± 1.

By equating the coefficients of n^2 on both sides of equation (12) we get

$$\theta^2 = \sin^2\theta + \frac{2}{3}\frac{\sin^4\theta}{2} + \frac{2\,.\,4}{3\,.\,5}\frac{\sin^6\theta}{3} + \frac{2\,.\,4\,.\,6}{3\,.\,5\,.\,7}\frac{\sin^8\theta}{4} + \ldots (22),$$

which may also be written in the form

$$(\text{arc sin}\,x)^2 = x^2 + \frac{2}{3}\frac{x^4}{2} + \frac{2\,.\,4}{3\,.\,5}\frac{x^6}{3} + \frac{2\,.\,4\,.\,6}{3\,.\,5\,.\,7}\frac{x^8}{4} + \ldots$$

when x is between ± 1. Differentiating this equation with regard to x, we get

$$\frac{\text{arc sin}\,x}{\sqrt{1 - x^2}} = x + \frac{2}{3}x^3 + \frac{2\,.\,4}{3\,.\,5}x^5 + \frac{2\,.\,4\,.\,6}{3\,.\,5\,.\,7}x^7 + \ldots;$$

if we put arc sin x = arc tan y, this equation becomes

$$\text{arc tan}\,y = \frac{y}{1 + y^2}\left\{1 + \frac{2}{3}\frac{y^2}{1 + y^2} + \frac{2\,.\,4}{3\,.\,5}\left(\frac{y^2}{1 + y^2}\right)^2 + \ldots\right\} \ldots\ldots (23).$$

This equation was given with two proofs by Euler in the *Nova acta* for 1793.

Gregory's series.

We have $\frac{1}{2}\log\frac{1 + x}{1 - x} = x + \frac{x^3}{3} + \frac{x^5}{5} + \frac{x^7}{7} + \ldots$; put ιy for x, the left side then becomes $\frac{1}{2}\{\log(1 + \iota y) - \log(1 - \iota y)\}$ or ι arc tan $y \pm \iota n\pi$;

hence
$$\text{arc tan}\,y \pm n\pi = y - \frac{y^3}{3} + \frac{y^5}{5} - \frac{y^7}{7} + \ldots.$$

The series is convergent if y lies between ± 1; if we suppose arc tan y restricted to values between $\pm\frac{\pi}{4}$, we have

$$\text{arc tan}\,y = y - \frac{y^3}{3} + \frac{y^5}{5} - \ldots \quad \ldots\ldots\ldots (24),$$

which is Gregory's series.

Series for calculation of π.

Various series derived from (24) have been employed to calculate the value of π. At the end of the 17th century π was calculated to 72 places of decimals by Abraham Sharp, by means of the series obtained by putting arc tan $y = \frac{\pi}{6}$, $y = \frac{1}{\sqrt{3}}$ in (24). The calculation is to be found in Sherwin's *Mathematical Tables* (1742). About the same time Machin employed the series obtained from the equation 4 arc tan $\frac{1}{5}$ − arc tan $\frac{1}{239} = \frac{\pi}{4}$ to calculate π to 100 decimal places. Long afterwards Euler employed the series obtained from $\frac{\pi}{4}$ = arc tan $\frac{1}{2}$ + arc tan $\frac{1}{3}$, which, however, gives less rapidly converging series (Introd., *Anal. infin.*, vol. i.). Lagny employed the formula arc tan $\frac{1}{\sqrt{3}} = \frac{\pi}{6}$ to calculate π to 127 places; the result was communicated to the Paris Academy in 1719. Vega calculated π to 140 decimal places by means of the series obtained from the equation $\frac{\pi}{4}$ = 5 arc tan $\frac{1}{7}$ + 2 arc tan $\frac{3}{10}$. The formula $\frac{\pi}{4}$ = arc tan $\frac{1}{2}$ + arc tan $\frac{1}{5}$ + arc tan $\frac{1}{8}$ was used by Dase to calculate π to 200 decimal places. Rutherford used the equation π = 4 arc tan $\frac{1}{5}$ − arc tan $\frac{1}{70}$ + arc tan $\frac{1}{99}$.

If in (23) we put $y = \frac{1}{3}$ and $\frac{1}{7}$, we have

$$\pi = 8 \text{ arc tan } \frac{1}{3} + 4 \text{ arc tan } \frac{1}{7}$$
$$= 2.4 \left\{1 + \frac{2}{3} \cdot \frac{1}{10} + \frac{2 \cdot 4}{3 \cdot 5} \frac{1}{10^2} + \ldots\ldots\right\}$$
$$+ .56 \left\{1 + \frac{2}{3} \cdot \frac{2}{100} + \frac{2 \cdot 4}{3 \cdot 5}\left(\frac{2}{100}\right)^2 + \ldots\ldots\right\},$$

a rapidly convergent series for π which was first given by Hutton in *Phil. Trans.* for 1776, and afterwards by Euler in *Nova acta* for 1793. Euler gives an equation deduced in the same manner from the identity $\pi = 20 \text{ arc tan } \frac{1}{7} + 8 \text{ arc tan } \frac{3}{79}$. The calculation of π has been carried out to 707 places of decimals; see *Proc. Roy. Soc.*, xxi. and xxii.; also SQUARING THE CIRCLE (vol. xxii. p. 435 *sq.*).

Factorization of sine and cosine.

We shall now obtain expressions for $\sin x$ and $\cos x$ as infinite products of rational factors. We have

$$\sin x = 2 \sin \frac{x}{2} \sin \frac{x+\pi}{2}$$
$$= 2^3 \sin \frac{x}{4} \sin \frac{x+\pi}{4} \sin \frac{x+2\pi}{4} \sin \frac{x+3\pi}{4};$$

proceeding continually in this way with each factor, we obtain

$$\sin x = 2^{n-1} \sin \frac{x}{n} \sin \frac{x+\pi}{n} \sin \frac{x+2\pi}{n} \ldots \sin \frac{x+\overline{n-1}\pi}{n},$$

where n is any positive integral power of 2. Now

$$\sin \frac{x+r\pi}{n} \sin \frac{x+\overline{n-r}\pi}{x} = \sin \frac{x+r\pi}{n} \sin \frac{r\pi - x}{n}$$
$$= \sin^2 \frac{r\pi}{n} - \sin^2 \frac{x}{n},$$

and
$$\sin \frac{x+\frac{1}{2}n\pi}{n} = \cos \frac{x}{n}.$$

Hence the above may be written

$$\sin x = 2^{n-1} \sin \frac{x}{n}\left(\sin^2 \frac{\pi}{n} - \sin^2 \frac{x}{n}\right)\left(\sin^2 \frac{2\pi}{n} - \sin^2 \frac{x}{n}\right)\ldots$$
$$\left(\sin^2 \frac{k\pi}{n} - \sin^2 \frac{x}{n}\right) \cos \frac{x}{n},$$

where $k = \frac{1}{2}n - 1$. Let x be indefinitely small, then we have

$$1 = \frac{2^{n-1}}{n} \sin^2 \frac{\pi}{n} \sin^2 \frac{2\pi}{n} \ldots \sin^2 \frac{k\pi}{n};$$

hence

$$\sin x = n \sin \frac{x}{n} \cos \frac{x}{n}\left(1 - \frac{\sin^2 x/n}{\sin^2 \pi/n}\right)\left(1 - \frac{\sin^2 x/n}{\sin^2 2\pi/n}\right)\ldots$$
$$\left(1 - \frac{\sin^2 x/n}{\sin^2 k\pi/n}\right).$$

We may write this

$$\sin x = n \sin \frac{x}{n} \cos \frac{x}{n}\left(1 - \frac{\sin^2 x/n}{\sin^2 \pi/n}\right)\ldots\left(1 - \frac{\sin^2 x/n}{\sin^2 m\pi/n}\right)R,$$

where R denotes the product

$$\left(1 - \frac{\sin^2 \frac{x}{n}}{\sin^2 \frac{\overline{m+1}\pi}{n}}\right)\left(1 - \frac{\sin^2 \frac{x}{n}}{\sin^2 \frac{\overline{m+2}\pi}{n}}\right)\ldots\left(1 - \frac{\sin^2 \frac{x}{n}}{\sin^2 \frac{k\pi}{n}}\right),$$

and m is any fixed integer independent of n. It is necessary, when we make n infinite, to determine the limiting value of the quantity R; then, since the limit of $\frac{\sin x}{n \sin \frac{x}{n} \cos \frac{x}{n}}$ is $\frac{\sin x}{x}$, and that of $\frac{\sin m\pi/n}{m\pi/n}$ is unity, we have

$$\frac{\sin x}{x} = \left(1 - \frac{x^2}{\pi^2}\right)\left(1 - \frac{x^2}{2^2\pi^2}\right)\ldots\left(1 - \frac{x^2}{m^2\pi^2}\right)R.$$

Now R is less than unity, since $\sin \frac{x}{n}$ is less than $\sin \frac{\overline{m+1}\pi}{n}, \sin \frac{\overline{m+2}\pi}{n} \ldots$; also by an elementary algebraical proposition R is greater than $1 - \sin^2 \frac{x}{n}\left(\text{cosec}^2 \frac{\overline{m+1}\pi}{n} + \ldots + \text{cosec}^2 \frac{k\pi}{n}\right)$ and $\text{cosec}\, \theta < \frac{\pi}{2\theta}$, if $\theta < \frac{\pi}{2}$; R is therefore greater than

$$1 - \frac{x^2}{4}\left(\frac{1}{\overline{m+1}|^2} + \frac{1}{\overline{m+2}|^2} + \ldots + \frac{1}{k^2}\right)$$

or than
$$1 - \frac{x^2}{4}\left\{\frac{1}{m} - \frac{1}{m+1} + \frac{1}{m+1} - \frac{1}{m+2} + \ldots + \frac{1}{k-1} - \frac{1}{k}\right\},$$

or than $1 - \frac{x^2}{4m}$. Hence $R = 1 - \frac{\theta x^2}{4m}$, where θ is some proper fraction; whence

$$\sin x = x\left(1 - \frac{x^2}{\pi^2}\right)\left(1 - \frac{x^2}{2^2\pi^2}\right)\ldots\left(1 - \frac{x^2}{m^2\pi^2}\right)\left(1 - \frac{\theta x^2}{4m}\right).$$

When m is indefinitely increased this becomes

$$\sin x = x\left(1 - \frac{x^2}{\pi^2}\right)\left(1 - \frac{x^2}{2^2\pi^2}\right)\ldots = xP_{n=-\infty}^{n=+\infty}\left(1 + \frac{x}{n\pi}\right) \quad (25).$$

The expression for $\cos x$ in factors may be found in a similar manner by means of the equation $\cos x = 2 \sin \frac{\pi - 2x}{4} \cos \frac{3\pi - 2x}{4}$, or may be deduced thus

$$\cos x = \frac{\sin 2x}{2 \sin x} = \frac{P\left(1 - \frac{4x^2}{n^2\pi^2}\right)}{P\left(1 - \frac{x^2}{n^2\pi^2}\right)} = \left(1 - \frac{4x^2}{\pi^2}\right)\left(1 - \frac{4x^2}{3^2\pi^2}\right)$$
$$\left(1 - \frac{4x^2}{5^2\pi^2}\right)\ldots = P_{n=-\infty}^{n=+\infty}\left(1 + \frac{2x}{\overline{2n+1}\pi}\right)\ldots\ldots\ldots(26).$$

If we change x into ιx, we have the formulæ for $\sinh x$, $\cosh$ as infinite products—

$$\sinh x = xP_{n=0}^{n=\infty}\left(1 + \frac{x^2}{n^2\pi^2}\right), \quad \cosh x = P_{n=0}^{n=\infty}\left(1 + \frac{4x^2}{\overline{2n+1}|^2\pi^2}\right).$$

In the formula for $\sin x$ as an infinite product put $x = \frac{\pi}{2}$, we then get $1 = \frac{\pi}{2} \cdot \frac{1 \cdot 3 \cdot 3 \cdot 5 \cdot 5 \ldots}{2 \cdot 2 \cdot 4 \cdot 4 \cdot 6 \ldots}$; if we stop after $2n$ factors in the numerator and denominator, we obtain the approximate equation

$$1 = \frac{\pi}{2} \frac{1^2 \cdot 3^2 \cdot 5^2 \ldots (2n-1)^2}{2^2 \cdot 4^2 \cdot 6^2 \ldots (2n)^2} \cdot (2n+1)$$

or $\frac{2 \cdot 4 \cdot 6 \ldots 2n}{1 \cdot 3 \cdot 5 \ldots 2n-1} = \sqrt{n\pi}$, where n is a large integer. This expression was obtained in a quite different manner by Wallis (*Arithmetica infinitorum*, vol. i. of *Opp.*).

Series for cot, cosec, tan, and sec.

We have

$$\frac{\sin (x+y)}{\sin x} = \frac{(x+y)P\left(1 + \frac{x+y}{n\pi}\right)}{xP\left(1 + \frac{x}{n\pi}\right)},$$

or $\cos y + \sin y \cot x$

$$= \left(1 + \frac{y}{x}\right)\left(1 + \frac{y}{x+\pi}\right)\left(1 + \frac{y}{x-\pi}\right)\left(1 + \frac{y}{x+2\pi}\right)$$
$$\left(1 + \frac{y}{x-2\pi}\right)\ldots.$$

Equating the coefficients of the first power of y on both sides we obtain the series

$$\cot x = \frac{1}{x} + \frac{1}{x+\pi} + \frac{1}{x-\pi} + \frac{1}{x+2\pi} + \frac{1}{x-2\pi} + \ldots(27).$$

From this we may deduce a corresponding series for $\text{cosec}\, x$, for, since $\text{cosec}\, x = \cot \frac{x}{2} - \cot x$, we obtain

$$\text{cosec}\, x = \frac{1}{x} - \frac{1}{x+\pi} - \frac{1}{x-\pi} + \frac{1}{x+2\pi} + \frac{1}{x-2\pi} - \frac{1}{x+3\pi}$$
$$- \frac{1}{x-3\pi} + \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (28).$$

By resolving $\frac{\cos(x+y)}{\cos x}$ into factors we should obtain in a similar manner the series

$$\tan x = \frac{2}{\pi - 2x} - \frac{2}{\pi + 2x} + \frac{2}{3\pi - 2x} - \frac{2}{3\pi + 2x}$$
$$+ \frac{2}{5\pi - 2x} - \frac{2}{5\pi + 2x} + \ldots(29),$$

and thence

$$\sec x = \tan\left(\frac{\pi}{4} + \frac{x}{2}\right) - \tan x = \frac{2}{\pi - 2x} + \frac{2}{\pi + 2x} - \frac{2}{3\pi - 2x}$$
$$- \frac{2}{3\pi + 2x} + \ldots\ldots\ldots\ldots\ldots\ldots\ldots(30).$$

These four formulæ may also be derived from the product formulæ for $\sin x$ and $\cos x$ by taking logarithms and then differentiating. Glaisher has proved them by resolving the expressions for $\frac{\cos x}{\sin x}$ and $\frac{1}{\sin x}$...as products into partial fractions (see *Quart. Journ. Math.*, vol. xvii.). The series for $\cot x$ may also be obtained by a continued use of the equation $\cot x = \frac{1}{2}\left(\cot \frac{x}{2} + \cot \frac{x+\pi}{2}\right)$ (see a paper by Dr. Schröter in Schlömilch's *Zeitschrift*, vol. xiii.).

Series for π derived from series for cot and cosec.

Various series for π may be derived from the series (27), (28), (29), (30), and from the series obtained by differentiating them one or more times. For example, in the formulæ (27) and (28), by putting $x = \frac{\pi}{n}$ we get

$$\pi = n\tan\frac{\pi}{n}\left\{1-\frac{1}{n-1}+\frac{1}{n+1}-\frac{1}{2n-1}+\frac{1}{2n+1}\cdots\right\},$$
$$\pi = n\sin\frac{\pi}{n}\left\{1+\frac{1}{n-1}-\frac{1}{n+1}-\frac{1}{2n-1}+\frac{1}{2n+1}\cdots\right\};$$

if we put $n=3$, these become

$$\pi = 3\sqrt{3}\left(1-\frac{1}{2}+\frac{1}{4}-\frac{1}{5}+\frac{1}{7}-\frac{1}{8}+\dots\right),$$
$$\pi = \frac{3\sqrt{3}}{2}\left(1+\frac{1}{2}-\frac{1}{4}-\frac{1}{5}+\frac{1}{7}+\frac{1}{8}\cdots\right).$$

By differentiating (27) we get

$$\operatorname{cosec}^2 x=\frac{1}{x^2}+\frac{1}{(x+\pi)^2}+\frac{1}{(x-\pi)^2}+\frac{1}{(x+2\pi)^2}+\frac{1}{(x-2\pi)^2}+\dots;$$

put $x=\frac{\pi}{6}$, and we get $\pi^2=9\left\{1+\frac{1}{5^2}+\frac{1}{7^2}+\frac{1}{11^2}+\dots\right\}$. These series, among others, were given by Glaisher (*Quart. Journ. Math.*, vol. xii.).

Sums of certain series.

We have $\sinh\pi x=\pi x P\left(1+\frac{x^2}{n^2}\right)$, $\cosh\pi x=P\left(1+\frac{x^2}{\left(\frac{2n+1}{2}\right)^2}\right)$; if we differentiate these formulæ after taking logarithms, we obtain the series

$$\frac{\pi}{2x}\coth\pi x-\frac{1}{2x^2}=\frac{1}{1^2+x^2}+\frac{1}{2^2+x^2}+\frac{1}{3^2+x^2}+\dots,$$
$$\frac{\pi}{2x}\tanh\pi x=\frac{1}{1^2+x^2}+\frac{1}{3^2+x^2}+\frac{1}{5^2+x^2}+\dots$$

These series were given by Kummer (in *Crelle's Journ.*, vol. xvii.). The sum of the more general series $\frac{1}{1^{2n}+x^{2n}}+\frac{1}{2^{2n}+x^{2n}}+\frac{1}{3^{2n}+x^{2n}}+\dots$, has been found by Glaisher (*Proc. Lond. Math. Soc.*, vol. vii.).

Certain series for sine and cosine.

If in the series (12) and (13) we put $n=2x$, $\theta=\frac{\pi}{6}$, we get

$$\cos\frac{\pi x}{3}=1-\frac{x^2}{\underline{|2}}+\frac{x^2(x^2-1^2)}{\underline{|4}}-\frac{x^2(x^2-1^2)(x^2-2^2)}{\underline{|6}}+\dots$$
$$\sin\frac{\pi x}{3}=\sqrt{3}\left\{x-\frac{x(x^2-1)}{\underline{|3}}+\frac{x(x^2-1^2)(x^2-2^2)}{\underline{|5}}\cdots\right\}.$$

These series were given by Schellbach (in *Crelle's Journ.*, vol. xlviii.).

If in the same series (12), (13) we put $\theta=\frac{\pi}{2}$, $n=\frac{2x}{\pi}$, we get

$$\cos x=1-\frac{4x^2}{1.2\pi^2}+\frac{4x^2(4x^2-2^2\pi^2)}{1.2.3.4\,\pi^4}-\frac{4x^2(4x^2-2^2\pi^2)(4x^2-4^2\pi^2)}{1.2.3.4.5.6\,\pi^6}+\dots,$$
$$\sin x=\frac{2x}{\pi}-\frac{2x(4x^2-\pi^2)}{1.2.3\,\pi^3}+\frac{2x(4x^2-\pi^2)(4x^2-3^2\pi^2)}{1.2.3.4.5\,\pi^5}-\dots$$

We have of course assumed the legitimacy of the substitutions made. These last series have been discussed by M. David (*Bull. Soc. Math. de France*, vol. xi.) and Glaisher (*Mess. of Math.*, vol. vii.).

Sums of powers of reciprocals of natural numbers.

If U_m denotes the sum of the series $\frac{1}{1^m}+\frac{1}{2^m}+\frac{1}{3^m}+\dots$, V_m that of the series $\frac{1}{1^m}+\frac{1}{3^m}+\frac{1}{5^m}+\dots$, and W_m that of the series $\frac{1}{1^m}-\frac{1}{3^m}+\frac{1}{5^m}-\frac{1}{7^m}+\dots$, we obtain by taking logarithms in the formulæ (25) and (26)

$$\log(x\operatorname{cosec}x)=U_2\left(\frac{x}{\pi}\right)^2+\frac{1}{2}U_4\left(\frac{x}{\pi}\right)^4+\frac{1}{3}U_6\left(\frac{x}{\pi}\right)^6+\dots,$$
$$\log(\sec x)=V_2\left(\frac{2x}{\pi}\right)^2+\frac{1}{2}V_4\left(\frac{2x}{\pi}\right)^4+\frac{1}{3}V_6\left(\frac{2x}{\pi}\right)^6+\dots;$$

and differentiating these series we get

$$\frac{1}{2}\cot x=\frac{1}{2x}-\frac{U_2}{\pi^2}x-\frac{U_4}{\pi^4}x^3-\frac{U_6}{\pi^6}x^5-\dots\ \dots(31),$$
$$\frac{1}{2}\tan x=\frac{V_2}{\pi^2}2^2x+\frac{V_4}{\pi^4}2^4x^3+\frac{V_6}{\pi^6}2^6x^5+\dots\ \dots(32).$$

In (31) x must lie between $\pm\pi$ and in (32) between $\pm\frac{1}{2}\pi$. Write equation (30) in the form

$$\sec x=\Sigma(-1)^n\frac{(2n+1)\pi}{\left(\overline{2n+1}\,\frac{\pi}{2}\right)^2-x^2},$$

and expand each term of this series in powers of x^2, then we get

$$\sec x=\frac{2^2W_1}{\pi}+\frac{2^4W_3x^2}{\pi^3}+\frac{2^6W_5x^4}{\pi^5}+\dots\ \dots(33),$$

where x must lie between $\pm\frac{1}{2}\pi$. By comparing the series (31), (32), (33) with the expansions of $\cot x$, $\tan x$, $\sec x$ obtained otherwise, we can calculate the values of U_2, $U_4\dots V_2$, $V_4\dots$and W_1, $W_3\dots$. When U_n has been found, V_n may be obtained from the formula $2^nV_n=(2^n-1)U_n$.

Continued factors for π.

For Lord Brounker's series of π, see SQUARING THE CIRCLE (vol. xxii. p. 452). It can be got at once by putting $a=1, b=3, c=5\dots$ in Euler's theorem $\frac{1}{a}-\frac{1}{b}+\frac{1}{c}-\dots=\frac{1}{a+}\,\frac{a^2}{b-a+}\,\frac{b^2}{c-b+}\cdots$.

Sylvester gave (*Phil. Mag.*, 1869) the continued fraction

$$\frac{\pi}{2}=1+\frac{1}{1+}\,\frac{1.2}{1+}\,\frac{2.3}{1+}\,\frac{3.4}{1+}\cdots,$$

which is equivalent to Wallis's formula for π. This fraction was originally given by Euler (*Comm. Acad. Petropol.*, vol. xi.); it is also given by Stern (in *Crelle's Journ.*, vol. x.).

Continued fractions for trigonometrical functions.

It may be shown by means of a transformation of the series for $\cos x$ and $\frac{\sin x}{x}$ that $\tan x=\frac{x}{1-}\,\frac{x^2}{3-}\,\frac{x^2}{5-}\,\frac{x^3}{7-}\cdots$ This may be also easily shown as follows. Let $y=\cos\sqrt{x}$, and let $y', y''\dots$denote the differential coefficients of y with regard to x, then by forming these we can show that $4xy''+2y'+y=0$, and thence by Leibnitz's theorem we have

$$4xy^{(n+2)}+(4n-2)y^{(n+1)}+y^{(n)}=0.$$

Therefore $\frac{y}{y'},=-2-\frac{4x}{y'/y''}$, $\frac{y^{(n)}}{y^{(n+1)}}=-2(2n-1)-\frac{4x}{y^{(n+1)}/y^{(n+2)}}$;

hence $-2\sqrt{x}\cot\sqrt{x}=-2-\frac{4x}{-6-}\,\frac{4x}{-10-}\,\frac{4x}{-14-}\cdots$

Replacing $\sqrt{x}$ by x we have $\tan x=\frac{x}{1-}\,\frac{x^2}{3-}\,\frac{x^2}{5-}\cdots$

Euler gave the continued fraction

$$\tan nx=\frac{n\tan x}{1-}\,\frac{(n^2-1)\tan^2x}{3-}\,\frac{(n^2-4)\tan^2x}{5-}\,\frac{(n^2-9)\tan^2x}{7-}\cdots;$$

this was published in *Mém. de l'Acad. de St. Pétersb.*, vol. vi. Glaisher has remarked (*Mess. of Math.*, vol. iv.) that this may be derived by forming the differential equation

$$(1-x^2)y^{(m+2)}-(2m+1)xy^{(m+1)}+(n^2-m^2)y^{(m)}=0,$$

where $y=\cos(n\operatorname{arc}\cos x)$, then replacing x by $\cos x$, and proceeding as in the former case. If we put $n=0$, this becomes

$$x=\frac{\tan x}{1+}\,\frac{\tan^2x}{3+}\,\frac{4\tan^2x}{5+}\,\frac{9\tan^2x}{7+}\cdots,$$

whence we have

$$\operatorname{arc}\tan x=\frac{x}{1+}\,\frac{x^2}{3+}\,\frac{4x^2}{5+}\,\frac{9x^2}{7+}\cdots\frac{n^2x^2}{2n+1+}\cdots$$

Purely analytical treatment of circular functions.

It is possible to make the investigation of the properties of the simple circular functions rest on a purely analytical basis. The sine of x would be defined as a function such that, if $x=\int_0^y\frac{dy}{\sqrt{1-y^2}}$, then $y=\sin x$; the quantity $\frac{\pi}{2}$ would be defined to be the complete integral $\int_0^1\frac{dy}{\sqrt{1-y^2}}$. We should then have $\frac{\pi}{2}-x=\int_y^1\frac{dy}{\sqrt{1-y^2}}$. Now change the variable in the integral to z, where $y^2+z^2=1$, we then have $\frac{\pi}{2}-x=\int_0^z\frac{dz}{\sqrt{1-z^2}}$, and z must be defined as the cosine of x, and is thus equal to $\sin\left(\frac{\pi}{2}-x\right)$, satisfying the equation $\sin^2x+\cos^2x=1$. Next consider the differential equation

$$\frac{dy}{\sqrt{1-y^2}}+\frac{dz}{\sqrt{1-z^2}}=0.$$

This is equivalent to

$$d\left(y\sqrt{1-z^2}+z\sqrt{1-y^2}\right)=0;$$

hence the integral is

$$y\sqrt{1-z^2}+z\sqrt{1-y^2}=\text{a constant.}$$

The constant will be equal to the value u of y when $z=0$; whence

$$y\sqrt{1-z^2}+z\sqrt{1-y^2}=u.$$

The integral may also be obtained in the form

$$yz-\sqrt{1-y^2}\sqrt{1-z^2}=\sqrt{1-u^2}.$$

Let $\alpha=\int_0^y\frac{dy}{\sqrt{1-y^2}}$, $\beta=\int_0^z\frac{dz}{\sqrt{1-z^2}}$, $\gamma=\int_0^u\frac{du}{\sqrt{1-u^2}}$; we have $\alpha+\beta=\gamma$, and

$$\sin\gamma=\sin\alpha\cos\beta+\cos\alpha\sin\beta,$$
$$\cos\gamma=\cos\alpha\cos\beta-\sin\alpha\sin\beta,$$

the addition theorems. By means of the addition theorems and the values $\sin\frac{\pi}{2}=1$, $\cos\frac{\pi}{2}=0$ we can prove that $\sin\left(\frac{\pi}{2}+x\right)=\cos x$, $\cos\left(\frac{\pi}{2}+x\right)=-\sin x$; and thence by another use of the addition theorems that $\sin(\pi+x)=-\sin x$, $\cos(\pi+x)=-\cos x$, from which the periodicity of the functions $\sin x$, $\cos x$ follows.

We have also $\int\frac{dy}{\sqrt{1-y^2}}=-\iota\log_e(\sqrt{1-y^2}+\iota y)$; whence $\log_e(\sqrt{1-y^2}+\iota y)+\log_e(\sqrt{1-z^2}+\iota z)=$ a constant.

Therefore $(\sqrt{1-y^2}+\iota y)(\sqrt{1-z^2}+\iota z)=\sqrt{1-u^2}+\iota u$, since $u=y$ when $z=0$; whence we have the equation

$$(\cos\alpha+\iota\sin\alpha)(\cos\beta+\iota\sin\beta)=\cos(\alpha+\beta)+\iota\sin(\alpha+\beta),$$

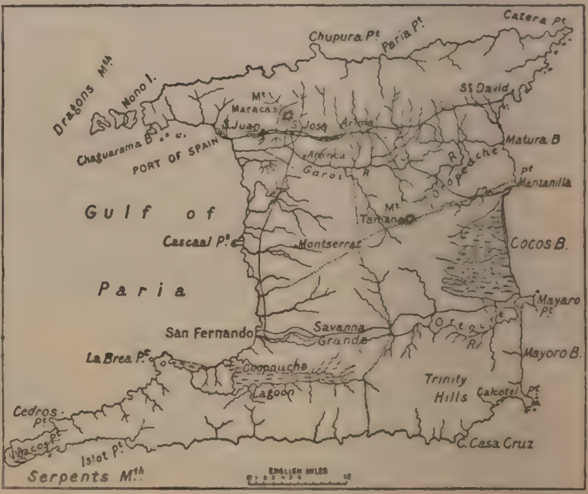
from which De Moivre's theorem follows. (E. W. H.)

TRILOBITES. See CRUSTACEA, vol. vi. p. 578 *sq.*

TRINCOMALEE, a town and naval station in the island of Ceylon, is situated on the northeast coast—which is bold, rocky, and picturesquely wooded—by road 113 miles north-northeast of Kandy, in 8° 33′ 30″ N. lat. and 81° 13′ 10″ E. long. It is built on the north side of the Bay of Trincomalee, on the neck of a bold peninsula separating the inner from the outer harbor. There is a lighthouse on the extremity of Foul Point at the southern side of the bay, and another on the summit of Round Island. The inner harbor is landlocked, with a safe anchorage and deep water close to the principal wharves; the outer harbor has an area of about 4 square miles, with a depth of about 70 fathoms. There is an admiralty dockyard, and the town is the principal naval station in the Indian seas. The breadth of the streets and esplanades somewhat atones for the mean appearance of the houses, but the town generally has a gloomy and impoverished aspect. Pearl oysters are found in the lagoon of Tambalagam to the west of the bay. The Government buildings include the barracks, the public offices and residences of the civil and naval authorities, and the official house of the officer commanding-in-chief in the Indian seas. There is an hospital and outdoor dispensary, and also a friend-in-need society. The population of Trincomalee in 1881 was 10,180.

The town was one of the earliest settlements of the Malabar race in Ceylon, who at a very early period erected on a height at the extremity of the peninsula, now crowned by Fort Frederick, a temple dedicated to Konatha, or Konasir, named the "temple of a thousand columns." The building was desecrated and destroyed in 1622, when the town was taken by the Portuguese, who made use of the materials for the erection of the fort. The town was successively held by the Dutch (1639), the French (1673), the Dutch (1674), the French (1782), and the Dutch (1783). After a siege of three weeks it surrendered to the British fleet in 1795, and with other Dutch possessions in Ceylon was formally ceded to Great Britain by the treaty of Amiens in 1801. Its fortifications have lately been strengthened.

TRINIDAD, a West Indian island, lying northeast of Venezuela, between 10° 3′ and 10° 50′ N. lat. and 61° 39′ and 62° W. long., being the most southern of the chain of islands separating the Atlantic from the Caribbean Sea. Its area is 1754 square miles, or nearly 1,123,000 acres. In shape the island is almost rectangular, but from its northwest and southwest corners project two long horns towards Venezuela, enclosing the Gulf of Paria. The northwest horn terminates in several islands, in one of the channels between which (the Boca Grande) lies the small British island of Patos. The general aspect of Trinidad is level. But three parallel ranges, varying from 600 to 3100 feet in height and clothed with forests, run from east to west. The plains are watered by numerous streams, and the mountains are deeply furrowed by innumerable ravines. The rivers falling into the gulf are somewhat obstructed by shallows, especially the Caroni and the Couva. Geologically, as well as botanically and zoologically, Trinidad differs little from the adjacent mainland, with which at one time it probably was connected. The soil, which is fertile, consists of clay, loam, and alluvial deposits. The Moriche palm and mountain cabbage, as well as the cedar and the balata, are prominent objects. Poisonous and medicinal plants grow everywhere, and the woods contain an inexhaustible supply of timber. There are two mineral springs. The most curious natural feature of the island is the pitch lake[1] in La Brea, 90 acres in extent, which furnishes an important export. The climate is healthy, the mean temperature being in January 76° Fahr. and in September 79°; it occasionally reaches 90°.



Map of Trinidad.

The population, which numbered 109,638 in 1871, was returned in 1881 at 153,128 (83,716 males and 69,412 females), and in 1885 at 171,914. Of these about 100,000 are natives of the island, principally of African race, 50,000 are coolies introduced from India (an industrious and prosperous element of the population), while the remainder includes the English and other European settlers. About 2000 coolies are introduced annually. Many French families from other parts of the West Indies settled in Trinidad many years ago, and traces of this and of the Spanish occupation are obvious in laws, municipal arrangements, language, and population. The two principal towns are Port of Spain and San Fernando. The former (31,000 inhabitants), the capital of the island, is built on a gently inclined plain near the northeast angle of the Gulf of Paria, and is a fine and safe port. In the town there are two cathedrals (the Roman Catholic and the Anglican), and outside it a botanical garden. San Fernando, about 30 miles southward, with a population of 7000, is an important shipping place.

Of the total area about 300,000 acres are cultivated. The principal productions of the island are sugar and cocoa; coffee is also becoming important. Trinidad has suffered much from the effect of foreign state bounties, especially

---

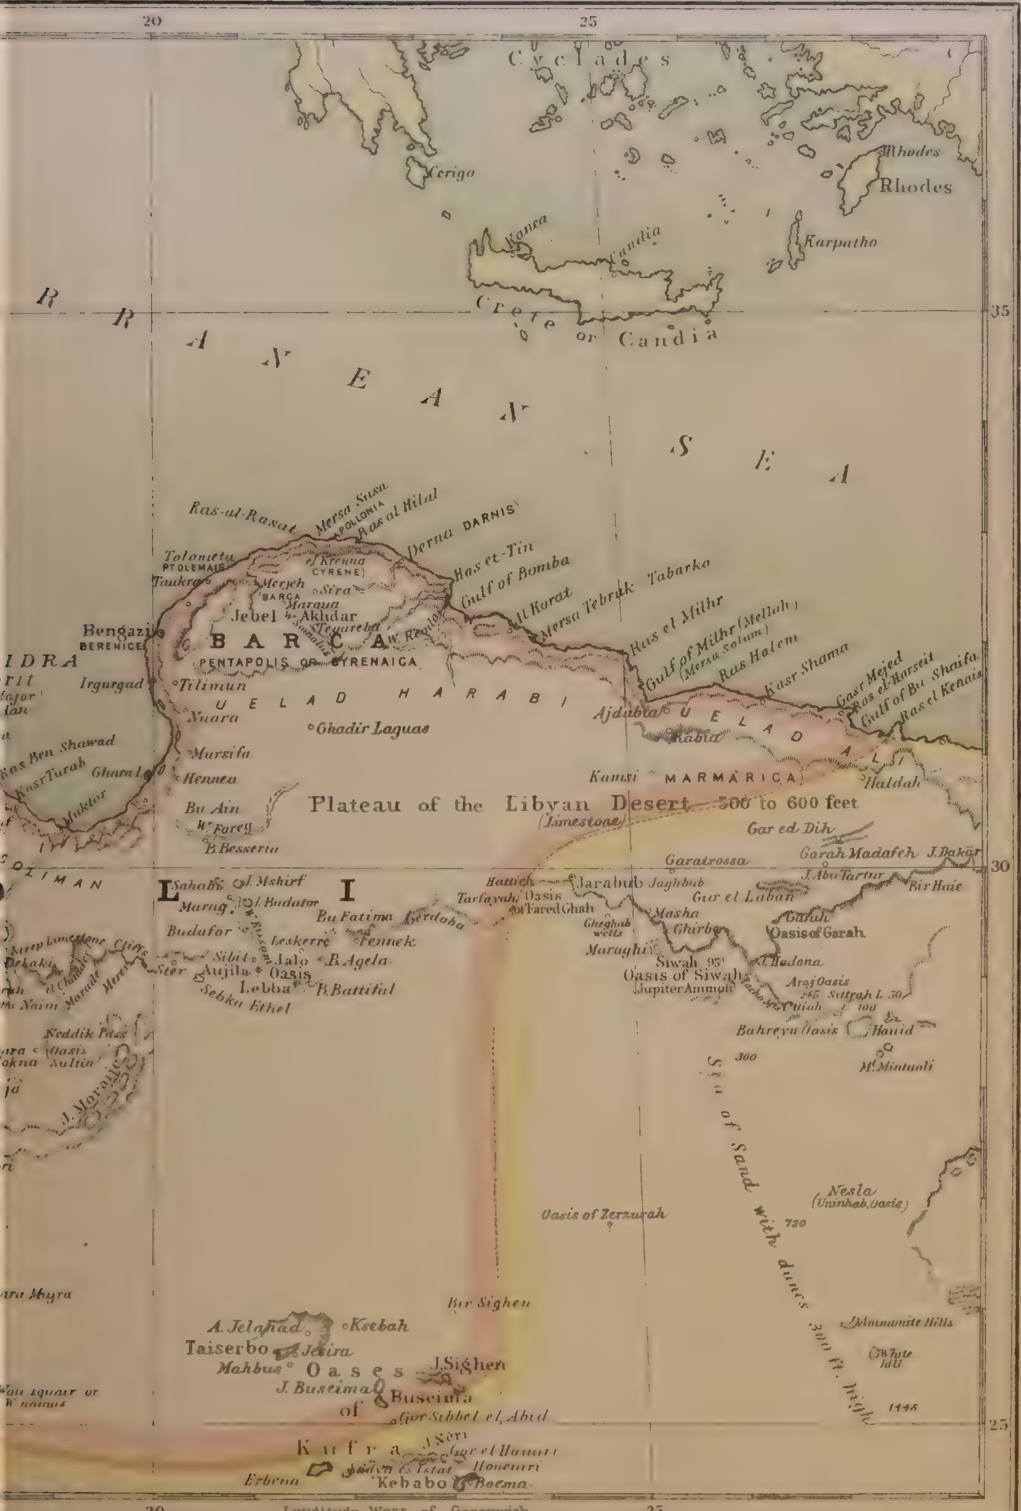
PLATE V.



A NINTH EDITION.

the export premiums of Germany and France. The sugar production in 1871 was 53,000 tons, in 1881 44,000 tons, and in 1885 64,000 tons. The principal exports in 1885 were—sugar, 64,000 tons (value £684,675 [$3,327,520.50]); rum, 72,525 galls. (£7878 [$38,287.08]); molasses, 2,416,761 galls. (£45,835 [$222,758.10]); cocoa, 14,904,840 lbs. (£421,974 [$2,050,795.64]); coffee, 20,270 lbs.; asphalt, 28,505 tons raw and 6731 tons boiled; cocoa-nuts, 9,645,700; bitters (Angostura and others) and liquors, 32,240 galls.; the total value was £2,246,664 [$10,918,887.04], including £707,421 [$3,338,066.06] specie and bullion. The imports in 1885 (including bullion and specie) were £2,241,478 [$10,893,583.18]. Among the principal items are cottons, linens, woollens, and textiles generally (largely from the United Kingdom), £235,895 [$1,146,449.70]; fish, flour, and provisions (principally from the United States), £270,000 [$1,312,200]; lumber (from Canada), £43,075 [$209,344.50]; rice (half from India), £113,940 [$553,748.40]; hardware and machinery (principally from the United Kingdom), £116,894 [$568,104.84]; gold (principally from Venezuela in transit), £651,398 [$3,165,794.28]. The sailing vessels entering Trinidad ports in 1885 had a burden of 150,219 tons, the steamers a burden of 385,950 tons. The total public revenue in 1885 was £429,307 [$2,086.432.02], of which £240,444 [$1,168,557.84] was for customs and excise. The total expenditure was £443,920 [$2,157,451.20]. There are 145 public schools, of which 61 are Government and 61 assisted, with a total attendance of 13,282 scholars. The principal towns are connected by railway lines.

Trinidad was discovered by Columbus on 31st July, 1498. It remained in Spanish possession (although its principal town, San José de Oruña, was burnt by Sir Walter Raleigh in 1595) until 1797, when a British expedition from Martinique caused its capitulation, and it was finally ceded to Great Britain in 1802 by the treaty of Amiens. Its real starting-point as a productive country was in 1781, when the Madrid Government began to attract foreign immigrants. Trinidad is still strictly a crown colony of Great Britain. The legislative council includes the governor as president, and six official and eight unofficial members, all appointed by the crown. During the labor crisis caused by emancipation and the subsequent equalization of the British duties on free and slave-grown sugar, the colony was greatly assisted by the skilful administration of Lord Harris, governor from 1846 to 1851.

See De Verteuil, *Trinidad; Colonial Office List;* Guppy, *Trinidad Almanac;* and *Government Geological Survey.*

TRINITARIANS (*Ordo Sanctæ Trinitatis et Captorum*), a religious order instituted about the year 1197 by Innocent III., at the instance of John de Matha (1160–1213) and Felix de Valois (*ob.* 1212), for the ransom of captives among the Moors and Saracens. The rule was the Augustinian, the dress white with a red and blue cross. De Matha was the first general and de Valois the first abbot of the mother house at Cerffroid near Meaux, where the idea of the institution had originated in a miraculous apparition. By 1200 as many as 200 Christians had been redeemed out of slavery in Morocco by the order, which accordingly spread rapidly not only in France but also in Italy and Spain. Further favored by Honorius III. and Clement IV., the Trinitarians spread into Portugal, the United Kingdom, Bohemia, Saxony, Poland, and Hungary, and even into America. In the 18th century they had in all about 300 houses; but the order is now almost extinct. About the middle of the 17th century it was stated that in France the "redemptions" up to that time had numbered 246, the number of prisoners bought off being 30,720; for Castile and Leon the corresponding figures were 362 and 11,809. The order is sometimes spoken of as the "ordo asinorum" from the circumstance that originally its members were not permitted to use any other beast of burden. In France they were known as Mathurins from the chapel of St. Mathurin or Mathelin in Paris, which belonged to them.

TRINITY HOUSE, CORPORATION OF. An association of English mariners, which originally had its headquarters at Deptford in Kent. In its first charter, received from Henry VIII. in 1514, it was described as the "guild or fraternity of the most glorious and undividable Trinity and of St. Clement," the court being made to consist of master, wardens, and assistants, numbering thirteen in all and elected annually by the brethren. Deptford having been made a royal dockyard by Henry VIII., and being the station where outgoing ships were supplied with pilots, the corporation rapidly developed its influence and usefulness. By Henry VIII. it was entrusted with the direction of the new naval dockyard. From Elizabeth, who conferred on it a grant of arms in 1573, it received authority to erect beacons and other marks for the guidance of navigators along the coasts of England. It was also recognized as the authority in the construction of vessels for the royal navy. In 1604 a select class was constituted called elder brethren, the other members being called younger brethren. By the charter of 1609 the sole management of affairs was conferred on the elder brethren, the younger brethren, however, having a vote in the election of master and wardens. The practical duties of the fraternity are discharged by the acting elder brethren, who have all had experience in naval affairs; but as a mark of honor persons of rank and eminence are admitted as elder brethren and now form a large proportion of the members. In 1647 the corporation was dissolved by parliament, but it was reconstructed in 1660, and the charter was renewed by James II. in 1685. A new hall and almshouses were erected at Deptford in 1765; but for some time the offices of the corporation had been transferred to London, and in 1798 their headquarters were removed to Trinity House, Tower Hill, built from the designs of Wyatt. By an Act of 1836 they received powers to purchase from the crown, as well as from private proprietors, all interests in coast lights. For the maintenance of lights, buoys, etc., they had power to raise money by tolls, the surplus being devoted to the relief of old and indigent mariners or their near relatives. In 1853 the control of the funds collected by the corporation was transferred to the Board of Trade, and the money over which the brethren were allowed independent control was ultimately reduced to the private income derived from funded and trust property. Their practical duties in the erection of lighthouses, buoys, and beacons remain as important as ever, the number of persons employed in their service being over 800. They also examine navigating lieutenants in the royal navy, and act as nautical advisers in the High Court of Admiralty.

TRINITY SUNDAY, which immediately follows Whitsunday, was in the older liturgies regarded merely as the "Octave" of Pentecost. The habit of keeping it as a distinct festival seems to have sprung up about the 11th century. According to Gervase of Canterbury, it was Thomas Becket who introduced it into England in 1162. The universal observance of it was established by Pope John XXII. in 1334.

TRIPOLI, a North African state, bounded by the Mediterranean on the north, by the desert of Barca (or Libyan Desert), which separates it from Egypt, on the east, by the Sahara and Fezzan on the southeast, south, and southwest, and by Tunis on the northwest. The country is made up of a strip of fertile soil adjacent to the sea, with vast sandy plains and parallel chains of rocky mountains, which finally join the Atlas range near Kairwán in Tunis. It is naturally divided into five parts, viz., Tripoli proper, to the northeast of which is the plateau of Barca and Jebel al-Akhdar, to the south the oasis of Fezzan, to the southeast that of Aujala, and to the southwest that of Ghadámes.[1] It is very badly watered: the rivers are small and the desert wells and watering places are often dry. As regards the coast, it is extremely difficult to fix the exact border between Egypt and Tripoli. The seaboard of the Libyan Desert is so little known to Europeans that the spacious harbors of Tebruk (Ta-

Plate V.

---

[1] Concerning the last-named districts full information can be found in *Sahara und Sudan* (Berlin, 1879–81) by Dr. Nachtigal, who continued the explorations of Southern Tripoli commenced by Barth and Rohlfs. Consult also *Narrative of Travels and Discoveries in Northern and Central Africa*, by Denham, Clapperton, and Oudney, London, 1826.

braca and Ṭabarḳa) and Bomba (Bombæa) have almost escaped notice. The land bordering the sea to the west of Cape Rás al-Tín does not partake of the sterile character of the wastes of Barca. The district of Jebel al-Akhḍar ("the Green Mountain"), which intervenes between Rás al-Tín and Bengházi, abounds in wood, water, and other resources; but its ports are scarcely worthy of the name, except Derna (Darnis), where vessels from Alexandria call to embark honey, wool, and wax. From Mersá Suza (Apollonia, later Sozusa), now a mere boat cove, but once a powerful city of Cyrenaica, to Bengházi the coast abounds in extensive ruins. Bengházi itself, on the Bay of Sidra (Syrtis Major), is an insignificant fortified town trading in cattle and other produce. The principal products of the country are corn, barley, olives, saffron, figs, and dates,—these last being perhaps the finest in the whole of North Africa. Fruit also is abundant in certain parts, and so are many kinds of vegetables. The horses and mules, though small, are capable of much hard work. The native tissues and pottery are almost as good as those of Tunis. Great quantities of castor oil come from Tadjura. In consequence of recent events in Tunis, Tripoli has become the last surviving centre of the caravan trade to Northern Africa. It is at least 250 miles nearer the great marts of the interior than either Tunis or Algiers. A large proportion of the commerce of Tripoli is in the hands of British merchants or dealers in British goods, who send cloth, cutlery, and cotton fabrics southwards and receive in return esparto grass, ivory, and ostrich feathers. The sirocco blows with great force at times during the autumn, and the heat is as a rule much greater than in Tunis. The climate is very variable; cold nights often succeed warm days; storms are of frequent occurrence; and rain is at times wanting for many months. In addition to the capitol TRIPOLI (see below), called Tarábulus al-Gharb to distinguish it from the town of the same name in Syria, the only important places are Murzuk and Ghadámes in the interior and Bengházi (Berenice) on the coast. The population of the country consists of Moors, Arabs, Kabyles, Kuluglis (descendants of Turkish fathers and Moorish mothers), Turks, Jews, Europeans, and Negroes. Nothing like a census has ever been attempted, and the number of inhabitants is purely a matter of conjecture. In the interior the population is very scattered, and it is not probable that the total exceeds from 800,000 to a million. The Europeans (2500 or 3000) on the coast are nearly all Maltese. There is a Jewish colony of about 4000 in the capital, and the trade is almost entirely in their hands and in those of the Maltese[1].

Since 1835 Tripoli has lost the semi-independent character of a regency which it formerly enjoyed in common with Tunis, and has become a vilayet or outlying province of the Turkish empire. For administrative purposes it is divided into five districts, which are again subdivided into twenty-five cantons, the former being governed by motasarrifs and the latter by caimacams. Each village has its sheikh, who is assisted by a sort of municipal council. Since the invasion of Tunis by the French, the Turkish garrison of Tripoli has been considerably reinforced, and many new fortifications are partially erected on the coast. The chief judge or *cadi* is nominated by the Porte; the *muftis* are subject to his authority. There are also a criminal court and a commercial tribunal. The taxes are collected by a receiver-general, also nominated from Constantinople, and they press very heavily on all classes of the inhabitants. The principal sources of revenue are the usual Mohammedan taxes. The constant succession of Turkish governors, each of whom invariably follows a different policy from that of his predecessor, has been fatal to the material progress of the country. There are few elementary schools in the capital, and instruction in the interior is entirely limited to the Koran.

History.—After falling successively into the hands of the Phœnicians, Romans (a four-sided triumphal arch, erected in honor of Aurelius Antoninus and Aurelius Pius, still stands near the Marina gate), Vandals, and Greeks, Tripoli was finally conquered by the Arabs twelve centuries ago, and has remained a Moslem state ever since. In 1510 Ferdinand the Catholic of Spain took it, and thirteen years later it was given to the Knights of St. John, who were expelled in 1553 by the Turkish corsairs Dragut and Sinan. Dragut, who afterwards fell in Malta, lies buried in a much venerated *ḳubba* close to one of the mosques. After his decease the connection between Tripoli and Constantinople seems to have been considerably weakened. But the Tripolitan pirates soon became the terror and scourge of the Mediterranean; half the states of Europe seem at some time or other to have sent their fleets to bombard the capital. In 1714, when Ḥosain ibn 'Alí founded the present line of the beys of Tunis,[2] Ahmed Pasha Caramanli achieved independence, and his descendants governed Tripoli until 1835. In that year the Turks took advantage of a civil war to reassert their authority, and since that date Tripoli has been governed by representatives of the Sultan.

The *khouan* (*ikhwán*) or semi-religious semi-political fraternities which exercise such considerable influence in Tunis, Algeria, and Morocco are perhaps still more powerful in Tripoli. The most remarkable is that of the *Senúsíya*, the centre of whose authority is Jaghbub or Jerabub, north-west of the oasis of Síwa. The sectaries of Senúsíya are found in all parts of North Africa, but exist in unusual force in Tripoli, and particularly in Ghadámes and Murzuk. A certain halo of romance surrounds the history of this powerful sect; but its chief has, up to the present time (1887), not played any conspicuous part in the affairs of the Soudan or in those of the North African littoral. Mohammed el-Senúsí came originally in 1830 from Mostaghánem in Algeria. He acquired a high reputation for sanctity at Fez in Morocco. After a visit to Mecca and the holy places he started a *záwiya* or convent-college at Alexandria, but, being excommunicated by the Sheikh al-Islam at Cairo, he fled across the Libyan Desert to the Jebel al-Akhḍar near Bengházi. He afterwards removed to Jaghbub, which has never been visited by any European traveller. Here he established his záwiya in the midst of palm-groves and soon gathered nearly a thousand followers. His austere doctrines are received with enthusiasm in the Moslem states of Northern and Central Africa. He established some one hundred sanctuaries in every considerable place between Morocco and Mecca, and appointed mukaddemín or lieutenants in nearly every part of Islam. Senúsí the elder died in 1860 and was succeeded by his son, who bore the title of Al-Mahdí. Under his rule the prosperity of the záwiya at Jerabub is said to have greatly increased. Pilgrims to Mecca from North Africa, as well as those coming from Bornou and the Saharan provinces, flock there to seek his blessing. He not only receives caravans of ivory and ostrich feathers from the different sultans of the interior, but cargoes of arms and ammunition often arrive for him at the almost unknown harbors of the coast. Rohlfs, Nachtigal, and Duveyrier found their passage barred by Senusian agents. It was confidently expected Senúsí would make some demonstration at the beginning of the 14th century of the Hijra (November, 1882). His followers were, however, doomed to disappointment. Most of the Tripolitan sheikhs are affiliated to the Senúsíya confraternity.

From an archæological point of view Tripoli possesses an interest equal to, if not greater than, that which attaches to Tunis. On this subject the fullest information is afforded by the book of the Beecheys, and in a less degree by that of Mr. Rae. The former is illustrated by numerous plans and engravings and still affords the safest guide to the antiquities of Tripoli. (A. M. B.)

TRIPOLI, the capital of the above country, is situated in 32° 53′ 40″ N. lat. and 13° 11′ 32″ E. long., on a promontory stretching out into the Mediterranean and forming a small bay. Its crenellated *enceinte* wall has the form of an irregular pentagon. A line of small half-ruined forts is supposed to protect one side of the harbor, and the castle of the governor the other. The desert almost touches the western side of the city, while on the east is the verdant oasis of Meshiga, where are still to be seen the tombs of the Caramanlian sultanas and the twelve-domed *marabout* of Sy Hamonda. In the town itself there are seven principal mosques, six of them possessing lofty minarets in the Turkish style. The streets are narrow, dirty, and unpaved; there is no European quarter properly so called: Tripoli is still a typical Moorish city. Its population numbers about 20,000.

---

[1] The best known English work on Tripoli is F. W. and H. W. Beechey's *Proceedings of the Expedition to Explore the Northern Coast of Africa from Tripoli Eastwards*, London, 1828. Admiral W. H. Smyth's *Mediterranean*, London, 1854, contains a description of the coast. See also Rae, *Country of the Moors*, London, 1877 and Broadley, *Tunis Past and Present*, London and Edinburgh, 1882.

[2] The *Letters* (London, 1819) of Richard Tully, who was consul at Tripoli from 1783 to 1793, throw a strange and vivid light on Tripolitan life during the 18th century.

TRIPOLI (*Ṭarábulus*), a town of Syria, capital of Liwā, on the river Ḳadīsha or Abū 'Alī, in 34° 26′ N. lat. and 35° 50′ E. long., is situated in a fertile maritime plain covered with orchards and dominated by a castle overhanging a gorge of the river, some parts of which are, perhaps, the work of the crusaders. The port (Al-Míná) is about two miles distant, on a small peninsula. The population is estimated at 17,000, with the port at 24,000 or a little more. Nearly half of these are Christians, the Maronites preponderating. There is a considerable export of silk cocoons and a native silk manufacture; the sponge fishery is a large industry; tobacco is exported; and soap is made from the olive oil of the district. There are eighteen churches, and several monasteries, nunneries, and large kháns.

The ancient Phœnician city which we known only by its Greek name of Tripolis was the seat in Persian times of the federal council of Sidon, Tyre, and Aradus, each of which cities had its separate quarter in the "triple town" (see vol. xviii. p. 822). In the second and first centuries B.C. it struck coins, on which it is designated a "holy and autonomous" city. These are succeeded by imperial coins ranging from 32 B.C. to 221 A.D. About 450, and again in 550, it was destroyed by earthquake. The Arabs took it in 638 after a prolonged siege, the inhabitants withdrawing by sea. It appears from Beládhorí (p. 127) that at this time the city still consisted of three fortified places. Mo'áwiya recruited the population by a colony of Jews and gave it fortifications and a garrison against the naval attacks of the Greeks, who, notwithstanding, retook it for a brief space in the time of Abdalmalik (Beládh., *ut sup.*). It was again taken by the Greeks in the war of 966–69 and was besieged by Basil II. in 995, after which date it was held by a garrison in the pay of the Fatimite caliphs of Egypt, who treated the city with favor and maintained in it a trading fleet. At this time, according to the description of Náṣiri Khosrau (ed. Schefer, p. 40 *sqq.*), who visited it in 1047, it lay on the peninsula of Al-Míná, bathed on three sides by the sea, and had about 20,000 inhabitants and important industries of sugar and paper-making. Of the great sea-walls and towers there are still imposing remains. From this date till it was taken by the crusaders, after a five years' siege, in 1109, the ruling family was that of 'Ammār, who founded a library of over 100,000 volumes. Under the crusaders Tripoli continued to flourish, exported glass to Venice, and had 4000 looms (Quatremère, *Hist. des Sultans Mamlouks*, ii. 103). In 1289 it was taken and destroyed by the sultan Ḳalaún of Egypt, and a new city was begun on the present site, which rapidly rose to importance (Ibn Baṭúṭa, i. 137). Its mediæval prosperity has obliterated most relics of remoter antiquity.

See Renan, *Mission de Phénicie*, p. 129 *sqq.*

TRIPOLITZA, officially Tripolis, a town of Greece, capital of the nomarchy of Arcadia, is situated in a plain 3000 feet above sea-level, 22 miles southwest of Argos. The name has reference to the three ancient cities of Mantinea, Pallantium, and Tegea, of which Tripolitza is the modern representative. Before the war of independence it was the capital of the Morea and the seat of a pasha, with about 20,000 inhabitants; but in 1821 it was taken and sacked by the insurgents, and in 1825 its ruin was completed by Ibrahim Pasha. The town has since been rebuilt, and now (1887) contains about 10,000 inhabitants.

TRISMEGISTUS. See Hermes Trismegistus.

TRISTAN. See Romance, vol. xx. p. 665 *sq.*

TRISTAN DA CUNHA, a group of three small volcanic islands, situated in the South Atlantic nearly midway between the Cape of Good Hope and the coast of South America, the summit of the largest being in 37° 5′ 50″ S. lat. and 12° 16′ 40″ W. long. They rise from the low submarine elevation which runs down the centre of the Atlantic and on which are likewise situated Ascension, St. Paul's Rocks, and the Azores; the average depth on this ridge is from 1600 to 1700 fathoms, while depths of 3000 fathoms are found on each side of it. The depth between the islands is in some places over 1000 fathoms. Tristan, the largest and northernmost island, is nearly circular in form, about 7 miles in diameter, with a volcanic cone in the centre (7640 feet). Precipitous cliffs, 1000 to 2000 feet in height, rise directly from the ocean on all sides, except on the northwest, where there is an irregular plain, 100 feet above the sea, and 2½ miles in length and ½ mile in breadth. The crater of the central cone is said to be filled with a fresh-water lake which never freezes. Inaccessible Island, the westernmost of the group, is about 20 miles from Tristan. It is quadrilateral in form, the sides being about 2 miles long. The highest point (1840 feet) is on the west side; all round there are perpendicular cliffs 1000 feet in height. At the base of these are in some places narrow fringes of beach a few feet above the sea-level. Nightingale Island, the smallest and most southern of the group, is 10 miles from Inaccessible Island. Its coasts, unlike those of the other two islands, are surrounded by low cliffs, from which there is a gentle slope up to two peaks, the one 1100 feet, the other 960 feet high. There are two small islets—Stoltenkoff (325 feet) and Middle (150 feet)—and several rocks adjacent to the coast. The rocks are feldspathic basalt, dolerite, augite-andesite, sideromelane, and paragonite; some specimens of the basalt have porphyritic augite. The caves in Nightingale Island indicate that it has been elevated several feet. On almost all sides the islands are surrounded by a broad belt of kelp, the gigantic southern seaweed (*Macrocystis pyrifera*), through which a boat may approach the rocky shores even in stormy weather. There is no good or safe anchorage. The beaches and lower lands are covered with a dense growth of tussock grass (*Spartina arundinacea*), 8 to 10 feet in height, which shelters millions of penguins (*Eudyptes chrysocoma*), which there form their rookeries. There is one small tree (*Phylica nitida*), which grows in detached patches on the lower grounds. Independently of introduced plants, fifty-five species have been collected in the group, twenty-nine being flowering plants and twenty-six ferns and lycopods. A majority of the species are characteristic of the present general flora of the south temperate zone rather than any particular part of it; botanically the group is generally classed with the islands of the Southern Ocean. A finch (*Nesospiza acunhæ*), a thrush (*Nesocichla eremita*), and a water hen (*Gallinula nesiotis*) are the only land birds—the first two being peculiar to the islands. In addition to the penguins numerous other sea birds nest on the islands, as petrels, albatrosses, terns, skuas, and prions. One or two land shells, a few spiders, several *Coleoptera*, a small lepidopter, and a few other insects are recorded, but no *Orthoptera* or *Hymenoptera*. The prevailing winds are westerly. December to March is the fine season. The climate is mild and on the whole healthy, the temperature averaging 68° Fahr. in summer, 55° in winter,—sometimes falling to 40°. Rain is frequent; hail and snow fall occasionally on the lower grounds. The sky is usually cloudy. The islands have a cold and barren appearance. The tide rises and falls about four feet.

The islands were discovered and named by the Portuguese in 1506. The Dutch described them in 1643. D'Etcheverri landed on them in the year 1767, when he gave Nightingale and Inaccessible Islands their names. Their exact geographical position was determined by Captain Denham in 1852, and the "Challenger" completed the exploration of the group in 1873. When first discovered the islands were uninhabited. Towards the end of the 18th and in the beginning of the 19th century several sealers resided on them for longer or shorter periods. In 1816 the islands were taken possession of by Great Britain. In 1817 the garrison was withdrawn, but Corporal William Glass, his wife and family, and two men were allowed to remain.[1]

---

[1] [The garrison was stationed on the island to keep a watch on Napoleon, then a prisoner at St. Helena, distant about 1300 miles, and was withdrawn after his death in 1821.—Am. Ed.]

This small colony received additions from time to time from shipwrecks, from whalers, and from the Cape of Good Hope. In 1826 there were 7 men and 2 women besides children. In 1873 there were 84 inhabitants, in 1886 97. They possess cattle, sheep, and geese. There are usually good potato crops. The settlement has always been on the flat stretch of land on the northwest of Tristan, and is called Edinburgh. Two Germans lived for several years on Inaccessible Island, but with this exception there have been no settlements either on this or on Nightingale Island.

TRITON. The genus *Triton* was constituted by Laurenti, in his *Synopsis Reptilium*, and the name was adopted by nearly all writers on *Amphibia*. In *Brit. Mus. Cat.: Batrachia Gradientia*, by G. A. Boulenger, the genus is expanded and called by the name *Molge*, which was used by Merrem in his *Tentamen Syst. Amphibia*, 1820. The genus belongs to the division *Mecodonta* of the family *Salamandrida* in Strauch's classification (see AMPHIBIA, vol. i. p. 667). The definition of *Molge* given by Boulenger, which closely agrees with that of Triton adopted by Strauch, is as follows. Tongue free along the sides, adherent or somewhat free posteriorly. Palatine teeth in two straight or slightly curved series. Fronto-squamosal arch present (except in *M. cristatus*), ligamentous or bony. Toes five. Tail compressed. In Bell's *British Reptiles*, 2d ed., 1849, four species were described as occurring in Britain. According to Boulenger, there are only three British species, *Molge cristata*, Boul. (Laurenti), *M. vulgaris*, Boul. (Linn.), and *M. palmata*, Boul. (Schneider). We give a short account of these under the names *Triton cristatus*, *T. vulgaris*, and *T. palmatus* respectively.

The name *Triton cristatus* for the first species has been used by a great number of authoritative writers on *Amphibia*, including Laurenti, Tschudi, Bonaparte, Duméril and Bibron, and Strauch, and also by Bell and Fleming among students of British fauna.[1] The diagnosis of *T. cristatus* is as follows: The males have a dorsal crest which is toothed; the fronto-squamosal arch is absent; the color of the ventral surface is orange with black spots. This species is commonly known as the great water-newt. The average length of the adult is 6 inches. The colors are most brilliant in the male, and more developed in the breeding-season—spring and summer—than in winter. The back is blackish or yellowish brown, with round black spots; the sides of the tail are white. The dorsal crest of the male is separated entirely from the tail crest, and both disappear in winter. The skin is covered with warty tubercles. There are no parotids; but glandular pores are present over the eyes and in a longitudinal series along each side. The species is pretty common in ponds and ditches in most parts of Britain, but more abundant in the south than in the north; in the neighborhood of London it is found in great numbers. Its food consists of aquatic insects and other small animals; in the spring it devours the young tadpoles of the frog with avidity, and occasionally it feeds on the smaller species, *T. vulgaris*. In winter it hibernates, either quitting the water and hiding under stones or remaining torpid at the bottom of the water. It breeds chiefly in May and June. As in all *Salamandrida*, a true copulation takes place and the fertilization of the ova is internal. The female deposits each egg separately in the fold of a leaf, which she bends by means of her hind feet; the adhesive slime surrounding the vitellus keeps the leaf folded. The tadpole when first hatched is much more fish-like in form than that of the frog, the body diminishing in thickness gradually to the end of the tail. A continuous median fin runs along the back from the head, round the end of the tail, along the ventral median line, to the region of the gills, thus extending, as in many fish larvæ, in front of the anus. The larva possesses three pairs of branched external gills, and in front of these a pair of processes by which it can adhere to fixed objects in the water. *T. cristatus* is abundant throughout Europe, ranging from Sweden and Russia southwards to Greece, and from Britain to the Caucasus.

The diagnosis of *T. vulgaris*, the *Lissotriton punctatus* of Bell, is: Males with a dorsal crest continuous with the caudal, and festooned; belly not brilliantly colored; back spotted. This species, often called the common or small newt, has a smooth skin, no glandular pores on the sides, but two patches on the head. It is as abundant in Britain as the former, or more so, but differs somewhat in habits, in autumn and winter being almost entirely terrestrial, and only living in water during the breeding season. Like the former species it is carnivorous. It is found in most parts of Britain, and throughout Europe, except in the south of France, Spain, and Portugal; it also extends into temperate Asia.

T. palmatus, Tschudi (Schneider), the *Lissotriton palmipes* of Bell, is thus distinguished: Male with dorsal crest, which is low with an even margin and continuous with the caudal; fronto-squamosal arch long; toes in male webbed. Other less distinctive features are that the back is flattened, with a raised line on each side, and the tail in the male truncate, terminating in a short slender filament. This species is not so common in Britain as the other two; it is widely distributed throughout Europe. It was first discovered in Britain in 1843.

Boulenger recognizes nineteen species of *Molge*, of which nine besides those found in Britain are European. Only two species occur in America. Strauch gives twenty species.

TRIUMPH, an honor awarded to generals in ancient Rome for decisive victories over foreign enemies; for victories in civil war or over rebels a triumph was not allowed. The power of granting a triumph rested with the senate; and it was a condition of granting it that the victorious general, on his return from the war, should not have entered the city until he entered it in triumph. Lucullus on his return from Asia waited outside of Rome three years for his triumph. The triumph consisted of a solemn procession, which, starting from the Campus Martius outside the city walls, passed through the city to the Capitol. Rome was *en fête*, the streets gay with garlands, the temples open. The procession was headed by the magistrates and senate, who were followed by trumpeters and then by the spoils, which included not only arms, standards, statues, etc., but also representations of battles, and of the towns, rivers, and mountains of the conquered country, models of fortresses, etc. Next came the victims destined for sacrifice, especially white oxen with gilded horns. They were followed by the prisoners who had not been sold as slaves but kept to grace the triumph; they were put to death when the procession reached the Capitol. The chariot which carried the victorious general (*triumphator*) was crowned with laurel and drawn by four horses. The general was attired like the Capitoline Jupiter in robes of purple and gold borrowed from the treasury of the god; in his right hand he held a laurel branch, in his left an ivory sceptre with an eagle at the point. Above his head the golden crown of Jupiter was held by a slave who reminded him in the midst of his glory that he was a mortal man. Last came the soldiers shouting *Io triumphe* and singing songs both of a laudatory and scurrilous kind. On reaching the temple of Jupiter on the Capitol, the general placed the laurel branch (in later times a palm branch) on the lap of the image of the god, and then offered the thank-offerings. A feast of the magistrates and senate, and sometimes of the soldiers and people, concluded the ceremony, which in earlier times lasted one day but in later times occupied several. A naval or maritime triumph was sometimes celebrated for victories at sea. Generals who were not allowed a regular triumph by the senate had a right to triumph at the temple of Jupiter Latiaris on the Alban Mount.

TRIVANDRUM, a town of India, capital of the native state of TRAVANCORE (*q.v.*), is situated in 8° 29′ 3″ N. lat. and 76° 59′ 9″ E. long., near the coast, not far from Cape Comorin. It is the residence of the maharajah, and contains an observatory and a museum, besides several other fine buildings. Commercially it is inferior in importance to Aleppi, the trade centre of the state. In 1881 it had a population of 37,652.

TROAD AND TROY. The Troad (ἡ Τρῳάς), or land of Troy, is the northwestern promontory of Asia Minor. The name "Troad" is never used by Homer,—who calls the land, like the city, Τροίη,—but is already known to Herod-

Geographical definition.

---

[1] The species of Triton are called in English efts, evets, or newts.

otus. The Troad is bounded on the north by the Hellespont and the westernmost part of the Propontis, on the west by the Ægean Sea, and on the south by the Gulf of Adramyttium. The eastern limit was variously defined by ancient writers. In the widest acceptation, the Troad was identified with the whole of western and southwestern Mysia, from the Æsepus, which flows into the Propontis a little west of Cyzicus, to the Caicus, which flows into the Ægean south of Atarneus. But the true eastern boundary is undoubtedly the range of Ida, which, starting from near the southeast angle of the Adramyttian Gulf, sends its northwestern spurs nearly to the coast of the Propontis, in the region west of the Æsepus and east of the Granicus. Taking Ida for the eastern limit, we have the definition which, as Strabo says, best corresponds with the actual usage of the name Troad. Ida is the key to the physical geography of the whole region; and it is the peculiar character which this mountain-system imparts to the land west of it that constitutes the real distinctness of the Troad from the rest of Mysia. Nature has here provided Asia Minor with an outwork against invaders from the northwest; and as in the dawn of Greek legend the Troad is the scene of the struggle between Agamemnon and Priam, so it was in the Troad that Alexander won the battle which opened a path for his further advance.

Natural divisions.

The length of the Troad from north to south—taking a straight line from the northwest point, Cape Sigeum (Yeni Shehr), to the southwest point, Cape Lectum (Babà-Calessi)—may be roughly given as forty miles. The breadth, from the middle point of the west coast to the main range of Ida, is not much greater. The whole central portion of this area is drained by the Mendere (the ancient Scamander), which rises in Ida and is by far the most important river of the Troad. The basin of the Mendere is divided by hills into two distinct parts, a southern and a northern plain. The southern—anciently called the Samonian plain—is the great central plain of the Troad, and takes its modern name from Bairamitch, the chief Turkish town, which is situated in the eastern part of it near Ida. It is of an elongated form, the extent from north to south being large in proportion to the average width, and is enclosed by hills which, especially towards the south, are low and undulating. From the north end of the plain of Bairamitch the Mendere winds in large curves through deep gorges in metamorphic rocks, and issues into the northern plain, stretching to the Hellespont. This is the plain of Troy, which has an average length of seven or eight miles from north to south, with a breadth of some two or three from east to west. The hills which enclose it on the south and east are quite low, and towards the east the acclivities are in places so gentle as to leave the limits of the plain somewhat indefinite. Next to the basin of the Mendere, with its two plains, the best-marked feature in the river-system of the Troad is the valley of the Touzla, the ancient Satniois. The Touzla rises in the western part of Mount Ida, south of the plain of Bairamitch, from which its valley is divided by hills; and, after flowing for many miles almost parallel with the south coast of the Troad, from which at Assus, it is less than a mile distant, it enters the Ægean about ten miles north of Cape Lectum. Three alluvial plains are comprised in its course. The easternmost of these, into which the river issues from rugged mountains of considerable height, is long and narrow. The next is the broad plain, which is overlooked by the lofty site of Assus, and which was a fertile source of supply to that city. The third is the plain at the embouchure of the river on the west coast. This was anciently called the Halesian (῾Αλήσιον) plain, partly from the maritime salt-works at Tragasæ, near the town of Hamaxitus, partly also from the hot salt-springs which exist at some distance from the sea, on the north side of the river, where large formations of rock-salt are also found. Maritime salt-works are still in operation at the mouth of the river, and its modern name (Touzla = salt) preserves the ancient association. A striking feature of the southern Troad is the high and narrow plateau which runs parallel with the Adramyttian Gulf from east to west, forming a southern barrier to the valley of the Touzla, and walling it off from a thin strip of seaboard. This plateau seems to have been formed by a volcanic upheaval which came late in the Tertiary period, and covered the limestone of the south coast with two successive flows of trachyte. The lofty crag of Assus, washed by the sea, is like a tower standing detached from this line of mountain-wall. The western coast is of a different character. North of the Touzla extends an undulating plain, narrow at first, but gradually widening. Much of it is covered with the valonia oak (*Quercus Ægilops*), one of the most valuable products of the Troad. Towards the middle of the west coast the adjacent ground becomes higher, with steep acclivities, which sometimes rise into peaks; and north of these, again, the seaboard subsides towards Cape Sigeum into rounded hills, mostly low.

Coasts.

Natural products.

The timber of the Troad is supplied chiefly by the pine-forests on the slopes of Mount Ida. But nearly all the plains and hills are more or less well wooded. Besides the valonia oak, the elm, willow, cypress, and tamarisk shrub abound. Lotus, galingale, and reeds are still plentiful, as in Homeric days, about the streams in the Trojan plain. The vine, too, is cultivated, the Turks making from it a kind of syrup and a preserve. In summer and autumn watermelons are among the abundant fruits. Cotton, wheat, and Indian corn are also grown. The Troad is, indeed, a country highly favored by nature—with its fertile plains and valleys, abundantly and continually irrigated from Ida, its numerous streams, its fine west seaboard, and the beauty of its scenery. Under a good government, it could not fail to be exceedingly prosperous. Under Turkish rule, the natural advantages of the land suffice to mitigate the poverty of the sparse population, but have scarcely any positive result.

Early history; Priam's kingdom.

In the Homeric legend, with which the story of the Troad begins, the people called the Troes are ruled by a king Priam, whose realm includes all that is bounded by "Lesbos, Phrygia, and the Hellespont" (*Il.*, xxiv. 544), *i.e.*, the whole "Troad," with some extension of it, beyond Ida, on the northwest. According to Homer, the Achæans under Agamemnon utterly and finally destroyed Troy, the capital of Priam, and overthrew his dynasty. But there is an Homeric prophecy that the rule over the Troes shall be continued by Æneas and his descendants. From the "Homeric" Hymn to Aphrodite, as well as from a passage in the 20th book of the *Iliad* (75–353)—a passage undoubtedly later than the bulk of the book—it is certain that in the seventh or sixth century B.C. a dynasty claiming descent from Æneas reigned in the Troad, though the extent of their sway is unknown. The Homeric tale of Troy is a poetic creation, for which the poet is the sole witness. The analogy of the French legends of Charlemagne warrants the supposition that an Achæan prince once held a position like that of Agamemnon. We may suppose that some memorable capture of a town in the Troad had been made by Greek warriors. But we cannot regard the *Iliad* in any closer or more exact sense as the historical document of a war. The geographical compactness of the Troad is itself an argument for the truth of the Homeric statement that it was once united under a strong king. How that kingdom was finally broken up is unknown. Thracian hordes, including the Treres, swept into Asia Minor from the northwest about the beginning of the seventh century B.C., and it is probable that, like the Gauls and Goths of later days, these fierce invaders made havoc in the Troad. The Ionian poet Callinus has recorded the terror which they caused further south.

Greek settlements.

A new period in the history of the Troad begins with the foundation of the Greek settlements. The earliest and most important of these were Æolic. Lesbos and Cyme in Æolis seem to have been the chief points from which the first Æolic colonists worked their way into the Troad. Commanding positions on the coast, such as Assus and Sigeum, would naturally be those first occupied; and some of them may have been in the hands of Æolians as early as the 10th century B.C. It appears from Herodotus (v. 95) that about 620 B.C. Athenians occupied Sigeum, and were resisted by Æolic colonists from Mytilene in Lesbos, who had already established themselves in that neighborhood. Struggles of this kind may help to account for the fact noticed by Strabo, that the earliest colonies had often migrated from one site in the Troad to another. Such changes of seat have been, he observes, frequent causes of confusion in the topography; and the fact has an important bearing on attempted identifications of the more obscure ancient sites.

Greek Ilium.

Among the Greek towns in the Troad, three stand out with especial prominence—Ilium in the north, Assus in the south, and Alexandria Troas in the west. The site of the Greek Ilium is marked by the low mound of Hissarlik ("place of fortresses") in the Trojan plain, about three miles from the Hellespont. The early Greek settlers in the Troad naturally loved to take Homeric names for their towns. The fact that Homer places the town of Dardania far inland, on the slopes of Ida, did not hinder the founders of the Æolic Dardanus from giving that name to their town on the shores of the Hellespont. The site of the historical Thymbra, again, cannot be reconciled with that of the Homeric Thymbra. Similarly, the choice of the name Ilion in no way justifies the assumption that the Greek settlers found that spot identified by tradition with the site of the town which Homer calls Ilios. It does not even warrant the hypothesis that they found a shrine of Athene Ilias existing there. For them, it would be enough that the sounding name could be safely appropriated,—the true site of Homeric Ilios being forgotten or disputed,—and that their town was at least in the neighborhood of the Homeric battlefields. The Greek Ilium may have been founded about 700 B.C. It is noticeable that no ancient writer suggests a later date than the time of Crœsus (*c.* 550 B.C.); and Strabo says that the establishment of the colony at Hissarlik—after previous occupation of a different site—took place "in the time of the Lydians" (ἐπὶ Λυδῶν). It would be reasonable to infer that the Greek Ilium preserved some well-marked traces of Lydian influence, perhaps in architecture or art, perhaps in manners or traditions. The traces of Lydian workmanship found in the excavations at Hissarlik are thus easily explained, without recourse to the shadowy hypothesis of a distinct Lydian settlement on the spot. When Xerxes visited the Trojan plain, he "went up to the Pergamon of Priam," and afterward sacrificed to the Ilian Athene (Herod., vii. 42). It is doubtful whether the "Pergamon" meant was at the Greek Ilium, or at another site (to be mentioned presently), Bunárbashi; strong reasons in favor of the latter have lately been adduced by Mr. George Nikolaides, in his *Ἰλιάδος Στρατηγικὴ Διασκευή*. In the 4th century Ilion is mentioned among the towns of the Troad which yielded to Dercyllidas (399 B.C.), and as captured by Charidemus (359 B.C.). It possessed walls, but was a petty place, of little strength. In 334 B.C. Alexander, on landing in the Troad, visited Ilium. In their temple of Athene the Ilians showed him arms which had served in the Trojan war, including the shield of Achilles. Either then, or after the battle of Granicus, Alexander directed that the town should be enlarged, and should have the rank of "city," with political independence, and exemption from tribute. The battle of Ipsus (301 B.C.) added northwestern Asia Minor to the dominions of Lysimachus, who executed the intentions of Alexander. He gave Ilium a wall 5 miles in circumference, incorporating with it some decayed towns of the neighborhood, and built a handsome temple of Athene. In the 3d century B.C. Ilium was the head of a federal league (κοινόν) of free Greek towns, which probably included the district from Lampsacus on the Hellespont to Gargara on the Adramyttian Gulf. Twice in that century Ilium was visited by Gauls. On the first occasion (278 B.C.) the Gauls, under Lutarius, sought to establish a stronghold at Ilium, but speedily abandoned it as being too weak for their purpose. Forty years later (238 B.C.) Gauls were brought over by Attalus I. to help him in his war against Achæus. After deserting his standard they proceeded to pillage the towns on the Hellespont, and finally besieged Ilium, from which, however, they were driven off by the troops of Alexandria Troas. At the beginning of the 2d century B.C. Ilium was in a state of decay. As Demetrius of Scepsis tells us, the houses "had not even roofs of tiles," but merely of thatch. Such a loss of prosperity is sufficiently explained by the incursions of the Gauls and the insecure state of the Troad during the latter part of the 3d century. The temple of the Ilian Athene, however, retained its prestige. In 192 B.C. Antiochus the Great visited it before sailing to the aid of the Ætolians. In 190 B.C., shortly before the battle of Magnesia, the Romans came into the Troad. At the moment when a Roman army was entering Asia, it was politic to recall the legend of Roman descent from Æneas. Lucius Scipio and the Ilians were alike eager to do so. He offered sacrifice to the Ilian Athene; and after the peace with Antiochus (189 B.C.) the Romans annexed Rhœteum and Gergis to Ilium, "not so much in reward of recent services, as in memory of the source from which their nation sprang." The later history of Ilium is little more than that of Roman benefits. A disaster befell the place in 85 B.C., when Fimbria took it, and left it in ruins; but Sulla presently caused it to be rebuilt. Augustus, while confirming its ancient privileges, gave it new territory. Caracalla (211–217 A.D.) visited Ilium, and like Alexander paid honors to the tomb of Achilles. The latest coins found on the site are those of Constantius II. (337–361). In the 4th century, as some rhetorical "Letters" of that age show, the Ilians still did a profitable trade in attracting tourists by their pseudo-Trojan memorials. After the 4th century the place is lost to view. But we find from Constantine Porphyrogenitus (911–959) that in his day it was one of the places in the Troad which gave names to bishoprics.

Assus.

While the Greek Ilium at Hissarlik owed its importance to a sham pretension, which amused sight-seers and occasionally served politicians, Assus, on the south coast, has an interest of a more genuine kind, and is, indeed, a better type of ancient town-life in the Troad. Its situation is one of the most magnificent in all the Greek lands. The seaward faces of the isolated and sea-washed rock on which Assus stood are carved to south and southwest into terraces. The natural cleavage of the trachyte into joint planes had already scarped out shelves which it was comparatively easy for human labor to shape; and so, high up on this cone of trachyte, the Greek town of Assus was built, with its colonnades, baths, theatre, its public walks and its monuments of the dead, mounting tier above tier, till the summit of the crag was crowned with a Doric temple of Athene. The view from the summit is not only very beautiful but also of great historical interest. In front is Lesbos, one of whose towns, Methymna, is said to have sent forth the founders of Assus, as early, perhaps, as 1000 or 900 B.C. The whole south coast-line of the Troad is seen, and in the southeast the ancient territory of Pergamum, from whose masters the possession of Assus passed to Rome by the bequest of Attalus III. (133 B.C.). The great heights of Ida rise in the east. Northward the Touzla is seen winding through its rich valley from a rocky defile in the east to the oak-forests in the western hills. This valley was traversed by the road which St. Paul must have followed when he came overland from Alexandria Troas to Assus, leaving his fellow-travellers to proceed by sea. The northwest gateway of Assus, to which this road led, is still flanked by two massive towers, of Hellenic work, and of an age which leaves no doubt that they are the same between which St. Paul entered the town. On the shore below, the ancient mole at which he embarked for Mytilene with his companions can still be traced by large blocks under the clear water. Assus affords the only harbor on the 50 miles of coast between Cape Lectum and the east end of the Adramyttian Gulf; hence it must always have been the chief shipping-place for the exports of the southern Troad. Too much off the highways to become a centre of import trade, it was thus destined to be a commercial town, content with a modest provincial prosperity. The great natural strength of the site protected it against petty assailants; but, like other towns in that region, it has known many masters,—Lydians, Persians, the kings of Pergamum, Romans, and Ottoman Turks. From the Persian wars to about 350 B.C. Assus enjoyed at least partial independence. It was about 348–345 B.C. that Aristotle spent three years at Assus with Hermeas, an ex-slave who had succeeded his former master Eubulus as despot of Assus and Atarneus. Aristotle has left some verses from an invocation to Arete (Virtue), commemorating the worth of Hermeas, who had been seized by Persian treachery and put to death. Under its Turkish name of Beihram, Assus[1] is still the commercial port of the southern Troad, being the place to which loads of valonia (acorn-cups for tanning) are conveyed by camels from all parts of the country. The recent excavations at Assus, conducted by explorers representing the Archæological Institute of America, have yielded results far more valuable for the history of Greek art and architecture than any excavations yet undertaken in the Troad. The sculptures form one of the most important links yet discovered between Oriental and early Greek art, especially in respect of the types of animals. The later Hellenic town-walls of Assus also well repay the new study which they have received. With their ramparts, towers, and posterns they form the finest and most instructive extant specimen of Greek military engineering. The director of the exploration, Mr. J. T. Clarke, published in 1882 an excellent report on the work so far as it had then been carried.

Alexandria Troas.

Alexandria Troas stood on the west coast at nearly its middle point, a little south of Tenedos. It was built by Antigonus, perhaps about 310 B.C., and was called by him Antigonia Troas. Early in the next century the name was changed by Lysimachus to Alexandria Troas, in honor of Alexander's memory. As the chief port of northwest Asia Minor, the place prospered greatly in Roman times, and the existing remains sufficiently attest its former importance. The site is now covered with valonia oaks; but the circuit of the old walls can be traced, and in several places they are fairly well preserved. They had a circumference of about six English miles, and were fortified with towers at regular intervals. Remains of some ancient buildings, including a bath and gymnasium, can be traced within this area. The harbor had two large basins, now almost choked with sand. A Roman colony was sent to the place, as Strabo mentions, in the reign of Augustus. The abridged name "Troas" (Acts xvi. 8) was probably the current one in later Roman times. The site is now called Eski Stambul.

Other ancient sites.

Many classical sites of less note in the Troad have been identified with more or less certainty. Neandria seems to be rightly fixed by Mr. F. Calvert at Mount Chigri, a hill not far from Alexandria Troas, remarkable for the fine view of the whole Troad which it commands. Cebrene has been conjecturally placed in the eastern part of the plain of Bairamitch, Palæscepsis being further east on the slopes of Ida, while the new Scepsis was near the site of Bairamitch itself. The evidence for this, however, is ambiguous. At the village of Kulaklee, a little south of the mouth of the Touzla, some Corinthian columns and other fragments mark the temple of Apollo Smintheus and (approximately) the site of the Homeric Chryse. Colonæ was also on the west coast, opposite Tenedos. Scamandria occupied the site of Eneh, in the middle of the plain of Bairamitch, and Cenchreæ was probably some distance north of it. The shrine of Palamedes, mentioned by ancient writers as existing at a town called Polymedium, has been discovered by Mr. J. T. Clarke on a site hitherto unvisited by any modern traveller, between Assus and Cape Lectum. It proves to have been a sacred enclosure (*temenos*) on the acropolis of the town; the statue of Palamedes stood on a rock at the middle of its southern edge. Another interesting discovery has been made by Mr. Clarke,—the existence of very ancient town walls on Gargarus, the highest peak of Ida.

Site of Homeric Troy.

The modern discussion as to the site of Homeric Troy may be considered as dating from Lechevalier's visits to the Troad in 1785–86. Homer describes Troy as "a great town," "with broad streets," and with a high acropolis, or "Pergamus," rising above it from which precipitous rocks descend abruptly to the plain beneath. These are the precipices over which the Trojans proposed to hurl the wooden horse, "when they had dragged it to the summit." Homer marks the character of the acropolis by the epithets "lofty," windy," and more forcibly still by "beetling." One site in the Trojan plain, and one only, satisfies this most essential condition. It is the hill at its southern edge called the Bali Dagh, above the village of Bunárbashi. It has a height of about 400 feet, with sheer precipices descending on the south and southwest to the valley of the Scamander (Mendere). Remains found upon it—though it has never yet been thoroughly explored —show it to have been the site of an ancient city. Homer describes two natural springs as rising a little to the northwest of Homeric Troy. A little to the northwest of Bunárbashi these springs still exist. "This pair of rivulets are the immutable mark of nature by which the height towering above is recognized as the citadel of Ilium" (E. Curtius).

Rejection of Ilian claims.

The low mound of Hissarlik—the site of the Greek Ilium—stands only 112 feet above the level of the open plain in which it is situated. To call it "beetling" (ὀφρυόεσσα) would have been a travesty of poetical license on which no poet could have ventured, and to describe it as "lofty" or "windy" would have been not less strange. There are no natural springs near it, such as Homer mentions. The Æolic settlers, having called the place Ilion, naturally persisted in maintaining its identity with Troy. Polemon, a native of the Greek Ilium, who lived about 200 B.C., declared that his fellow townsmen could show the very stone on which Palamedes had given lessons in the game of draughts. The only other ancient writer who is known to have admitted the Ilian claim is Hellanicus of Lesbos (*c.* 482–397 B.C.), who, as Strabo remarks, wished "to gratify the Ilians, as is his wont." Like the Ilians, Hellanicus was of Æolian origin; and in compiling the local

---

[1] The name Assus probably means "dwelling," "town" being connected with the Sanskrit *vas*, "to dwell," which appears in the Greek *astu*, and also in the ending of such names as Mylasa and Larissa, where in Greek the *s* is alternatively single or double —an ending which, as Fligier has shown, is found in old town names from India to Dacia. Homer supplies an example in his "steep Pedasus" on the Satniois, and it has been suggested by Mr. J. T. Clarke that Pedasus may have been identical in site with the later Assus.

By ancient criticism.

legends of various places he is known to have been wholly uncritical, merely repeating what was told to him as he had heard it. On the other hand, the claim of the Greek Ilium to stand on the site of Troy was decisively rejected by the general consent of those ancient writers who had any claim to critical authority. The orator Lycurgus (*c.* 332 B.C.) speaks of the site of Troy as desolate, and this at a moment when the recent visit of Alexander the Great to the Greek Ilium (334 B.C.) had drawn attention to the claim made by its inhabitants. Demetrius, a native of Scepsis in the Troad, who flourished about 160 B.C., wrote a book entitled Τρωϊκὸς Διάκοσμος ("The Marshalling of the Trojans"), an exhaustive commentary on the catalogue of the Trojan forces in the second book of the *Iliad.* Demetrius knew the topography of the Troad as thoroughly as he knew the text of Homer. The extant notices of his work, which had a great reputation in antiquity, warrant the belief that he was not only learned but acute. In the *Diacosmus*, which was the chief work of his life, he must have bestowed much thought on the question as to the site of Homeric Troy,—the central point of his subject. He pronounced decidedly, as we know from Strabo, against the claim of the Greek Ilium. It has been suggested that Demetrius rejected the Ilian claim because, as a native of Scepsis, he was jealous of Ilium,—a suggestion which is not only absurd in itself, since it assumes that such a motive would have induced Demetrius to mar his life's work, but also betrays ignorance of Strabo's text. Scepsis was not a possible claimant of the contested honor, since it was not in the plain of Troy but in the plain of Bairamitch; and further, Demetrius had already provided in another manner for the Homeric dignity of Scepsis by making it the royal seat of Æneas on the strength of its position relatively to Lyrnessus. The verdict of Demetrius against the Ilian claim was also the general verdict of the other ancient writers consulted by Strabo, as the latter's language shows. From the passage in which Strabo notices the various definitions of the Troad (xiii. § 4) it appears that among such writers were the following historians and geographers: Charon of Lampsacus (flor. 500 B.C.), Damastes of Sigeum (400 B.C.), Scylax of Caryanda (350 B.C.), Ephorus of Cyme (340 B.C.), Eudoxus of Cyzicus (130 B.C.). It is to such writers as these that Strabo refers when he indicates the general consent of his authorities. In favor of the claim of the Greek Ilium, on the other hand, there are only two literary witnesses, and these, as we have seen, are alike worthless. Equally valueless from a critical point of view is the fact that the Ilian claim was sometimes allowed by soldiers or statesmen who wished to utilize Trojan memories. They required an official Troy, and they cared not where they found it. Nothing could more curiously illustrate the extreme poverty of the case for the Greek Ilium than the fact that some of its advocates have been reduced to arguing as if Alexander and Lucius Scipio, when they led their armies through the Troad, had been conducting archæological excursions, and as if their acquiescence in a convenient local myth had the weight of independent critical testimonies.

By modern.

In negativing the Ilian claim the conclusion of ancient criticism has been confirmed by a great preponderance of modern opinion. Since Lechevalier visited the Troad in 1785–86 an overwhelming majority of competent judges have favored his belief that the Bali Dagh above Bunárbashi was the Pergamus of the Homeric poet's conception. Before Leake's visit this opinion had been expressed by Choiseul-Gouffier, Morritt, Hawkins, Gell, and Hamilton. Leake spoke with a decision which derives additional weight from the habitual sobriety of his acute judgment, and from the care with which, in this case, he had examined the alleged objections to the view which he finally adopted. He remarks that no one accustomed to observe the sites of ancient Greek towns could fail to fix on Bunárbashi "for the site of the chief place of the surrounding country." So Mr. Tozer, in his *Highlands of Turkey*, says: "A person accustomed to observe the situation of Hellenic cities would at once fix on this as far more likely to have recommended itself to the old inhabitants of the country than any other in the neighborhood." Count von Moltke has expressed the same opinion, that "he knew no other site in the Trojan plain for a chief town of ancient time." Another supporter of Bunárbashi is Forchhammer. Another is Kiepert. The opinion of Ernst Curtius has been already cited. But space precludes more names; it is enough to say that the correspondence of the Bali Dagh with the Homeric Pergamus—a correspondence absolutely unique in the Trojan plain—has been recognized with virtual unanimity by modern travellers who have patiently inspected the scenery of the *Iliad*, having competent knowledge, and being free from bias in favor of a theory formed before their visit. Partial excavations on the summit of the Bali Dagh have been more than once undertaken, with the result of discovering ancient walls. Pottery, too, has been found there, part of which is allowed on all hands to be probably as old, at least, as 900 B.C. But the Bali Dagh has never yet been explored with any approach to thoroughness.

The remains at Hissarlik.

The result of the excavations conducted by Dr. Schliemann on the mound of Hissarlik has been to lay bare the remains of the Greek Ilium, and also, below these, some prehistoric remains of a rude and poor kind. In *Troy*, his first book on the subject, the explorer held that the remains of the Greek Ilium ceased at a depth of 6 feet below the surface, and that all the other remains, down to 52½ feet, were prehistoric. He distinguished the latter into five groups, representing five prehistoric "cities" which had succeeded each other on the site; and in his second work, *Ilios*, he added to these a sixth prehistoric city, on the strength of some scanty vestiges of supposed Lydian workmanship, found at a depth of 6½ feet. In both books, Homeric Troy was identified with the third prehistoric city from the bottom, which was supposed to have been destroyed, though not totally, by fire. Professor Jebb was the first to show (1) that the lines of demarcation between the alleged prehistoric strata, as drawn in *Ilios*, could not be accurate, and (2) that, if any part of the prehistoric remains could be supposed to represent Homeric Troy, it must be that part which Dr. Schliemann had called the second city from the bottom, and the destruction of which by fire appeared to have been total. In 1882 the architects employed by Dr. Schliemann proved that the stratification given in *Ilios* had in fact been incorrect. The errors, too, affected precisely that region of the deposit which was most important to the Trojan hypothesis, viz., the lower strata. In Dr. Schliemann's third volume, *Troja*, these errors were admitted; and Troy was now identified no longer with the third city, but with the second, of which the supposed area was now enlarged. Another fact to which the English critic had drawn attention was that the remains of the Greek Ilium must extend to a considerably greater depth than 6 feet below the surface. Further examination confirmed this view also. It showed that the remains on the mound at Hissarlik belong to the following periods or groups. (1) At the top, the remains of the Greek Ilium as it existed in the Roman age, *i.e.*, as rebuilt after its destruction by Fimbria in 85 B.C. (2) A city which, like the former, extended beyond the mound of Hissarlik (its acropolis) over the adjacent plain. This corresponds with the Greek Ilium of the Macedonian age, as embellished and enlarged by Lysimachus, *c.* 300 B.C. (3) A smaller city, probably confined to the mound. Here we may recognize the Greek Ilium as it existed before the Macedonian age. It was a small and poor place, as appears from the known incidents of its history in the 5th and 4th centuries B.C., owing its chief importance to the shrine of Athene Ilias. (4) A petty town or village, confined to the mound, and poorly built. The evidence of architecture fails to decide whether it was Hellenic or not; if Hellenic, it might represent the primitive settlement of the Æolic colonists, perhaps *c.* 700 B.C. It was a small house in this village that Dr. Schliemann at first identified with Priam's palace. The ground-plan shows four rooms, of which the largest measured 24 feet 4 inches by 12 feet. (5) A large town, to which the mound was only acropolis, and which extended to some distance south and southeast over the plain. These remains are unquestionably prehistoric. (6) A few remains of a small settlement which, if indeed distinct from No. 5, preceded it. The reason for distinguishing 6 from 5 is that some of the acropolis buildings of 5 are above those of 6, and seem to have been built on carefully levelled ground. Apart from architectural evidence, objects found in the excavations prove that the remains of the historical age extend much below 6 feet. One of these was a terra-cotta disk, stamped with the head of a warrior, in an advanced style of workmanship, found at 26 feet 3 inches below the surface (*Troy*, p. 294). Another is a terra-cotta ball, found at 26 feet, which cannot be older than *c.* 360 B.C. Then, at 20 feet, was found another terra-cotta, marked with the Greek letter P. A piece of ivory, belonging to a seven-stringed lyre, and therefore not older than *c.* 660 B.C., was found at 26 feet. Thus we have at Hissarlik the remains of the Greek Ilium in three successive phases,—Roman, Macedonian, and Æolic, and below these the remains of at least one prehistoric settlement, the age and origin of which are unknown.

Their relation to Homer.

Homeric conception of Troy.

We can no longer either prove or disprove that these prehistoric remains are those of a town which was once taken after a siege, and which originally gave rise to the legend of Troy. But most certainly it is not the "lofty" Troy of which the Homeric poet was thinking when he embodied the legend in the *Iliad*. The conception of Troy which dominates the *Iliad* is based on the site at Bunárbashi, and suits no other. The sole phrase in the epic which favors Hissarlik occurs in book xx. (216 *sq.*), where Dardania is said to have been built on the spurs of Ida, when Ilios "had not yet been built in the plain"; and this phrase occurs in a passage which, as the best recent critics agree, is one of the latest interpolations in the *Iliad*, having been composed after the Greek Ilium had actually arisen "in the plain." Its purpose was the same as that which appears in the Hymn to Aphrodite, viz., to glorify reputed descendants of Æneas, and it probably belongs to the same age, the 7th century B.C. The tactical data of the *Iliad*—those derived from the incidents of the war—cannot be treated with such rigor as if the poem were a military history. But Nikolaides has shown that they can at least be brought into general agreement with the site at Bunárbashi, while they are hopelessly incompatible with Hissarlik. The *Iliad* makes it clear that the general description of the Trojan plain was founded on accurate knowledge. At this day all the essential Homeric features can be recognized. And it is probable that the poet who created the Troy of the *Iliad* knew, personally or by description, a strong town on the Bali Dagh above Bunárbashi. The legend of the siege may or may not have arisen from an older town at Hissarlik, which had then disappeared. The poet might naturally place his Troy in a position like that of the existing strong city on the Bali Dagh, giving it a "beetling" acropolis and handsome buildings, while he also reproduced the general course of the rivers and that striking feature,—an indelible mark of the locality,—the natural springs at the foot of the hill, just beyond the city gates on the northwest. But, while he thus imagined his Troy in the general likeness of the town on the Bali Dagh, he would retain the privilege of a poet who was adorning an ancient legend, and whose theme was a city that had long ago vanished. Instead of feeling bound to observe a rigorous accuracy of local detail, he would rather feel impelled to avoid it; he would use his liberty to introduce some traits borrowed from other scenes known to him, or even from imagination. To this extent, and in this sense, his topography would be eclectic. Such a consideration might suffice to explain the fact, well known to those who have studied this question on the spot, that neither Bunárbashi nor any other one site can be harmonized with every detail of the poem. The recommendations of Bunárbashi are, first, that it satisfies the capital and essential conditions, while no other site does so, and secondly, that the particular difficulties which it leaves unsolved are relatively slight and few. This character of Homeric topography becomes still easier to understand, if, as most critics would now concede, our *Iliad* contains work of various hands and ages. Few questions, perhaps, of equal literary interest have been so much confused by inattention to the first conditions of the problem. The tale of Troy, as the *Iliad* gives it, is essentially a poetical creation; and we have no evidence other than the *Iliad*. That is, our sole data are (1) of the mythical class, (2) of inadequate precision, and (3) of uncertain origin. But they show a general knowledge of the ground; and the question is how far particular features of the ground can be recognized in the poem. It may be doubted whether the case admits of any solution more definite than that which has been indicated above.

Bibliography.—1. Works dealing with the Troad generally,—Strabo, bk. xiii. ch. 1. is the principal source for the ancient Troad. Of books by modern travellers in Asia Minor the following may be mentioned: Philip Barker Webb, in the Italian *Biblioteca Acerbi*, June and July, 1821, whose studies are better known through the French edition, *Topographie de la Troade*, 1844; W. M. Leake, *Journal of a Tour in Asia Minor*, London, 1824; P. de Tchihatchef, *Asie Mineure*, etc., Paris, 1853–69; R. Virchow, "Beiträge zur Landeskunde der Troas," in *Trans.* of Berlin Acad., 1879; H. F. Tozer, *The Highlands of Turkey*, 1869; H. Schliemann, *Reise der Troas in Mai*, 1881; Joseph T. Clarke, *Report on the Investigations at Assos*, Boston, U.S.A., and London, 1882, including "Notes on the Geology and Topography of the Troad" by J. S. Diller, and on "Bunárbashi," etc., by W. C. Lawton and C. H. Walker. J. T. Clarke's "Notes on Greek Shores," in the *Report* of the Archæological Institute of America for 1880, are also valuable.

2. For the question as to the site of Troy, see—Lechevalier, *Voyage de la Troade*, Paris, 1802; Gustave D'Eichthal, *Le Site de Troie selon Lechevalier*, etc., Paris, 1875; H. Schliemann's *Troy* (1875), *Ilios* (1880), *Troja* (1884), which contain many good plans and illustrations; E. Brentano, *Zur Lösung der troianischen Frage*, Heilbronn, 1881, and *Troia und Neu-Ilion*, *ibid.*, 1882; R. C. Jebb, "Schliemann's Ilios," in *Edinb. Rev.*, No. cccxiv., April, 1881; Id., "Homeric and Hellenic Ilium," in *Journ. of Hellenic Studies*, vol. ii. pp. 7–43, 1881; Id., "The Ruins at Hissarlik," *ibid.*, iii. 185–217, 1882; Id., "Homeric Troy," in *Fortnightly Review*, April, 1884; G. Nikolaides, *’Ιλιάδος Στρατηγικὴ Διασκευή*, Athens, 1883; P. W. Forchhammer, *Erklärung der Ilias, auf Grund der in der beigegebenen Original-Karte von Spratt and Forchhammer dargestellten topischen und physischen Eigenthümlichkeiten der Troischen Ebene*, Kiel, 1884; and W. J. Stillman, "Les Découvertes de Schliemann," in the journal *L'Homme*, Paris, October, 1884. (R. C. J.)

LEGEND OF TROY.

According to Greek legend, the oldest town in the Troad was that founded by Teucer, who was a son of the river Scamander and the nymph Idæa. Tzetzes says that the Scamander in question was the Scamander in Crete, and that Teucer was told by an oracle to settle wherever the "earth-born ones" attacked him. So when he and his company were attacked in the Troad by mice, which gnawed their bowstrings and the handles of their shields, he settled on the spot, thinking that the oracle was fulfilled. He called the town Sminthium and built a temple to Apollo Smintheus, the Cretan word for a mouse being *sminthus*. In his reign Dardanus, son of Zeus and the nymph Electra, daughter of Atlas, in consequence of a deluge, drifted from the island of Samothrace on a raft or a skin bag to the coast of the Troad, where, having received a portion of land from Teucer and married his daughter Batea, he founded the city of Dardania or Dardanus on high ground at the foot of Mount Ida. On the death of Teucer, Dardanus succeeded to the kingdom and called the whole land Dardania after himself. He begat Erichthonius, who begat a son Tros by Astyoche, daughter of Simois. On succeeding to the throne, Tros called the country Troy and the people Trojans. By Callirrhoe, daughter of Scamander, he had three sons,—Ilus, Assaracus, and Ganymede. From Ilus and Assaracus sprang two separate lines of the royal house,—the one being Ilus, Laomedon, Priam, Hector; the other Assaracus, Capys, Anchises, Æneas. Ilus went to Phrygia, where, being victorious in wrestling, he received as a prize from the king of Phrygia a spotted cow, with an injunction to follow her and found a city wherever she lay down. The cow lay down on the hill of the Phrygian Até; and here accordingly Ilus founded the city of Ilios. It is stated that Dardania, Troy, and Ilios became one city. Desiring a sign at the foundation of Ilios, Ilus prayed to Zeus and as an answer he found lying before his tent the Palladium, a wooden statue of Pallas, three cubits high, with her feet joined, a spear in her right hand, and a distaff and spindle in her left. Ilus built a temple for the image and worshipped it. By Eurydice, daughter of Adrastus, he had a son Laomedon. Laomedon married Strymo, daughter of Scamander, or Placia, daughter of Atreus or of Leucippus. It was in his reign that Poseidon and Apollo, or Poseidon alone, built the walls of Troy. In his reign also Hercules besieged and took the city, slaying Laomedon and his children, except one daughter Hesione and one son Podarces. The life of Podarces was granted at the request of Hesione; but Hercules stipulated that Podarces must first be a slave and then be redeemed by Hesione; she gave her veil for him; hence his name of Priam (from *priasthai* to buy). Priam married first Arisbe and afterwards Hecuba and had fifty sons and twelve daughters. Among the sons were Hector and Paris, and among the daughters Polyxena and Cassandra. To recover Helen, whom Paris carried off from Sparta, the Greeks under Agamemnon besieged Troy for ten years. (See ACHILLES, AGAMEMNON, AJAX, HECTOR, HELEN, PARIS.) At last they contrived a wooden horse, in whose hollow belly many of the Greek heroes hid themselves. Their army and fleet then withdrew to Tenedos, feigning to have raised the siege. The Trojans conveyed the wooden horse into Troy; in the night the Greeks stole out, opened the gates to their returning friends, and Troy was taken.

See Homer, *Il.*, vii. 452 *sq.*, xx. 215 *sq.*, xxi. 446 *sq.*; Apollodorus, ii. 6, 4, iii. 12; Diodorus, iv. 75, v. 48; Tzetzes, *Schol. on Lycophron*, 29, 72, 1302; Conon, *Narrat.*, 21; Dionysius Halicarn., *Antiq. Rom.*, i. 68 *sq.* The Iliad deals with a period of fifty-one days in the tenth year of the war. For the wooden horse, see Homer, *Od.*, iv. 271 *sq.* Virgil, *Æn.*, ii. 13 *sq.*

TROGLODYTES (τρωγλοδύται), a Greek word meaning "cave-dwellers." Caves have been widely used as human habitations both in prehistoric and in historic times (see CAVE), and ancient writers speak of Troglodytes in various parts of the world, as in Mœsia near the lower Danube (Strabo, vii. 5, p. 318), in the Caucasus (Id., xi. 5, p. 506), but especially in various parts of Africa from Libya (Id., xvii. 3, p. 828, to the Red Sea. Herodotus (iv. 183) tells of a race of Troglodyte Ethiopians in inner Africa, very swift of foot, living on lizards and creeping things, and with a speech like the screech of an owl. The Garamantes hunted them for slaves. It has been supposed that these Troglodytes may be Tibbus, who still in part are cave-dwellers. Aristotle also (*Hist. An.*, vii. 12) speaks of a dwarfish race of Troglodytes on the upper course of the Nile, who possessed horses and were in his opinion the Pygmies of fable. But the best known of these African cave-dwellers were the inhabitants of the "Troglodyte country" on the coast of the Red Sea, who reached as far north as the Greek port of Berenice, and of whose strange and savage customs an interesting account has been preserved by Diodorus and Photius from Agatharchides.[1] They were a pastoral people, living entirely on the flesh of their herds, or, in the season of fresh pasture, on mingled milk and blood. But they killed only old or sick cattle (as indeed they killed old men who could no longer follow the flock), and the butchers were called "unclean;" nay, they gave the name of parent to no man, but only to the cattle of which they had their subsistence. This last point seems to be a confused indication of totemism. They went almost naked; the women wore necklaces of shells as amulets. Marriage was unknown, except among the chiefs,—a fact which agrees with the prevalence of female kinship in these regions in much later times. They practiced circumcision or a mutilation of a more serious kind. The whole account, much of which must be here passed by, is one of the most curious pictures of savage life in ancient literature.

The Biblical Horim, who inhabited Mount Seir before the Edomites, bore a name which means cave-dwellers, and may probably have been a kindred people to the Troglodytes on the other side of the Red Sea. Jerome, on Obadiah 5, speaks of this region as containing many cave-dwellings, and such habitations are still sometimes used on the borders of the Syro-Arabian desert.

TROGON, a word apparently first used as English[2] by Shaw (*Mus. Leverianum*, p. 177) in 1792, and now for many years accepted as the general name of certain birds forming the Family *Trogonidæ* of modern ornithology, the species *Trogon curucui* of Linnæus being its type. But, since doubts exist as to whether this is that which was subsequently called by Vieillot *T. collaris* or the *T. melanurus* of Swainson, though evidence is in favor of the former (*cf.* Cabanis, *Mus. Heineanum*, iv. p. 177, and Finsch, *Proc. Zool. Society*, 1870, p. 559), several recent writers have dropped the Linnæan specific term.

The Trogons are birds of moderate size: the smallest is hardly bigger than a Thrush and the largest less bulky than a Crow. In most of them the bill is very wide at the gape, which is invariably beset by recurved bristles. They seize most of their food, whether caterpillars or fruits, on the wing, though their alar power is not exceptionally great, their flight being described as short, rapid, and spasmodic. Their feet are weak and of a unique structure, the second toe, which in most birds is the inner anterior one, being reverted, and thus the Trogons stand alone, since in all other birds that have two toes before and two behind it is the outer toe that is turned backward. The plumage is very remarkable and characteristic. There is not a species which has not beauty beyond most birds, and the glory of the group culminates in the QUEZAL (*q.v.*). But in others golden green and steely blue, rich crimson[3] and tender pink, yellow varying from primrose to amber, vie with one another in vivid coloration, or contrasted, as happens in many species, with a warm tawny or a sombre slaty gray—to say nothing of the delicate freckling of black and white, as minute as the markings of a moth's wing—the whole set off by bands of white, producing an effect hardly equalled in any group. It is impossible within brief space to describe its glowing tints; but the plumage is further remarkable for the large size of its coutour-feathers, which are extremely soft and so loosely seated as to come off in scores at a touch, and there is no down. The tail is generally a very characteristic feature, the rectrices, though in some cases pointed, being often curiously squared at the tip, and when this is the case they are usually barred ladder-like with white and black.[1] According to Gould, they are larger and more pointed in the young than in the old, and grow squarer and have the white bands narrower at each succeeding moult. He also asserts that in the species which have the wing-coverts freckled, the freckling becomes finer with age. So far as has been observed, the nidification of these birds is in holes of trees, wherein are laid without any bedding two roundish eggs, generally white but certainly in one species (Quezal) tinted with bluish green.

---

[1] See also Artemidorus in Strabo, xvi. 17, p. 785 *sq.*

[2] *Trogonem* (the oblique case) occurs in Pliny (*H. N.*, x. 16) as the name of a bird of which he knew nothing, save that it was mentioned by Hylas, an augur, whose work is lost; but some would read *Trygonem* (Turtle-Dove). In 1752 Möhring (*Av. Genera*, p. 85) applied the name to the "Curucui" (pronounced "Suruquá" *fide* Bates, *Nat. Amazons*, i. p. 250) of Marcgrave (*Hist. Nat. Brasiliæ*, p. 211), who described and figured it in 1648 recognizably. In 1760 Brisson (*Ornithologie*, iv. p. 164) adopted *Trogon* as a generic term, and, Linnæus having followed his example, it has since been universally accepted.

[3] M. Anatole Bogdanoff determined the red pigment of the feathers of *Pharomacrus auriceps* to be a substance which he called "zooxanthine" (*Comptes Rendus*, 2d November, 1857, xlv. p. 690).

The Trogons form a very well-marked Family, belonging to the multifarious group treated in the present series of articles as *Picariæ;* but, instead of being (so far as is known) like all the rest of them and, as Prof. Huxley believed, "desmognathous," they have been shown by W. A. Forbes (*Proc. Zool. Society*, 1881, p. 836) to be "schizognathous"—thus demonstrating, in the words of the latter, "that the structure of the palate has not that unique and peculiar significance that has been claimed for it in the classification of birds." Perhaps the explanation of this anomaly may lie in the fact that the Trogons are a very old form. The remains of one *T. gallicus*, have been recognized by Prof. A. Milne-Edwards (*Ois. foss. de la France*, ii. p. 395, pl. 177, Figs. 18–22) from the Miocene of the Allier, and it may not be too much to suppose that the schizognathous structure was more ancient than the desmognathous. Again too this fortunate discovery of that eminent palæontologist seems to account for the remarkable distribution of the Trogons at the present day. While they chiefly abound, and have developed their climax of magnificence, in the tropical parts of the New World, they yet occur in the tropical parts of the Old. The species now inhabiting Africa, forming the group *Hapaloderma*, can hardly be separated generically from those of the Neotropical *Trogon*, and the difference between the Asiatic forms, if somewhat greater, is still comparatively slight. It is plain then that the Trogons are an exceptionally persistent type; indeed in the whole Class few similar instances occur and perhaps none that can be called parallel. The extreme development of the type in the New World just noticed also furnishes another hint. While in some of the American Trogons (*Pharomacrus*, for instance) the plumage of the females is not very much less beautiful than that of the males, there are others in which the hen birds retain what may be fairly deemed a more ancient livery, while the cocks flaunt in brilliant attire. Now the plumage of both sexes in all but one[2] of the Asiatic Trogons, *Harpactes*, resembles rather that of the young and of those females of the American species which are modestly clothed. The inference from this fact would seem to be that the general coloration of the Trogons prior to the establishment, by geographical estrangement, of the two types was a russet similar to that now worn by the adults of both sexes in the Indian region, and by a portion only of the females in the Neotropical. The Ethiopian type, as already said, very closely agrees with the American, and therefore would be likely to have been longer in connection therewith. Again, while the adults of most of the American Trogons (*Pharomacrus* and *Euptilotis* excepted) have the edges of the bill serrated, their young have them smooth or only with a single notch on either side near the tip, and this is observable in the Asiatic Trogons at all ages. At the same time the most distinctive features of the whole group, which are easily taken in at a glance, but are difficult to express briefly in words, are equally possessed by both branches of the Family, showing that they were in all likelihood—for the possibility that the peculiarities may have been evolved apart is not to be overlooked—reached before the geographical sundering of these branches (whereby they are now placed on opposite sides of the globe) was effected.

It remains to say that about sixty species of Trogons are recognized, which Gould in the second edition of his *Monograph* of the Family (1875) divides into seven genera; but their characters are hardly laid down. *Pharomacrus*, *Euptilotis*, and *Trogon* inhabit the mainland of tropical America, no species passing to the northward of the Rio Grande nor southward of the forest district of Brazil, while none occur on the west coast of Peru or Chili. *Prionotelus* and *Tmetotrogon*, each with one species, are peculiar respectively to Cuba and Hispaniola. The African form *Hapaloderma* has two species, one found only on the west coast, the other of more general range. The Asiatic Trogons, *Harpactes* (with eleven species according to the same authority), occur from Nepal to Malacca, in Ceylon, and in Sumatra, Java, and Borneo, while one species is peculiar to some of the Philippine Islands. (A. N.)

TROGUS, Cn. Pompeius, a Roman historian, nearly contemporary with Livy. Although the epitome of his historical writings by Justin, and a few fragments, are all that have come down to us, there is abundant reason to believe that he deserves a place in the history of Roman literature by the side of Sallust, Livy, and Tacitus. Of his life little is known. He was almost certainly of Greek descent. His grandfather served with Pompey in the war against Sertorius, and received through the influence of that general the Roman citizenship; hence the name Pompeius, which was adopted as a token of gratitude to the benefactor. The father of Trogus was an officer of Cæsar. Trogus himself seems to have been a man of encyclopædic knowledge. He wrote, after Aristotle and Theophrastus, books on the natural history of animals and plants, used by the elder Pliny, who calls Trogus "one of the most precise among authorities" (*auctor ipse e severissimis*). But the principal work of Trogus consisted of forty-four *Libri Historiarum Philippicarum*. This was a great history of the world, or rather of those portions of it which came under the sway of Alexander and his successors. The tale began with Ninus, the founder of Nineveh, and ceased at about the same point as Livy's great work, viz., 9 A.D. The last event recorded by the epitomator Justin (*q.v.*) is the recovery of the Roman standards captured by the Parthians (20 B.C.). The history of Rome was treated as merely subsidiary to that of Greece and the East. The work was based upon the writings of Greek historians, such as Theopompus, Ephorus, Timæus, Polybius. It has been contended that Trogus did not gather together the information from the leading Greek historians for himself, but that it was already combined into a single book by some Greek, whom Trogus followed closely with some superficial errors. But the assumption appears improbable in itself, merely on a review of the remains of the historical writings, and is moreover inconsistent with what we know of the works in natural history, for which Trogus certainly went back to what were regarded in his time as first-hand authorities. It is generally admitted that Trogus had genuine qualifications for writing history, though he could not rid himself entirely of the faults of his authorities. His idea of history was more severe and less rhetorical than that followed by Sallust and Livy, whom he blamed for putting elaborate speeches in the mouths of the characters of whom they wrote. Yet his own Latin style had a vivid force which is still to be recognized in the extracts made by Justin. For the ancient history of the East, Trogus, even in the present mutilated state of his historical work, often proves to be an authority of great importance.

The chief modern editions are those of Gronovius (Leyden, 1719 and 1760); Frotscher (Leipsic, 1827–30); and Jeep (Leipsic, 1859 and 1862). In Engelmann's *Bibliotheca Scriptorum Classicorum*, ii., under Justin and Trogus, will be found a large number of references to scattered modern articles. Perhaps the most important is that of A. v. Gutschmid on the sources of the history of Trogus, in the second supplementary vol. of the *Jahrbb. f. class. Philol.* (Leipsic, 1857).

TROITSK, a district town of Russia, in the government of Orenburg, situated in a fertile steppe 392 miles to the northeast of Orenburg, on the Siberian highway, is one of those towns which have grown rapidly of late in the southeast of Russia. The Troitskiy fort, erected in 1743, became a centre for the exchange trade with the Kirghiz steppe and Turkestan, and in that trade Troitsk is now second only to Orenburg. Cotton, silk, and especially horses and cattle are imported, while leather, cotton, and woollen and metal wares are exported. An active trade in corn for the Ural gold-mines is carried on. The population in 1884 was 13,000.

---

[1] In the Trogon of Cuba, *Prionotelus*, they are most curiously scooped out, as it were, at the extremity, and the lateral pointed ends diverge in a way almost unique among birds.

[2] Or two species if *H. macloti* be more than a local form of *H. reinwardti*.

TROLLOPE, ANTHONY (1815–1882), English novelist, was born in Keppel Street, Russell Square, London, according to most authorities, on 24th April, 1815; in his own *Autobiography* he merely gives the year. His father, a barrister, who had been fellow of New College, Oxford, brought himself and his family into the sorest straits by unbusiness-like habits, by quarrelling with his profession, or at least with the attorneys, and by injudicious speculations, especially in farming. Trollope's mother, Frances Milton, according to her son, was nearly thirty when she married in 1809. By her husband's wish she made a strange journey to America in 1827, for the purpose of setting up a kind of fancy shop in Cincinnati, which failed utterly. Her visit, however, furnished her with the means of writing *The Domestic Manners of the Americans.* This at once brought her in a considerable sum, and thenceforward she continued to be the mainstay of her family. Her husband being obliged at last actually to fly the country from his creditors, his wife maintained him by her pen, at Bruges, till his death there in 1835. For some time Mrs. Trollope wrote chiefly travels; but she soon became known as a novelist, and was very industrious. Her novels, the best of which are probably *The Vicar of Wrexhill* and *The Widow Barnaby*, are now rarely read, and indeed were never at their best above good circulating library level: they are written with cleverness indeed, and a certain amount of observation, but with many faults of taste, and with an almost total want of artistic completeness and form. Her late beginning, her industrious career (for she wrote steadily for more than thirty years, till her death in October, 1863, at Florence), and the entire absence in her of any blue-stocking or *femme-savante* weakness would have made her remarkable, even if she had not transmitted, as she undoubtedly did transmit, her talent, much increased, to her children.

Anthony Trollope was the third son. By his own account few English men of letters have had an unhappier childhood and youth. He puts down his own misfortunes, at Harrow, at Winchester, at Harrow again, and elsewhere, to his father's pecuniary circumstances, which made his own appearance dirty and shabby, and subjected him to various humiliations. But it is permissible to suspect that this was not quite the truth, and that some peculiarities of temper, of which in after life he had many, contributed to his unpopularity. At any rate he seems to have reached the verge of manhood as ignorant as if he had had no education at all. While living abroad he tried ushership; but at the age of nineteen he was pitchforked by favor (for he could not pass even the ridiculous examination then usual) into the post-office. Even then his troubles were not over. He got into debt; he got into ridiculous entanglements of love affairs, which he has very candidly avowed; he was in constant hot water with the authorities; and he seems to have kept some very queer company, which long afterwards stood him in stead as models for some of his novel pictures. At last in August, 1841, he obtained the appointment of clerk to one of the post-office surveyors in a remote part of Ireland, with a very small nominal salary. This salary, however, was practically quadrupled by allowances; living was cheap; and the life suited Trollope exactly, being not office work, which he always hated, but a kind of travelling inspectorship. And here he not only began that habit of hunting which (after a manner hardly possible in the stricter conditions of official work nowadays) he kept up for many years even in England, but within three years of his appointment engaged himself to Miss Rose Heseltine, whom he had met in Ireland but who was of English birth. They were married in June, 1844. His headquarters had previously been at Banagher; he was now transferred to Clonmel.

Trollope had always dreamt of novel-writing, and his Irish experiences seemed to supply him with promising subjects. With some assistance from his mother he got his first two books, *The Macdermots of Ballycloran* and *The Kellys and the O'Kellys*, published, the one in 1847, the other the next year. But neither was in the least a success, though the second perhaps deserved to be; and a third, *La Vendée*, which followed in 1850, besides being a much worse book than either, was an equal failure. Trollope made various other literary attempts, but for a time ill fortune attended all of them. Meanwhile he was set on a new kind of post-office work, which suited him even better than his former employment—a sort of roving commission to inspect rural post deliveries and devise their extension, first in Ireland, then throughout the west of England and South Wales. That he did good work is undeniable; but his curious conception of official duty (on his discharge of which he prided himself immensely) is exhibited by his confessions that he "got his hunting out of it," and that he felt "the necessity of travelling miles enough [he was paid by mileage] to keep his horses." It was during this work that he struck the vein which gave him fortune and fame—which might perhaps have given him more fame and not much less fortune if he had not worked it so hard—by conceiving *The Warden.* This was published in 1855. It brought him little immediate profit, nor was even *Barchester Towers*, which followed, very profitable, though it contains his freshest, his most original, and, with the exception of *The Last Chronicle of Barset*, his best work. The two made him a reputation, however, and in 1858 he was able for the first time to sell a novel, *The Three Clerks*, for a substantial sum, £250 [$1215]. A journey on post-office business to the West Indies gave him material for a book of travel, *The West Indies and the Spanish Main*, which he frankly and quite truly acknowledges to be much better than some subsequent work of his in the same kind. From this time his production (mainly of novels) was incessant, and the sums which he received were very large, amounting in one case to as much as £3525 [$17,131.50] for a single book, and to nearly £70,000 [$340,200] in the twenty years between 1859 and 1879. All these particulars are given with great minuteness by himself, and are characteristic. The full high tide of his fortunes began when the *Cornhill Magazine* was established in the autumn of 1859. He was asked at short notice to write a novel, and wrote *Framley Parsonage*, which was extremely popular; two novels immediately preceding it, *The Bertrams* and *Castle Richmond*, had been much less successful.

As it will be possible to notice few of his subsequent works in detail, the list of them, a sufficiently astonishing one, may be given here: *Tales of All Countries* (3 series, 1861–1870); *Orley Farm, North America* (1862); *Rachael Ray* (1863); *The Small House at Allington, Can You Forgive Her?* (1864); *Miss Mackenzie* (1865); *The Claverings, Nina Balatka, The Last Chronicle of Barset* (1867); *Linda Tressel* (1868); *Phineas Finn, He Knew He Was Right* (1869); *Brown, Jones, and Robinson, The Vicar of Bullhampton, An Editor's Tales, Cæsar* (1870); *Sir Harry Hotspur of Humblethwaite, Ralph the Heir* (1871); *The Golden Lion of Granpere* (1872); *The Eustace Diamonds, Australia and New Zealand* (1873); *Phineas Redux, Harry Heathcote of Gangoil, Lady Anna* (1874); *The Way We Live Now* (1875); *The Prime Minister* (1876); *The American Senator* (1877); *Is He Popenjoy? South Africa* (1878); *John Caldigate, An Eye for an Eye, Cousin Henry, Thackeray* (1879); *The Duke's Children, Cicero* (1880); *Ayala's Angel, Dr. Wortle's School* (1881); *Frau Frohmann, Lord Palmerston, The Fixed Period, Kept in the Dark, Marion Fay* (1882); *Mr. Scarborough's Family, The Land Leaguers* (1883); and *An Old Man's Love* (1884).

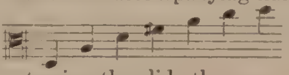
How this enormous total was achieved in spite of official work (of which, lightly as he took it, he did a good deal, and which he did not give up for many years), of hunting three times a week in the season, of whist-playing, of not a little going into general society, he has explained with his usual curious minuteness. He reduced novel-writing to the conditions of regular mechanical work—so much so that latterly he turned out so many words in a quarter of an hour, and wrote at this rate so many hours a day. He divided every book beforehand into so many days' work and checked off the tallies as he wrote.

A life thus spent could not be very eventful, and its events may be summed up rapidly. In 1858 he went to Egypt also on post-office business, and at the end of 1859 he got himself transferred from Ireland to the eastern district of England. Here he took a house at Waltham. He took an active part in the establishment of *The Fortnightly Review* in 1865; he was editor of *St. Paul's* for some time after 1867; and at the end of that year he resigned his position in the post-office. He stood for Beverley and was defeated; he received from his old department special missions to America and elsewhere (he had already gone to America in the midst of the Civil War). He went to Australia in 1871, and before going broke up his household at Waltham. When he returned he established himself in London, and lived there till 1880, when he removed to Harting on the confines of Sussex and Hampshire. He had visited South Africa in 1877 and travelled elsewhere. On 3d November, 1882, he was seized with paralysis, and died on 6th December.

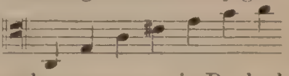
Of Trollope's personal character it is not necessary to say much. Strange as his conception of official duty may seem, it was evidently quite honest and sincere, and, though he is said to have been as an official popular neither with superiors nor inferiors, he no doubt did much good work. Privately he was much liked and much disliked,—a great deal of real kindness being accompanied by a blustering and overbearing manner, and an egotism, not perhaps more deep than other men's, but more vociferous. His literary work needs more notice. Nothing of it but the novels is remarkable for merit. His *Cæsar* and the *Cicero* are curious examples of a man's undertaking work for which he was not in the least fitted. *Thackeray* exhibits (though Trollope appears to have both admired Thackeray as an artist and liked him as a man) grave faults of taste and judgment and a complete lack of real criticism. The books of travel are not good, and of a kind not good. *Nina Balatka* and *Linda Tressel*, published anonymously and as experiments in the romantic style, have been better thought of by the author and by some competent judges than by the public or the publishers. *Brown, Jones, and Robinson* was still more disliked, and is certainly very bad as a whole, but has touches of curious originality in parts. The rest of the novels have been judged very differently by different persons. There is no doubt that their enormous volume prejudiced readers against them even long before the author let the public into the secret of their manufacture, which has made the prejudice deeper. There is also no doubt that Trollope seldom or never creates a character of the first merit (Mr. Crawley in the *Last Chronicle of Barset* is the one possible exception), and that not one of his books can be called a work of genius. At the same time no one probably has produced anything like such a volume of anything like such merit. He claims for himself that his characters are always more or less alive, and they are. After his first failures he never produced anything that was not a faithful and sometimes a very amusing transcript of the sayings and doings of possible men and women. His characters are never marionettes, much less sticks. He has some irritating mannerisms, notably a trick of repetition of the same form of words. He is sometimes absolutely vulgar,—that is to say, he does not deal with low life, but shows, though always robust and pure in morality, a certain coarseness of taste. He is constantly rather trivial, and perhaps nowhere out of the Barset series (which, however, is of itself no inconsiderable work) has he produced books that will live. The very faithfulness of his representation of a certain phase of thought, of cultivation, of society, uninformed as it is by any higher spirit, in the long run damaged, as it had first helped, the popularity of his work. But, allowing for all this, it may and must still be said that he held up his mirror steadily to nature, and that the mirror itself was fashioned with no inconsiderable art. (G. SA.)

TROMBONE, a musical instrument of brass. It has a cupped mouthpiece, and is formed of two principal parts—the bell, the bore of which gradually widens, and the slide, which is composed of two cylindrical tubes parallel to each other, upon which two other tubes, communicating at their lower extremities by a pipe curved in a half-circle, glide without loss of air. The mouthpiece is adapted to one of the upper ends of the slide and the bell to the other end. When the slide, which is moved by the right hand, is closed, the instrument is at its highest pitch; the note is lowered in proportion as the column of air is lengthened by drawing out the slide.

Formerly the trombone was known as the *sackbut;* its modern designation—great trumpet—comes from the Italian. The Germans call it *posaune.* It is difficult to say where or at what epoch the instrument was invented. In a manuscript of the 9th century, preserved at Boulogne, there is a drawing of an instrument which bears a great resemblance to a trombone deprived of its bell. Virdung[1] says little about the trombone, but he gives an engraved representation of it, under the name of *busaun*, which shows that early in the 16th century it was almost the same as that employed in our day. By that time the trombone had come into vogue in England: the band of musicians in the service of Henry VIII. included ten sackbut players, and under Elizabeth, in 1587, there were six. English instrumentalists then enjoyed a certain reputation and were sought for by foreign courts; thus in 1604 Charles III. of Lorraine sought to recruit his sackbut players from English bands. Prætorius[2] classes the trombones in a complete family, the relative tonalities of which were thus composed: 1 *alt-posaun*, 4 *gemeine rechte posaunen*, 2 *quart-posaunen*, 1 *octav-posaun*,—8 in all. The alt-posaun was in D. With the slide closed it gave the first of the accompanying harmonics:



The gemeine rechte posaunen, or ordinary trombones, were in A. Without using the slide they gave the subjoined sounds:



The quart-posaun was made either in E, the fourth below the gemeine rechte posaun, or in D, the lower fifth. In the latter case it was exactly an octave below the alt-posaun. The octav-posaun was in A. It was constructed in two different fashions: either it had a length double that of the ordinary trombone, or the slide was shortened, the length of the column of air being still maintained by the adaptation of a crook. The first system, which was invented by Hans Schreiber four years before the work of Prætorius appeared, gave the instrumentalist a slide by which he could procure in the lower octave all the sounds of the ordinary trombone. The second system, which Prætorius had known for years, was distinguished from the first, not only by modifications affecting the form, but also by a larger bore. Mersenne[3] calls the trombone *trompette harmonique*, but he does not appear to have made himself acquainted with its construction, for we can scarcely find an allusion in the confused text of his work to the tonality of the trombone then in vogue. He established this fact, however, that it was customary in France to lower the instrument a fourth below the pitch of the ordinary trombone by means of a *tortil*, a kind of crook with a double turn that was fitted between the bell and the slide, "in order," he said, "to make the bass to hautbois concerts."

The compass of the trombone is not limited to the mere harmonics obtained by leaving the instrument at its shortest length—that is, with the slide close up; it in fact comprises seven positions, which are obtained by shifting the slide as many lengths and in such a way that each of these produces a series of harmonics a semitone lower than the length which has preceded. This system, so simple and rational, might have been expected always to serve for the basis of the technique of the instrument; but from the middle of the 18th century the art of playing the trombone became the object of purely empiric teaching. Only four positions were made use of.[1] By the first—that is, with the slide closed up—there was obtained from the ordinary trombone, then called the tenor trombone, the first series of the subjoined harmonics (the numerals indicating the order): the fundamental or first note being difficult to obtain; the second position produced

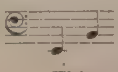
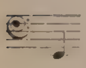
the third position produced

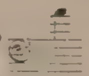
and the fourth



In thus lowering by semitones, the sounds furnished by the four positions gave the tenor trombone a diatonic scale from



to



This scale was formed with notes that could be perfectly just, but the result would have been less satisfactory to the ear if the player had strictly observed the rules laid down by the teaching of that period for the production of the chromatic intervals. Thus to pass from a note furnished by one of the four positions to another a semitone lower it was necessary to lengthen the slide by two fingers; if the semitone higher was required the slide had to be shortened to the same extent.[2] A consideration of the laws affecting lengths of pipes will show the viciousness of that rule.

Of all wind instruments the trombone has perhaps been least modified in form; changes have occasionally been attempted, but for the most part with only trifling success. The innovation which has had the most vogue dates from the end of the 18th century; it consisted in bending the tube of the bell in a half circle above the head of the executant, which produced a very bizarre effect. It also gave rise to very serious inconveniences; by destroying the regularity of the proportions of the bell it prejudicially affected the quality of tone and intonation of the instrument. For a long time the curved bell with its serpent's mask was maintained in military music, and it is only about twenty years ago that it was completely given up. By giving a half turn more to the bell tube its opening was directed to the back of the executant; but this form, in fashion for a little while about 1830, was not long adhered to, and the trombone reassumed its primitive form, which is still maintained. As appears from a patent deposited by Stölzel and Blümel at Berlin on 12th April, 1818, the application of ventils or pistons was then made for the first time.[3] The ventils, at first two in number, effected a decided lengthening of the instrument. The first augmented the length of the tube by a tone, lowering by as much the natural harmonics. The second produced a similar effect for a semitone, and the simultaneous employment of the two pistons resulted in the depression of a tone and a half. The principle, therefore, of the employment of ventils or pistons is the same as that which governs the use of slides. For instance, a trombone is provided with three pistons, and without their help it produces the first of the following sets of harmonics (the numbers indicating the order). Then by pressing down the second piston we obtain a lengthening of the column of air that lowers the instrument by a semitone and makes it produce the second set of harmonics here shown; with the aid of the first piston we relengthen the column, so as to get a whole tone lower, producing the third set of sounds; the third piston, in the same way, lowers the instrument a tone and a half, as in (4); by the simultaneous employment of the second and third pistons we arrive at two tones, as in (5); the combination of the first and third pistons lowers the instrument two tones and a half, as shown in (6); finally, uniting the three pistons lowers the trombone three tones and a half, as shown in (7).

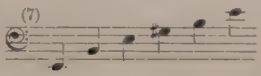
(7)



Notwithstanding the increased facility obtained by the use of pistons, they are very far from having gained the suffrages of all players: many prefer the slide, believing that it gives a facility of emission that they cannot obtain with a piston trombone. For this illustration of the use of pistons, we have taken a tenor trombone in B♭; the flat tonalities having been preferred for military music since the commencement of the 19th century, the pitch of each variety of trombones has been raised a semitone. At present six trombones are more or less in use, viz., the alto trombone in F, the alto in E♭ (formerly in D), the tenor in B♭ (formerly in A), the bass in G, the bass in F (formerly in E), the bass in E♭ (formerly in D). This transposition has no reference to the number of vibrations that may be officially or tacitly adopted as the standard pitch of any country or locality. A trombone an octave lower than the tenor has recently been reintroduced into the orchestra, principally by Wagner. The different varieties just cited are constructed with pistons or slides, as the case may be. (V. M.)

TROMP, the name of two famous Dutch admirals.

I. **Martin Harpertzoon Tromp** (1597–1653) was born at Brielle, South Holland, in 1597. At the age of eight he made a voyage to the East Indies in a merchantman, but was made prisoner and spent several years on board an English cruiser. On making his escape to Holland he entered the navy in 1624, and in 1637 was made lieutenant admiral.[1] In February, 1639, he surprised, off the Flemish coast near Gravelines, a large Spanish fleet, which he completely destroyed, and in the following September he defeated the combined fleets of Spain and Portugal off the English coast—achievements which placed him in the first rank of Dutch naval commanders. On the outbreak of war with England Tromp appeared in the Downs in command of a large fleet and anchored off Dover. On the approach of Blake he weighed anchor and stood over towards France, but suddenly altered his course and bore down on the English fleet, which was much inferior to his in numbers. In the engagement which followed (19th May, 1652) he had rather the worst of it and drew off with the loss of two ships. In November he again appeared in command of eighty ships of war, and a convoy of 300 merchantmen, which he had undertaken to guard past the English coast. Blake resolved to attack him, and, the two fleets coming to close quarters near Dungeness on the 30th November, the English, after severe losses, drew off in the darkness and anchored off Dover, retiring next day to the Downs, while Tromp anchored off Boulogne till the Dutch merchantmen had all passed beyond danger. The statement that he sailed up the Channel with a broom at his masthead in token of his ability to sweep the seas is probably mythical. In the following February (1653), while in charge of a large convoy of merchantmen, he maintained a running fight with the combined English fleets under Blake, Penn, and Monk off Portland to the sands of Calais, and, though baffling to some extent the purposes of the English, had the worst of the encounter, losing nine ships of war and thirty or forty merchantmen. On 3d June he fought an indecisive battle with the English fleet under Dean in the Channel, but the arrival of reinforcements under Blake on the following day enabled the English to turn the scale against him and he retired to the Texel with the loss of seventeen ships. Greatly discouraged by the results of the battle, the Dutch sent commissioners to Cromwell to treat for peace, but the proposal was so coldly received that war was immediately renewed, Tromp again appearing in the Channel towards the end of July, 1653. In the hotly-contested conflict which followed with the English under Monk on the 29th Tromp was shot by a musket bullet through the heart. He was buried with great pomp at Delft, where there is a monument to his memory in the old church.

[1] *Der sich selbst informirende Musicus*, Augsburg, 1762, by Johann Jacob Lotter.

[2] It need hardly be remarked that the higher semitone cannot be produced in the first position.

[3] This was mentioned in the Leipsic *Allgemeine musikalische Zeitung* in 1815, the merit of the invention being assigned to Heinrich Stölzel of Pless in Silesia.

[4] [He was a lieutenant on board of a Dutch ship-of-the-line in 1622 and in 1624 commander of a frigate.—Am. Ed.]

II. **CORNELIUS TROMP** (1629–1691), the second son of the preceding, was born at Rotterdam on 9th September, 1629. At the age of nineteen he commanded a small squadron charged to pursue the Algerian pirates. In 1652 and 1653 he served in Van Galen's fleet in the Mediterranean, and after the action with the English fleet off Leghorn, 13th March, 1653, in which Van Galen was killed, Tromp was promoted to be rear-admiral. On 13th July, 1665, his squadron was by a hard stroke of ill fortune defeated by the English under the duke of York. In the following year Tromp served under De Ruyter, and on account of De Ruyter's complaints of his negligence in the action of 5th August he was deprived of his command. He was, however, reinstated in 1673 by the stadtholder William, afterwards king of England, and in the actions of 7th and 14th June, against the allied fleets of England and France, manifested a skill and bravery which completely justified his reappointment. In 1675 he visited England, when Charles II. created him a baron. In the following year he was named lieutenant-admiral of the United Provinces. He died at Amsterdam, 29th May, 1691, shortly after he had been appointed to the command of a fleet against France. Like his father he was buried at Delft.

See H. de Jager, *Het Geslacht Tromp*, 1883.

TROMSÖ, a town of Norway, capital of the amt of the same name and an episcopal see, stands on the eastern shore of a low fertile islet of the same name between Hvaloe and the mainland, in 69° 38′ N. lat. and 18° 55′ E. long. It consists principally of one wide street of wooden houses; the chief public buildings are the town-hall, the national church, the Roman Catholic church, and the museum, which contains a good zoological collection. The town has a high school and a normal seminary. The main specialty of the place is bears' skins and other kinds of fur. The herring fishery of Tromsö is very productive, and the activity of the town is further increased by the circumstance that it is the port of call for ships making for the seal fishing and walrus hunting on Spitzbergen and Nova Zembla. Tromsö was founded in 1794. The population, which in 1816 did not exceed 300, was 5409 in 1882.

TRONDHJEM. See THRONDHJEM.

TROPIC-BIRD, so called of sailors from early times,[1] because, as Dampier (*Voyages*, i. p. 53) among many others testifies, it is "never seen far without either Tropick," and hence, indulging a pretty fancy, Linnæus bestowed on it the generic term, continued by modern writers, of *Phaethon*, in allusion to its attempt to follow the path of the sun.[2] There are certainly three well-marked species of this genus, but their respective geographical ranges have not yet been definitely laid down. All of them can be easily known by their totipalmate condition, in which the four toes of each foot are united by a web, and by the great length of the two middle tail-quills, which project beyond the rest, so as to have gained for the birds the names of "Rabijunco," "Paille-en-queue," and "Pijlstaart" among mariners of different nations. These birds fly to a great distance from land and seem to be attracted by ships, frequently hovering round or even settling on the mast-head.

The Yellow-billed Tropic-bird, *P. flavirostris* or *candidus*, appears to have habitually the most northerly, as well, perhaps, as the widest range, visiting Bermuda yearly to breed there, but also occurring numerously in the southern Atlantic, the Indian, and a great part of the Pacific Ocean. In some islands of all these three it breeds, sometimes on trees, which the other species are not known to do. However, like the rest of its congeners, it lays but a single egg, and this is of a pinkish white, mottled, spotted, and smeared with brownish purple, often so closely as to conceal the ground color. This is the smallest of the group, and hardly exceeds in size a large Pigeon; but the spread of its wings and its long tail make it appear more bulky than it really is. Except some black markings on the face (common to all the species known), a large black patch partly covering the scapulars and wing-coverts, and the black shafts of its elongated rectrices, its ground color is white, glossy as satin, and often tinged with roseate. Its yellow bill readily distinguishes it from its larger congener *P. aethereus*, but that has nearly all the upper surface of the body and wings closely barred with black, while the shafts of its elongated rectrices are white. This species has a range almost equally wide as the last; but it does not seem to occur in the western part of the Indian Ocean. The third and largest species, the Red-tailed Tropic-bird, *P. rubricauda* or *phœnicurus*, not only has a red bill, but the elongated and very attenuated rectrices are of a bright crimson red, and when adult the whole body shows a deep roseate tinge. The young are beautifully barred above with black arrow-headed markings. This species has not been known to occur in the Atlantic, but is perhaps the most numerous in the Indian and Pacific Oceans, in which last great value used to be attached to its tail-feathers to be worked into ornaments.[3]

That the Tropic-birds form a distinct family, *Phaethontidæ*, of the *Steganopodes* (the *Dysporomorphæ* of Prof. Huxley), was originally maintained by Brandt, and is now generally admitted, yet it cannot be denied that they differ a good deal from the other members of the group[4]; indeed Prof. Mivart in the Zoological *Transactions* (x. p. 364) will hardly allow *Fregata* and *Phaethon* to be steganopodous at all; and one curious difference is shown by the eggs of the latter, which are in appearance so wholly unlike those of the rest. The osteology of two species has been well described and illustrated by Prof. Alph. Milne-Edwards in M. Grandidier's fine *Oiseaux de Madagascar* (pp. 701–704, pls. 279–281a). (A. N.)

TROPPAU (Slavonic *Opava*), the chief town of Austrian Silesia, is a busy commercial place on the right bank of the Oppa, close to the Prussian border. A well-built town with extensive suburbs, it has two market-places and contains six churches, an old town-house recently restored in the Gothic style, and numerous educational, benevolent, and commercial institutions. The site of the former fortifications is laid out in pleasant promenades. Troppau manufactures large quantities of cloth, especially for the army; and its industrial establishments include a large sugar-refinery and manufactories of machines and stoves. In 1880 the population was 20,562. German is spoken in the town proper, but a dialect of Polish prevails in the suburbs.

Troppau was founded in the 13th century; but almost its only claim to historical mention is the fact that in 1820 the monarchs of Austria, Russia, and Prussia met here to deliberate on the tendencies of the Neapolitan revolution. This congress of Troppau, however, left nearly the whole matter to be considered and decided at Laibach. The former principality of Troppau is now divided between Austria and Prussia, the latter holding the lion's share.

---

[1] More recently sailors have taken to call it "Boatswain-bird"—a name probably belonging to a very different kind (*cf.* SKUA).

[2] Occasionally, perhaps through violent storms, Tropic-birds wander very far from their proper haunts. In 1700 Leigh, in his *N. H. Lancashire* (i. pp. 164, 195, Birds, pl. i., Fig. 3), described and figured a "Tropick Bird" found dead in that county. Another is said by Mr. Lees (*Zoologist*, ser. 2, p. 2666) to have been found dead at Cradley near Malvern—apparently before 1856 (J. H. Gurney, jun., *op. cit.*, p. 4766)—which, like the last, would seem (W. H. Heaton, *op. cit.*, p. 5086) to have been of the species known as *P. aethereus*. Naumann was told (*Rhea*, i. p. 25) of its supposed occurrence at Heligoland, and Col. Legge (*B. Ceylon*, p. 1174) mentions one taken in India 170 miles from the sea. The case cited by MM. Degland and Gerbe (*Ornith. Européenne*, ii. p. 263) seems to be that of an Albatross.

[3] A fourth species, *P. indicus*, has been described from the Gulf of Oman, but doubt is expressed as to its validity (*cf.* Legge, *ut supra*, pp. 1173, 1174).

[4] *Sulidæ* (GANNET), *Pelecanidæ* (PELICAN), *Plotidæ* (SNAKE-BIRD), *Phalacrocoracidæ* (CORMORANT), and *Fregatidæ* (FRIGATE-BIRD).

TROTZENDORFF, or Trocedorfius, Valentin Friedland (1490–1556), called Trotzendorff from his birthplace, near Görlitz, in Prussian Silesia, was born on 14th February, 1490, of parents so poor that they could not keep him at school. The boy taught himself to read and write while herding cattle; he made paper from birch bark, and ink from soot. When difficulties were overcome and he was sent for education to Görlitz, his mother's last words were "stick to the school, dear son." The words determined his career: he refused all ecclesiastical promotion, and lived and died a schoolmaster. He became a distinguished student, learned Ciceronian Latin from Peter Mosellanus and Greek from Richard Croke, and after graduation was appointed assistant master in the school at Görlitz. There he also taught the rector and other teachers. When Luther began his attack on indulgences, Trotzendorff resigned his position and went to study under Luther and Melanchthon, supporting himself by private tuition. Thence he was called to be a master in the school at Goldberg in Silesia, and in 1524 became rector. There he remained three years, when he was sent to Liegnitz. He returned to Goldberg in 1531 and began that career which has made him the typical German schoolmaster of the Reformation period. His system of education and discipline speedily attracted attention. He made his best elder scholars the teachers of the younger classes, and insisted that the way to learn was to teach. He organized the school in such a way that the whole ordinary discipline was in the hands of the boys themselves. Every month a "consul," twelve "senators," and two "censors" were chosen from the pupils, and over all Trotzendorff ruled as "dictator perpetuus." One hour a day was spent in going over the lessons of the previous day. The lessons were repeatedly recalled by examinations, which were conducted on the plan of academical disputations. Every week each pupil had to write two "exercitia styli," one in prose and the other in verse, and Trotzendorff took pains to see that the subject of each exercise was something interesting. The fame of the Goldberg school extended over all Protestant Germany, and a large number of the more famous men of the following generation were taught by Trotzendorff. He died on 20th April, 1556.

See Herrmann, *Merkwürdige Lebensgeschichte eines berühmtes Schulmans, V. F. Trotzendorffs*, 1727; Frosch, *V. F. Trotzendorff, Rektor zu Goldberg*, 1818; Pinzger, *V. F. Trotzendorff* (with the Goldberg portrait, and a complete list of his writings), 1825; Koehler, *V. F. Trotzendorff, ein biographischer Versuch*, 1848. These biographies appear to take *all* their facts from a funeral or memorial oration delivered by Balthasar Rhau in the university of Wittenberg on 15th August, 1564, and published in an edition of Trotzendorff's *Rosarium*, 1565.

TROUBADOURS. See Provencal Literature, vol. xix. p. 899, and France, vol. ix. p. 569.

TROUGHTON, Edward (1753–1835), instrument maker, was born in the parish of Corney in Cumberland, in October, 1753. He joined his elder brother John in carrying on the business of mathematical instrument makers in Fleet Street, London, and continued it alone after his brother's death, until he in 1826 took W. Simms as a partner. He died in London on 12th June, 1835.

Troughton was very successful in improving the mechanical part of most nautical, geodetic, and astronomical instruments. He was completely color-blind, which prevented him from attempting experiments in optics. The first modern transit circle (see Roemer) was constructed by him in 1806 for Groombridge; but Troughton was dissatisfied with this form of instrument, which a few years afterwards was brought to great perfection by Reichenbach and Repsold (*qq.v.*), and designed the mural circle in its place. The first instrument of this kind was erected at Greenwich in 1812, and ten or twelve others were subsequently constructed for other observatories; but they were ultimately superseded by Troughton's earlier design, the transit circle, by which the two co-ordinates of an object can be determined simultaneously. He also made transit instruments, equatorials, etc.; but his failure to construct an equatorial mounting of large dimensions, and the consequent lawsuit with Sir James South, embittered the last years of his life.

TROUT. See Salmonidæ; also Angling, vol. ii. p. 38.

TROUVILLE, a fashionable seaside town of France, chef-lieu of the department of Calvados, and a port of the English Channel, is situated at the mouth of the river Touques, on the right bank, 136 miles west-northwest of Paris and 34 northeast of Caen by rail. The climate is mild, and the neighborhood well wooded; there are villas in all styles of architecture, a casino, and vast stretches of sand where the visitors (15,000 in 1881) bathe and walk. With Havre, which lies on the other side of the estuary of the Seine, 8 or 10 miles off, there is continual steamer communication. In 1886 the population was 5750 (commune 6300). Deauville, on the left bank of the Touques, opposite Trouville, is remarkable for its casino, terrace, and fine mansions, but, except during the race-week in August, is comparatively deserted. In 1886 its population was 2100 (commune 2220). In 1866 a dock, 985 feet in length by 262 in breadth, with 24 feet of depth at high water, was constructed between Trouville and Deauville; in 1882 292 vessels (54,391 tons) entered and 283 (53,510 tons) cleared.

TROVER, or trover and conversion, the name of a form of action in English law no longer in use, corresponding to the modern action of conversion. It was brought for damages for the detention of a chattel, and differed from detinue in that the latter was brought for the return of the chattel itself. The name trover is due to the action having been based on the fictitious averment in the plaintiff's declaration that he had lost the goods and that the defendant had found them. The necessity for this fictitious averment was taken away by the Common Law Procedure Act, 1852. An action of trover lay (as an action of conversion still lies) in every case where the defendant was in possession of a chattel of the plaintiff and refused to deliver it up on request, such refusal being *prima facie* evidence of conversion. The damages recoverable are usually the value of the chattel converted. In an action for detention of a chattel (the representative of the old action of detinue), the plaintiff may have judgment and execution by writ of delivery for the chattel itself or for its value at his option. An action for conversion or detention must be brought within six years. The corresponding action in Scotch law is the action of spuilzie. It must be brought within three years in order to entitle the pursuer to violent profits, otherwise it prescribes in forty years.

TROWBRIDGE, an ancient town of Wilts, England, is situated on the river Mere or Biss, a feeder of the Avon, and on a branch of the Great Western Railway, 33 miles northwest of Salisbury and 97½ west of London. The parish church of St. James is an ancient stone structure in the Gothic style, with a west square tower, surmounted by a spire 159 feet in height, and a baptistery (1885). The site of the ancient castle was at the mound called Courthill, but all traces of it have long disappeared, it having been demolished before the reign of Henry VIII. Among the charitable institutions are the Edward and Yerbury almshouses (1698), the old men's almshouses, and the cottage hospital (1886). There are a market house and a town hall. Public gardens 4 acres in extent were opened in 1884. A water company (incorporated in 1873) supplies the town with water from the chalk hills in the neighborhood of Biss. The principal industry is the manufacture of kerseymere and of broad and other woollen cloths, established as early as the reign of Henry VIII. The town is governed by a local board of health of twenty-one members. The population of the urban sanitary district (area 2080 acres) in 1871 was 11,508, and in 1881 it was 11,040.

The town was defended in behalf of Matilda against Stephen by Humphrey de Bohun. By Leland it is called Throughbridge or Thoroughbridge. Anciently it was a royal manor forming part of the duchy of Lancaster, having been granted by the crown to John of Gaunt. Afterwards it reverted to the crown and was given by Henry VIII. in the 28th year of his reign to Sir Edward Seymour. It again lapsed to the crown under Elizabeth, and in the 24th year of her reign was assigned to Edward, earl of Hertford. By marriage it passed to the Rutland family, who, however, eventually sold it. It formerly gave the title of baron to the Seymour family. The poet Crabbe was rector of the parish from 1814 to 1832.

TROY. See TROAD.

TROY, a city of the United States, county seat of Rensselaer county, New York, is situated in 42° 44′ N. lat. and 73° 41′ W. long., upon the east bank of the Hudson river, at the head of tide water. It is nearly north of New York City (151 miles) and somewhat north of west from Boston (191 miles). The city, which has a length of about 4 miles, with an average breadth of 1 mile, is built mainly upon a level terrace slightly elevated above the river, but of late years the residence portion has extended up the hills (rising to 400 feet) which limit this plain on the east. It is in the main regularly laid out, and is traversed by street railways. Troy is situated at what is practically the terminus of the Erie Canal, connecting the Hudson river (here navigable for vessels of 8 to 10 feet draught) with Lake Erie, and of the Champlain Canal. It has three railroads, by which it is connected with New York on the south, Buffalo on the west, and also with the east and north. The principal industries, which in 1880 gave employment to 22,434 persons, are metal-working, especially in iron and steel, and the making of stoves and linen goods. The value of the products was $26,497,163. The city is the seat of the Rensselaer Polytechnic Institute, which was for many years the leading engineering school of the United States, and still maintains a high reputation. The population, which in 1810 was only 3895, had in 1830 risen to 11,556, and by 1880 to 56,747 (27,154 males and 29,593 females, the excess of the latter being explained by the large number of women employed as factory operatives). The proportion of foreign born (16,938) was large.

The city was founded in 1787 by the Dutch, under the name of Vanderheyden, and two years later the present name was adopted. In 1794 it was incorporated as a village, and in 1816 it received a city charter. The opening of the Erie and the Champlain Canals in 1822-5 insured its prosperity and rapid growth.

TROY, JEAN FRANÇOIS DE (1679–1752), a French painter highly endowed by nature, was born at Paris in 1679. He received his first lessons from his father, himself a skilful portrait-painter, who afterwards sent his son to Italy. There his amusements occupied him fully as much as his studies; but his ability was such that on his return he was at once made an official of the Academy and obtained a large number of orders for the decoration of public and private buildings, executing at the same time a quantity of easel pictures of very unequal merit. Amongst the most considerable of his works are thirty-six compositions painted for the hotel of De Live (1729), and a series of the story of Esther, designed for the Gobelins whilst De Troy was director of the school of France at Rome (1738–51),—a post which he resigned in a fit of irritation at court neglect. He did not expect to be taken at his word, but found himself forced to return to France, and was making ready to leave when he died suddenly (24th January, 1752) of an attack on the lungs.

His desire to make a figure in the world led him to neglect his more serious duties and injured his professional reputation. The life-size painting (Louvre) of the First Chapter of the Order of the Holy Ghost held by Henry IV., in the church of the Grands Augustins, is one of his most complete performances, and his dramatic composition, the Plague at Marseilles, is widely known through the excellent engraving of Thomassin. The Cochins, father and son, Fessard, Galimard, Bauvarlet, Herisset, and the painters Boucher and Parrocel have engraved and etched the works of De Troy.

TROY, WEST. See WEST TROY.

TROYES, a town of France, formerly the capital of Champagne, and now chef-lieu of the department of Aube, and an episcopal see, is 104 miles southeast of Paris by the railway to Belfort, at the junction of the line from Orleans to Châlons. Several arms of the Seine and also the Haute-Seine Canal run through the town. The cathedral of St. Peter and St. Paul, the building of which lasted from 1206 till the 16th century, still wants the south tower. The choir, the end chapels, and the sacristy were restored in 1849–1866. The 16th century façade, with mutilated bas-reliefs and statues, is surmounted by the tower of St. Peter (230 feet). The choir, one of the most beautiful in France, belongs to the 13th century, as does also its remarkable glass. The treasury contains gospels of the 11th and 12th centuries, precious stones brought from the East at the time of the crusades, and ancient and beautiful lace. The unfinished church of St. Urban, begun in 1262 at the expense of Urban IV., is a charming specimen of the best period of Gothic architecture, the side portals being remarkably light and delicate. The church of St. Madeleine, built at the beginning of the 12th century, enlarged in the 16th, and recently restored, contains a rich rood-screen by Jean de Gualde (1508). In 1420 the treaty of Troyes was signed in the church of St. John, where Henry V. of England and Catherine of France were subsequently married. The church of St. Remy, with a Romanesque tower, the churches of St. Nizier and St. Nicholas, both of the 16th century, and that of St. Pantaléon, of the 16th and 17th, should also be noticed. There are some curious fireplaces in the town hall (17th century), and the municipal archives contain the correspondence of the dukes of Lorraine and Guise. The old abbey of St. Loup is occupied by the library (80,000 volumes and 2720 manuscripts) and a museum containing numerous collections; that relating to natural history is rich in ornithology and entomology, and has many aerolites. Most of the old houses of Troyes are of wood, but some of stone of the 16th century are remarkable for their beautiful and original architecture. The chief industry of Troyes and the surrounding district is the manufacture of cotton and woollen hosiery, which is woven almost entirely by hand, and is exported to America and Switzerland. One-fourth of the population live by subsidiary industries. There are 14 cotton mills with 10,000 spindles, bleaching, dressing, and dye-works, workshops for making looms, needle factories, iron and copper foundries, 8 flour mills, and nursery and market gardens. A trade is carried on in pork and cheese. A few miles from the town stands the curious church of St. Andrew (16th century), with a remarkable portal. The population in 1886 was 46,972 (46,067 in 1881).

At the beginning of the Roman period Troyes (*Augustobona*) was the principal settlement of the Tricassi. It was christianized in the 3d century, and its bishop St. Loup (426–479) founded renowned schools, and averted the fury of Attila. In 484 Troyes passed into the hands of Clovis, and belonged sometimes to Neustria, sometimes to Austrasia, till all Gaul was united under Charles Martel. In 878 Pope John VIII. presided at a council in Troyes. The town was fired and sacked by the Saracens in 720, and by the Normans in 889 and 905. In 1229 Theobold IV., besieged in his capital, was delivered by king Louis IX., and in 1230 he granted the inhabitants a municipal charter. From this time the fairs of Troyes became celebrated. During the captivity of King John in England, Troyes resisted all attacks, and after Agincourt took the part of the Burgundians. In 1417 the rule of Queen Isabeau of Bavaria was established in Troyes, where in 1418 the parlement of Paris met; and on 21st May, 1420, Henry V. of England, Charles VI. of France, Isabeau, and Philip of Burgundy signed the famous treaty of Troyes. On 9th July, 1429, the town capitulated to Joan of Arc. In the 16th century Protestantism made rapid progress, but in 1562 the Huguenots were forced to retire to Bar-sur-Seine; after the massacre of St. Bartholomew in Paris, the Calvinists in the prisons of Troyes met the same fate. In 1577 the inhabitants joined the League, and only opened their gates to Henry IV. in 1594. In 1787 the parlement of Paris again met here. In 1814 both the allied and the imperial armies occupied Troyes; and in 1870 the town was occupied by the Germans.

TROYES, CHRESTIEN DE. See CHRESTIEN DE TROYES, and ROMANCE, vol. xx. p. 655.

TRUCE OF GOD. The orderly administration of justice and the universal peace, which the Roman empire established from the Euphrates to the Atlantic, did not long survive the inroads of the Teutonic tribes who in western Europe divided the inheritance of the Latin world. All the early Teutonic codes, being based, however remotely, on the right of private war and private vengeance, might discourage, but were powerless to abolish, the instinct which impels the members of half-civilized communities to avenge their own wrongs. Hence the *pax Romana* died with the empire; nor could the splendid organization of Charlemagne do more than effect a very partial resuscitation of it. Throughout the 9th and 10th centuries, as the life-benefices of the later Carolingian kings became gradually transformed into hereditary fiefs, the insecurity of life and property grew greater; for there was no central power to curb the injustice of the petty dukes and counts who warred and pillaged at their will. At this moment, when western Europe threatened to sink back into the chaos from which it had been won by Rome, the church came forward to arrest the process of its dissolution. Speaking at first in her own interest and in that of the poor, whose great protector she claimed to be, she decreed a special peace for the unarmed clerk and the industrious husbandman. The council of Charroux in Poitou led the way in 989. With the opening of the next century the movement spread over Aquitaine and the rest of France. Everywhere the bishops set themselves to exact from the whole diocese, noble and simple alike, a novel oath to abstain from violence and to respect the sanctity of churches. William V. of Aquitaine, the most powerful lord of southern France, lent his influence to the cause at the councils of Limoges (994) and Poitiers (999). The latter council prescribed the methods by which all who violated their solemn engagement should be punished. The times, however, were hardly ripe for the inauguration of an era of peace. Gerard of Soissons, perhaps, was not the only bishop who eyed this dream of universal harmony askance, as tending to encroach on the king's prerogative (see Bouquet, x. 201); and, on the whole, it may be said that the "Peace of God" was at best but a somewhat ineffectual protection to churches, priests, and laborers. If there was any hope of restraining the mutual feuds of the barons it must be by other means. And here the church again, recognizing the impossibility of absolutely stopping all feudal warfare, endeavored to limit it. This limitation of the right of perpetual warfare, reduced to writing, sanctioned by an oath, and confirmed by the decrees of councils, assumed the name of the "Truce of God" (*treva* or *treuga Dei*). The truce of God seems to have been first established at the synod of Tuluges, near Perpignan in Roussillon, on 16th May, 1027. In accordance with its decrees all warfare was to be suspended from noon on Saturday till prime on Monday; and the peace of God was permanently extended to all monks, clerks, bishops, and churches. Like the *pax ecclesiæ*, this laudable example was soon followed elsewhere. About 1041 it extended itself over Aquitaine and all France; in 1042 the council of Caen, under the sanction of Duke William, established it in Normandy—a country in which, according to a contemporary writer (Rudolph Glaber, v. 1), it was not at first accepted. By this time its terms had been much enlarged; and we may perhaps take the provisions of a second synod at Tuluges (1041) as representing its normal form. According to this synod the *treuga Dei* was to last from the Wednesday evening to the Monday morning in every week, from the beginning of Advent to the octave of the Epiphany, from the beginning of Lent till the octave of Pentecost, for the feasts of the Holy Cross, the three great feasts of the Virgin, and those of the twelve apostles and a few other saints. More usually the interval between the Epiphany octave and Lent and that from Easter to Rogations were left subject to the weekly truce only. Thus from being a mere local institution it spread rapidly over all France, and seems to have crossed into Germany, Italy, Spain, and England. It had also its special courts and methods of procedure. Excommunication and banishment for seven or thirty years were its penalties. Before long both the *pax ecclesiæ* and the *treuga Dei* were sanctioned by the holy see. Special clauses were added to protect pilgrims, women, merchants, monks, and clerks; while the cattle and agricultural implements of the peasant—his ox, horse, plough, and even his olive trees—were covered by the ægis of the church. The first clause of the council of Clermont (1095), at which Urban II. preached the first crusade, proclaimed the weekly truce for all Christendom, and perhaps enjoined it in its most extended form, adding also a clause by which the oath was to be renewed every three years by all men above the age of twelve, whether noble, burgess, villain, or serf.[1] The same council seems to have accorded safety to all who took refuge at a wayside cross (cap. 29) or at the plough (*homines ad carrucas fugientes*). The truce of God was most powerful in the 12th century, during which period it was sanctioned both by local and papal councils, such as that held at Rheims by Calixtus II. in 1119, and the lateran councils of 1139 and 1179. With the 13th century its influence began to decline, as the power of the king gradually led to the substitution of the king's peace for that of the church.

For an exhaustive account of the whole question, see M. Semichon's book, to which the above article is largely indebted.

TRUCK SYSTEM. See LABOR, vol. xiv. p. 173, and WAGES.

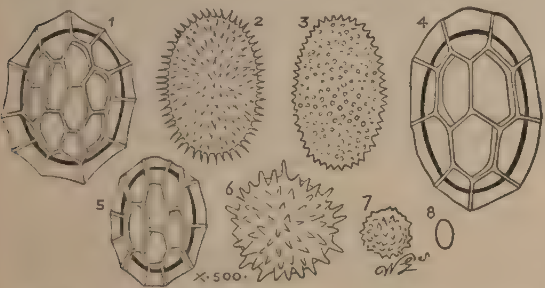
TRUFFLE, the name of several different species of subterranean fungi which are used as food. The species sold in English markets is *Tuber æstivum;* the commonest species of French markets is *T. melanosporum*, and of Italian the garlic-scented *T. magnatum.* Of the three, the English species is the least excellent, and the French is possibly the best. The truffle used for Perigord pie (*pâté de foie gras*) is *T. melanosporum.* When, however, the stock of *T. melanosporum* happens to be deficient, some manufacturers use inferior species of *Tuber*, such as the worthless or dangerous *Chœromyces meandriformis.* Even the rank and offensive *Scleroderma vulgare* (one of the puff-ball series of fungi) is sometimes used for stuffing turkeys, sausages, etc. Indeed, good truffles, and then only *T. æstivum*, are seldom seen in English markets. The taste of *T. melanosporum* can be detected in Perigord pie of good quality. True and false truffles can easily be distinguished under the microscope.

Tuber æstivum, the English truffle, is roundish in shape, covered with coarse polygonal warts, black in color outside and brownish and veined with white within; its average size is about that of a small apple. It grows from July till autumn or winter, and prefers beech, oak, and birch woods on argillaceous or calcareous soil, and has sometimes been observed in pine woods. It grows gregariously, often in company with *T. brumale* and (in France and Italy) *T.*

---

[1] Labbe's *Concilia*, xx. 816; with which *cf.* Semichon *La Paix et la Trêve de Dieu*, Paris, 1869, p. 125.

melanosporum, and sometimes appears in French markets with these two species, as well as with *T. mesentericum*. The odor of *T. æstivum* is very strong and penetrating; it is generally esteemed powerfully fragrant, and its taste is considered agreeable. Its price in England is two or three shillings [50 to 75 cents] a pound. The common French truffle, *T. melanosporum*, is a winter species. The tubers are globose, bright brown or black in color, and rough with polygonal warts; the mature flesh is blackish gray, marbled within with white veins. It is gathered in autumn and winter in beech and oak woods, and is frequently seen in Italian markets, where it is sometimes sold for 12s. 6d. [$3.04] a pound. The odor of *T. melanosporum* is very pleasant, especially when the tubers are young, then somewhat resembling that of the strawberry; with age the smell gets very potent, but is never considered really unpleasant. The common Italian truffle, *T. magnatum* is pallid ochreous or brownish buff in color, smooth or minutely papillose, irregularly globose, and lobed; the interior is a very pale brownish liver color veined with white. It grows towards the end of autumn in plantations of willows, poplars, and oaks, on clayey soil. Sometimes it occurs in open cultivated fields. The odor of the mature fungus is very potent, and is like strong garlic, onion, or decaying cheese. *T. brumale* referred to above, grows in Britain. It is a winter truffle, and is found chiefly under oaks and abele trees from October to December. It is black in color, globose, more or less regular in shape and is covered with sharp polygonal warts; the mature flesh is blackish gray marbled with white veins. The odor is very strong and lasts a long time; the taste is generally esteemed agreeable. *Chœromyces meandriformis*, which occurs in Britain, is sometimes sold for *T. magnatum*, the color of the flesh of both species being somewhat similar. *Scleroderma vulgare*, the "false truffle," is extremely common on the surface of the ground in woods, and is gathered by Italians and Frenchmen in Epping Forest for the inferior dining-rooms of London where Continental dishes are served. It is a worthless, offensive, and possibly dangerous fungus. A true summer truffle, *T. mesentericum*, found in oak and birch woods on calcareous clay soil, is frequently eaten on the Continent. It is esteemed equal to *T. æstivum*. It probably grows in Britain. Another edible species, *T. macrosporum*, also grows in Britain, in clayey places under young beeches and oaks, on the borders of streams and roads, and sometimes in fields; more rarely it grows in plantations of willow and poplar. It has a strong scent of onions or garlic. *Terfezia leonis*, a famous truffle of Italy, Algeria, Sardinia, etc., resembles externally a potato. It grows in March, April, and May. Some persons eat it in a raw state, sliced, and dipped in oil or egg. It is not scented, and its taste is generally considered insipid or soapy. Sometimes an ally of the puff-balls, and therefore (like *Scleroderma*) not a true truffle, *Melanogaster variegatus*, is eaten in England and France. It has been and possibly still is, occasionally sold in England under the name of "red truffle." It is a small ochreous brown species with a strong aromatic and pleasant odor of bitter almonds. When the plant is eaten raw the taste is sweet and sugary, but when cooked it is hardly agreeable. The odor belonging to many truffles is so potent that their places of growth can be readily detected by the odor exhaled from the ground. Squirrels, hogs, and other animals commonly dig up truffles and devour them, and pigs and dogs have long been trained to point out the places where they grow. Pigs will always eat truffles and dogs will do so occasionally; it is therefore usual to give the trained pig or dog a small piece of cheese or some little reward each time it is successful. Truffles are produced by spores, bodies which serve the same purpose as seeds in flowering plants; in true truffles the spores are borne in transparent asci or sacs, from four to eight spores in each ascus. The asci are embedded in vast numbers in the flesh of the truffle. In false truffles the spores are free and are borne on minute spicules or supports. The spores of the chief European truffles, true and false, enlarged five hundred diameters, are shown in the accompanying illustration. Many references to truffles occur in classical authors. The truffle *Elaphomyces variegatus* was till quite recent times used, under the name of Hart's nut or Lycoperdon nut on account of its supposed aphrodisiac qualities.



Spores of the chief European truffles. Enlarged 500 diameters. 1, *Tuber æstivum*; 2, *T. brumale*; 3, *T. melanosporum*; 4, *T. mesentericum*; 5, *T. magnatum*; 6, *Chœromyces Meandriformis*; 7, *Scleroderma vulgare*; 8, *Melanogaster variegatus*.

TRUMBULL,[1] the surname of more than one individual of note in the literature, art, and politics of America.

1. BENJAMIN TRUMBULL was born at Hebron, Connecticut, on 19th December, 1735, and died at North Haven, Connecticut, on 2d February, 1820. He graduated at Yale in 1759, and entered the ministry. His literary work was considerable, the most important being the standard *History of Connecticut* to 1764.

2. JOHN TRUMBULL was born at Waterbury, Connecticut, on 24th April, 1750, and died at Detroit, Michigan, on 12th May, 1831. He graduated at Yale in 1767, and became a lawyer and author of high reputation. His best work is *M'Fingal*, a Hudibrastic poem, intended to serve the Whig side in the American Revolution.

3. JOHN TRUMBULL, son of the following, was born at Lebanon, Connecticut, on 6th June, 1756, and died at New York city on 10th November, 1843. He graduated at Harvard in 1773, studied painting with Benjamin West in London, and left at his death a number of historical works. The earlier of these are the better; the later and larger were painted for the capitol at Washington.

4. JONATHAN TRUMBULL was born at Lebanon, Connecticut, on 10th June, 1710, and died at the same place on 17th August, 1785. He graduated at Harvard in 1727, and became a lawyer and colonial politician. His place in American history was gained as governor of Connecticut from 1769 until 1783, through the whole period of the American Revolution. He was a trusted supporter and confidential adviser of Washington, who was accustomed to speak of him as "brother Jonathan," and the term has since passed into popular use as equivalent to the people of the United States.

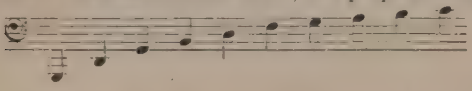
5. JONATHAN TRUMBULL, son of the preceding, was born at Lebanon, Connecticut, on 26th March, 1740, and died at the same place on 7th August, 1809. He graduated at Harvard in 1759, and served as member of congress, 1789–95 (being speaker of the house of representatives during the last two years of his term), as United States senator, 1795–96, and as governor of Connecticut, 1798–1809.

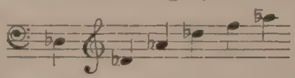
TRUMPET, a musical instrument, consisting of a long, narrow brass tube, cylindrical for the greater part of its length: the fusiform development which terminates in the bell or opening of the lower end only begins at a point that varies from a third to a fourth of the total length from that extremity. The air inside is set in vibration by the lips (which act as true reeds) applied to the edges of a basin-like mouthpiece fitted to the upper part of the instrument. The material has nothing to do with the production of that brilliant quality of tone by which the trumpet is so easily distinguished from every other mouthpiece instrument: the difference is partly due to the distinct form given to the basin of the mouthpiece, but principally to the proportions of the column of air determined by the conical or cylindrical form of its envelope.

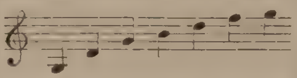
The possibility of producing sonorous disturbance of a mass of air through a mouthpiece, or more simply through the orifice of the tube, has been known from a very early period,—a shell bored at its extremity, or a horn with the point removed, being without doubt the most ancient instrument for producing sound. Nearly all the nations of antiquity had mouthpiece instruments; but the greater number of these, though grouped under the general designation of trumpets, have only a very distant relationship to the modern instrument. The Romans had four such instruments,—the *tuba*, *buccina*, *cornu*, and *lituus*. The tuba, represented in the bas-reliefs of the triumphal arch of Titus, was a kind of straight bronze clarion, with a conical column of air. It is ordinarily designated the Roman trumpet, and was about 39 inches long; its compass should not go beyond the first six proper notes of the harmonic scale. The Roman tuba and the Greek salpinx are supposed to be one and the same instrument. The buccina was also of bronze, with a tube measuring fully 11 feet in length. The tube is only slightly conical, and the quality of tone bears a striking resemblance to that of the bass trombone in G; the proper tones for harmonics were those subjoined.[1] The cornu was often made of a bullock's horn, but bronze was also employed, as in a specimen in the British Museum. This instrument measured 4 feet 6 inches in length, and the scale was that herewith shown. The Roman cornu was probably like the Greek keras. The three preceding instruments were used in giving signals to the infantry. The cavalry calls were given with the lituus, a specimen of which exists in the museum of the Vatican, found in 1827 in a tomb at Cerveteri (Cære). The tube is cylindrical for the greater part of its length, its conical development beginning only at the lower end, where the instrument begins to curve. The lituus easily produces the accompanying proper notes; its quality of tone is like that of a trumpet in G. In Ireland and Denmark numerous mouthpiece instruments in bronze have been found, sixteen different specimens being preserved in the museum of the Royal Irish Academy at Dublin, and six (of which fac similes exist in South Kensington Museum) in the museum at Copenhagen. But none of these have the proportions of a trumpet; all, by the conical development of the tube as well as by the curved form, recall their first model, the horn, successive transformations of which have given rise to the clarion and the numerous family of bugles.

---

[1] [For fuller biographies of these Trumbulls, and for notices of others of the family, see APPENDIX to this volume.—AM. ED.]



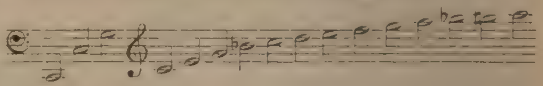




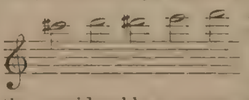
We have no precise information as to the form which the lituus, the ancestor of the modern trumpet, assumed during the Middle Ages. A miniature in the Bible[2] presented in 850 to Charles the Bald places the lituus in the hands of one of the companions of King David, but we are not warranted in concluding from this that the Etruscan instrument was in use in the 9th century. The earliest representation of the trumpet with its present proportions of tube and form of bell seems to belong to the 15th century. Fra Angelico (d. 1455) has painted angels with trumpets having either straight or zigzag tubes, the shortest being about 5 feet long. The perfect representation of the details, the exactness of the proportions, the natural pose of the angel players, suggest that the artist painted the instruments from real models.

The credit of having bent the tube of the trumpet in three parallel branches, thus creating its modern form, has usually been claimed for a Frenchman named Maurin (1498–1515). But the transformation was really made in Italy about the middle of the 15th century, as is proved by the bas-reliefs of Luca della Robbia intended to ornament the organ chamber of the cathedral of Florence (see vol. xx. p. 605); there a trumpet having the tube bent back as just described is very distinctly figured. From the beginning of the 16th century we have numerous sources of information. Virdung[3] cites three kinds of mouthpiece instruments—the *felttrumet*, the *clareta*, and the *thurner horn*; unfortunately he does not mention their distinctive characters, and it is impossible to make them out by examination of his engravings. Probably the felttrumet and the clareta closely resembled each other; but the compass of the former, destined for military signals, hardly went beyond the 8th proper tone, while the latter, reserved for high parts, was like the clarino (see below). The thurner horn was probably a kind of clarino or clarion used by watchmen on the towers. The *trummet* and the *jäger trommet* are the only two mouthpiece instruments of the trumpet kind cited by Prætorius.[4] The first was tuned in D at the chamber pitch or "kammerton," but with the help of a shank it could be put in C, the equivalent of the "chorton" D, the two differing about a tone. Sometimes the trummet was lowered to B and even B♭. The jägar trommet, or "trompette de chasse," was composed of a tube bent several times in circles, like the posthorn, to make use of a comparison employed by Prætorius himself. His drawing does not make it clear whether the column of air was like that of the trumpet; there is therefore some doubt as to the true character of the instrument. The same author further cites a wooden trumpet (*hölzern trommet*), which is no other than the Swiss alpenhorn or Norwegian luur. Mersenne's[5] information is not very instructive; but he gives a description of the *sourdine*, a kind of mute or damper introduced into the bell, already employed in his time, and still made use of to weaken the sound. The shape of the trumpet, as seen in the bas-reliefs of Luca della Robbia, was retained for more than three hundred years: the first alterations destined to revolutionize the whole technique of the instrument were made about the middle of the 18th century. Notwithstanding the imperfections of the trumpet during this long period, the performers upon it acquired an astonishing dexterity.

The usual scale of the typical trumpet, that in D, is



Prætorius exceeds the limits of this compass in the higher range, for he says a good trumpeter could produce the subjoined notes. This opinion is shared by Bach, who, in a trumpet solo which ends the cantata "Der Himmel lacht," wrote up to the twentieth of these sounds. So considerable a compass could not be reached by one instrumentalist: the trumpet part had therefore to be divided, and each division was designated by a special name.[6] The fundamental or first proper note was called *flattergrob*, the second *grobstimme*, the third *faulstimme*, the fourth *mittelstimme*. The part that was called principal went from the fifth to the tenth of these tones. The higher region, which had received the name of "clarino," was again divided into two parts: the first began at the eighth proper tone and mounted up towards the extreme high limit of the compass, according to the skill of the executant; the second, beginning at the sixth proper tone, rarely went beyond the twelfth. Each of these parts was confided to a special trumpeter, who executed it by using a larger or a smaller mouthpiece.



Playing the clarino differed essentially from playing the military trumpet, which corresponds in compass to that called principal. Compelled to employ very small mouthpieces to facilitate the emission of very high sounds, clarino players could not fail to alter the tone of the instrument, and instead of getting the brilliant and energetic quality of tone of the mean register they were only able to produce more or less doubtful notes without power and splendor. Apart from this inconvenience, the clarino presented numerous deviations from just intonation. Hence the players of that time failed to obviate the bad effects inevitably resulting from the natural imperfection of the harmonic scale of the trumpet in that extreme part of its compass; in the execution, for instance, of the works of Bach, where the trumpet should give sometimes , and sometimes , the instrumentalist could only command the eleventh proper tone, which is neither the one nor the other of these. Further the thirteenth proper tone, for which  is written, is really too flat, and it is absolutely impossible to remedy this defect, since it entirely depends upon the laws of resonance affecting columns of air.

---

[1] The difficulty of producing the fundamental or first proper note increases with the length and narrowness of the tube. The proportions of the buccina render the production of this note very difficult.

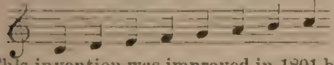
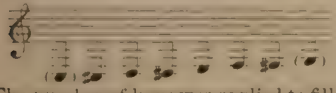
Since the abandonment of the clarino (about the middle of the 18th century) our orchestras have been enriched with trumpets that permit the execution of the old clarino parts, not only with perfect justness of intonation, but with a quality of tone that is not deficient in character when compared with the mean register of the old principal instrument. The introduction of the clarinet or little clarino is one of the causes which led to the abandonment of the older instrument and may explain the preference given by the composers of that epoch to the mean register of the trumpet. The clarino having disappeared before Mozart's day, he had to change the trumpet parts of Handel and Bach to allow of their execution by the performers of his own time. It was now that crooks began to be frequently used. Trumpets were made in F instead of in D, furnished with a series of shanks of increasing length for the tonalities of E, E♭, D, D♭, C, B, B♭, and sometimes even A.

The first attempts to extend the limited resources of the instrument in its new employment arose out of Hampel's idea of lowering the harmonic sounds by introducing the hand into the bell. But, instead of fixing the shanks between the mouthpiece and the upper extremity, they were adapted to the body of the instrument itself by a double slide, upon the two branches of which tubes were inserted bent in the form of a circle and gradually lengthened as required. This modified instrument became known as the "invention horn." This system was applied to the trumpet by Michel Woegel (born at Rastatt in 1748), whose "invention trumpet" had a great success, notwithstanding the unavoidable imperfection of a too great disparity in quality of tone between the open and the closed sounds. The idea of applying the trombone slide to the trumpet is obvious. The slide trumpet is mentioned by T. E. Altenburg,[1] who compares it, and with reason, to the alto trombone; and there are grounds for identifying it with the "tromba da tirarsi" employed by J. S. Bach in some of his compositions. The slide trumpet is still used in England in a somewhat modified form. About 1760, Kolbel, a Russian musician, applied a key to the horn, and soon afterwards the trumpet received a similar addition. By opening this key, which is placed near the bell, the instrument was raised a diatonic semitone, and by correcting errors of intonation by the pressure of the lips in the mouthpiece the following diatonic succession was obtained:



This invention was improved in 1801 by Weidinger, trumpeter to the imperial court at Vienna, who increased the number of keys and thus made the trumpet chromatic throughout its scale. The instrument shown in the accompanying figure is in G; the keys are five in number, and as they open one after another or in combination it is possible to connect the second proper tone with the third by chromatic steps, and thus produce the following succession:



Keyed trumpet.

The number of keys was applied to fill up the gaps between the extreme sounds of the interval of a fifth; and a like result was arrived at more easily for the intervals of the fourth, the major third, etc., furnished by the proper tones of 3, 4, 5, etc. But though the keyed trumpet was a notable improvement on the invention trumpet, the sounds obtained by means of the lateral openings of the tube did not possess the qualities which distinguish sounds caused by the resonance of the air-column vibrating in its entirety. But in 1815 Stölzel made a genuine chromatic trumpet by the invention of the ventile or piston; for this ingenious mechanism, see TROMBONE. The simple trumpet is now no longer employed except in cavalry regiments. It is usually in E♭. The bass trumpet in E♭, which is an octave lower, is sometimes, but rarely, used. Trumpets with pistons are generally constructed in F, with crooks in E and E♭. In Germany trumpets in the high B♭ with a crook in A are very often used in the orchestra. They are easier for cornet à piston players than the trumpet in F. The present writer has recently constructed for the concerts of the Conservatoire at Brussels trumpets in the high D, an octave above the old trumpet in the same key. They permit the execution of the high trumpet parts of Handel and J. S. Bach. The bass trumpet with pistons used for Wagner's tetralogy is in E♭, in unison with the ordinary trumpet with crooks of D and C; but, when constructed so as to allow of the production of the second proper tone as written by this master, this instrument belongs rather to the trombones than to the trumpets. (V. M.)

TRUMPET, SPEAKING AND HEARING. The speaking trumpet, though some instrument of the kind appears to have been in earlier use in more than one part of the world, is connected in its modern form with the name of Athanasius Kircher and that of Sir Samuel Morland, who in 1670 proposed to the Royal Society of London the question of the best form for a speaking trumpet. Lambert, in the *Berlin Memoirs* for 1763, seems to have been the first to give a theory of the action of this instrument, based on an altogether imaginary analogy with the behavior of light. In this theory, which is still commonly put forward, it is assumed that sound, like light, can be propagated in rays. This, however, is possible only when the aperture through which the wave-disturbance passes into free air is large compared with the wave-length. If the fusiform mouth of the speaking trumpet were half a mile or so in radius, Lambert's theory might give an approximation to the truth. But with trumpets whose aperture is only a foot in diameter at most the problem is one of diffraction; and it has not yet been seriously studied from this point of view.

In the case of the hearing trumpet, the disturbance is propagated along the converging tube much in the same way as the tide-wave is propagated up the estuary of a tidal river.

Until the theory has been rigorously worked out the only safe course to adopt in manufacturing either class of instruments is to be guided by the results of varied trials.

The theoretical foundations of the subject will be found in Lord Rayleigh's *Sound* and in Sir G. Airy's *Tides and Waves*, respectively. In speaking and hearing trumpets alike all reverberation of the instrument should be avoided by making it thick and of the least elastic materials, and by covering it externally with cloth.

TRUMPETER, or TRUMPET-BIRD, the literal rendering in 1747, by the anonymous English translator of De la Condamine's travels in South America (p. 87), of that writer's "Oiseau trompette" (*Mém. de l'Acad. des Sciences*, 1745, p. 473), which he says was called "Trompetero" by the Spaniards of Maynas on the upper Amazons, from the peculiar sound it utters. He added that it was the "Agami" of the inhabitants of Para and Cayenne,[2] wherein he was was not wholly accurate, since those birds are specifically distinct, though, as they are generically united, the statement may pass. But he was also wrong, as had been Barrere (*France Equinoxiale*, p. 132) in 1741, in identifying the "Agami" with the "Macucagua" of Marcgrave, for that is a Tinamou (*q.v.*); and both still more wrongly accounted for the origin of the peculiar sound just mentioned, whereby Barrere was soon after led (*Ornith. Spec. Novum*, pp. 62, 63) to apply to the bird the generic and vulgar names of *Psophia* and "Petteuse," the former of which, being unfortunately adopted by Linnæus, has ever since been used, though in 1766 and 1767 Pallas (*Miscellanea*, p. 67, and *Spicilegia*, iv. p. 6), and in 1768 Vosmær (*Descr. du Trompette Américain*, p. 5), showed that the notion it conveys is erroneous. Among English writers the name "Trumpeter" was carried on by Latham and others so as to be generally accepted, though an author may occasionally be found willing to resort to the native "Agami," which is that almost always used by the French.

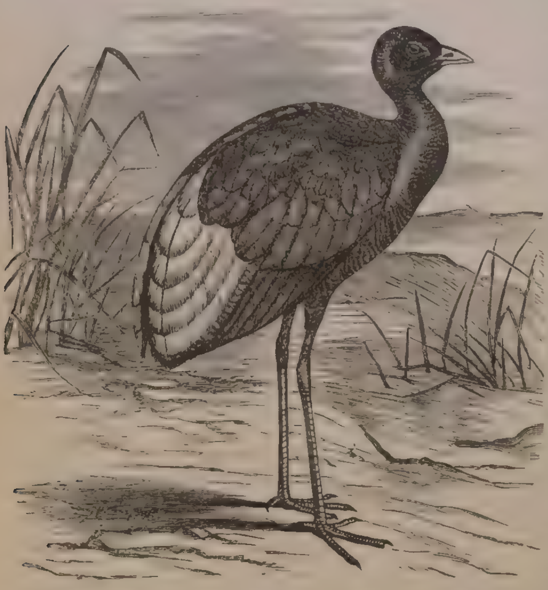
[1] *Versuch einer Anleitung zur heroisch-musikalischen Trompeter- und Pauker-Kunst*, Halle, 1795.

[2] Not to be confounded with the "Heron Agami" of Buffon (*Oiseaux*, vii. p. 382), which is the *Ardea agami* of other writers.



White-winged trumpeter (*Psophia leucoptera*). After Mitchell.

Messrs. Sclater and Salvin in their *Nomenclator* (p. 141) admit 6 species of Trumpet-Birds—(1) the original *Psophia crepitans* of Guiana; (2) *P. napensis* of Eastern Ecuador (which is very likely the original "Oiseau trompette" of De la Condamine); (3) *P. ochroptera* from the right bank of the Rio Negro; (4) *P. leucoptera* from the right bank of the upper Amazons; (5) *P. viridis* from the right bank of the Madeira; and (6) *P. obscura* from the right bank of the lower Amazons near Para. And they have remarked in the Zoological *Proceedings* (1867, p. 592) on the curious fact that the range of the several species appears to be separated by rivers, a statement confirmed by Mr. Wallace (*Geogr. Distr. Animals*, ii. p. 358); and in connection therewith it may be observed that these birds have short wings and seldom fly, but run, though with a peculiar gait, very quickly. A seventh species, *P. cantatrix*, from Bolivia, has since been indicated by Prof. W. Blasius (*Journ. f. Ornith.*, 1884, pp. 203–210), who has given a monographic summary of the whole group very worthy of attention. The chief distinctions between the species lie in color and size, and it will be here enough to describe briefly the best known of them, *P. crepitans*. This is about the size of a large barn-door Fowl; but its neck and legs are longer, so that it is a taller bird. The head and neck are clothed with short velvety feathers; the whole plumage is black, except that on the lower front of the neck the feathers are tipped with golden green, changing according to the light into violet, and that a patch of dull rusty brown extends across the middle of the back and wing-coverts, passing into ash-color lower down, where they hang over and conceal the tail. The legs are bright pea-green. The habits of this bird are very wonderful, and it is much to be wished that fuller accounts of them had appeared. The curious sound it utters, noticed by the earliest observers, has been already mentioned, and by them also was its singularly social disposition towards man described; but the information supplied to Buffon (*Oiseaux*, iv. pp. 496–501) by Manoncour and De la Borde, which has been repeated in many works, is still the best we have of the curious way in which it becomes semi-domesticated by the Indians and colonists and shows strong affection for its owners as well as for their living property—poultry or sheep—though in this reclaimed condition it seems never to breed.[1] Indeed nothing can be positively asserted as to its mode of nidification; but its eggs, according to Mr. E. Bartlett, are of a creamy white, rather round, and about the size of Bantams'. Waterton in his *Wanderings* (Second Journey, chap. iii.) speaks of falling in with flocks of 200 or 300 "Waracabas," as he called them, in Demerara, but added nothing to our knowledge of the species; while the contributions of Trail (*Mem. Wern. Society*, v. pp. 523–532) and Dr. Hancock (*Mag. Nat. History*, ser. 2, ii. pp. 490–492) as regards its habits only touch upon them in captivity.

To the Trumpeters must undoubtedly be accorded the rank of a distinct Family, *Psophiidæ*; but like so many other South American birds they seem to be the less specialized descendants of an ancient generalized group—perhaps the common ancestors of the *Rallidæ* and *Gruidæ*—and they are therefore rightly placed in Prof. Huxley's *Geranomorphæ*.[2] The structure of the syrinx is stated by Trail (*ut supra*) to be quite unique; but his description of it is unsatisfactory, and he clearly had not an adult male to dissect or he would have hardly failed to notice the curious arrangement of the trachea in that sex made known by Hancock (*ut supra*). This, though different from that described in any Crane (*q.v.*), suggests an early form of the structure which in some of the *Gruidæ* is so marvellously developed, for in *Psophia* the windpipe runs down the breast and belly immediately under the skin to within about an inch of the anus, whence it returns in a similar way to the front of the sternum, and then enters the thorax. Analogous instances of this formation occur in several other groups of birds not at all allied to the *Psophiidæ*. The skeleton and some of the detached bones are figured in Eyton's *Osteol. Avium* (pls. xxix. and 5 K). (A. N.)

TRURO, a city, municipal borough, and port of Cornwall, England, is situated on a kind of peninsula formed by the rivers Allen and Kenwyn, which below the town unite with a branch of Falmouth harbor called Truro creek or river. Truro is 300 miles south-west of London by the Great Western Railway, and 11 north of Falmouth, to which there is a branch line. The town is regularly built, chiefly of granite, with spacious streets, through the principal of which there flows a stream of water. The new cathedral of St. Mary by Mr. Pearson, R.A., one of the most important modern ecclesiastical buildings in England, is a fine example of Early English at its best period. The old south aisle of the church previously existing is ingeniously incorporated in the new edifice. The secular buildings include the town-hall and market-house in the Italian style (1846), the corn exchange, the theatre, the public rooms, the music-hall, and the county library (1792). There is also a theological library, presented by Bishop Phillpotts in 1856 and largely augmented by a bequest of books in 1883. Among the educational and benevolent institutions are the grammar-school (founded by a member of the Borlase family, and having two exhibitions at Exeter College, Oxford), the cathedral divinity schools, the Wesleyan middle schools, the literary institution, the royal Cornwall infirmary, the dispensary, and a hospital for ten widows. There is sufficient depth of water in the channel of Truro creek to permit vessels of 70 tons burden to come up to the town quay. The principal imports are coal from Wales and timber from Norway, and the exports consist of tin, iron ores, lead, and zinc, from the mines in the neighborhood. The population of the municipal borough (area 1171 acres) in 1871 was 11,049, and 10,619 in 1881.

---

[1] In connection herewith may be mentioned the singular story told by Montagu (*Orn. Dict.*, Suppl. Art. "Grosbeak, White-winged"), on the authority of the then Lord Stanley, afterwards president of the Zoological Society, of one of these birds, which, having apparently escaped from confinement, formed the habit of attending a poultry-yard. On the occasion of a pack of hounds running through the yard, the Trumpeter joined and kept up with them for nearly three miles.

[2] *Cf.* Parker, *Trans. Zool. Soc.*, x. p. 502 *sq.*

Truro is one of the oldest towns in England. It is the seat of the stannary and other courts connected with the duchy of Cornwall (see CORNWALL, vol. vi. p. 377). It was one of the ancient privileged tin coinage towns. Anciently it was called Tueura, Treura, and Truruburgh. It was a borough by prescription, but was incorporated by Reginald, earl of Cornwall. In the 12th century it belonged to Richard de Lucy. In a charter of Henry VII. it is called the "ville de Teuro." The government was vested in a mayor and burgesses by Elizabeth, who gave the corporation jurisdiction over the port of Falmouth, the port dues of that town being collected by them until its incorporation by Charles II. Norden, writing of Truro in 1574, says, "there is not a towne in the west part of the shire more commendable for neatness of buyldinges, nor more discommendable for the pride of the people." In 1642 Sir Ralph Hopton levied here a large body of men for the king. By the Municipal Act Truro was divided into two wards, and is governed by a mayor, six aldermen, and eighteen councillors. The corporation act as the urban sanitary authority. Truro sent two representatives to parliament from the 23d year of Edward I., but ceased to be separately represented in 1885. By Act 39 and 40 Vict. c. 54, it was constituted the head of a new diocese comprising the archdeaconry of Cornwall.

TRUST. In Roman and English law alike that legal relation between two or more persons implied in the word *trust* was of comparatively late growth. The trust of English law is probably based upon a combination of the Roman conceptions of *usus* and *fideicommissum*. To *usus* is perhaps due the name as well as the idea of that right over property, co-ordinate with the right of the nominal owner, possessed by the person having the use. To *fideicommissum* appears to be due the name as well as the idea of that confidence reposed in another which is the essence of the modern trust. *Usus* was in Roman law a personal servitude, or right of one person over the land of another, confined to his personal wants and without the right to the produce and profits which *ususfructus* carried. It has little in common with the use of English law but the name and the conception of a dual ownership. The *fideicommissum* is more important; see ROMAN LAW, vol. xx. p. 725. By the legislation of Justinian the law of *legata* was practically assimilated to that of *fideicommissa*. The only thing that distinguished the one from the other was the mode in which the gift was made: if by words of direct bequest, it was a *legatum*, if by precatory words, a *fideicommissum*. It may be noticed, as an illustration of the course afterwards taken by the law in England, that *fideicommissa* in favor of the church were so far favored over others that if paid over by mistake they could not be recovered. In addition to *usus* and *fideicommissum*, the Roman division of ownership into quiritary and bonitary (to use words invented at a later time) may perhaps to some extent have suggested the English division into legal and equitable estate. The two kinds of ownership were amalgamated by Justinian. Legal and equitable estate are still distinct in England, though attempts have been made in the direction of amalgamation. The gradual manner in which the beneficiary became subject to the burdens attaching to the property of which he enjoyed the benefit was a feature common to both the Roman and the English system.

Uses in Early English Law.—The use or trust[1] is said to have been the invention of ecclesiastics well acquainted with Roman law, the object being to escape the provisions of the laws against MORTMAIN (*q.v.*) by obtaining the conveyance of an estate to a friend on the understanding that they should retain the use, *i.e.*, the actual profit and enjoyment of the estate. Uses were soon extended to other purposes. They were found valuable for the defeat of creditors, the avoiding of attainder, and the charging of portions. A use had also the advantage of being free from the incidents of feudal tenure: it could be alienated *inter vivos* by secret conveyance, and could be devised by will. In many cases the feoffee[2] to uses, as he was called, or the person seized to the use of another, seems to have been specially chosen on account of his rank and station, which would enable him to defy the common law and protect the estate of his *cestui que use*, or the person entitled to the beneficial enjoyment. The Act of 1 Ric. II. c. 9 was directed against the choice of such persons. This alienation of land in use was looked upon with great disfavor by the common law courts, in whose eyes the cestui que use was only a tenant at will. Possibly the ground of their refusal to recognize uses was that the assizes of the king's court could only be granted to persons who stood in a feudal relation to the king. The denial of the right followed the denial of the remedy. The use was on the other hand supported by the Court of Chancery, and execution of the confidence reposed in the feoffee to uses was enforced by the court in virtue of the general jurisdiction which as a court of conscience it claimed to exercise over breach of faith. Jurisdiction was no doubt the more readily assumed by ecclesiastical judges in favor of a system by which the church was generally the gainer. A double ownership of land thus gradually arose, the nominal and ostensible ownership,—the only one acknowledged in the courts of common law,—and the beneficial ownership protected by the Court of Chancery. The reign of Henry V. to a great extent corresponds with that of Augustus at Rome, as the point of time at which legal recognition was given to what had previously been binding only in honor. The means of bringing the feoffee to uses before the court was the writ of *subpœna*, said to have been invented by John de Waltham, bishop of Salisbury and master of the rolls in the reign of Richard II. By means of this writ the feoffee to uses could be compelled to answer on oath the claim of his cestui que use. The doctrine of the Court of Chancery as to the execution of a use varied according as there was transmutation of possession or not. In the former case it was unnecessary to prove consideration; in the latter, generally a case of bargain and sale, the court would not enforce the use unless it was executed in law,—that is, unless there was a valuable consideration, even of the smallest amount. Where no consideration could be proved or implied, the use resulted to the feoffor. This theory led to the insertion up to a recent date in deeds (especially in the lease of the lease and release period of conveyancing) of a nominal consideration, generally five shillings. Lands either in possession, reversion, or remainder could be granted in use. Most persons could be feoffees to uses. The king and corporations aggregate were, however, exceptions, and were entitled to hold the lands discharged of the use. On the accession of Richard III., who from his position of authority had been a favorite feoffee, it was necessary to pass a special Act (1 Ric. III. c. 5), vesting the lands of which he had been feoffee either in his co-feoffees or, in the absence of co-feoffees, in the cestui que use. The practical convenience of uses was so obvious that it is said that by the reign of Henry VII. most of the land in the kingdom was held in use. The freedom of uses from liability to forfeiture for treason must have led to their general adoption during the Wars of the Roses.[3] The secrecy with which a use could be transferred, contrary as it was to the publicity required for livery of SEISIN (*q.v.*) at common law, led to the interference of the legislature on several occasions between the reigns of Richard II. and Henry VIII., the general tendency of the legislation being to make the cestui que use more and more subject to the burdens incident to the ownership of land. One of the most important statutes was the Statute of Mortmain (15 Ric. II. c. 5), forbidding evasion of the Statute *De Religiosis* of Edward I. by means of feoffments to uses. Other Acts enabled the cestui qui use to transfer the use without the concurrence of the feoffee to uses (1 Ric. III. c. 1), made a writ of *formedon* maintainable against him (1 Hen. VII. c. 1), rendered his heir liable to wardship and relief (4 Hen. VII. c. 17), and his lands liable to execution (19 Hen. VII. c. 15). At length in 1535 the famous Statute of Uses (27 Hen. VIII. c. 10) was passed.[4] The preamble of the statute enumerates the mischiefs which it was considered that the universal prevalence of uses had occasioned, among others that by fraudulent feoffments, fines, recoveries, and other like assurances to uses, confidences, and trusts lords lost their feudal aids, men their tenancies by the curtesy, women their dower, manifest perjuries in trials were committed, the king lost the profits of the lands of persons attainted or enfeoffed to the use of aliens, and the king and lords their rights of year, day, and waste, and of escheats of felons' lands. To remedy this state of things it was enacted, *inter alia*, that, where any person was seized of any hereditaments to the use, confidence, or trust of any other person by any means, the person having such use, confidence, or trust should be seized, deemed, and adjudged in lawful seisin, estate, and possession of such hereditaments. Full legal remedies were given to the cestui que use by the statute. He was enabled to distrain for a rent charge, to have action, entry, condition, etc. The effect of this enactment was to make the cestui que use the owner at law as well as in equity (as had been done once before under the exceptional circumstances which led to 1 Ric. III. c. 5), provided that the use was one which before the statute would have been enforced by the Court of Chancery. For some time after the passing of the statute an equitable as distinct from a legal estate did not exist. But the somewhat narrow construction of the statute by the common law courts in Tyrrel's case[1] (1557) enabled estates cognizable only in equity to be again created. In that case it was held that a use upon a use could not be executed; therefore in a feoffment to A and his heirs to the use of B and his heirs to the use of C and his heirs only the first use was executed by the statute. The use of B being executed in him, that of C was not acknowledged by the common law judges; but equity regarded C as beneficially entitled, and his interest as an equitable estate held for him in trust, corresponding to that which B would have had before the statute. The position taken by the Court of Chancery in trusts may be compared with that taken in MORTGAGE (*q.v.*). The Judicature Act, 1873, while not going as far as the Statute of Uses and combining the legal and equitable estates, makes equitable rights cognizable in all courts. From the decision in Tyrrel's case dates the whole modern law of uses and trusts. In modern legal language use is restricted to the creation of legal estate under the Statute of Uses, trust is confined to the equitable estate of the cestui que trust or beneficiary.

---

[1] Use seems to be an older word than trust. Its first occurrence in statute law is in 7 Ric. II. c. 12, in the form *ops*. In Littleton "confidence" is the word employed. The Statute of Uses seems to regard use, trust, and confidence as synonymous. According to Bacon, it was its permanency that distinguished the use from the trust.

[2] Feoffment, though the usual, was not the only mode of conveyance to uses. The preamble of the Statute of Uses mentions fines and recoveries, and other assurances.

[3] The use, as in later times the trust, was, however, forfeited to the crown on attainder of the feoffee or trustee for treason.

[4] It was adopted in Ireland exactly a century later by 10 Car. I. c. 1 (Ir.). The law of uses and trusts in Ireland is practically the same as that in England, the main differences being in procedure rather than in substantive law.

Uses since 1535.—The Statute of Uses is still the basis of conveyancing. A grant in a deed is still, after the alterations in the law made by the Conveyancing Act, 1881, made "to and to the use of A." The statute does not, however, apply indiscriminately to all cases, as only certain uses are executed by it. It does not apply to leaseholds or copyholds, or to cases where the grantee to uses is anything more than a mere passive instrument, *e.g.*, where there is any direction to him to sell the property. The seisin, too, to be executed by the statute, must be in another than him who has the use, for where A is seized to the use of A it is a common law grant. The difference is important as far as regards the doctrine of POSSESSION (*q.v.*). Constructive possession is given by a deed operating under the statute even before entry, but not by a common law grant (at any rate sufficient to entitle the grantee to be registered as a voter), until actual receipt of rent by the grantee. The operation of the Statute of Uses was supplemented by the Statute of Inrolments and that of Wills. (See WILL.) The Statute of Inrolments (27 Hen. VIII. c. 16) enacted that no bargain and sale should pass a freehold unless by deed indented and inrolled within six months after its date in one of the courts at Westminster or with the *custos rotulorum* of the county. As the statute referred only to freeholds, a bargain and sale of a leasehold interest passed without inrolment. Conveyancers took advantage of this omission (whether intentional or not) in the Act, and the practical effect of it was to introduce a mode of secret alienation of real property, the lease and release, which was the general form of conveyance up to 1845. (See REAL ESTATE, SALE). Thus the publicity of transfer, which it was the special object of the Statute of Uses to effect, was almost at once defeated. In addition to the grant to uses there were other modes of conveyance under the statute which are now obsolete in practice, viz., the covenant to stand seized and the bargain and sale. Under the statute, as before it, the use has been found a valuable means of limiting a remainder to the person creating the use and of making an estate take effect in derogation of a former estate by means of a shifting or springing use. At common law a freehold could not be made to commence *in futuro;* but this end may be attained by a shifting use, such as a grant (common in marriage settlements) to A to the use of B in fee simple until a marriage, and after the celebration of the marriage to other uses. An example of a springing use would be a grant to A to such uses as B should appoint and in default of and until appointment to C in fee simple. The difficulty of deciding where the seisin was during the suspension of the use led to the invention of the old theory of *scintilla juris*, or continued possibility of seisin in the grantee to uses. This theory was abolished by 23 and 24 Vict. c. 38, which enacted that all uses should take effect by force of the estate and seisin originally vested in the person seized to the uses. The most frequent instances of a springing use are powers of appointment, usual in wills and settlements. There has been much legislation on the subject of powers, the main effect of which has been to give greater facilities for their execution, release or abandonment, to aid their defective execution, and to abolish the old doctrine of illusory appointments.

Trusts.—A trust in English law is defined by Mr. Lewin, adopting Coke's definition of a use, as "a confidence reposed in some other, not issuing out of the land, but as a thing collateral, annexed in privity to the estate of the land, and to the person touching the land, for which *cestui que trust* has no remedy but by *subpœna* in Chancery." The term *trust* or *trust estate* is also used to denote the beneficial interest of the cestui que trust. The term *truster* is not used, as it is in Scotland, to denote the creator of the trust. A trust has some features in common with CONTRACT (*q.v.*); but the great difference between them is that a contract can only be enforced by a party or one in the position of a party to it, while a trust can be, and generally is, enforced by one not a party to its creation. It has more resemblance to *fideicommissum.* But the latter could only be created by a testamentary instrument, while a trust can be created either by will or *inter vivos;* nor was there any trace in Roman law of that permanent legal relation which is suggested by the position of trustee and cestui que trust. The heir, too, in Roman law was entitled, from 70 A.D. to the reign of Justinian, to one-fourth of a *hereditas fideicommissaria* as against the beneficiary, while the very essence of the trust is its gratuitous character. Trusts may be divided in more than one way, according to the ground taken as the basis of division. One division, and perhaps the oldest, as it rests on the authority of Bacon, is into *simple* and *special*, the first being where the trust is simply vested in a trustee and the nature of the trust left to construction of law, the second where there is an act to be performed by the trustee. Another division is into *lawful* and *unlawful*, and corresponds to Bacon's division into intents or confidences and frauds, covins, or collusions. A third division is into *public* and *private*, the former being synonymous with charitable trusts. A division often adopted in modern text-books and recognized by parliament in the Trustee Act, 1850, is into *express*, *implied*, and *constructive*. An express trust is determined by the person creating it. It may be either *executed* or *executory*, the former where the limitations of the equitable interest are complete and final, the latter where such limitations are intended to serve merely as minutes for perfecting the settlement at some future period, as in the case of marriage articles drawn up as a basis of a marriage settlement to be in conformity with them. An implied trust is founded upon the intention of the person creating it; examples of it are a resulting trust, a precatory trust, and the trust held by the vendor on behalf of the purchaser of an estate after contract and before conveyance. In this case the vendor is sometimes called a trustee *sub modo* and the purchaser a cestui que trust *sub modo*. A constructive trust is judicially created from a consideration of a person's conduct in order to satisfy the demands of justice, without reference to intention. The distinction between an implied and a constructive trust is not always very consistently maintained. Thus the position of a vendor towards a purchaser after contract is sometimes called a constructive trust. The present law governing trusts rests upon the doctrines of equity as altered by legislation. Its great importance has led to its becoming one of the most highly developed departments of equity. The devolution of successive interests in wills and settlements is almost wholly attained by means of trusts.

Who may be a Trustee or Cestui que Trust.—The modern trust is considerably more extensive in its operation than the ancient use. Thus the crown and corporations aggregate can be trustees, and personalty can be held in trust. Provision is made by the Municipal Corporations Act, 1882, for the administration of charitable and special trusts by municipal corporations. The crown does not appear to be a trustee to as complete a degree as a subject may be. Unsuccessful attempts have recently been made to impress the crown, or a secretary of state as agent of the crown, with trusts of funds voted by parliament for the public service, of booty of war granted by royal warrant, and of money paid over by a foreign state in pursuance of a treaty. There are certain persons who for obvious reasons, even if not legally disqualified, ought not to be appointed trustees. Such are infants, lunatics, persons domiciled abroad, felons, bankrupts, and *cestuis que trustent*. The appointment of any such person, or the falling of any existing trustee into such a position, is generally ground for application to the court for appointment of a new trustee in his place. Any one may be a cestui que trust except a corporation aggregate, which cannot be a cestui que trust of real estate without a license from the crown.

---

[1] Dyer's *Reports*, 155a.

Creation and Extinction of the Trust.—A trust may be created either by act of a party or by operation of law. Where a trust is created by act of a party, the creation at common law need not be in writing. The Statute of Frauds (see FRAUD) altered the common law by enacting that all declarations or creations of trusts or confidences of any lands, tenements, or hereditaments shall be manifested and proved by some writing, signed by the party who is by law enabled to declare such trust, or by his last will in writing, or else they shall be utterly void and of none effect. Trusts arising or resulting by implication or construction of law are excepted, and it has been held that the statute applies only to real estate and chattels real, so that a trust of personal chattels may still be declared by parol. The declaration of a trust by the crown must be by letters patent. Trusts created by will must conform to the requirements of the Wills Act (see WILL). Except in the case of charitable trusts, the cestui que trust must be a definite person. A trust, for instance, merely for keeping up family tombs is void. Alteration of the trust estate by appointment of a new trustee could up to 1860 only be made where the instrument creating the trust gave a power to so appoint, or by order of the Court of Chancery. But now by the Conveyancing Act, 1881 (superseding Lord St. Leonard's Act of 1860), the surviving or continuing trustee or trustees, or the personal representative of the last surviving or continuing trustee, may nominate in writing a new trustee or new trustees. On such appointment the number of trustees may be increased. Existing trustees may by deed consent to the discharge of a trustee wishing to retire. Trust property may be vested in new or continuing trustees by a simple declaration to that effect. By the Conveyancing Act, 1882, a separate set of trustees may be appointed for any part of the property held on distinct trusts. Trusts created by operation of law are either those which are the effect of the application of rules of equity or those which have been constituted by a judicial authority. They include resulting and constructive trusts. A resulting trust is a species of implied trust, and consists of so much of the equitable interest as is undisposed of by the instrument creating the trust, which is said to result to the creator and his representatives. An example is the purchase of an estate in the name of the purchaser and others, or of others only. Here the beneficial interest is the purchaser's. An example of a constructive trust is a renewal of a lease by a trustee in his own name, where the trustee is held to be constructively a trustee for those interested in the beneficial term. An instance of a constructive trust upon which the courts have often been called upon to decide is the fiduciary relation between the promoter of a proposed joint-stock company and the members of the company when formed. The other trusts falling under the head of trusts by operation of law would be those imposed upon a trustee by order of a court, even though they are imposed in pursuance of provisions contained in a trust created by a party. Such would be the trusts which have come within the cognizance of the court by virtue of the Trustee Act, 1850, or in any other way. The powers of the court over trusts have been much extended by legislation. The Act of 1850 (13 and 14 Vict. c. 60) enabled the Court of Chancery to appoint new trustees where expedient, and to make vesting orders in many cases where such orders could not previously have been made, as where a trustee was a lunatic, or an infant, or refused to convey. This Act was extended by the Trustee Extension Act, 1852 (15 and 16 Vict. c. 55). By the Conveyancing Act, 1881, a trustee appointed by the Chancery Division is to have the same powers as if he had been originally appointed a trustee by the instrument creating the trust. The Bankruptcy Act, 1883, enables the court to appoint a new trustee in the place of a bankrupt trustee. Besides being duly created, it is necessary for the validity of the trust that it should be a lawful one. An unlawful trust is one which contravenes the policy of the law in any respect. Examples of such trusts are trusts for a corporation without license, for a perpetuity, and for purposes subversive of morality, such as trusts for illegitimate children to be hereafter born. Superstitious uses (see ROMAN CATHOLIC CHURCH, vol. xx. p. 648) also fall under this head. There are also certain trusts which are avoided by statute under particular circumstances, such as settlements in fraud of creditors (see BANKRUPTCY, SETTLEMENT). The law cannot be evaded by attempting to constitute a secret trust for an unlawful purpose. If an estate be devised by words *prima facie* carrying the beneficial interest, with an understanding that the devisee will hold the estate in trust for such a purpose, he may be compelled to answer as to the secret trust, and on acknowledgment or proof of it there will be a resulting trust to the heir-at-law. In the case of an advowson suspected to be held for the benefit of a Roman Catholic patron, there is a special enactment to the same effect (see QUARE IMPEDIT). The rules of equity in charitable trusts (which include all those mentioned in the preamble to 43 Eliz. c. 4)[1] are less strict than those adopted in private trusts. Charitable trusts must be lawful, *e.g.*, they must not contravene the Statutes of Mortmain; but a wider latitude of construction is allowed in order to carry out the intentions of the founder, and they will not be allowed to fail for want or uncertainty of objects to be benefited. The court, applying the doctrine of *cy près*, will, on failure of the original ground of the charity, apply the funds as nearly as possible in the same manner. On this principle gifts originally made for purely charitable purposes have been extended to educational purposes. Further, trustees of a charity may act by a majority, but ordinary trustees cannot by the act of a majority (unless specially empowered so to do) bind a dissenting minority or the trust property. A trust estate is subject as far as possible to the rules of law applicable to a legal estate of a corresponding nature, in pursuance of the maxim, "Equity follows the law." Thus trust property is assets for payment of debts, may be taken in execution, passes to creditors in bankruptcy, and is subject to dower and curtesy, to the rules against perpetuities, and to the Statutes of Limitation. This assimilation of the legal and equitable estates has been produced partly by judicial decisions, partly by legislation. A trust is extinguished, as it is created, either by act of a party or by operation of law. An example of the former mode of extinction is a release by deed, the general means of discharge of a trustee when the purposes of the trust have been accomplished. Extinction by operation of law takes place when there is a failure of the objects of the trust: *e.g.*, if the cestui que trust die intestate without heirs or next of kin, the trustee retains the property discharged of the trust if it be real estate, if it be personalty it falls to the crown. Equitable interests in real estate abroad are as a rule subject to the *lex loci rei sitæ*, and an English court has no jurisdiction to enforce a trust or settle a scheme for the administration of a charity in a foreign country. An English court has, however, jurisdiction to administer the trusts of a will as to the whole real and personal estate of a testator, even though only a very small part of the estate, and that wholly personal, is in England. This was decided by the House of Lords in a well-known case in 1883.[2]

Rights and Duties of the Trustee.—The principal general properties of the office of trustee, as given by Mr. Lewin, are these: (1) A trustee having once accepted the trust cannot afterwards renounce. (2) He cannot delegate it. (3) In the case of co-trustees the office must be exercised by all the trustees jointly. (4) On the death of one trustee there is survivorship: that is, the trust will pass to the survivors or survivor. (5) One trustee shall not be liable for the acts of his co-trustee. (6) A trustee shall derive no personal benefit from the trusteeship. The office cannot be renounced or delegated, because it is one of personal confidence. It can, however, be resigned, and recent legislation, as has been already stated, has given a retiring trustee large powers of appointing a successor. In the case of the death of a single or last surviving trustee of real estate, the trust estate by the Conveyancing Act, 1881, now devolves upon his personal representative instead of upon his heir or devisee. The liability of one trustee for the acts or defaults of another often raises very difficult questions. A difference is made between trustees and executors. An executor is liable for joining in a receipt *pro forma*, as it is not necessary for him to do so, one executor having authority to act without his co-executor; a trustee can show that he only joined for conformity, and that another received the money. A trustee's receipt in writing is, under the Conveyancing Act, 1881 (superseding Lord St. Leonards's Act of 1860), a sufficient discharge, and exonerates the person paying from seeing that the money paid is duly applied according to the trust. If one trustee be cognizant of a breach of trust committed by another, and conceal it or do not take active measures to protect the cestui que trust's interests, he will be liable for the breach of trust. An indemnity clause is now implied by statute in every trust deed, but this does not protect a trustee against liability which would attach at law. A trustee, if he commit a breach of trust at the request of his cestui que trust, may secure himself by an indemnity, provided that the cestui que trust has been fully informed of the facts of the case, and is not under any disability to consent, such as infancy. The rule that a trustee is not to benefit by his office is subject to some exceptions. He may do so if the instrument creating him trustee specially allows him remuneration, as is usually the case where a solicitor is appointed. Where the trust entirely fails, as has been said above, the trustee is indirectly remunerated by his right to retain the trust estate. The main duties of trustees are to place the trust property in a proper state of security, to keep it (if personalty) in safe custody, and to properly invest and distribute it. A trustee must be careful not to place himself in a position where his interests might clash with his duty. As a rule he cannot safely purchase from his cestui que trust while the fiduciary relation exists between them. In all purchases with trust money he is bound to obtain the best price, unless where an Act of Parliament, like the Housing of the Working Classes Act, 1885, specially authorizes sale at an under value. Investments by trustees demand special notice. The general rule is that a trustee must take as much care of the trust property as of his own. He is, therefore, justified in following the usual course of business adopted by prudent men in making investments, *e.g.*, by employing a stock-broker in the ordinary way. At the same time he has not an uncontrolled power of investment, for (unless authorized by the instrument creating the trust) he cannot lend trust money on personal security or invest in shares of a private company. A trustee of shares may be liable as a beneficial owner, even though his name appears on the register of the company as a trustee. By recent legislation trustees, where not expressly forbidden by the instrument creating the trust, have either an absolute or qualified right to invest in certain securities. They have an absolute right to invest in real securities in the United Kingdom (but not on a second mortgage), in charges or mortgages under the Improvement of Land Act, 1864, in consols, exchequer bills, or any security the interest whereon is guaranteed by parliament, in Bank of England, Bank of Ireland, East India, and Metropolitan Board of Works stock. They have a qualified power of investment (that is, an extension of powers already given in the instrument) in debentures or debenture stock of railway and other companies, and of corporations and local authorities under the Local Loans Act, 1875, in mortgage debentures under the Mortgage Debenture Acts of 1865 and 1870, and in securities of the Isle of Man Government. Trustees under the Settled Land Act, 1882, have somewhat larger powers as to railway stock. In many cases there are restrictions on investment in stock certificates payable to bearer, although in authorized securities. A power of varying investments is generally implied, though not expressly given by statute as in Scotland. The duties of trustees in the distribution of trust funds have been made less onerous by the Trustee Relief Acts of 1847 and 1849, which enabled trustees or a majority of them to pay into the Bank of England to the account of the particular trust any moneys belonging to the trust, thus bringing the property within the jurisdiction of the court, from which it can only be obtained on petition. Similar powers were conferred upon trustees of charities by 18 and 19 Vict. c. 124. By more recent Acts (22 and 23 Vict. c. 35, 23 and 24 Vict. c. 38) applications for advice may be made by a trustee to a judge of the Chancery Division on a petition or summons. The liability of a trustee to his cestui que trust on any claim for property held on an express trust or in respect of breach of such trust is not barred by any statute of limitations, 36 and 37 Vict. c. 66. s. 26 (2). The powers of trustees have lately been considerably extended by the Conveyancing Act, 1881, and the Settled Land Act, 1882, in other matters besides those that have been already noticed. One of the most important of the new powers is that of compounding, compromising, or abandoning claims relating to the trust. For the trustee in bankruptcy, see Bankruptcy. The trustee to preserve contingent remainders, at one time common in conveyancing, has ceased to be necessary (see Remainder, Term). A bare trustee is one to whose office no duties were originally attached, or who, though such duties were attached, would on the requisition of the cestui que trust be compellable to convey the estate to him or by his direction. The term is used in some Acts of Parliament, for instance the Vendor and Purchaser Act, 1874.[1]

---

[1] See CHARITIES, where the preamble of the statute is set out in full.

[2] Ewing *v.* Orr-Ewing, *Law Reports*, 9 Appeal Cases, 34.

Rights and Duties of the Cestui que Trust.—These may be to a great extent deduced from what has been already said as to the correlative duties and rights of the trustee. The cestui que trust has a general right to the due management of the trust property, to proper accounts, and to enjoyment of the profits. He can as a rule only act with the concurrence of the trustee, unless he seeks a remedy against the trustee himself. Thus the trustee must be a party to an action brought in respect of the trust estate, and must join in presenting a petition in bankruptcy on account of a debt due to the estate, but the cestui que trust on giving indemnity can require the trustee to lend his name as a party. He may also require the trustee to execute conveyances of the legal estate according to his directions. Trust property if parted with by the trustee in fraud of the trust may be followed by the cestui que trust, even into the hands of a purchaser for value with notice of the trust. The cestui que trust may lose his rights by fraud, by laches, and by concurrence or acquiescence in a breach of trust. Though no lapse of time bars his remedy against the trustee personally, he cannot, by the terms of the Real Property Limitation Act, 1874, recover land or rent vested in a trustee upon an express trust after twelve years from the time when the right accrued or six years after the cesser of any disability. The equitable right of the cestui que trust has sometimes been recognized by statute in cases where it would be manifestly unjust that he should suffer disability by virtue of his having merely an equitable interest. The cestui que trust has the right of voting for members of parliament, and is qualified to serve as a juror. On bankruptcy of the trustee the trust estate is not affected. Nor was it affected even before the Felony Act, 1870, by the conviction and attainder of the trustee for felony. Attainder of the trustee for treason involved, however, forfeiture of a trust estate of inheritance. (See Treason.) The recognition of the cestui que trust as owner is still not complete. Thus no notice of a trust is recognized in certain public documents, as the books of the Bank of England and the registers kept under the Merchant Shipping Act, 1854, the Companies Act, 1862, the Land Transfer Act, 1875, and the Colonial Stock Act, 1877.

Procedure.—This is regulated almost entirely by legislation. Proceedings relating to a trust may be brought in different courts of first instance,—(1) the Chancery Division of the High Court of Justice or the Chancery Court of the County Palatine of Lancaster, (2) a court of bankruptcy, (3) a county court, (4) a criminal court. (1) By the Judicature Act, 1873, § 34, the execution of trusts, charitable or private, is assigned to the Chancery Division. The rules of the Supreme Court, 1883, provide for special indorsement in an action on a trust, for the parties to the action, for interrogatories and pleading, and for proceeding by originating summons. (See Summons.) Forms of pleading are given in the appendix to the rules. An injunction rather than an action may sometimes be the proper remedy, as in the case of threatened breach of trust. The Trustee Relief Acts, the Trustee Act, and Lord St. Leonards's Act of 1859 provide for proceeding by petition or summons. Applications under the Conveyancing Act must be in chambers in the first instance, and so must applications under the Trustee Relief Acts where the money or securities in court do not exceed £1000 [$4860] or £1000 nominal value. The procedure in charitable trusts differs to some extent from that in use in private trusts. The most usual course of proceeding is by information in the name of the attorney-general. Another mode is by petition under Sir Samuel Romilly's Act, 52 Geo. III. c. 101, superseding the cumbrous procedure by commission which had been previously in use under 43 Eliz. c. 4. A third mode is under the powers of the Charitable Trusts Acts, the first of which was passed in 1853. No proceeding under these Acts can be taken without the authority of the charity commissioners. (2) The equitable debt due from the trustee to the cestui que trust will support a petition in bankruptcy, and is a debt provable in bankruptcy. An order of discharge in bankruptcy does not release the bankrupt from any debt or liability incurred by means of fraudulent breach of trust, nor does it release a co-trustee of the bankrupt. (3) The County Courts Equitable Jurisdiction Act, 1865, confers on county courts the authority of the High Court in the execution of trusts and proceedings under the Trustee Acts where the trust estate does not exceed £500 [$2430] in amount or value. By the County Courts Act, 1867, applications may be made at chambers for transfer to a county court of an action pending in the High Court where the property does not exceed £500 in amount or value. The same Act allows trust funds not exceeding that limit to be paid into the post-office savings bank in a county court town in the name of the registrar. A county court has jurisdiction in charitable trusts where the income of a charity does not exceed £50 [$243]. The county court rules, 1886, contain orders regulating the practice with respect to both private and charitable trusts. Powers similar to those given to county courts in England have been conferred upon the civil bill courts in Ireland. (4) At common law trustees committing a fraudulent breach of trust could not be punished criminally. This was altered by the Fraudulent Trustees Act of 1857, now superseded by the Larceny Act, 1861, under which a trustee on an express trust, whether public or private, created by deed, will, or instrument in writing, who with intent to defraud converts to his own use or benefit or the use or benefit of any other person than the cestui que trust, or for any purpose other than the public or charitable purpose, or otherwise disposes of or destroys such property or any part thereof, is guilty of misdemeanor and punishable with penal servitude for a term not exceeding seven years. No prosecution is to be commenced without the sanction of the attorney-general or—where civil proceedings have been already taken against the trustee—without the sanction of the civil court. The offence cannot be prosecuted at quarter sessions.[1]

---

[1] The phrase "bare trust" occurs as long ago as 1686, Nevil *v.* Saunders, 1 *Vernon's Rep.*, 415.

Scotland. The history of the law differs considerably from that of England, though perhaps the position of the Scotch trustee is now not very different from that of the trustee in England. The Statute of Uses did not apply to Scotland, since neither that nor any similar legislation was necessary in a system in which law and equity were administered by the same tribunals. Trusts seem to have existed from time immemorial, and have been frequently regulated by statute. The policy of the English Statute of Frauds was no doubt intentionally imitated in the Act 1696, c. 25, enacting that no action of declarator of trust should be sustained as to any deed of trust made for thereafter, except upon a declaration or back-bond of trust lawfully subscribed by the person alleged to be trustee and against whom or his heirs or assignees the declarator should be intended, or unless the same were referred to the oath of the party *simpliciter*. The Act does not apply to all cases, but only to those in which by the act of parties documents of title are in the name of a trustee, but the beneficial interest in another. The person creating the trust is called the *truster*, a term unknown in England. On the other hand the term *cestui que trust* is unknown in Scotland. The office of trustee is *prima facie* gratuitous, as in England, it being considered to fall under the contract of mandate. Some of the main differences between English and Scotch law are these. There is no presumption in Scotland of a resulting trust in favor of a purchaser. A trust which lapses by the failure of a beneficiary goes to the crown as *ultimus heres*, not to the trustee. The office of trustee is not a joint office, therefore there is no right of survivorship, and on the death of a trustee the survivors are incompetent to act, unless a certain number be declared or presumed to be a *quorum*, or the office be conferred on trustees and the accedors and survivors of them. Sometimes the concurrence of one trustee is rendered absolutely necessary by his being named *sine quo non*. The Court of Session may appoint new trustees, but generally appoints a judicial factor. There has been a considerable amount of recent legislation, chiefly in the direction of extending the powers of trustees and of the court, in trust matters. By 24 and 25 Vict. c. 84 (amended by 26 and 27 Vict. c. 115) an appointment of gratuitous trustees by deed or local act was to be held to include certain provisions usually included in deeds of appointment, *i.e.*, powers of resignation and of assumption of new trustees, and provisions that the majority of trustees accepting and surviving should be a *quorum*, and that each trustee should only be liable for his own acts and intromissions and should not be liable for omissions. The Trusts Act, 1867 (30 and 31 Vict. c. 97), added to the common law powers of trustees by giving them authority to appoint factors and law agents, to discharge trustees who have resigned, to grant leases for a limited period, to uplift, discharge, or assign debts, to compromise claims, to grant all necessary deeds, and to pay debts due by the truster or the trust estate. It also gave the Court of Session power (exercisable by the lord ordinary in the first instance) beyond what it possessed by its *nobile officium*, in cases of expediency, of selling the trust estate, of granting feus or long leases, and of borrowing and excambion. Power was given to trustees to appoint additional trustees by deed of assumption, and where such assumption could not be made the court might appoint. Authority was conferred upon the beneficiary of a lapsed trust to complete title on petition. The powers of investment given to trustees have since been largely increased by the Trusts Amendment Act, 1884. They are now much the same as those allowed in England. The principal differences are that in Scotland there is a statutory power to vary securities, and that statutory investment by a Scotch trustee is not allowed in Bank of Ireland stock or on real security in Ireland. The Titles to Land Consolidation Act, 1868 (31 and 32 Vict. c. 101), contained provisions as to the mode of completing title by a judicial factor on a trust estate and by trustees in sequestration and as to the vesting in trustees of heritable property conveyed for religious or educational purposes. The Conveyancing Act, 1874 (37 and 38 Vict. c. 94,) dealt with compositions payable by trustees on the death of a vassal, and with completion of title by the heir of a sole or last surviving trustee, by a successor of an *ex officio* trustee and by trustees where words of conveyance are not expressed to be in favor of such trustees. Forms of documents relating to trust property will be found in Juridical Styles and in the schedules to the Acts of 1867, 1868, and 1874. A conveyance in trust may be either absolute with a back-bond or in form a conveyance in trust. A trustee is responsible for the due execution of the trust, subject to the limitations contained in 24 and 25 Vict. c. 84. The provision of the Companies Act, 1862, that no trust is to be entered on the register does not apply to Scotland. A trustee, a member of a joint-stock company, though entered on the register as a trust disponee, may incur personal liability as a partner, unless the contrary be expressed. Liability under such circumstances was established in the litigation which followed the suspension of the City of Glasgow Bank in 1878.[2] A sheriff court has jurisdiction over actions of declarator, relating to questions of heritable right or title, where the value of the subject in dispute does not exceed £50 [$243] by the year or £1000 [$4860] in value (40 and 41 Vict. c 50). A judicial factor may be appointed by the sheriff court where the yearly value of the estate does not exceed £100 [$486] (43 and 44 Vict. c. 4). Fraudulent trustees are criminally liable at common law, not by statutory enactment, as in England. Adjudication on a trust bond is a mode of obtaining the decision of the Court of Session on a bond by a fictitious creditor for the purpose of giving title to the heir, by preventing his liability to possible passive representation. It is regulated by 1695, c. 24.[3]

United States.—In New York and some other States uses and trusts have been abolished (with certain exceptions), and every estate, subject to those exceptions, is deemed a legal right cognizable in courts of law. The exceptions are in New York implied trusts and express trusts to sell land for the benefit of creditors, to sell, mortgage, or lease lands for the benefit of legatees, or for the purpose of satisfying any charge thereon, to receive the rents and profits of lands and apply them to the use of any person during the life of such person or any shorter term, or to receive such rents and profits, and accumulate the same within the limits allowed by the law. Trusts of personalty for public purposes are very generally allowed in States where private trusts do not exist. Provisions similar to those of the English Statute of Frauds have been generally adopted by the States which recognize private trusts. Some States go further than the statute and allow the creation of trusts (other than those arising by implication or operation of law) only by means of will or deed. Where the trust is of real estate, the deed must generally be registered (see REGISTRATION). Forms of deeds of trust are given in the Statutes of Virginia and other States. The English doctrine of *cy près* seems to have been adopted only in Pennsylvania. Conveyances in trust for the settler are generally void against creditors by the policy of the Acts of Elizabeth. By the legislation of some States a freehold may commence *in futuro* without the operation of the Statute of Uses. Societies of professional trustees, receiving a percentage of the income of the property as payment for their trouble and liability, are frequently recognized by law. Such societies are generally under an obligation to make periodical returns of their receipts and expenditure. A public trustee as a corporation sole exists in some States. Trustee process in the New England States is what is generally known as garnishee process in England, that is, a means of reaching property and credits of a debtor in the hands of third persons for the benefit of an attaching creditor.[4] (J. W†.)

TSARITSYN, a district town of the government of Saratoff, Russia, situated on the right bank of the lower Volga where it suddenly turns towards the southeast, only 40 miles distant from the Don. It is the terminus of a railway line which begins at Riga and, running southeastwards, crosses all the main lines which radiate from Moscow to the south. It is also connected by rail with Kałatch on the Don, where merchandise from the Sea of Azoff is disembarked and transported by rail to Tsaritsyn, to be sent thence by rail or steamer to different parts of Russia. Corn from middle Russia for Astrakhan is transferred from the railway to boats at Tsaritsyn; timber and wooden wares from the upper Volga are unloaded here and sent by rail to Kałatch; and fish, salt, and fruits sent from Astrakhan by boat up the Volga are here unloaded and despatched by rail to the interior of Russia. The town has grown rapidly since the completion of the railway system, and has a large trade in naphtha from Baku, which is shipped up the Volga to Tsaritsyn and sent thence by rail to the interior of Russia. The railway between the Baskunchak salt lakes of Astrakhan and the Volga has made Tsaritsyn also a depôt for the salt trade. In 1882 10,000,000 cwts. of merchandise, valued at one million sterling [$4,860,000], were landed at Tsaritsyn, and since then the figures have notably increased. In addition Tsaritsyn is the centre of the trade connected with the mustard plantations of Sarepta, Dubovka, and the neighborhood; 170,000 cwts. of mustard seed are either ground or converted into oil annually, the exports being 70,000 cwts. of mustard and half the corresponding quantity of oil (valued at £250,000) [$1,215,000]. The fisheries of the place are also important. The population (6750 in 1861) numbered 31,220 in 1882. It is still larger in summer, Tsaritsyn having become the gathering-place of poor people in search of work, and the misery and filth in its poorer quarters are very great. The buildings of the town do not improve proportionately with the increase of wealth. They include a (wooden) theatre, a public library, and two gymnasia for boys and girls. The old church of St. John (end of 16th century) is a fine specimen of the architecture of its period.

Tsaritsyn was founded in the 16th century, when a fort was erected to prevent the incursions of the free Cossacks and runaway serfs who gathered on the lower Volga, as also those of the Kalmucks and Circassians. In 1606 Tsaritsyn took part in the rising in favor of the false Demetrius, and Razin took the town in 1670. The Kalmucks and Circassians of the Kubañ attacked it repeatedly in the 17th century, so that it had to be fortified by a strong earthen and palisaded wall, traces of which are still visible.

TSARSKOYE SELO, a district town of Russia, in the government of St. Petersburg, and an imperial residence, 18 miles to the south of the capital, is situated on the Duderhof Hills and consists of the town proper, surrounded by several villages and a German colony, which are summer resorts for the inhabitants of St. Petersburg, and the imperial parks and palaces. The town is built according to a regular plan, and its houses, a great number of which have been erected by the crown, are nearly all surrounded by gardens. The cathedral of St. Sophia is a miniature copy of that at Constantinople. The town has two gymnasia for boys and girls. The imperial parks and gardens cover 1680 acres; the chief of them is the "old" garden containing the "old palace," built by Rastrelli, the gallery of Cameron adorned with fine statues, and numerous pavilions and kiosks. The population numbered 15,000 in 1885.

When Peter I. took possession of the mouth of the Neva a Finnish village, Saari-mois, stood on the site now occupied by the town, and its Russified name Sarskaya was changed into Tsarskoye when Peter I. presented it to his wife Catherine. It was especially embellished by Elizabeth. Under Catherine II., a town, Sophia, was built close by, but its inhabitants were transferred to Tsarskoye Selo under Alexander I. The railway connecting the town with St. Petersburg (1838) was the first to be constructed in Russia.

TSCHUDI, or Schudy, the name of one of the oldest and most distinguished families of the land of Glarus, Switzerland. From 1029 to 1253 a member of the clan held the office of steward of the abbess of Säckingen on the Rhine, the lady of the manor; and after Glarus joined the Swiss Confederation in 1352 various members of the family held high political offices at home, and were distinguished abroad as soldiers and in other ways. In literature, its most eminent member was Giles or Ægidius Tschudi (1505–1572), who, after having served his native land in various offices, in 1558 became the chief magistrate or "landammann." Originally inclined to moderation, he became later in life more and more devoted to the cause of the counter-Reformation. It is, however, as the historian of the Swiss Confederation that he is best known; by incessant wanderings and unwearied researches amongst original documents he collected material for three great works, which therefore can never wholly lose their value, though his researches have been largely supplemented and corrected by those of more recent students. In 1538 his book on Rhætia, written in 1528, was published in Latin and in German—*De prisca ac vera Alpina Rhætia*, or *Die uralt wahrhafftig Alpisch Rhätia.*

His other works were not published until long after his death. The *Beschreibung Galliæ Comatæ* appeared under Gallati's editorship in 1758, and is mainly devoted to a topographical, historical, and antiquarian description of ancient Helvetia and Rhætia, the latter part being his early work on Rhætia revised and greatly enlarged. This book was designed practically as an introduction to his *magnum opus*, the *Chronicon Helveticum*, part of which (from 1100 to 1470) was published by J. R. Iselin in two stately folios (1734–36); the rest (to 1564) consists only of rough materials. The value of the work rests very largely on the constant use of original documents, no fewer than 750 being printed in Iselin's edition, though the transcripts do not always in point of accuracy come up to the standard demanded by the modern critical historian. Many ballads are incorporated and also many oral traditions, both being employed to give life and picturesqueness to his story, though often at the expense of historical truth, the stock instance of which is the manner in which he completed and elaborated the Tell legend (see Tell). In many ways his book, save in its flowing and quaint German, is rather like the work of a 14th-century chronicler than a critical history; but it has been the source from which all later Swiss writers have drawn their information, and in many cases preserves the evidence of original documents which have since disappeared. It is in short a history rather resembling that of Livy than that of Hallam or Stubbs.

Subjoined is a list of other prominent members of the family. Dominic (1596–1654) was a Benedictine monk at Muri and wrote a painstaking work, *Origo et genealogia gloriosissimorum comitum de Habsburg* (1651). Joseph, a Benedictine monk at Einsiedeln, wrote a useful history of his abbey (1823). The family, which became divided in religious matters at the Reformation, also includes several Protestant ministers,—John Henry (1670–1729), who wrote *Beschreibung des Lands Glarus* (1714); John Thomas (1714–1788), who left behind him several elaborate MSS. on the local history of Glarus; and John James (1722–1784), who compiled an elaborate family history from 900 to 1500, and an account of other Glarus families.[1] John Louis (d. 1784), who settled in Metz and contributed to the *Encyclopédie*, and Friedrich (1820–1886), the author of *Das Thierleben der Alpenwelt*, were distinguished naturalists. Among the soldiers may be mentioned Christopher (1571–1629), a knight of Malta and an excellent linguist, who served in the French and Spanish armies; while the brothers Louis Leonard (1700–1779) and Joseph Anthony (1703–1770) were in the Neapolitan service. Valentine (1499–1555), the cousin of Giles, was, like the latter, a pupil of Zwingli, whom he afterwards succeeded as pastor of Glarus, and by his moderation gained so much influence that during the thirty years of his ministry his services were attended alike by Catholics and Protestants.

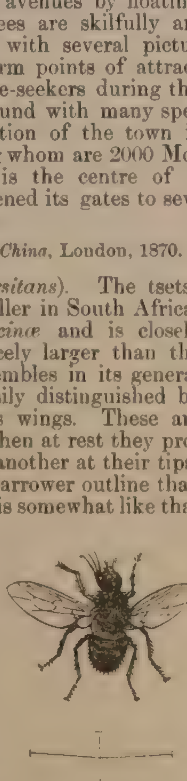
---

[1] [*John James Von Tschudi*, a grandson of the historian, born 1818, is noted as a diplomatist, linguist and explorer. He explored Peru and Brazil from 1838 to 1859; published a Peruvian grammar and dictionary in 1853; was Swiss minister to Brazil in 1860; and at Vienna in 1866.—Am. Ed.]

TSE-NAN FOO, the capital city of the province of Shantung in China, stands in 36° 40′ N. lat. and 117° 1′ E. long. It is situated in one of the earliest settled districts of the empire, and figures repeatedly in the records of the wars which troubled the country during the six centuries that preceded the Christian era. On the establishment of the Han dynasty (B.C. 206) it had the name which it now bears; but during the next 200 years it was known at different periods as P'ing-yuen, Ts'ien-sh'ing, and Po-hai. In the 4th century its name was changed to Tse; and by the founder of the T'ang dynasty (618–907) it was christened Lin-tsze, by which name it was known until the overthrow of the Mongol dynasty in the 14th century, when the name of Tse-nan was restored to it. The city, which lies in the valley of the present channel of the Yellow river (Hoang-Ho), and at a short distance from its banks, is surrounded by a triple line of defence. First is the city wall, strongly built and carefully guarded, outside this a granite wall, and beyond this again a mud rampart. The streets are full of good shops, among which book, picture, and flower shops are conspicuous. There are two fine examination halls, one for bachelors of arts and the other for doctors of law, several handsome temples, and a metropolitan "drum" tower. The most noticeable feature about the city is three springs outside the west gate, which throw up as many streams of tepid water to a height of about 2 feet. This water, which is pleasant to the taste, and is highly prized for its healing qualities, flows in such abundant quantities that it fills the moat and forms a fine lake in the northern quarter of the city. With the taste which Chinamen always show in such matters, the lake is divided into a number of water avenues by floating banks, on which flowers and trees are skilfully arranged, and is further adorned with several picturesque summer houses, which form points of attraction to picnic parties and pleasure-seekers during the warmer months. Its waters abound with many species of edible fish. The population of the town is reckoned at about 100,000, among whom are 2000 Mohammedan families. The city is the centre of a Roman Catholic see, and has opened its gates to several Protestant missionary bodies.

See Williamson, *Journeys in North China*, London, 1870.

TSETSE FLY (*Glossina morsitans*). The tsetse fly, so much dreaded by the traveller in South Africa, belongs to the sub-family *Muscinæ* and is closely allied to *Stomoxys*. It is scarcely larger than the common house fly, which it resembles in its general shape. It can, however, be easily distinguished by its color and the position of its wings. These are longer than the abdomen, and when at rest they project behind it, overlapping one another at their tips. This gives the fly a longer and narrower outline than that of the house fly. The color is somewhat like that of the honey bee: the thorax is chestnut brown with four longitudinal black stripes, the abdomen light yellow with transverse bars of dark brown on its dorsal surface. The proboscis, with which the fly inflicts its sting, is grooved and contains two long styles; and it is guarded by a pair of setose palps. At the base of the proboscis is a dilated horny bulb, and in this swelling it is supposed that the poison is secreted. The bite of the tsetse is innocuous to man and is not more painful than that of a gnat. Large game, goats, and apparently all animals whilst suckling, are also unaffected by it. But to the horse, ox, and dog it is fatal. The poison may take effect after a few days, or the animal may remain apparently unaffected for some months; but eventually symptoms of poisoning appear. These symptoms seem to be rather variable; as a rule swellings arise under the jaws and around the navel, the eyes and nose begin to run, and, although the animal continues to graze, it becomes more and more emaciated, suffers violently from purging, and at length succumbs to extreme exhaustion. Post-mortem examination shows that the muscles, and especially the heart, are in a very soft and flabby condition. The lungs and liver are affected, the gall bladder distended with bile. The fat is of a greenish yellow color and oily consistency, the blood small in quantity and very thin, with hardly any power of staining. At present no cure is known for the bite, nor does inoculation seem to afford any protection. The fly is said to avoid animal excreta, and in some parts a paste composed of milk and manure is smeared on cattle which are about to pass through the "fly-belts." This affords a certain amount of protection. Lion's fat is used in the same way, and is said to be efficacious.



Tsetse fly (*Glossina morsitans*).

The fly is found as a rule in the neighborhood of water, and its habitat is usually sharply defined. Often it occurs on one side of a stream but not on the other. The limits of the "fly-belts" are well known to the natives, and travellers can ensure comparative safety to their cattle by passing through these districts after sundown. The northern limits of the area inhabited by the tsetse are not known. It is found throughout the valley of the Limpopo river, but does not come much south of this, except in the eastern borders of the Transvaal. Here it extends far south of Delagoa Bay, and infests the Lobombo Mountains and the Amatonga country, reaching to the confines of Santa Lucia Bay. It appears to be gradually retreating northwards, following the big game.

The fly is figured in *Proc. Zool. Soc.*, 1850, and by Frank Oates, *Matabele Land and the Victoria Falls*, 1881.

TUAM, a market town and episcopal city of Galway, Ireland, is the terminus of the Athenry and Tuam Railway, and lies 20 miles northeast of Galway and 129 west of Dublin. An abbey was founded here towards the end of the 5th century, and in the beginning of the 6th an episcopal see by St. Jarlath. The new Protestant cathedral of St. Mary occupies the site of the original cathedral, built in 1130, and includes the chancel arch of the ancient building, now forming the great doorway,—a very fine specimen of the old Romanesque. The Roman Catholic cathedral in the later Early English style is one of the finest modern Catholic churches in Ireland. Adjoining it is the Roman Catholic college of St. Jarlath, usually called the "New College," founded in 1814 for the education of candidates for the priesthood. To the west are the archbishop's palace and a convent of Presentation nuns. The other public buildings are the workhouse, the dispensary, and the market-house. The town has a considerable retail trade, and is a centre for the disposal of agricultural produce. From 4223 in 1871 the population decreased to 3567 in 1881.

The see of Tuam was raised to an archbishopric about 1152. Under the Church Temporalities Act of 1839 it was reduced to a bishopric, but is still the seat of a Roman Catholic archbishop. It received its first charter in the 11th year of James I. It formerly returned two members to parliament, but was disfranchised at the Union.

TUAMOTU ARCHIPELAGO,[1] a broad belt of seventy coral islands lying between 14° 5′ and 23° 22′ S. lat. and 134° 25′ and 148° 40′ W. long., and now under the protection of France. They trend in irregular lines in a northwest and southeast direction, and cover 1500 miles of the Pacific, the easternmost Tuamotus being 3600 miles from Peru.[2] With the exception of a few insignificant islands the archipelago consists of atolls (see CORALS and PACIFIC OCEAN), mostly chains of low islets that crown the reefs and sometimes also obstruct the deep lagoons which they encircle. The largest island, Nairsa (Dean's Island), with a lagoon 45 miles long by 15 wide, is made up of twenty islets. Fakarava, the next in size, consists of fifteen islets, and its oblong lagoon affords the best anchorage in the group. Hao has fifty islets, and its lagoon is dangerously studded with coral. The symmetrically placed eleven islets of Anao suggested to Captain Cook the name of Chain Island. Matahiva, Niau, and Mururoa are good specimens of the horseshoe-shaped atoll. Nengonengone, Fangataufa, and Marutea, true lagoon islands, form unbroken rings round their lake-like lagoons. In a few of the smaller atolls the lagoons have been completely silted up. To the southeast lie the Gambier Islands, a cluster of four larger and many smaller volcanic islets, enclosed in one wide reef. The wooded crags of Mangareva, the largest islet, 5 miles in length, rise to a height of 1300 feet and are covered with a rich vegetation, quite Tahitian in character; but, as in the other Tuamotus, there is a dearth of animal life. This group was discovered by Captain Wilson of the London Missionary Society in 1797. Tahitian teachers were sent thither in 1834; but Catholic missionaries followed in 1836, and converted the entire population. The natives, once very numerous, now number less than a thousand, and are still decreasing. Cannibalism was formerly prevalent. In physique, language, religion, and custom the Gambier Islanders closely resemble the Rarotongans. Beechey surveyed the group in 1826, and D'Urville in 1838. Pitcairn Island and a few uninhabited rocks lie still farther to the southeast. The Tuamotus are healthy and as a rule have a lower mean temperature than Tahiti. The easterly trade winds prevail. Rain and fogs occur even during the dry season. The stormy season lasts from November to March, when devastating hurricanes are not uncommon and a southwesterly swell renders the western shores dangerous. Plants and animals are very meagrely represented, even more so than in the atolls of Micronesia. Cocoa-palms and the pandanus thrive on many of the islets, and the bread-fruit, banana, pineapple, and arum have been introduced from Tahiti into the western islands. Mammals are represented by a rat; among land-birds a parakeet, a thrush, and a dove are noticeable; and of reptiles there is only one lizard. Insects are scarce. But the sea and lagoons teem with turtle, fish, mollusks, crustaceans, and zoophytes. Coral grows luxuriantly everywhere. From the abundance of pearl-oysters the archipelago gets its name of Pearl Islands; pearl-fishing indeed is the only remunerative industry. Under French control the newest appliances for obtaining shells have now mostly superseded the laborious diving of the natives. The Tuamotus are very thinly inhabited by a fine strong Polynesian race, more muscular and mostly darker-skinned than that inhabiting Tahiti. In the west considerable intermixture with other races has taken place. Of the habits of the people little is known, and many of the islands are still marked "hostile inhabitants" on the English Admiralty charts. In the eastern islands cannibalism existed. Tattooing is not universal. Clothing and ornaments are very scanty. The huts are mean square buildings, often mere shelters of leaves. Good outrigger and single and double canoes are built, the larger ingeniously stitched together of small pieces of drift wood. Fishing with net and hook is much practiced. Food besides fish consists almost exclusively of cocoa-nuts and pandanus fruit. Water is scarce.

---

[1] There is no collective name for the archipelago among the Tuamotuans themselves, but the Tahitians call it Paumotu (*i.e.*, Cloud of Islands). The group is Bougainville's Dangerous Archipelago, Fleurieu's Bad Sea, Krusenstern's Low Islands, and the Pearl Islands of traders.

[2] Distinct names have been given to eight clusters of the archipelago,—Disappointment Islands, King George's Islands, Palliser Islands, Raeffsky Islands, Two Groups, Duke of Gloucester Islands, Actæon or Amphitrite group, and Gambier Islands.

Magellan's first discovery of land after reaching the Pacific in 1520 was one of the Tuamotus. Various portions of the archipelago were in turn crossed by Queiros (1605) Lemaire and Schouten (1616), Roggeween (1722), Byron (1765), Wallis (1767), Bougainville (1768), Cook (1769), the "Duff" (1797), Krusenstern (1803), Kotzebue (1816), Fitzroy (1835), D'Urville (1838), and Belcher (1840). The first systematic survey was instituted in 1818 by Bellinghausen, and was continued in 1823 by Duperry, in 1826 by Beechey, and in 1839 by Wilkes. Thanks to these many explorers, the islands have been christened and rechristened with a chaos of Spanish, Dutch, English, French, German, and Russian names.

See the narratives of the various explorers cited above, and Meinicke, *Inseln des stillen Oceans* (Leipsic, 1876); for general statistics and an account of the pearl-fisheries, see *Notices Coloniales*, Paris, 1886.

TUBERCLE. See PATHOLOGY, vol. xviii. p. 415, and PHTHISIS.

TUBEROSE. The cultivated tuberose (*Polianthes tuberosa*) is allied to the Mexican agaves and is a native of the same country. The tuberous root-stock sends up a stem 3 feet in height, with numerous lanceolate leaves and terminal racemes of white funnel-shaped, very fragrant flowers. Each flower is about 1½ inches long, with a long tube and a six-parted limb. The stamens are six in number, emerging from the upper part of the tube, and bear linear anthers. The ovary is three-celled; but the mature fruit and seed are not botanically known. The plant is largely grown in the United States and at the Cape of Good Hope for export to England, as it is found that imported bulbs succeed better than those grown in the United Kingdom. The cultivated plants have double flowers and require a rich soil, considerable heat, and, at first, abundance of water.

TÜBINGEN, the university town of Würtemberg, is picturesquely situated on the hilly and well-wooded banks of the Neckar, at the junction of the Ammer and Steinlach, 18 miles S.S.W. of Stuttgart, and on the S.E. border of the Black Forest. The older town is irregularly built and unattractive, but the newer suburbs, the chief of which is the Wilhelmsstrasse, are handsome. The most conspicuous building is the old ducal castle of Hohentübingen, built in 1507–1540 on a hill overlooking the town, and now containing the university library, observatory, chemical laboratory, etc. Among the other chief buildings are the quaint old Stiftskirche (1469–83), and the new aula and numerous institutes of the university, all of which are modern. A monument was erected in 1873 to the poet Uhland (1787–1862), who was born and is buried here. Tübingen's chief claim to attention lies in its famous university, founded in 1477 by Duke Eberhard. The university adopted the Reformed faith in 1534, and in 1536 a Protestant theological seminary—the so-called Stift—was incorporated with it. In 1817 a Roman Catholic theological faculty (the "Convict") and a faculty of politics and economics were added, and in 1863 a faculty of science. The leading faculty has long been that of theology, and an advanced school of theological criticism, the founder and chief light of which was F. C. BAUR (*q.v.*), is known as the Tübingen school. Melanchthon was lecturer at Tübingen before he was summoned to Wittenberg. The university is attended by about 1400 students, a considerable proportion of whom are foreigners, and has a teaching staff of 53 professors, 17 extraordinary professors, and 10 lecturers. The commercial and manufacturing industries of the town are slight. Printing, book-selling, the manufacture of surgical and philosophical instruments, and the cultivation of hops, fruit, and vines are among the leading occupations of the inhabitants. The population in 1885 was 12,660 (11,708 in 1880). The country in the neighborhood of Tübingen is very attractive; one of the most interesting points is the former Cistercian monastery of Bebenhausen, founded in 1185, and now a royal hunting-chateau.

Tübingen is mentioned as a strong fortress in 1078. In 1342 it was purchased by the count of Würtemberg, whose descendants afterwards acquired the title of duke. The treaty of Tübingen is the name given in German history to an arrangement made in 1514 between Duke Ulrich and his subjects, by which the latter acquired various rights and privileges on condition of relieving the former of his debts. The town was captured by the Swabian League in 1519, by Turenne in 1647, and again in 1688 by the French, who destroyed the fortifications. Tübingen was made a garrison town in 1875.

TUCKER, ABRAHAM (1705–1774), holds a place of his own among the English moralists of the 18th century. He was born in London, of a Somerset family, on 2d September, 1705. His father, a wealthy city merchant, died in his son's infancy, leaving him to the guardianship of his uncle, Sir Isaac Tillard, a man of a rare integrity of character, to whom Tucker never failed to acknowledge a deep debt of gratitude. In 1721 Tucker entered Merton College, Oxford, as a gentleman commoner. Here he devoted himself chiefly to philosophical and mathematical studies, but also found leisure to master French and Italian, and to acquire considerable proficiency in music. He afterwards studied law at the Inner Temple, but as his fortune made him independent of a profession he was never called to the bar. In 1727 he bought Betchworth Castle, near Dorking, where he passed the remainder of his life, occupied, in addition to his favorite studies, with the usual pursuits of a well-to-do country gentleman. He took no part in politics, however, and even wrote a pamphlet, *The Country Gentleman's Advice to his Son on the Subject of Party Clubs* (1755), cautioning young men against the dangers of rashly pledging themselves to political principles and measures of which their riper judgment may disapprove. In 1736 Tucker married Dorothy Barker, the daughter of a neighboring landed proprietor. His wife, to whom he was fondly attached, died in 1754, leaving him with two daughters. "As soon as the first excess of his grief was somewhat mitigated," we are told, "he occupied himself in collecting together all the letters that had passed between them at periods when they were accidentally separated from each other, which he transcribed twice over, under the title of 'The Picture of Artless Love.' One copy he gave to Mr. Barker, his father-in-law, and the other he kept, and frequently read over to his daughters." He took an active part in the education of his daughters, and from this time onward began to occupy himself with the composition of the work by which he is known—*The Light of Nature Pursued.* He made several sketches of the plan of his work, one of which—in dialogue—he went the length of printing before finally deciding on the method he should pursue. He also sought to qualify himself for authorship by the study of the most elegant Greek and Latin classics and by translating the most admired passages of Cicero, Demosthenes, and Pliny several times over. Moreover, after his work was written, he twice transcribed it with his own hand. In 1763 he published a specimen under the title of "Free Will." The strictures of a critic in the *Monthly Review* of July, 1763, drew from him a pamphlet called *Man in Quest of Himself, by Cuthbert Comment.* This, as its sub-title states, is "a defence of the individuality of the human mind or self"; it has been reprinted in Parr's *Metaphysical Tracts* (1837). In 1765 the first four volumes of his work were published under the pseudonym of Edward Search. The remaining three volumes did not appear till after his death. His eyesight failed him completely in 1771, but his cheerfulness did not leave him. He contrived an ingenious apparatus which enabled him to write so legibly that the result could easily be transcribed by his daughter. In this way he completed the later volumes, which were ready for publication when he was seized by his last illness. He died on 20th November, 1774.

A second edition of *The Light of Nature* appeared in 1805, with a short life of the author by his grandson, Sir H. P. St. John Mildmay, which forms the sole biographical source. The work has since been repeatedly republished in two large closely printed volumes. A useful abridgment was published (anonymously) by Hazlitt in 1807; for, as he truly says, it is "swelled out with endless repetitions of itself. The author was a private gentleman, who wrote at his ease, and for his own amusement. When a subject presented itself to him, he exhausted all he had to say upon it, and then dismissed it for another. If the same subject recurred again in a different connection, he turned it over in his thoughts afresh; as his ideas arose in his mind, he committed them to paper; he repeated the same things over again or inserted any new observation or example that suggested itself to him in confirmation of his argument; and thus by the help of a new title, and by giving a different application to the whole, a new chapter was completed. By this means, as he himself remarks, his writings are rather a tissue of loose essays than a regular work." In spite of Tucker's elaborate care in composition, there is no doubt that this fairly characterizes the rambling prolixity of his book; but it may be questioned whether an epitome can convey the real merits of such a style and treatment—qualities which have earned for Tucker from Sir James Mackintosh the designation of a "metaphysical Montaigne." These are his sound hearty common sense, the originality of a man who looks at everything for himself completely untrammelled by system, a remarkable aptness in illustration, and occasional gleams of a mild humor. Though the *Light of Nature* embraces in its scope many psychological and more strictly metaphysical discussions, it is chiefly in connection with ethics that Tucker's speculations are remembered. This is the subject which the author puts into the foreground himself; from his earliest youth, he tells us, his thoughts took a turn "toward searching into the foundations and measures of right and wrong." In some important points Tucker anticipates the utilitarianism shortly afterwards systematized by Paley, and Paley, it may be noted, expresses in the amplest terms his obligations to his predecessor. "Every man's own satisfaction" Tucker holds to be the ultimate end of action; and satisfaction or pleasure is one and the same in kind, however much it may vary in degree. This universal motive is further connected, as by Paley, through the will of God, with the "general good, the root where out all our rules of conduct and sentiments of honor are to branch." Tucker adopts from Hartley the principle of association, or, as he calls it, "translation," to explain the formation of the moral sentiments and the phenomena of disinterested action generally. In his general analysis of the mind he professes to follow Locke, though with great latitude in details, and even in much that is not matter of detail.

TUCKER, JOSIAH (1711–1799), dean of Gloucester from 1758, a sagacious and candid writer on politics and political economy. See POLITICAL ECONOMY (vol. xix. p. 378).

TUCSON, a city in Pima county, Arizona Territory, United States, is situated in 32° 13′ N. lat. and 110° 53′ W. long. at an elevation of 2403 feet above the sea, upon the Santa Cruz river and on the Southern Pacific Railroad, about 70 miles from the Mexican frontier. The surrounding country is arid and barren, except where it has been fertilized by irrigation. The climate is exceedingly hot and dry. The principal industries of Tucson, besides stock-rearing, are connected with mining, as it is a supply point for mining districts in the neighboring mountains and has several smelting works. The population which in 1860 was 915, in 1870 3224, had grown by 1880 to 7007, and in 1887 was estimated to number nearly 10,000. About one-half are of foreign birth, a large proportion being Mexicans. Tucson is one of the oldest settlements in the United States, having been founded as a Jesuit mission by the Spaniards in the 17th century.

TUCUMAN, or, more fully, **SAN MIGUEL DE TUCUMAN**, capital of the province of Tucuman, in the Argentine Republic, is a straggling town on the right bank of the Tala (a subtributary of the Rio Salado), at the eastern base of the Sierra de Aconquija, in 26° 50′ S. lat. and 64° 35′ W. long. It is connected by rail with Cordova and Rosario. The surrounding district is fertile and also produces excellent timber. Leather and sugar are the principal objects of industry. The population was recently estimated at 17,000.

TUDELA, a city of Spain, in the province of Navarre, is situated on the right bank of the Ebro where it is joined by the Queyles, and on the railway from Zaragoza to Pamplona, about 50 miles to the northwest of the former city. The Ebro is here crossed by a fine old bridge, 400 yards in length, consisting of seventeen arches. The only building within the town of any interest is the fine church of Santa Maria, founded in 1135 and consecrated in 1188, the doorways and cloisters being especially rich in sculptural ornamentation. The manufactures of the place (cloth, silk, pottery) are unimportant. There is some trade in wine and oil. The population within the municipal boundaries in 1877 was 10,086.

Tudela, anciently *Tutela*, was the birthplace of the celebrated mediæval traveller BENJAMIN (*q.v.*) of Tudela. It was made an episcopal see in 1783, which was suppressed in 1851.

TUDOR, HOUSE OF. See HENRY VII. and LANCASTER, HOUSE OF, vol. xiv. p. 256.

TUKE, SAMUEL (1784–1857), English philanthropist, son of Henry Tuke, born at York in 1784, greatly advanced the cause of the amelioration of the condition of the insane, and devoted himself largely to the York Retreat, the methods of treatment pursued in which he made more widely known by his *Description of the Retreat near York*, etc. (York, 1813). His writings on the construction of asylums and on other subjects connected with the insane are well known. He died in 1857.

TUKE, WILLIAM (1732–1822), English philanthropist, was born at York in 1732. He devoted himself to many philanthropic objects, but his name is more especially known in connection with the humane treatment of the insane, for whose care he projected in 1792 the Retreat at York, which became famous both abroad and in Great Britain as an institution in which a bold attempt was made to manage lunatics without the excessive restraints then regarded as essential. Not less remarkable was the departure from the beaten track of treatment in regard to copious bleedings and the frequent administration of emetics and depressing remedies. The asylum was entirely under the management of the Society of Friends, and remains so at the present time, but there are a large number of inmates not connected in any way with this body. The original character of the methods pursued at the Retreat attracted much attention, and its marked success led to comparisons being made between it and other establishments, the abuses in some of which became so notorious as to be brought under the notice of parliament, and led to more stringent legislation in the interests of the insane. The condition of this unfortunate class became greatly improved in consequence. William Tuke did not live to see the most important of the Acts passed, but when he died, in 1822, the superiority of the treatment adopted at the Retreat was fully acknowledged.

See *Report of the Select Committee of the House of Commons*, 1815–1816; Dr. Conolly, *Treatment of the Insane without Mechanical Restraints*, 1856; Dr. Hack Tuke, *Chapters in the History of the Insane in the British Isles*, 1882.

HENRY TUKE (1756–1814), son of the preceding and father of Samuel Tuke, co-operated with his father in the reform at the York Retreat. He was the author of several moral and theological treatises, which have been translated into German and French.

TULA, a government of central Russia, bounded by Moscow on the N., Ryazañ on the E., Tamboff and Orel on the S., and Kaluga on the W., has an area of 11,950 square miles. It is intersected from southwest to northeast by a gently undulating plateau, from 950 to 1020 feet in height, which separates the drainage area of the Oka from that of the Don. The average elevation of Tula is about 800 feet, and its surface is an undulating plain; but the rivers flow in valleys so deeply cut and so scored with ravines, that in their neighborhood the country assumes the aspect of a hilly region. Devonian limestones, dolomites, and sandstones appear chiefly in the southwest; Lower and Middle Carboniferous limestones and clays occupy the remainder of the area. The former contain deposits of coal, which are now worked (chiefly at Malevka and Novoselsk) to the extent of nearly one and a half million cwts. annually. Jurassic clays are found in patches here and there. Glacial boulder clay covers most of the region, while Lacustrine deposits are widely spread in the valleys and depressions. Iron-ore is found all over the government; limestone, fire-clay, and pottery clay are also obtained. The soil is black earth in the south and east and clay or sandy clay in the northwest. Tula is watered chiefly by the Oka and its tributaries (Upa, Zusha, Osetr, and Pronya). The Don rises in Lake Ivan-Ozero (which feeds also a tributary of the Oka), and has a course of 35 miles within Tula. It is not navigable, and Peter I.'s attempt to connect it with the Oka by means of a canal was never carried out. Lakes and marshes (chiefly in the northwest) are few. Forests (8 per cent. of the area) are rapidly disappearing. The climate is less rigorous than that of Moscow, the average yearly temperature being 40.2° Fahr. (January, 13.8°; July, 67.5°).

The flora of Tula deserves some attention as marking the transition from that of the southeast steppes to that of northwest Russia. A line drawn on the northern slope of the water-parting already mentioned (a few miles to the south of the city of Tula) divides the province into two parts, of which the southern is a black earth region and the other is chiefly covered with boulder clay. The boundary is marked by a series of crown forests—formerly a means of defence against the nomad tribes, whence their name Zasyeka—which at the same time constitute a line that is not passed by several species characteristic of the steppe region, such as the *Lilia* of the steppes, *Lilium Martagon*, *Linum flavum*, *Lathyrus pisiformis*, *Geranium sanguineum*, *Pyrethrum corymbosum*, and *Serratula heterophylla*. On the other hand, several northern species, which are quite common in the marshes of Moscow, do not penetrate into Tula, and several others, such as *Linnæa borealis*, *Viola palustris*, *Cirsium palustre*, *Pedicularis palustris*, do not cross the Zasyeka. The same forests shelter several northern species which do not appear either in northern or southern Tula, as also several southern herbaceous plants which are now only occasionally met with in the black earth steppes of south Russia. Several West-European plants (*Sanicula europæa*, *Carex remota*, *Cephalanthera ensifolia*, *Allium ursinum*) find their eastern limits in Tula. Another interesting feature is the extension down the valley of the Oka, not only of pine-forests, which are not found elsewhere within the province, but also of many herbaceous plants originally from the south or southwest. The steppe flora of Tula is being rapidly impoverished in consequence of the spread of agriculture: many steppe plants are now found only in their last retreats on the dry uncultivated limestone crags.

The population of the government (750,000 in 1777) in 1883 was 1,360,000, of whom 115,770 were urban. They are all Great Russians, and either Orthodox Greeks or Raskolniks. Their chief occupation is agriculture, 70 per cent. of the area being arable. Nearly one-half of the soil belongs to landlords and merchants, and the other half to the peasant communities (53 per cent. of the area, and 58 per cent. of the land under culture). The crops for 1883–85 averaged 7,574,200 quarters of grain and 10,172,000 bushels of potatoes, largely used for distilleries. Beet-root culture is increasing (8520 acres in 1885, yielding 59,800 cwts. of sugar). The growth of tobacco is also spreading (10,000 cwts. in 1885). There were in 1883 380,620 horses, 203,500 cattle, and 786,000 sheep. Manufactures are rapidly developing: their aggregate production was valued at £1,649,720 [$8,017,639.20] in 1883 (distilleries £293,956 [$1,428,626.16], sugar-works £601,827 [$2,924,879.22], tanneries £148,356 [$721,010.16], iron works, brass works, etc., about £150,000 [$729,000]). Petty trades, especially the manufacture of tea-urns, small brass ware, and harmoniums, and also weaving, are extensively carried on and support a lively export trade; timber, raw metals, and various manufactured wares are imported. The government is traversed by the Moscow and Sebastopol and the Ryazhsk and Vyazemsk Railways, as well as by the Oka. The government is divided into twelve districts, the chief towns of which, with their population in 1882, are TULA (see below), Alexin (4960), Bogoroditsk (8030), Byeleff (9300), Epifañ (3820), Efremoff (7770), Kashira (4610), Krapivna (1560), Novosil (4660), Odoeff (5140), and Tcherñ (2675). Byeleff, Alexin, and Kashira are important loading places on the Oka. The villages Malevka (coal-mines) and Nikitino have more than 5000 inhabitants each.

History.—Before the Slavonic immigration, the territory of Tula was inhabited by the Mordves on the north and the Mestchers in the south. The Slavs who occupied the Oka belonged to the branch of the Vyatichis, who were soon compelled to pay a tribute to the Khazars. Subsequently the territory on the Oka belonged to the principality of Tchernigoff, thus maintaining its connection with southwest Russia. In the 14th century part of it fell under the rule of Ryazañ and Moscow, while the remainder was under Lithuanian dominion till the 15th century. Several of the towns of Tula were founded in the 12th century, but the colonization of this fertile region went on slowly on account of the raids of the Tatars.

TULA, capital of the above government, is situated on the Upa, 120 miles by rail to the south of Moscow. Other railway lines connect it with Ryazañ and Orel. It is built in the broad but low, marshy, and unhealthy valley of the Upa and is divided into three parts,—the Posad on the left bank, the Zaryetskaya or Oruzheinaya on the right bank, and Tchulkova between the Upa and the Tulitsa. It is an old town of Old Russia, but its growth began only towards the end of the 18th century after the manufacture of arms had commenced, and now (1887) its population has reached 65,100 (63,500 in 1882). They are employed chiefly either at the imperial gun factory or at numerous private factories (about 130, with 4350 men) and small workshops. The main branch of the industry is the making of rifles (from 20,000 to 30,000 annually). Next in importance comes the manufacture of *samovars* (tea-urns), in which more than 5000 persons are engaged. All sorts of cutlery and ironmongery are manufactured in the small workshops of Tula, which have a high repute in Russia. No fewer than 240,000 harmoniums are turned out annually; nearly 150,000 cwts. of steel, iron, and brass are imported every year for this industry alone.

The town of Tula is first mentioned in 1147; but its former site seems to have been higher up the Tulitsa. Its wooden fort was replaced in 1514–1521 by a stone "kreml," which still exists. Boris Godunoff founded a gun factory at Tula in 1595, and in 1632 a Dutchman, Winius, established an iron foundry. Michael Alexis and Peter I., especially the last-named, took great interest in the gun factories, and large establishments were built in 1705 and 1714, which soon turned out 15,000 rifles in a year. Catherine II. and Paul I., further improved the manufactures, which during the wars with France supplied more than half a million rifles.

TULIP (*Tulipa*), a genus of bulbous herbs belonging to the *Liliaceæ*. The species are found wild along the northern shores of the Mediterranean, in the Levant, Armenia, Caucasus, Persia, Central Asia, and Afghanistan. The cup-shaped flowers have six regular segments in two rows, as many free stamens, and a three-celled ovary with a sessile stigma, which ripens into a leathery many-seeded capsule. The species are numerous and are distinguished one from another by the scales of the bulb being woolly or smooth on the inner surface, by the character of the flower-stalks, by the filaments being hairy or otherwise, and by other characters. Owing to the great beauty of the flowers they have been favorites in European gardens for two or three centuries, and have been crossed and recrossed till it has become almost impossible to refer the plants to their original types. The early flowering "Van Thol" tulips, the segments of which are mostly scarlet with yellow edges, are derived from *T. suaveolens*, a native of the Caspian region. *T. Gesneriana*, a native of Armenia and central Russia, is the origin of some of the later flowering varieties. *T. pubescens*, thought by Mr. Baker to be a hybrid between the two species just named, is the source of some of the early flowering kinds known as "pottebakker," etc. *T. oculus solis* and *T. Clusiana* are lovely species, natives of southern France, and *T. silvestris*, with elegant yellow pendulous flowers, is a doubtful native of England. During the last few years, owing to the exertions of Russian naturalists, a large number of new species have been discovered in Turkestan, and introduced into Europe. Some of these are very beautiful, and render it probable that by intercrossing with the older species still further difficulties will be presented in the way of identification. These difficulties are further enhanced by the fact that, quite apart from any crossbreeding, the plants, when subjected to cultivation, vary so greatly in the course of two or three years from the original species from which they are directly descended that their parentage is scarcely recognizable. This innate power of variation has enabled the florist to obtain, and ultimately to "fix," so many remarkable varieties. At the present day tulips are less fashionable than they once were, and consequently the enormous prices given for new or improved varieties no longer obtain, though, even now, two and three guineas [$10 and $15] are asked for special bulbs. It must, however, be remembered that the "tulipomania" of the 17th century was really a form of gambling, in which admiration of the flower and interest in its culture were very secondary matters. Tulips were introduced into the low countries in the 16th century from Constantinople and the Levant by way of Vienna and Venice. There is a legend that an Antwerp merchant, to whom bulbs were sent, cooked them for onions; and to this day the natives of some parts of Persia and Afghanistan use the bulbs of *Tulipa chrysantha* for food. The mode of growth of a tulip bulb is worthy of attention. In spring, at the flowering period, each bulb is a composite structure. It consists, first, of the bulb of the year, which produces the flowers and the leaves. From the axil of one (or more) of the scales of the flowering bulb emerges a secondary bulb, destined to form leaves and flowers for the next season's growth. In like manner from the side of the second generation are produced tertiary bulbs, which flower in the third year after their formation. Each bulb, therefore, has an existence of three years, flowering in the third year, and dying afterwards, so that the bulb planted in the autumn is not the same one that flowered in the spring, but a second generation. For the cultivation of tulips, see HORTICULTURE, vol. xii. p. 268.

TULLE, a town of France, chef-lieu of the department of Corrèze and a bishop's see, is 61 miles east-northeast of Pêrigueux by the railway from Bordeaux to Clermond-Ferrand. The town rises picturesquely on both banks of the Corrèze, a sub-tributary of the Dordogne. The Corrèze, crossed by four bridges, flows between embankments, and the narrow streets on the steep left bank are connected by stairs. Of the 12th-century cathedral only the porch and the nave of six bays remain, the choir and transept having been destroyed in 1793; but there is a 14th-century tower, with a fine stone steeple. The neighboring cloister (13th century) is being restored. The abbot's house (15th century) has a carved doorway and well-preserved windows; and some curious houses of the 12th, 13th, and 14th centuries still exist. Tulle possesses normal schools for male and female teachers, and is the headquarters of the Historical Society of Lower Limousin. The principal industry is the manufacture of firearms. The Government establishments employ from 1500 to 3000 workmen, and can turn out 70,000 guns annually. Manufactories for the variety of lace called "tulle" were first established here. There is a collection of the firearms of all nations. The population in 1886 was 10,635 (commune 16,275).

Tulle (*Tutela Lemovicum*) owed its importance in the Middle Ages to an abbey founded by St. Martin, or, according to another authority, in the 7th century, which was raised to a bishopric in 1317. Mascaron was bishop in the 17th century. The town was taken by the English in 1346, and was subsequently ravaged by the Black Death. It was again conquered by the English in 1369; but, when the inhabitants succeeded in freeing themselves, they were exempted from all imposts by Charles V. The viscount of Turenne, leader of the Protestants, tried in vain to seize Tulle in 1577, but was successful in 1585.

TULLE, a term restricted in England to a fine bobbinnet of silk, used for veils, scarfs, millinery purposes, and trimmings of ladies' dresses, etc. The French used the word to mean all machine-made lace the basis of which is the intertwisted net-work made on the bobbinnet machine. The word is derived from the town of Tulle in France (see above).

TULLOCH, John (1823–1886); Scottish theologian, was born at Bridge of Earn, Perthshire, in 1823, went to school at Perth, and received his university education at St. Andrews and Edinburgh. In 1845 he became minister of St. Paul's, Dundee, and in 1849 of Kettins, in Strathmore, where he remained for six years. His literary gifts, shown in his contributions to various reviews, as well as his talent for society drew attention to him, and in 1854 he was appointed to the principalship of St. Mary's College, St. Andrews. The appointment was immediately followed by the appearance of his Burnet prize essay on *Theism*. At St. Andrews, where he held along with the principalship the post of professor of systematic theology and apologetics, his work as a teacher was distinguished by several features which at that time were new. He lectured on comparative theology and treated doctrine historically, as being not a fixed product but a growth. From the first he secured the attachment and admiration of his students. In 1862 he was appointed one of the clerks of the General Assembly, and from that time forward he took a leading part in the councils of the Church of Scotland. In 1878 he was chosen moderator of the Assembly. No one, except perhaps Dr. Robert Lee, has done more during the last generation to widen the national church. Two positions on which he repeatedly insisted in the Assembly have taken a firm hold on the mind of that church,—first, that it is of the essence of a church to be comprehensive of various views and tendencies, and that a national church especially should seek to represent all the elements of the life of the nation; secondly, that subscription to a creed can bind no one to all its details, but only to the sum and substance, or the spirit of the symbol. For three years before his death he was convener of the church interests committee of the Church of Scotland, which had to deal with a great agitation for disestablishment. He was also deeply interested in the reorganization of education in Scotland, both in school and university, and acted as one of the temporary board which settled the primary school system under the Education Act of 1872. His death took place at Torquay on 13th February, 1886.

Tulloch's best known works are collections of biographical sketches of the leaders of great movements in church history, such as the Reformation and Puritanism. His most important book, *Rational Theology and Christian Philosophy* (1872), is one in which the Cambridge Platonists and other leaders of dispassionate thought in the 17th century are similarly treated. He delivered the second series of the Croall lectures, on the *Doctrine of Sin*, which were afterwards published. He also published a small work, *The Christ of the Gospels and the Christ of History*, in which the views of Renan on the gospel history were dealt with; a monograph on *Pascal* for Blackwood's Foreign Classics series; and a little work, *Beginning Life*, addressed to young men, written at an earlier period. *A Life* of Tulloch by Mrs. Oliphant is in preparation.

TULLUS HOSTILIUS, third legendary king of Rome, is represented as having reigned for thirty-two years (670–638 B.C.). His successful wars with Alba, Fidenæ, and Veii shadow forth the earlier conquests of Latian territory and the first extension of the Roman domain beyond the walls of Rome. See Rome, vol. xx. p. 752.

TUMKUR, or Toomkoor, a district of India, in the west of the Nandidrúg division of Mysore, situated between 12° 43′ and 14° 10′ N. lat. and 76° 10′ and 77° 30′ E. long., with an area of 3420 square miles. It is bounded on the north by the Bellary district, on the east by Kolar and Bangalore, on the south by Mysore, and on the west by Chitaldrúg and Hassan. Tumkur consists chiefly of elevated land intersected by river valleys. A range of hills rising to nearly 4000 feet crosses it from north to south, and forms the water-parting between the systems of the Krishna and the Káveri. The principal streams are the Jayamangala and the Shimsha. The mineral wealth of Tumkur is considerable: iron is obtained in large quantities from the hill sides; and excellent building stone is quarried. The slopes of the Devaráy-durga Hills, a tract of 18 square miles, are clothed with forests, in which large game are numerous, including tigers, leopards, bears, and wild hogs. The climate of Tumkur is generally considered as equable and healthy; the average annual rainfall amounts to nearly 33 inches. The Mysore State Railway enters the district at the southeast corner and traverses it to the west.

In 1881 the population of Tumkur numbered 413,183 (males 203,253, females 209,930), embracing 395,443 Hindus, 17,130 Mohammedans, and 603 Christians. Tumkur town, situated at the base of the Devaráy-durga Hills, 43 miles northwest of Bangalore, with a population of 9909, is the administrative headquarters. The cultivated products consist chiefly of *rági*, millet, wheat, sugar-cane, various pulses, and oil seeds. Of the total area 745 square miles are cultivated and 1544 cultivable. The chief industries are the making of coarse cotton cloths, woollen blankets, and ropes. The exports comprise *rági*, unhusked rice, cocoa-nuts, areca-nuts, earth salt, pulses and vegetables; the imports include European piece goods, rice, spices, cotton, etc.

The history of Tumkur is common to the rest of Mysore. After the assumption of the administration of Mysore by the British in 1832 the district received its present name and limits.

TUMOR. See Pathology, vol. xviii. p. 373–79, and Surgery, vol. xxii. p. 722.

TUMULUS. See Architecture, vol. ii. p. 336, and Barrows, vol. iii. 342.

TUNBRIDGE, or Tonbridge, a town of Kent, England, is situated on rising ground above the Medway, and on the South-Eastern Railway, 41 miles (by rail) southeast of London and 33 northwest of Hastings. The Medway is crossed by a stone bridge, erected in 1775. The town consists chiefly of one long main street and a large number of suburban villas. The church of St. Peter and St. Paul, chiefly Decorated and Perpendicular with some portions of an earlier date, has lately been restored. The grammar school, founded by Sir Andrew Judd, an alderman of London, in the 1st year of Edward VI., was rebuilt in 1865, remodelled in 1880, and extended in 1887. Among other public buildings are the town hall and market house, the public hall, and the free library. Some traffic is carried on by the Medway, which has been made navigable for barges. Tunbridge ware, chiefly sold at Tunbridge Wells, is largely manufactured. There are gunpowder mills on the banks of the Medway; and wool-stapling, brewing, and tanning are carried on. The population of the urban sanitary district (area 1200 acres) in 1871 was 8209 and in 1881 it was 9317.

Tunbridge owed its early importance to the castle built by Richard, earl of Clare, in the reign of Henry I. The castle was besieged by William Rufus, was taken by John in the wars with the barons, and again by Prince Edward, son of Henry III. Subsequently it became the property of the Staffords, and on the attainder of the duke of Buckingham in the reign of Henry VIII. was taken possession of by the crown. It was dismantled during the Civil War. The remains now consist chiefly of a finely preserved gateway flanked by two round towers. Formerly it was defended by three moats, one of them formed by the Medway. The lords of the castle had the right of attending the archbishops of Canterbury on state occasions as chief butlers.

TUNBRIDGE WELLS, an inland watering-place of England, chiefly in Kent but partly in Sussex, is situated in the midst of charming and picturesque scenery, on the South-Eastern Railway and at the terminus of a branch line of the London, Brighton, and South Coast Railway, 46 miles (by rail) southeast of London and 5 south of Tunbridge. It owes its popularity to its chalybeate spring and its romantic situation. The wells are situated near the Parade (or Pantiles), a walk associated with fashion since the time of their discovery. The houses and shops in the Parade somewhat resemble the Rows at Chester. It was paved with pantiles in the reign of Queen Anne. The town is built in a picturesquely irregular manner, and a large part of it consists of districts called "parks," occupied by villas and mansions. On Rusthall common, about a mile from the town, is the curiously shaped Toad Rock, and about a mile southwest the striking group called High Rocks. The principal public buildings are the pump-room, the town-hall, the corn exchange, the public hall, the mechanics' institute, the friendly society's hall, the dispensary and infirmary, and the provident dispensary. The Tunbridge Wells sanatorium is situated in grounds sixty acres in extent, and is capable of receiving 150 visitors. There is a large trade in Tunbridge ware, which is made chiefly at Tunbridge, and includes work tables, boxes, toys, etc., made of hard woods, such as beech, sycamore, holly, and cherry, and inlaid with mosaic. The town is governed by a local board of twenty-four members. The population of the urban sanitary district (area 3351 acres) in 1871 was 19,410, and in 1881 24,308.

The town owes its rise to the discovery of the medicinal springs by Dudley, Lord North, in 1606. Henrietta Maria, wife of Charles I., retired to drink the waters at Tunbridge after the birth of her eldest son Charles. Soon after the Restoration it was visited by Charles II. and Catherine of Braganza. It was a favorite residence of Anne previous to her accession, and from that time became one of the special resorts of London fashion. It reached the height of its comparative popularity in the latter half of the 18th century, and is specially associated with Colley Cibber, Samuel Johnson, Cumberland the dramatist, Garrick, Richardson, Reynolds, Beau Nash, Miss Chudleigh, and Mrs. Thrale. The Tunbridge of that period is sketched with much graphic humor in Thackeray's *Virginians*. Though it still attracts an increasing number of visitors, its importance in reference to London society has considerably declined.

T'UNG-CHOW, a sub-prefectural city in Chih-li, the metropolitan province of China, is situated on the banks of the Peiho in 39° 54′ N. lat. and 116° 41′ E. long., about 12 miles southeast of Peking. Like most Chinese cities, T'ung-Chow has appeared in history under various names. By the founder of the Han dynasty (206 B.C.) it was called Lu-Hien; with the rise of the T'ang dynasty (618 A.D.) its name was changed to Heuen-Chow; and at the beginning of the 12th century, with the advent of the Kin dynasty to power, Heuen-Chow became T'ung-Chow. The city marks the highest point at which the Peiho is navigable, and here merchandise for the capital is transferred to a canal, by which it reaches Peking. The city, which is faced on its eastern side by the river, and on its other three sides is surrounded by populous suburbs, is upwards of 3 miles in circumference. The walls are about 45 feet in height and about 24 feet wide at the top. They are being allowed to fall into decay. Two main thoroughfares run through the city, one connecting the north and south gates, and the other the east and west gates. The place derives its importance from the fact that it is the port of Peking. Its population was estimated at about 50,000 in 1887.

It was at T'ung-Chow that Sir Harry Parkes, Sir Henry Loch, and their escort were treacherously taken prisoners by the Chinese when they were sent forward by Lord Elgin to negotiate terms of peace after the troubles of 1860.

TUNGSTEN (Germ. *wolfram*, or, antiquated, *scheel*), one of the metallic elements of chemistry. The mineral tungsten (meaning in Swedish "heavy stone") used to be taken for a tin ore until this was disproved by Cronsted. Scheele showed in 1781 that it is a compound of lime with a peculiar acid, the metallic nature of which was recognized in the same year by Bergmann. It occurs only as a component of a number of relatively rare minerals, the most important of which are wolfram or wolframite, (Fe, Mn) $O.WO_3$, and scheelite (tungsten), $CaOWO_3$ (see MINERALOGY). The metal is prepared from the pure oxide WO_3 by reduction with hydrogen in a platinum tube at a high temperature. It forms resplendent tin-white or gray plates, or a dull black powder similar to hydrogen-reduced iron. Sp. gr. = 19.129, water of 4° C. [39.2° F.] = 1 (Roscoe). It is more difficult to fuse than even MANGANESE (*q.v.*). It is unalterable in ordinary air; oxygen and even chlorine act upon it only at a high temperature. Hydrochloric and sulphuric acid do not attack it. Nitric acid attacks it slowly, aqua regia readily, with formation of the trioxide WO_3. Impure tungsten is now being prepared industrially for the production of a peculiar kind of steel (see IRON, vol. xiii. p. 362.)

Chlorides.—Tungsten forms four chlorides,—WCl_2, WCl_4, WCl_5, WCl_6. The highest, WCl_6, is obtained by heating the pure powdery metal in a current of absolutely pure chlorine. In the presence of moisture or air oxy-chlorides are produced. It sublimes off as a dark red liquid, freezing into crystals. These fuse at 275° C. [527° F.] and re-solidify at 270° [518° F.]; the liquid boils at 346.7° [656° F.]. The sp. gr. of the vapor is in accordance with the formula at 350° [662° F.]; at higher temperatures it dissociates into WCl_5 and free Cl_2 (Roscoe). When the vapor of WCl_6 is passed over heated trioxide, the two bodies unite, WO_3 with $2WCl_6$ into $3WOCl_4$, forming magnificent red needles, which fuse at 210.4° [410.7° F.] and boil at 227.5° C. [441.5° F.] (Wöhler). Both compounds, WCl_6 and $WOCl_4$, are decomposed by water, the oxy-chloride more readily, with formation of hydrochloric acid and trioxide. For other chlorides and oxy-chlorides, see the ordinary hand-books of chemistry.

Oxides, WO_2 and WO_3, and Compounds of These with Each Other.—The trioxide, popularly known as tungstic acid, is the more important. Impure trioxide is producible by treating scheelite (WO_3CaO) with hot hydrochloric acid. Wolframite is not so readily decomposed; but when fused with twice its weight of chloride of calcium it passes into lime salt, obtainable as an insoluble residue by lixiviation of the fuse with water. The oxide obtained forms a yellow powder insoluble in water and in hydrochloric acid. To purify it, it is washed, dissolved in aqueous ammonia, and the filtered solution evaporated, when an acid tungstate of ammonia separates out in scales of great purity. These, when heated in air, leave behind them a pseudo-morphose of pure yellow oxide. Trioxide of tungsten combines with basic oxides into tungstates; but the proportion in which it unites with a given base is subject to great variation: for instance, the quantity Na_2O of soda unites into so many definite tungstates with 1, $1\frac{1}{2}$, 2, $2\frac{1}{3}$, $2\frac{2}{5}$, $2\frac{1}{2}$, 4 times WO_3 and in each case more or less of water. To each of these soda salts corresponds theoretically a certain tungstic acid,—to the salt $Na_2OW_2O_6$, for instance, the acid $H_2OW_2O_6$ or $H_2W_2O_7$. But few of these hydrates actually exist, and they are not individual acids in the sense in which the three phosphoric acids are, except perhaps that remarkable substance known as metatungstic acid, $H_2W_4O_{13} + 7H_2O$. This acid forms crystals of the stated composition; it dissolves in water and the solution unites with bases into meta-tungstates. Most meta-tungstates are soluble in water; of the tungstates proper only the alkali salts are so soluble. The soda tungstate, $5Na_2O \, . \, 12WO_3 + xH_2O$, known as para-tungstate of soda, is made industrially by fusing wolframite with carbonate of soda and lixiviating the fuse with water. The insoluble oxides of iron and manganese are filtered off; the filtrate, while still hot, is nearly neutralized with hydrochloric acid and allowed to crystallize. It forms large crystals containing twenty-one, twenty-five, or twenty-eight times H_2O according to the temperature at which they are formed. The salt has been recommended as a mordant in dyeing and calico-printing, but has not taken root in these industries. Oppenheim and Versmann recommended it before 1862 as the best means for rendering textile fabrics uninflammable. If a solution of the para-tungstate is boiled with hydrated tungstic acid (as obtained by precipitating any ordinary alkaline tungstate solution with hydrochloric acid in the heat), or is simply mixed with excess of acetic acid, the meta-tungstate is formed; in the latter case it separates out as a heavy oil. Meta-tungstate of soda forms octahedral crystals of the composition $Na_2O \, . \, 4WO_3 + 10H_2O$. If concentrated warm solutions of this salt and the equivalent quantity of chloride of barium are mixed and allowed to cool after addition of a little hydrochloric acid, meta-tungstate of barium crystallizes out as $BaO.4WO_3 + 9H_2O$, in large quadratic pyramids which are very easily soluble in water. From this salt the free acid is easily produced by addition of the exact quantity of sulphuric acid required to precipitate the baryta, and from it any other meta-tungstate is easily produced. Meta-tungstic acid solution is a sensitive and characteristic precipitant for almost all alkaloids (strychnine, quinine, etc.). The alkaloid, whatever its name, goes down as a flocculent insoluble meta-tungstate. Tungstic acid combines with phosphoric acid and with silicic acids into highly complex phospho-tungstic acids and silico-tungstic acids. Of the former there is quite a series, each consisting of one P_2O_5 united with respectively fourteen, sixteen, eighteen, twenty, twenty-two, twenty-four times WO_3 and six H_2O of basic water. Of silico-tungstic acids three are known, namely, one $4H_2O.SiO_2.10WO_3 + 3Aq$ and two $SiO_2.12WO_3xH_2O$. All these complex acids (both kinds) are easily soluble in water. The phospho acids are delicate precipitants for all alkaloids.

The binoxide, WO_2, is obtained when the trioxide is reduced by hydrogen at a dull red heat. This oxide is very prone to pass into trioxide or tungstate. An interesting and beautiful class of compounds of WO_3, WO_2, and bases are known as tungsten bronzes. The first of these was discovered by Wöhler. Normal tungstate of soda, Na_2OWO_3, is fused, and trioxide added to it as long as it dissolves. The product is then heated in hydrogen as long as water goes away, and the substance thus reduced is exhausted successively with water, hydrochloric acid, caustic potash ley, and again with water. A residue of the composition $Na_2O.W_2O_6 + WO_2$ remains in the shape of magnificent gold-like lustrous cubes, of specific gravity 6.617, which conduct electricity like a metal. Only hydrofluoric acid dissolves this soda-tungsten bronze. There are a number of other tungsten bronzes, all distinguished by metallic lustre and magnificent purple, red, yellow, or blue colors.

Analysis.—Oxides of tungsten dissolve in fused microcosmic salt, $Na_2OP_2O_5$; the bead becomes blue in the reducing flame, in the presence of iron blood-red, and in the oxidizing flame colorless. When heated on charcoal with (not too much) carbonate of soda or cyanide of potassium in the reducing flame, they yield a gray heavy powder of metal, obtainable by elutriation. The process fails in the presence of too much alkali. Insoluble tungstates (*e.g.*, the ordinary tungsten minerals) are disintegrable by fusion with alkaline carbonate; the fuse, when treated with water, yields a solution of alkaline tungstate. This solution, when mixed with excess of hydrochloric acid, gives a white precipitate of hydrated trioxide, which on boiling becomes yellow by partial dehydration. The yellow unignited precipitate is soluble in aqueous ammonia. If tungstate of alkali solutions are mixed with hydrochloric acid and then treated with metallic zinc, they become blue through the formation of a compound of WO_3 and WO_2 or rather the respective chloride; this reaction gains in definiteness through the presence of phosphoric acid.

(W. D.)

TUNGUSES, a wide-spread Asiatic people, forming a main branch of the Mongol division of the Mongol-Tatar family. They are the *Tung-hu* of the Chinese, probably a corrupt form of *tonki* or *donki*, that is, "men" or "people." The Russian form *Tungus*, wrongly supposed to mean "lake people," appears to occur first in the Dutch writer Massa (1612); but the race has been known to the Russians ever since they reached the Yenisei. The Tungus domain, covering many hundred thousand square miles in central and east Siberia and in the Amur basin, stretches from the Yenisei eastwards to the Pacific, where it occupies most of the seaboard between Corea and Kamchatka. It also reaches the Arctic Ocean at two points, in the Nisovaya tundra, west of the Khatanga river, and in a comparatively small enclosure in the Yana basin over against the Liakhoff (New Siberia) Archipelago. But the Tunguses proper are chiefly centred in the region watered by the three large eastern tributaries of the Yenisei, which from them take their names of the Upper, Middle or Stony, and Lower Tunguska. Here the Tunguses are known to the Samoyedes by the name of *Aiya* or "younger brothers," implying a comparatively recent immigration (confirmed by other indications) from the Amur basin, which appears to be the original home both of the Tunguses and of the closely-allied Manchus. The Amur is still mainly a Tungus river almost from its source to its mouth: the Oroches (Orochus), Daurians, Birars, Golds, Manegrs, Sanagirs, Ngatkons, Nigidals, and some other aboriginal tribes scattered along the main stream and its affluents,—the Shilka, Sungari, and Usuri,—are all of Tungus stock and speech. On the Pacific the chief subdivisions of the race are the Lamuts, or "sea people," grouped in small isolated hunting communities round the west coast of the Sea of Okhotsk, and further south the Yu-pi-ta-tze ("fish-clad"), the Tazi of the Russians, between the Amur delta and Corea. The whole race, exclusive of Manchus, numbers probably about 80,000, of whom 15,000 are in the Amur basin, the rest in Siberia.

The Tungus type is essentially Mongolic, being characterized by broad flat features, small nose, wide mouth, thin lips, small black and somewhat oblique eyes, black lank hair, dark olive or bronze complexion, low stature, averaging not more than five feet four inches; they are distinguished from other Mongolic peoples by the square shape of the skull and the slim, wiry, well-proportioned figure. This description applies more especially to the Tunguska tribes, who may be regarded as typical Tunguses, and who, unlike most other Mongols, betray no tendency to obesity. They are classed by the Russians, according to their various pursuits, as Reindeer, Horse, Cattle, Dog, Steppe, and Forest Tunguses. A few have become settled agriculturists; but the great bulk of the race are still essentially forest hunters, using the reindeer both as mounts and as pack animals. Nearly all lead nomad lives, in pursuit of fur-bearing animals, whose skins they supply to Russian and Yakut traders, in exchange for provisions, clothing, and other necessaries of life. The picturesque and even elegant national costume shows in its ornamentation and general style decided Japanese influence, due no doubt to long-continued intercourse with that nation at some period previous to the spread of the race from the Amur valley to Siberia. Many of the Tungus tribes have been baptized, and are, therefore, reckoned as "Greek Christians"; but Russian orthodoxy has not penetrated far below the surface, and most of them are still at heart Shamanists and nature-worshippers, secretly keeping the teeth and claws of wild animals as idols or amulets, and observing Christian rites only under compulsion. But, whether Christians or pagans, all alike are distinguished above other Asiatics, perhaps above all other peoples, for their truly noble moral qualities. All observers describe them as "cheerful under the most depressing circumstances, persevering, open-hearted, trustworthy, modest yet self-reliant, a fearless race of hunters, born amidst the gloom of their dense pine-forests, exposed from the cradle to every danger from wild beasts, cold, and hunger. Want and hardships of every kind they endure with surprising fortitude, and nothing can induce them to take service under the Russians or quit their solitary woodlands" (Keane's *Asia*, p. 479). Their numbers are steadily decreasing, owing to the ravages of small-pox, scarlet fever, and especially famine, their most dreaded enemy. Their domain is also being continually encroached upon by the aggressive Yakuts from the north and east, and from the south by the Slavs, now settled in compact bodies in the province of Irkutsk about the upper coast of the Yenisei. It is remarkable that, while the Russians often show a tendency to become assimilated to the Yakuts, the most vigorous and expansive of all the Siberian peoples, the Tunguses everywhere yield before the advance of their more civilized neighbors or become absorbed in the surrounding Slav communities. In the Amur valley the same fate is overtaking the kindred tribes, who are disappearing before the great waves of Chinese migration from the south and Russian encroachments both from the east and west. In 1880 the Oroches were already reduced to about 260, and the Tazi to a little over 200. For the philological relations of the Tunguses, see vol. xviii. p. 792.

TUNICATA.

THIS group of animals was formerly regarded as constituting along with the *Polyzoa* and the *Brachiopoda* the invertebrate class *Molluscoidea*. It is now known to be a degenerate branch of the *Chordata*, and to be more nearly related to the *Vertebrata* than to any group of the *Invertebrata*.

HISTORY.[1]

Simple Ascidians. More than two thousand years ago Aristotle gave a short account of a Simple Ascidian under the name of *Tethyum*. He described the appearance and some of the more important points in the anatomy of the animal. From that time onwards to little more than a century ago, although various forms of Ascidians had been briefly described by writers on marine zoology, comparatively little advance was made upon the knowledge of Aristotle. **Compound Ascidians.** Schlosser and Ellis, in a paper containing a description of *Botryllus*, published in the *Philosophical Transactions* of the Royal Society for 1756, first brought the Compound Ascidians into notice; but it was not until the commencement of the 19th century, as a result of the careful anatomical investigations of Cuvier (**1**) upon the Simple Ascidians and of Savigny (**2**) upon the Compound, that the close relationship between these two groups of the *Tunicata* was conclusively demonstrated. **Cuvier and Savigny.** Up to 1816, the date of publication of Savigny's great work (**2**), the few Compound Ascidians then known had been generally regarded as *Alcyonaria* or as Sponges; and, although many new Simple Ascidians had been described by O. F. Müller (**4**) and others, their internal structure had not been investigated. **Lamarck.** Lamarck (**3**) in 1816, chiefly as the result of the anatomical discoveries of Savigny and Cuvier, instituted the class *Tunicata*, which he placed between the *Radiata* and the *Vermes* in his system of classification. The *Tunicata* included at that time, besides the Simple and the Compound Ascidians, the pelagic forms *Pyrosoma*, which had been first made known by Péron in 1804, and *Salpa*, described by Forskål in 1775.

Chamisso and alternation of generations. Chamisso in 1820 made the important discovery that *Salpa* in its life-history passes through the series of changes which were afterwards more fully described by Steenstrup in 1842 as "alternation of generations"; and a few years later Kuhl and Van Hasselt's investigations upon the same animal resulted in the discovery of the alternation in the directions in which the wave of contraction passes along the heart and in which the blood circulates through the body. **Circulation.** It has since been found that this observation holds good for all groups of the *Tunicata*. In 1826 H. Milne-Edwards and Audouin made a series of observations on living Compound Ascidians, and amongst other discoveries they found the free-swimming tailed larva, and traced its development into the young Ascidian. **Milne-Edwards.** Milne-Edwards (**5**) also founded the group of "Social" Ascidians, now known as the *Clavelinidæ*, and gave a classification of the Compound Ascidians which was universally accepted for many years. From the year 1826 onwards a number of new and remarkable forms were discovered, as, for instance, some of the *Bolteninæ* (Macleay), *Chelyosoma* (Broderip and Sowerby, and afterwards Eschricht), *Oikopleura* (Mertens), *Perophora* (Lister), *Pelonaia* (Forbes and Goodsir), *Chondrostachys* and *Diplosoma* (Denis Macdonald), *Diazona* (Forbes and Goodsir), and *Rhodosoma* (Ehrenberg, and afterwards Lacaze-Duthiers).

Carl Schmidt. In 1845 Carl Schmidt (**6**) first announced the presence in the test of some Ascidians of "tunicine," a substance very similar to cellulose, and in the following year Löwig and Kölliker (**7**) confirmed the discovery and made some additional observations upon this substance and upon the structure of the test in general. **Huxley.** Huxley (**8**), in an important series of papers published in the *Transactions* of the Royal and Linnean Societies of London from 1851 onwards, discussed the structure, embryology, and affinities of the pelagic Tunicates *Pyrosoma*, *Salpa*, *Doliolum*, and *Appendicularia*. These important forms were also investigated about the same time by Gegenbaur, Vogt, H. Müller, Krohn, and Leuckart. **Kowalevsky.** The most important epoch in the history of the *Tunicata* is the date of the publication of Kowalevsky's celebrated memoir upon the development of a Simple Ascidian (**9**). **Tailed larva.** The tailed larva had been previously discovered and investigated by several naturalists—notably H. Milne-Edwards (**5**), J. P. van Beneden (**10**), and Krohn (**11**); but its minute structure had not been sufficiently examined, and the meaning of what was known of it had not been understood. **Relationship to Vertebrates.** It was reserved for Kowalevsky in 1866 to demonstrate the striking similarity in structure and in development between the larval Ascidian and the vertebrate embryo. He showed that the relations between the nervous system, the notochord, and the alimentary canal are much the same in the two forms, and have been brought about by a very similar course of embryonic development. This discovery clearly indicated that the *Tunicata* are closely allied to *Amphioxus* and the *Vertebrata*, and that the tailed larva represents the primitive or ancestral form from which the adult Ascidian has been evolved by degeneration, and this led naturally to the view usually accepted at the present day, that the group is a degenerate side-branch from the lower end of the phylum *Chordata*, which includes the *Tunicata* (*Urochorda*), *Amphioxus* (*Cephalochorda*), and the *Vertebrata*. **Kupffer, Giard, etc.** Kowalevsky's great discovery has since been confirmed and extended to all other groups of the *Tunicata* by Kupffer (**12**), Giard (**13** and **15**), and others. **Gemmation.** Important observations upon the process of gemmation and the formation of colonies in various forms of Compound Ascidians have been made by Krohn, Metschnikoff, Kowalevsky, Ganin, Giard, Della Valle, and others, and have gradually led to the establishment of the general principle, that all the more important layers of the bud are derived more or less directly from the corresponding regions in the body of the parent.

Fol, etc. In 1872 Fol (**14**) added largely to the knowledge of the *Appendiculariidæ*, and Giard (**15**) to that of the Compound Ascidians. The latter author described a number of new forms and remodelled the classification of the group. The most important additions which have been made to the Compound Ascidians since Giard's work have been those described by Von Drasche (**16**) from the Adriatic and those discovered by the "Challenger" expedition (**17**). The structure and the systematic arrangement of the Simple Ascidians have been mainly discussed of recent years by Alder and Hancock (**18**), Heller (**19**), Lacaze-Duthiers (**20**), Traustedt (**21**), and Herdman (**17**, **22**). **Subneural gland and dorsal tubercle.** In 1874 Ussoff (**23**) investigated the minute structure of the nervous system and of the underlying gland, which was first discovered by Hancock, and showed that the gland has a duct which

[1] Only the more important works can be mentioned here. For a more detailed account of the history of the group and a full bibliography, see (17) in the list of works at the end of this article.

Thaliacea.

Van Beneden and Julin.

communicates with the front of the branchial sac or pharynx by an aperture in the dorsal (or "olfactory") tubercle. In an important paper published in 1880 Julin (**24**) drew attention to the similarity in structure and relations between this gland and the *hypophysis cerebri* of the vertebrate brain, and insisted upon their homology. He suggests that they perform a renal function. The *Thaliacea* have of late years been the subject of several very important memoirs. The researches of Todaro, Brooks (**25**), Salensky (**26**), and others have elucidated the embryology, the gemmation, and the life-history of the *Salpidæ;* and Grobben, Barrois (**27**), and more especially Uljanin (**28**) have elaborately worked out the structure and the details of the complicated life-history of the *Doliolidæ*. Finally, in an important work published in 1886 on the morphology of the *Tunicata*, E. van Beneden and Julin (**30**) have, mainly as the result of a close comparison of the embryology of Ascidians with that of *Amphioxus* and other *Chordata*, added considerably to our knowledge of the position and affinities of the *Tunicata*, and of the exact relations of their organs to the corresponding parts of the body in the *Vertebrata*.

ANATOMY.

Ascidia mentula.

External characters.

As a type of the *Tunicata*, *Ascidia mentula*, one of the larger species of the Simple Ascidians, may be taken. This species is found in most of the European seas, generally in shallow water on a muddy bottom. It has an irregularly ovate form, and is of a dull gray color. It is attached to some foreign object by one end (Fig. 1). The opposite end of the body is usually narrow, and it has a terminal opening surrounded by eight rounded lobes. This is the mouth or branchial aperture, and it always indicates the anterior end[1] of the animal. About half-way back from the anterior end, and on a rounded projection, is the atrial or cloacal aperture—an opening surrounded by six lobes—which is always placed upon the dorsal region. When the Ascidian is living and undisturbed, water is being constantly drawn in through the branchial aperture and passed out through the atrial. If colored particles be placed in the water near the apertures, they are seen to be sucked into the body through the branchial aperture, and after a short time some of them are ejected with considerable force through the atrial aperture. The current of water passing in is for respiratory purposes, and it also conveys food into the animal. The atrial current is mainly the water which has been used in respiration, but it also contains all excretions from the body, and at times the ova and spermatozoa or the embryos.

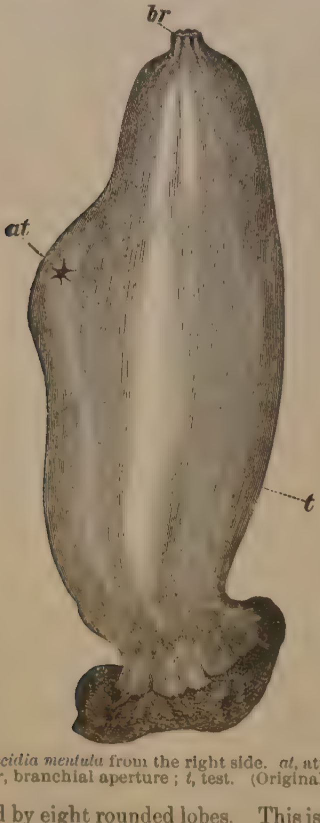

FIG. 1.—*Ascidia mentula* from the right side. *at*, atrial aperture; *br*, branchial aperture; *t*, test. (Original.)

The test.

The outer gray part of the body, which is attached at or near its posterior end and penetrated by the two apertures, is the "test." This is a firm gelatinous cuticular secretion from the outer surface of the ectoderm, which is a layer of flat cells lining its inner surface. Although at first produced as a cuticle, the test soon becomes organized by the migration into it of cells derived from the ectoderm (see Fig. 2). These test cells may remain as rounded or fusiform or stellate cells imbedded in the gelatinous matrix, to which they are constantly adding by secretions on their surfaces; or they may develop vacuoles in their protoplasm, which become larger and fuse to form a huge ovate clear cavity (a "bladder cell"), surrounded by a delicate film of protoplasm and having the nucleus still visible at one point; or they may form pigment granules in the protoplasm; or, lastly, they may deposit carbonate of lime, so that one or several of them together produce a calcareous spicule in the test. Only the unmodified test cells and the bladder cells are found in *Ascidia mentula*. Calcareous spicules are found chiefly in the *Didemnidæ*, amongst Compound Ascidians; but pigmented cells may occur in the test of almost all groups of *Tunicata*. The matrix in which these structures are imbedded is usually clear and apparently homogeneous; but in some cases it becomes finely fibrillated, especially in the family *Cynthiidæ*. It is this matrix which contains tunicine. At one point on the left side near the posterior end a tube enters the test, and then splits up into a number of branches, which extend in all directions and finally terminate in rounded enlargements or bulbs, situated chiefly in the outer layer of the test. These tubes are known as the "vessels" of the test, and they contain blood. Each vessel is bounded by a layer of ectoderm cells lined by connective tissue (Fig. 3, *B*), and is divided into two tubes by a septum of connective tissue. The septum does not extend into

---

[1] Some writers use a different nomenclature of regions; see (**17**).

the terminal bulb, and consequently the two tubes communicate at their ends (Fig. 3, *A*). The vessels are formed by an outgrowth of a blood sinus (derived originally from the blastocœle of the embryo) from the body wall (mantle) into the test, the wall of the sinus being formed by connective tissue and pushing out a covering of ectoderm in front of it (Fig. 2, *s′*). The test is turned inwards at the branchial and atrial apertures to line two funnel-like tubes,—the branchial siphon leading to the branchial sac and the atrial siphon leading to the atrial or peribranchial cavity.

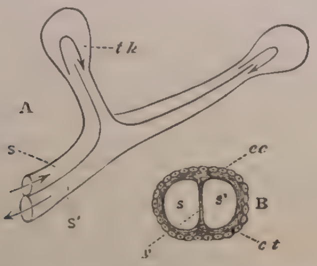

FIG. 3.—*A*, a vessel from the test. *B*, diagrammatic transverse section of a vessel. *ec*, ectoderm; *ct*, connective tissue; *s*, *s′*, the two tubes; *y*, septum; *tk*, terminal bulb. (Original.)

Mantle.

The body wall, inside the test and the ectoderm, is formed of a layer (the somatic layer of mesoderm) of connective tissue, inclosing muscle fibres, blood sinuses, and nerves. This layer (the mantle) has very much the shape of the test outside it, but at the two apertures it is drawn out to form the branchial and atrial siphons (Fig. 4). In the walls of these siphons the muscle fibres form powerful circular bands, the sphincter muscles. Throughout the rest of the mantle the bands of muscle fibres form a rude irregular network. They are numerous on the right side of the body, and almost totally absent on the left. The muscles are all formed of very long fusiform non-striped fibres. The connective tissue of the mantle is chiefly a clear gelatinous matrix, containing cells of various shapes; it is frequently pigmented and is penetrated by numerous lacunæ, in which the blood flows. Inside the mantle, in all parts of the body, except along the ventral edge, there is a cavity,—the atrial or peribranchial cavity,—which opens to the exterior by the atrial aperture. This cavity is lined by a layer of cells derived originally from the ectoderm[1] and directly continuous with that layer through the atrial aperture (Fig. 5); consequently the mantle is covered both externally and internally by ectodermal cells.

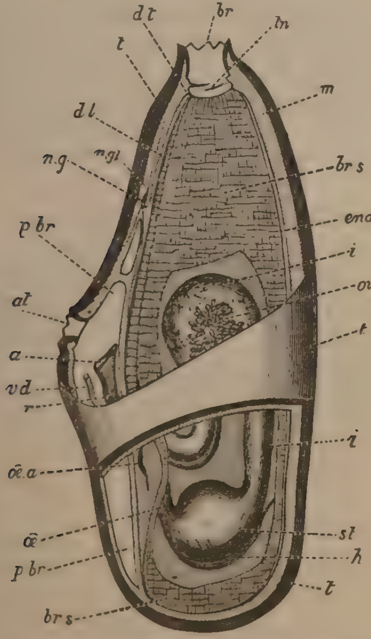

FIG. 4.—Diagrammatic dissection of *A. mentula* to show the anatomy. *at*, atrial aperture; *br*, branchial aperture; *a*, anus; *brs*, branchial sac; *dl*, dorsal lamina; *dt*, dorsal tubercle; *end*, endostyle; *h*, heart; *i*, intestine; *m*, mantle; *ng*, nerve ganglion; *œ*, œsophagus; *œa*, œsophageal aperture; *ov*, ovary; *pbr*, peribranchial cavity; *r*, rectum; *st*, stomach; *t*, test; *tn*, tentacles; *vd*, vas deferens; *ngl*, subneural gland. (Original.)

Branchial sac and neighboring organs.

The branchial aperture (mouth) leads into the branchial siphon (buccal cavity or stomodæum), and this opens into the anterior end of a very large cavity (the branchial sac) which extends nearly to the posterior end of the body (see Figs. 4 and 5). This branchial sac is an enlarged and modified pharynx, and is, therefore, properly a part of the alimentary canal. The œsophagus opens from it far back on the dorsal edge (see below, p. 651). The wall of the branchial sac is pierced by a large number of vertical slits,—the stigmata,—placed in numerous transverse rows. These slits place the branchial sac in communication with the peribranchial or atrial cavity, which lies outside it (Fig. 5, *B*). Between the stigmata the wall of the branchial sac is traversed by bloodvessels, which are arranged in three regular series (Fig. 6),—(1) the transverse vessels, which run horizontally round the wall and open at their dorsal and ventral ends into large longitudinal vessels, the dorsal and ventral sinuses; (2) the fine longitudinal vessels, which run vertically between adjacent transverse vessels and open into them, and which bound the stigmata; and (3) the internal longitudinal bars, which run vertically in a plane internal to that of the transverse and fine longitudinal vessels. These bars communicate with the transverse vessels by short side branches where they cross, and at these points are prolonged into the lumen of the sac in the form of hollow papillæ. The edges of the stigmata are richly set with cilia, which drive the water from the branchial sac into the peribranchial cavity, and so cause the currents that flow in through the branchial aperture and out through the atrial.

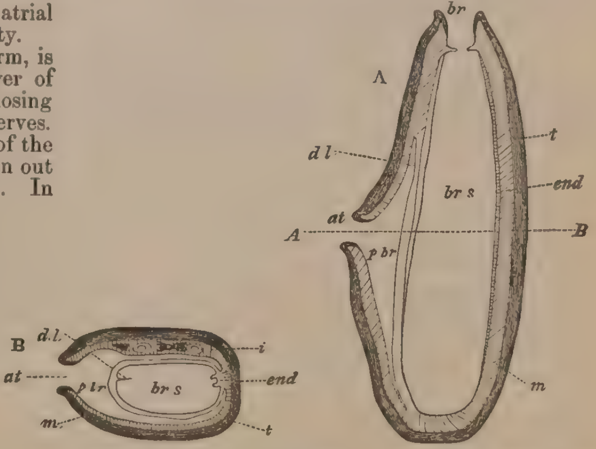

FIG. 5.—Diagrammatic longitudinal (A) and transverse (B) sections through *Ascidia* to show the position of the ectoderm and the relations of the branchial and peribranchial cavities. The lettering is the same as for Fig. 4. B represents a section taken along the dotted-line *A-B* in A. (Original.)

Along its ventral edge the wall of the branchial sac is continuous externally with the mantle (Fig. 5, *B*),

---

[1] According to E. van Beneden and Julin's recent investigations (30) only the outer wall of the atrium is lined with epiblast, the inner wall being derived from the hypoblast of the primitive branchial sac.

Endostyle.

while internally it is thickened to form two parallel longitudinal folds bounding a groove, the "endostyle," hypobranchial groove, or ventral furrow (Figs. 4, 5, *end*).

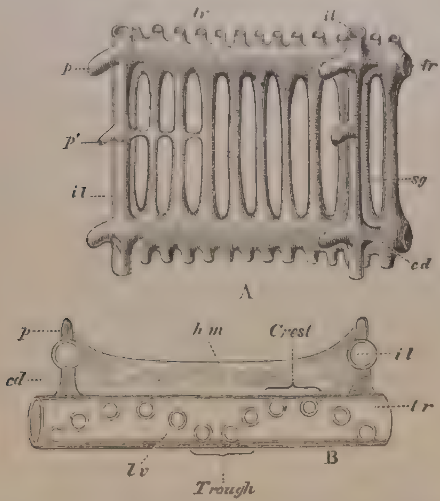

FIG 6.—*A*. Part of branchial sac of *Ascidia* from inside. *B*. Transverse section of same. *tr*, transverse vessel: *cd*, connecting duct; *hm*, horizontal membrane; *il*, internal longitudinal bar; *lv*, fine longitudinal vessels; *p*. *p'*, papillæ; *sg*, stigmata. A and B are drawn to different scales. (From Herdman, Challenger *Report*.)

The endoderm cells which line the endostyle are greatly enlarged at the bottom and on parts of the sides of the furrow so as to form projecting pads, which bear very long cilia. It is generally supposed that this organ is a gland for the production of the mucous secretion which is spread round the edges of the branchial sac and catches the food particles in the passing current of water; but it has recently been pointed out that there are comparatively few gland cells in the epithelium of the endostyle, and that it is more probable that this furrow is merely a ciliated path along which the mucous secretion (produced possibly by the subneural gland) is conveyed posteriorly along the ventral edge of the branchial sac.

Peripharyngeal bands.

At its anterior end the edges of the endostyle become continuous with the right and left halves of the posterior of two circular ciliated ridges,—the peripharyngeal bands,—which run parallel to one another round the front of the branchial sac.

Dorsal lamina.

The dorsal ends of the posterior peripharyngeal band bend posteriorly (enclosing the epibranchial groove), and then join to form the anterior end of a fold which runs along the dorsal edge of the branchial sac as far as the œsophageal aperture. This fold is the dorsal lamina (Figs. 4, 5, *dl*). It probably serves to direct the stream of food particles entangled in a string of mucus from the anterior part of the dorsal lamina to the œsophagus.

Dorsal languets.

In many Ascidians this organ, instead of being a continuous membranous fold as in *A. mentula*, is represented by a series of elongated triangular processes—the dorsal languets,—one attached in the dorsal median line opposite to each transverse vessel of the branchial sac. The anterior peripharyngeal band is a complete circular ridge, having no connection with either the endostyle or the dorsal lamina. In front of it lies the prebranchial zone, which separates the branchial sac behind from the branchial siphon in front. The prebranchial zone is bounded anteriorly by a muscular band—the posterior edge of the sphincter muscle,—which bears a circle

Tentacles.

of long delicate processes, the tentacles (Figs. 4, 7, 8, *tn*). These project inwards at right angles so as to form a network across the entrance to the branchial sac. Each tentacle consists of connective tissue covered with epithelium (endoderm), and contains two or more cavities which are continuous with blood sinuses in the mantle.

Subneural gland.

In the dorsal median line near the anterior end of the body, and imbedded in the mantle on the ventral surface of the nerve ganglion, there lies a small glandular mass—the subneural gland—which, as Julin has shown (**24**), there is reason to regard as the homologue of the *hypophysis cerebri* of the vertebrate brain. Julin and E. van Beneden have suggested that the function of this organ may possibly be renal.[1] The subneural gland, which was first noticed by Hancock, communicates anteriorly, as Ussoff (**23**) pointed out, by means of a narrow duct with the front of the branchial sac (pharynx). The opening of the duct is enlarged to form a funnel-shaped cavity which may be folded upon itself, convoluted, or even broken up into a number of smaller openings, so as to form a complicated projection, called the dorsal tubercle, situated in the dorsal part of the prebranchial zone (Fig. 7).

Dorsal tubercle.

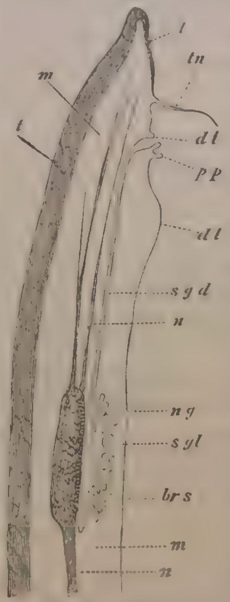

FIG. 7.—Diagrammatic section through anterior dorsal part of *A. mentula*, showing the relations of the nerve ganglion, subneural gland, etc. Lettering as for Fig. 4; *n*, nerve; *n'*, myelon; *pp*, peripharyngeal band; *sgl*, subneural gland; *sgd*, its duct; *t'*, test lining branchial siphon. (Original.)

The dorsal tubercle in *A. mentula* is somewhat horse-shoe-shaped (Fig. 8); it varies in form in most Ascidians according to the genus and species, and in some cases in the individual also. Possibly, besides being the opening of the duct from the subneural gland, it may be a sense-organ for testing the quality of the water entering the branchial sac.

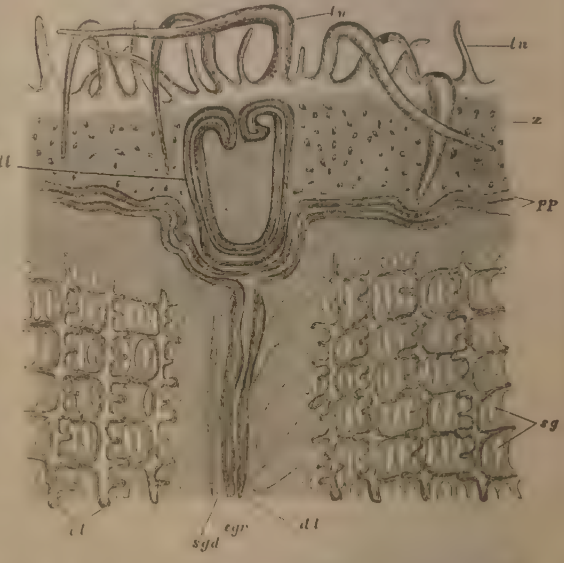

FIG. 8.—Dorsal tubercle and neighboring organs of *A. mentula*. Lettering as before; *egr*, epibranchial groove; *z*, prebranchial zone. (Original.)

The single elongated ganglion in the median dorsal

---

[1] See also Herdman, *Nature*, vol. xxviii. p. 284.

Nervous system. **Sense organs.**

line of the mantle between the branchial and atrial siphons is the only nerve-centre in *A. mentula* and most other *Tunicata*. It is the degenerate remains of the anterior part of the cerebro-spinal nervous system of the tailed larval Ascidian (see below, p. 653). The posterior or spinal part has entirely disappeared in most *Tunicata*. It persists, however, in the *Appendiculariidæ*, and traces of it are found in some Ascidians (*e.g.*, *Clavelina*; see Julin). The ganglion gives off distributory nerves at both ends, which run through the mantle to the neighborhood of the apertures, where they divide and subdivide. The only sense-organs are the pigment spots between the branchial and atrial lobes, the tentacles at the base of the branchial siphon, and possibly the dorsal tubercle and the languets or dorsal lamina. These are all in a lowly developed condition. The larval Ascidians on the other hand have well-developed intra-cerebral optic and auditory sense-organs; and in some of the pelagic *Tunicata* otocysts and pigment spots are found in connection with the ganglion.

Alimentary canal. The mouth and the pharynx (branchial sac) have already been described. The remainder of the alimentary canal is a bent tube which in *A. mentula* and most other Ascidians lies imbedded in the mantle on the left side of the body, and projects into the peribranchial cavity. The œsophagus leaves the branchial sac in the dorsal middle line near the posterior end of the dorsal lamina (see Fig. 4, *œa*). It is a short curved tube which leads ventrally to the large fusiform thick-walled stomach. The intestine emerges from the ventral end of the stomach, and soon turns anteriorly, then dorsally, and then posteriorly so as to form a curve—the intestinal loop—open posteriorly. The intestine now curves anteriorly again, and from this point runs nearly straight forward as the rectum, thus completing a second curve—the rectal loop—open anteriorly (see Fig. 4). The wall of the intestine is thickened internally, to form the typhlosole, a pad which runs along its entire length. The anus opens into the dorsal part of the peribranchial cavity near to the atrial aperture. The walls of the stomach are glandular; and a system of delicate tubules with dilated ends, which ramifies over the outer wall of the intestine and communicates with the cavity of the stomach by means of a duct, is probably a digestive gland.

Excretory organs. A mass of large clear vesicles which occupies the rectal loop, and may extend over the adjacent walls of the intestine, is a renal organ without a duct. Each vesicle is the modified remains of a part of the primitive cœlom or body-cavity, and is formed of cells which eliminate nitrogenous waste matters from the blood circulating in the neighboring blood-lacunæ and deposit them in the cavity of the vesicle, where they form a concentrically laminated concretion of a yellowish or brown color. These concretions contain uric acid, and in a large Ascidian are very numerous. The nitrogenous waste products are thus deposited and stored up in the renal vesicles in place of being excreted from the body. In other Ascidians the renal organ may differ from the above in its position and structure; but in no case has it an excretory duct, unless the subneural gland is to be regarded as a renal organ.

Blood-vascular system and cœlom. The heart is an elongated fusiform tube placed on the ventral and posterior edge of the stomach, in a space (the pericardium) which is part of the original cœlom or body-cavity, the rest of which exists merely in the form of lacunæ and of the cavities of the reproductive organs and renal vesicles in the adult Ascidian. The wall of the heart is formed of a layer of epithelio-muscular cells, the inner ends of which are cross-striated; and waves of contraction pass along it from end to end, first for a certain number of beats in one direction and then in the other, so as to reverse the course of circulation periodically. At each end the heart is continued into a vessel (see Fig. 9), a large sinus or lacuna lined with a delicate endothelial layer. The sinus leaving the ventral end of the heart is called the branchio-cardiac vessel,[1] and the heart itself is merely the differentiated posterior part of this sinus and is therefore a ventral vessel. The branchio-cardiac vessel, after giving off a branch which, along with a corresponding branch from the cardio-visceral vessel, goes to the test, runs along the ventral edge of the branchial sac externally to the endostyle, and communicates laterally with the ventral ends of all the transverse vessels of the branchial sac. The sinus leaving the dorsal end of the heart is called the cardio-visceral vessel, and this, after giving off to the test the branch above mentioned, breaks up into a number of sinuses, which ramify over the alimentary canal and the other viscera. These visceral lacunæ finally communicate with a third great sinus, the viscero-branchial vessel, which runs forward along the dorsal edge of the branchial sac externally to the dorsal lamina and joins the dorsal ends of all the transverse vessels of the branchial sac. Besides these three chief systems there are numerous lacunæ in all parts of the body, by means of which anastomoses are established between the different currents of blood. All these blood spaces and lacunæ are to be regarded as derived from the blastocœle of the embryo, and not, as has been usually supposed, from the cœlom (**30**).

Course of circulation. When the heart contracts ventro-dorsally, the course of the circulation is as follows: the blood which is flowing through the vessels of the branchial sac is collected in an oxygenated condition in the branchio-cardiac vessel, and, after receiving a stream of blood from the test, enters the heart. It is then propelled from the dorsal end of the heart into the cardio-visceral vessels, and so reaches the test and digestive and other organs; then, after circulating in the visceral lacunæ, it passes into the viscero-branchial vessel in an impure condition, and is distributed to the branchial vessels to be purified again. When the heart on the other hand contracts dorso-ventrally, this course of circulation is reversed. As the test receives a branch from each end of the heart, it follows that it has afferent and efferent vessels whichever way the blood is flowing. In some Ascidians the vessels in the test become very numerous and their end branches terminate in swollen bulbs close under the outer surface of the test. In this way an accessory respiratory organ[2] is probably formed in the superficial layer of the test. The blood corpuscles are chiefly colorless and amœboid; but in most if not all Ascidians there are also some pigmented corpuscles in the blood. These are generally of an orange or reddish brown tint, but may be opaque white, dark indigo-blue, or of intermediate colors. Precisely similarly pigmented cells are found throughout the connective tissue of the mantle and other parts of the body.

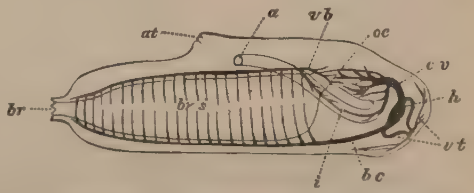

FIG. 9.—Diagram of circulation in *Ascidia*. Lettering as before; *bc*, branchio-cardiac or ventral vessel; *cv*, cardio-visceral vessels; *vb*, viscero-branchial or dorsal vessel; *vt*, vessels to test. (Original.)

Reproductive organs. *A. mentula* is hermaphrodite, and the reproductive organs lie, with the alimentary canal, on the left side of the body. The ovary is a ramified gland which occupies the greater part of the intestinal loop (see Fig. 4). It contains a cavity which, along with the cavities of the testis, is derived from a part of the original cœlom, and the ova are formed from its walls and fall when mature into the cavity. The oviduct is continuous with the cavity of the ovary and leads forwards alongside the rectum, finally opening near the anus into the peribranchial cavity. The testis is composed of a great number of delicate branched tubules, which ramify over the ovary and the adjacent parts of the intestinal wall. Those tubules terminate in ovate swellings. Near the commencement of the rectum the larger tubules unite to form the vas deferens, a tube of considerable size, which runs forwards alongside the rectum, and, like the oviduct, terminates by opening into the peribranchial cavity close to the anus. The lumen of the tubules of the testis, like the cavity of the ovary, is a part of the original cœlom, and the spermatozoa are formed from the cells lining the wall. In some Ascidians reproductive organs are present on both sides of the body, and in others (*Polycarpa*) there are many complete sets of both male and female systems, attached to the inner surface of the mantle on both sides of the body and projecting into the peribranchial cavity.[1]

---

[1] On account of the periodic reversal of the circulation none of the vessels can be called arteries or veins.

[2] See Herdman, *Nature*, vol. xxxi. p. 247.

EMBRYOLOGY[2] AND LIFE HISTORY.

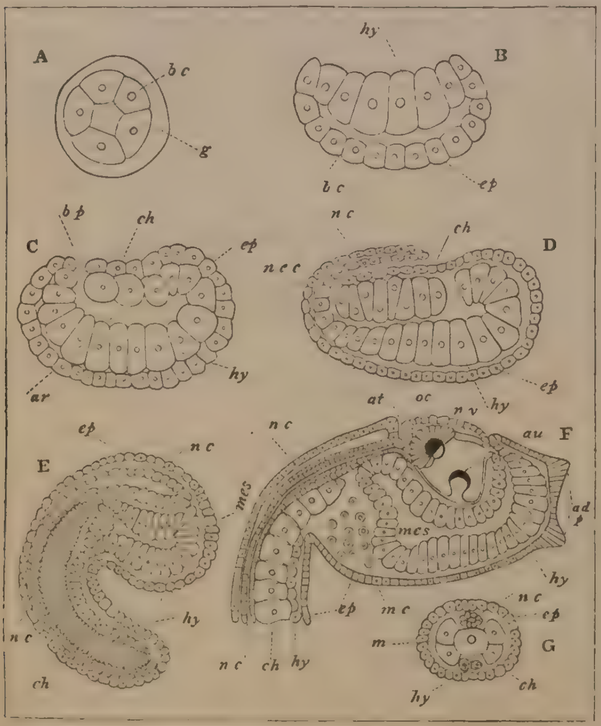

FIG. 10.—Stages in the embryology of a Simple Ascidian (after Kowalevsky). A to F. Longitudinal vertical sections of embryos, all placed with the dorsal surface uppermost and the anterior end at the right. A. Early blastula stage, during segmentation. B. Early gastrula stage. C. Stage after gastrula, showing commencement of notochord. D. Later stage, showing formation of notochord and of neural canal. E. Embryo showing body and tail and completely formed neural canal. F. Larva just hatched; end of tail cut off. G. Transverse section of tail of larva.

adp, adhering papillæ of larva: *at*, epiblastic (atrial) involution; *au*, auditory organ of larva; *ar*, archenteron: *bc*, blastocœle; *bp*, blastopore; *ch*, notochord; *ep*, epiblast; *hy*, hypoblast; *nc*, neural canal; *nec*, neurenteric canal; *oc*, ocular organ of larva; *g*, gelatinous investment of embryo; *m*, muscle cells of tail; *mes*, mesenteron; *mc*, mesoderm cells; *nv*, cerebral vesicle at anterior end of neural canal.

Embryology.

In most Ascidians the eggs are fertilized in the peribranchial cavity, and undergo most of their development before leaving the parent; in some cases, however, the eggs are laid, and fertilization takes place in the surrounding water. The segmentation is complete and regular (Fig. 10, A) and results in the formation of a spherical blastula, which then undergoes invagination (Fig. 10, B). The embryo elongates, and the blastopore or invagination opening comes to be placed on the dorsal edge near the posterior end (Fig. 10, C). The hypoblast cells lining the archenteron are columnar in form, while the epiblast cells are more cubical (Fig. 10, B, C, D). The dorsal surface of the embryo now becomes flattened and then depressed to form a longitudinal groove, extending forwards from the blastopore to near the front of the body. This "medullary groove" now becomes converted into a closed canal by its side walls growing up, arching over, and coalescing in the median dorsal line (Fig. 10, D). This union of the *laminæ dorsales* to form the neural canal commences at the posterior and behind the blastopore and gradually extends forwards. Consequently the blastopore comes to open into the posterior end of the neural canal (Fig. 10, D), while the anterior end of that cavity remains open to the exterior. In this way the archenteron communicates indirectly with the exterior. The short canal leading from the neural canal to the archenteron is known as the neurenteric canal (Fig. 10, D, *nec*). Previous to this stage some of the hypoblast cells at the front edge of the blastopore and forming part of the dorsal wall of the archenteron (Fig. 10, C, *ch*) have become separated off, and then arranged to form an elongated band, two cells wide, underlying the posterior half of the neural canal (Fig. 10, D, E, *ch*). This is the origin of the notochord. Outgrowths from the sides of the archenteron give rise to laterally placed masses of cells, which are the origin of the mesoblast. These masses show no trace of metameric segmentation. The cavities (reproductive and renal vesicles) which are formed later in the mesoblast represent the cœlom. Consequently the body-cavity of the *Tunicata* is a modified form of enterocœle. The anterior part of the embryo, in front of the notochord, now becomes enlarged to form the trunk, while the posterior part elongates to form the tail (Fig. 10, E). In the trunk the anterior part of the archenteron dilates to form the mesenteron, the greater part of which becomes the branchial sac; at the same time the anterior part of the neural canal enlarges to form the cerebral vesicle, and the opening to the exterior at the front end of the canal now closes. In the tail part of the embryo the neural canal remains as a narrow tube, while the remains of the wall of the archenteron—the dorsal part of which becomes the notochord—are converted into lateral muscle bands (Fig. 10, G) and a ventral cord of cells, which eventually breaks up to form blood corpuscles. As the tail grows longer, it becomes bent round the trunk of the embryo inside the egg-membrane. About this period the epiblast cells begin to form the test as a cuticular deposit upon their outer surface. The test is at first devoid of cells and forms a delicate gelatinous investment, but it shortly afterwards becomes cellular by the migration into it of test cells formed by proliferation fromthe epiblast.[3]

Larval stage.

The embryo is hatched about two or three days after fertilization, in the form of a tadpole-like larva, which swims actively through the sea by vibrating its long tail. The anterior end of the body is provided with three adhering papillæ (Fig. 10, F, *adp*) in the form of epiblastic thickenings. In the free-swimming tailed larva the nervous system, formed from the walls of the neural canal, becomes considerably differentiated. The anterior part of the cerebral vesicle remains thin-walled (Fig. 10, F), and two unimpaired sense organs develop from its wall and project into the cavity. These are a dorsally and posteriorly placed optic organ, provided with retina, pigment layer, lens, and cornea, and a ventrally placed auditory organ, consisting of a large spherical partially pigmented otolith, attached by delicate hair-like processes to the summit of a hollow *crista acoustica* (Fig. 10, F, *au*). The posterior part of the cerebral vesicle thickens to form a solid ganglionic mass traversed by a narrow central canal. The wall of the neural canal behind the cerebral vesicle becomes differentiated into an anterior thicker region, placed in the posterior part of the trunk and having a superficial layer of nerve fibres, and a posterior narrower part which traverses the tail, lying on the dorsal surface of the notochord, and gives off several pairs of nerves to the muscles of the tail.

---

[1] For structure of other forms, see p 653 *sq.* below.

[2] For reproduction by gemmation, see under "Classification," p. 653 *sq.* below.

[3] Some of the first test cells are also probably derived from the epithelium of the egg follicle.

Just in front of the anterior end of the nervous system a dorsal involution of the epiblast breaks through into the upturned anterior end of the mesenteron and thus forms the mouth opening. Along the ventral edge of the mesenteron, which becomes the branchial sac, the endostyle is formed as a narrow groove with thickened side walls. It probably corresponds to the median portion of the thyroid body of *Vertebrata*. A curved outgrowth from the posterior end of the mesenteron forms the alimentary canal (œsophagus, stomach, and intestine), which at first ends blindly. An anus is formed later by the intestine opening into the left of two lateral epiblastic involutions (the atria), which rapidly become larger and fuse dorsally to form the peribranchial cavity. Outgrowths from the wall of the branchial sac meet these epiblastic involutions and fuse with them to give rise to the first-formed pair of stigmata, which thus come to open into the peribranchial cavity; and these alone correspond to the gill clefts of *Amphioxus* and the *Vertebrata*.

Metamorphosis to adult form.

After a short free-swimming existence the fully developed tailed larva fixes itself by its anterior adhering papillæ to some foreign object, and then undergoes a remarkable series of retrogressive changes, which convert it into the adult Ascidian. The tail atrophies, until nothing is left but some fatty cells in the posterior part of the trunk. The adhering papillæ disappear and are replaced functionally by a growth of the test over neighboring objects. The nervous system with its sense organs atrophies until it is reduced to the single small ganglion, placed on the dorsal edge of the pharynx, and a slight nerve cord running for some distance posteriorly (Van Beneden and Julin). Slight changes in the shape of the body and a further growth and differentiation of the branchial sac, peribranchial cavity, and other organs now produce gradually the structure found in the adult Ascidian.

The most important points in connection with this process of development and metamorphosis are the following: (1) In the Ascidian embryo all the more important organs (*e.g.*, notochord, neural canal, archenteron) are formed in essentially the same manner as they are in *Amphioxus* and other *Chordata*. (2) The free-swimming tailed larva possesses the essential characters of the *Chordata*, inasmuch as it has a longitudinal skeletal axis (the notochord) separating a dorsally placed nervous system (the neural canal) from a ventral alimentary canal (the archenteron); and therefore during this period of its life-history the animal belongs to the *Chordata*. (3) The Chordata larva is more highly organized than the adult Ascidian, and therefore the changes by which the latter is produced from the former may be regarded as a process of degeneration (31). The important conclusion drawn from all this is that the *Tunicata* are the degenerate descendants of a group of the primitive *Chordata* (see below p. 658).

Classification and Characters of Groups.

Order I.—LARVACEA.

Characters of *Larvacea*.

Free-swimming pelagic forms provided with a large locomotory appendage (the tail), in which there is a skeletal axis (the urochord). A relatively large test (the "Haus") is formed with great rapidity as a secretion from the ectoderm; it is merely a temporary structure, which is cast off and replaced by another. The branchial sac is simply an enlarged pharynx with two ventral ciliated openings (stigmata) leading to the exterior. There is no separate peribranchial cavity. The nervous system consists of a large dorsally placed ganglion and a long nerve cord, which stretches backwards over the alimentary canal to reach the tail, along which it runs on the left side of the urochord. The anus opens ventrally on the surface of the body in front of the stigmata. No reproduction by gemmation or metamorphosis is known in the life-history.

Structure of *Appendicularia*.

This is one of the most interesting groups of the *Tunicata*, as it shows more completely than any of the rest the characters of the original ancestral forms. It has undergone little or no degeneration, and consequently corresponds more nearly to the tailed-larval condition than to the adult forms of the other groups. The order includes a single family, the APPENDICULARIIDÆ, all the members of which are minute and free-swimming. They occur on the surface of the sea in most parts of the world. They possess the power to form with great rapidity an enormously large investing gelatinous layer (Fig. 11), which corresponds to the test of other groups. This was first described by Von Mertens and by him named "Haus." It is only loosely attached to the body and is frequently thrown off soon after its formation. The tail in the *Appendiculariidæ* is attached to the ventral surface of the body (Fig. 12) and usually points more or less anteriorly. It shows distinct traces of metameric segmentation, having its muscle bands broken up into myotomes, while the nerve cord presents a series of enlargements from which distributary nerves are given off (Fig. 12, *ng''*). Near the base of the tail there is a distinct elongated ganglion (Fig. 12, *ng'*). The anterior (cerebral) ganglion has connected with it an otocyst, a pigment spot, and a tubular process opening into the branchial sac and representing the dorsal tubercle and associated parts of an ordinary Ascidian. The branchial aperture or mouth leads into the branchial sac or pharynx. There are no tentacles. The endostyle is short. There is no dorsal lamina, and the peripharyngeal bands run dorsally and posteriorly. The wall of the branchial sac has only two ciliated apertures. They are homologous with the primary stigmata of the typical Ascidians and the gill clefts of Vertebrates. They are placed far back on the ventral

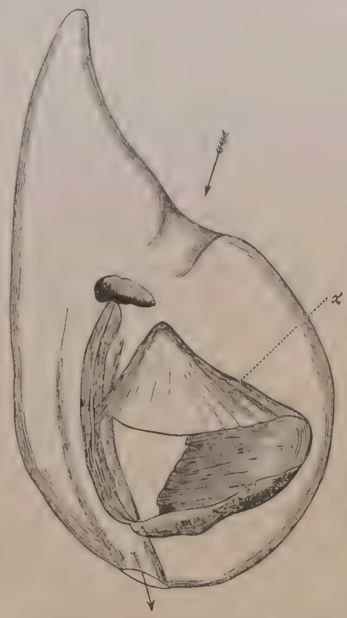

FIG. 11.—*Oikopleura cophocerca* in "Haus" (after Fol), seen from right side, magnified six times. The arrows indicate the course of the water; *x*, lateral reticulated parts of "Haus."

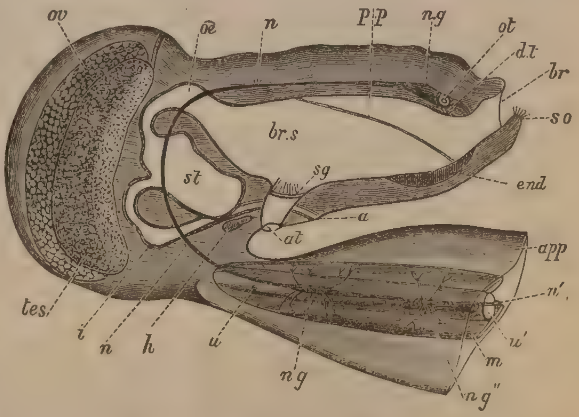

FIG. 12.—Semi-diagrammatic view of *Appendicularia* from the right. *a*, anus; *at*, one of the atrial apertures; *app*, tail; *br*, branchial aperture; *brs*, branchial sac; *dt*, dorsal tubercle; *end*, endostyle; *h*, heart; *i*, intestine; *m*, muscle band of tail; *n*, nerve cord in body; *n'*, nerve cord in the tail; *œ*, œsophagus; *ot*, otocyst; *ov*, ovary; *pp*, peripharyngeal band; *ng*, cerebral ganglion; *ng'*, caudal ganglion; *ng''*, enlargement of nerve cord in tail; *so*, sense organ (tactile) on lower lip; *sg*, ciliated aperture in pharynx; *st*, stomach; *tes*, testis; *u*, urochord; *u'*, its cut end. (Original.)

surface, one on each side of the middle line, and lead into short funnel-shaped tubes which open on the surface of the body behind the anus (Fig. 12, *at*). These tubes correspond to the right and left atrial involutions which, in an ordinary Ascidian, fuse to form the peribranchial cavity. The heart, according to Lankester, is formed of two cells, which are placed at the opposite ends and connected by delicate contractile protoplasmic fibrils. The large ovary and testis are placed at the posterior end of the body. The remainder of the structural details can be made out from Fig. 12.

The family *Appendiculariidæ* comprises the genera,—*Oikopleura* (Mertens), and *Appendicularia* (Cham.), in both which the body is short and compact and the tail relatively long, while the endostyle is straight; *Fritillaria* (Q. and G.), in which the body is long and composed of anterior and posterior regions, the tail relatively short, the endostyle recurved, and an ectodermal hood is formed over the front of the body; and *Kowalevskia* (Fol), a remarkable form described by Fol (**14**), in which the heart, endostyle, and intestine are said to be absent, while the branchial sac is provided with four rows of ciliated tooth-like processes.

Order II.—THALIACEA.

Thaliacea.

Free-swimming pelagic forms which may be either simple or compound, and the adult of which is never provided with a tail or a notochord. The test is permanent and may be either well developed or very slight. The musculature of the mantle is in the form of more or less complete circular bands, by the contraction of which locomotion is effected. The branchial sac has either two large or many small apertures, leading to a single peribranchial cavity, into which the anus opens. Alternation of generations occurs in the life-history, and may be complicated by polymorphism. The *Thaliacea* comprises two groups, *Cyclomyaria* and *Hemimyaria*.

Sub-order 1.—**Cyclomyaria**.

Characters of *Cyclomyaria.*

Free-swimming pelagic forms which exhibit alternation of generations in their life-history but never form permanent colonies. The body is cask-shaped, with the branchial and atrial apertures at the opposite ends. The test is more or less well-developed. The mantle has its musculature in the form of circular bands surrounding the body. The branchial sac is fairly large, occupying the anterior half or more of the body. Stigmata are usually present in its posterior part only. The peribranchial cavity is mainly posterior to the branchial sac. The alimentary canal is placed ventrally close to the posterior end of the branchial sac. Hermaphrodite reproductive organs are placed ventrally near the intestine.

This group forms one family, the DOLIOLIDÆ, including two genera, *Doliolum* (Quoy and Gaimard) and *Anchinia* (C. Vogt).

Structure of *Doliolum.*

Doliolum, of which several species are known from various seas, has a cask-shaped body, usually from 1 to 2 cm. in length. The terminal branchial and atrial apertures (Fig. 13) are lobed, and the lobes are provided with sense organs. The test is very slightly developed and contains no cells. The mantle has eight or nine circular muscle bands surrounding the body. The most anterior and posterior of these form the branchial and atrial sphincters. The wide branchial and atrial apertures lead into large branchial and peribranchial cavities, separated by the posterior wall of the branchial sac, which is pierced by stigmata; consequently there is a free passage for the water through the body along its long axis, and the animal swims by contracting its ring-like muscle bands, so as to force out the contained water posteriorly. Stigmata may also be found on the lateral walls of the branchial sac, and in that case there are corresponding anteriorly directed diverticula of the peribranchial cavity. There is a distinct endostyle on the ventral edge of the branchial sac and a peripharyngeal band surrounding its anterior end, but there is no representative of the dorsal lamina on its dorsal edge. The œsophagus commences rather on the ventral edge of the posterior end of the branchial sac, and runs backwards to open into the stomach, which is followed by a curved intestine opening into the peribranchial cavity. The alimentary canal as a whole is to the right of the middle line. The hermaphrodite reproductive organs are to the left of the middle line alongside the alimentary canal. They open into the peribranchial cavity. The ovary is nearly spherical, while the testis is elongated, and may be continued anteriorly for a long distance. The heart is placed in the middle line ventrally, between the posterior end of the endostyle and the œsophageal aperture. The nerve ganglion lies about the middle of the dorsal edge of the body, and gives off many nerves. Under it is placed the subneural gland, the duct of which runs forward and opens into the anterior end of the branchial sac by a simple aperture, surrounded by the spirally twisted dorsal end of the peripharyngeal band (Fig. 13, *dt*).

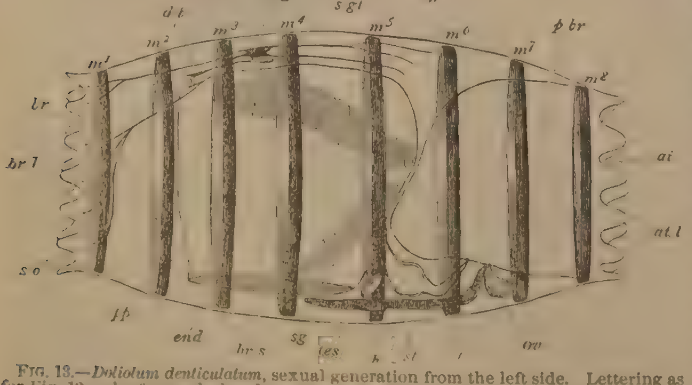

FIG. 13.—*Doliolum denticulatum*, sexual generation from the left side. Lettering as for Fig. 12; m^1–m^8, muscle bands; *ng*, nerve ganglion; *sg*, stigmata; *sgl*, subneural gland; *pbr*, peribranchial cavity; *atl*, atrial lobes; *so*, sense organs; *brl*, branchial lobes. (Original.)

Development of *Doliolum.*

The ova of the sexual generation produce tailed larvæ; these develop into forms known as "nurses" (blastozooids), which are asexual, and are characterized by the possession of nine muscle bands, an auditory sac on the left side of the body, a ventrally-placed stolon near the heart, upon which buds are produced, and a dorsal outgrowth near the posterior end of the body. The buds give rise eventually to the sexual generation, which is polymorphous, having three distinct forms, in two of which the reproductive organs remain undeveloped. The buds while still very young migrate from their place of origin on the stolon, divide by fission, and become attached to the dorsal outgrowth of the body of the nurse, where they develop. The three forms produced are as follows. (1) Nutritive form (trophozooids), which remain permanently attached to the nurse and serve to provide it with food; they have the body elongated dorso-ventrally, and the musculature is very slightly developed. (2) Foster forms (phorozooids), which, like the preceding, do not become sexually mature, but, unlike them, are set free as cask-shaped bodies with eight muscle bands and a ventral outgrowth, which is formed of the stalk by which the body was formerly united to the nurse. On this outgrowth the (3) forms (gonozooids) which become sexually mature are attached while still young buds, and after the foster forms are set free these reproductive forms gradually attain their complete development, and are eventually set free and lose all trace of their connection with the foster forms. They resemble the foster forms in having a cask-shaped body with eight muscle bands, but differ in having no outgrowth or process, and in having the reproductive organs fully developed.[1]

Anchinia.

Anchinia, of which only one species is known, *A. rubra*, from the Mediterranean, has the sexual forms permanently attached to portions of the dorsal outgrowth from the body of the unknown nurse. The body is elongated dorso-ventrally. The test is well developed and contains branched cells. The musculature is not so well developed as in *Doliolum*. There are two circular bands at the anterior end and two at the posterior, and two on the middle of the body. The stigmata are confined to the obliquely placed posterior end of the branchial sac. The alimentary canal forms a U-shaped curve. The reproductive organs are placed on the right side of the body. The life-history is still imperfectly known. As in the case of *Doliolum* the sexual generation is polymorphous, and has three forms, two of which remain in a rudimentary condition so far as the reproductive organs are concerned. In *Anchinia*, however, the three forms do not occur together on one stolon or outgrowth, but are produced successively, the reproductive forms of the sexual generation being independent of the "foster forms" (see Barrios, 27).

---

[1] For further details see Uljanin (**28**).

Sub-order 2.—Hemimyaria.

Characters of *Hemimyaria.*

Free-swimming pelagic forms which exhibit alternation of generations in their life-history and in the sexual condition form colonies. The body is more or less fusiform, with the long axis antero-posterior, and the branchial and atrial apertures nearly terminal. The test is well developed. The musculature of the mantle is in the form of a series of transversely-running bands, which do not form complete independent rings as in the *Cyclomyaria*. The branchial and peribranchial cavities form a continuous space in the interior of the body, opening externally by the branchial and atrial apertures, and traversed obliquely from the dorsal and anterior end to the ventral and posterior by a long narrow vascular band, which represents the dorsal lamina, the dorsal bloodvessel, and the neighboring part of the dorsal edge of the branchial sac of an ordinary Ascidian. The alimentary canal is placed ventrally. It may either be stretched out so as to extend for some distance anteriorly, or—as is more usual—be concentrated to form along with the reproductive organs a rounded opaque mass near the posterior end of the body, known as the visceral mass or "nucleus." The embryonic development is direct, no tailed larva being formed.

This sub-order contains two very distinct families, the SALPIDÆ, which are the typical members, and the OCTACNEMIDÆ, including a single very remarkable form (*Octacnemus bythius*), which in some respects does not conform with the characters given above.

Salpidæ.

The *Salpidæ* includes the single genus *Salpa* (Forskål), which, however, may be divided into two well-marked groups of species,—(1) those, such as *S. pinnata*, in which the alimentary canal is stretched out along the ventral surface of the body, and (2) those, such as *S. fusiformis* (Fig. 14, A), in which the alimentary canal forms a compact globular mass, the "nucleus," near the posterior end of the body. About fifteen species altogether are known; they are all pelagic forms and are found in nearly all seas. Each species occurs in two forms—the solitary asexual (*proles solitaria*) and the aggregated sexual (*proles gregaria*)—which are usually quite unlike one another. The solitary form (Fig. 14, B), gives rise by internal gemmation to a complex tubular stolon, which contains processes from all the more important organs of the parent body and which becomes segmented into a series of buds or embryos. As the stolon elongates, the embryos near the free end which have become advanced in their development are set free in groups, which remain attached together by processes of the test, each enclosing a diverticulum from the mantle so as to form "chains" (Fig. 15). Each member of the chain is a *Salpa* of the sexual or aggregated form, and when mature may—either still attached to its neighbors or separated from them (Fig. 14, A)—produce one or several embryos, which develop into the solitary *Salpa*. Thus the two forms alternate regularly.

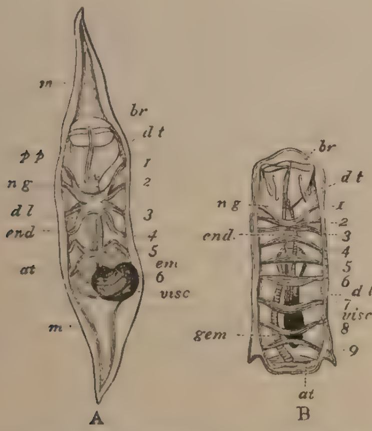

FIG. 14.—*Salpa runcinata-fusiformis.* A. Aggregated form. B. Solitary form. Lettering as before; 1-9, muscle bands; *em*, embryo; *gem*, gemmiparous stolon; *m*, mantle; *visc*, visceral mass (nucleus). (Original.)

Structure of *Salpa.*

The more important points in the structure of a typical *Salpa* are shown in Fig. 16. The branchial and atrial apertures are at opposite ends of the body, and each leads into a large cavity, the branchial and peribranchial sacs, which are in free communication at the sides of the obliquely-running dorsal lamina or "gill." The test is well developed and adheres closely to the surface of the mantle.

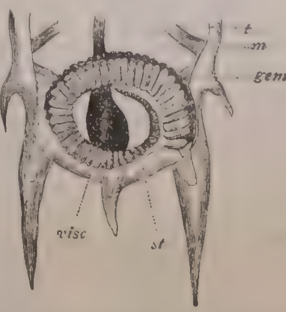

FIG. 15.—Posterior part of solitary form of *Salpa democratica-mucronata*, showing a chain of embryos nearly ready to be set free. *gem*, young aggregated *Salpæ* forming the chain; *st*, stolon; *m*, muscle band of the mantle. (Original.)

The muscle bands of the mantle do not completely encircle the body. They are present dorsally and laterally, but the majority do not reach the ventral surface. In many cases neighboring bands join in the median dorsal line (Fig. 14). The anterior end of the dorsal lamina is prolonged to form a prominent tentacular organ, the languet, projecting into the branchial sac. The nerve ganglion, subneural gland, dorsal lamina, peripharyngeal bands, and endostyle are placed in the usual positions. A pigment spot and an otocyst are found in connection with the ganglion. The large spaces at the sides of the dorsal lamina (often called the gill or branchia of *Salpa*), by means of which the cavity of the branchial sac is placed in free communication with the peribranchial cavity, are to be regarded as gigantic stigmata formed by the suppression of the lateral walls of the branchial sac. Fig. 16 represents an aggregated or sexual *Salpa* which was once a member of a chain, since it shows a testis and a developing embyro.

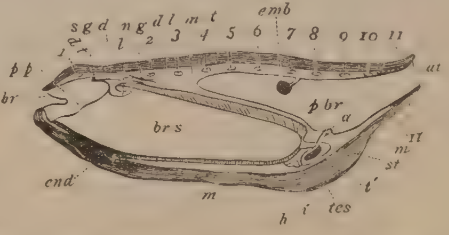

FIG. 16.—Semi-diagrammatic representation of *Salpa* from left side. Lettering as before; *emb*, embryo; *m*, mantle; *l*, languet; *sgd*, duct of subneural gland; 1-11 muscle bands of mantle; *t'* thickening of test over nucleus; *dl*, gill or branchia. (Original.)

The ova (always few in number, usually only one) appear at a very early period in the developing chain *Salpa*, while it is still a part of the gemmiparous stolon in the body of the solitary *Salpa*. This gave rise to the view put forward by Brooks (25), that the ovary really belongs to the solitary *Salpa*, which is therefore a female producing a series of males by asexual gemmation, and depositing in each of these an ovum, which will afterwards when fertilized, develop in the body of the male into a solitary or female *Salpa*. This idea would of course entirely destroy the view that *Salpa* is an example of alternation of generations. The sexual or chain *Salpa*, although really hermaphrodite, is always protogynous: *i.e.*, the female elements or ova are produced at an earlier period than the male organ or testis. This prevents self-fertilization. The ovum is fertilized by the spermatozoa of an older *Salpa* belonging to another chain, and the embryo is far advanced in its development before the testis is formed.

Development of *Salpa.*

At an early period in its development a part of the embryo becomes separated off, along with a part of the wall of the cavity in which it lies, to form the "placenta," in which the embryonic and the maternal blood streams circulate in close proximity (or actually coalesce during one period) and so allow of the passage of nutriment to the developing embryo. At a somewhat later stage a number of cells placed at the posterior end of the body alongside the future nucleus become filled up with oil-globules to form a mass of nutrient material—the elæoblast—which is used up later on in the development. Many suggestions have been made as to the homology of the elæoblast. The most probable is that it is the disappearing rudiment of the tail found in the larval condition of most Ascidians.

Octacnemidæ.

The family *Octacnemidæ* includes the single remarkable form *Octacnemus bythius*, found during the "Challenger" expedition, and first described by Moseley (**29**). It is apparently a deep-sea representative of the pelagic *Salpidæ*, and may possibly be fixed. The body is somewhat discoid, with its margin prolonged to form eight tapering processes, on to which the muscle bands of the mantle are continued. The alimentary canal forms a compact nucleus (Fig. 17); the endostyle is very short; and the dorsal lamina is apparently absent. The reproduction and life-history are entirely unknown.

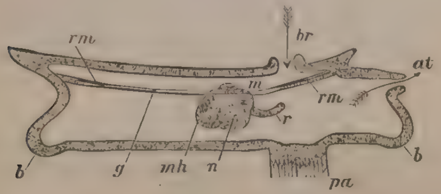

FIG. 17.—Diagrammatic vertical longitudinal section of *Octacnemus bythius* (after Moseley). *br*, branchial aperture; *m*, opening of œsophagus; *r*, rectum; *at*, atrial aperture; *rm*, *rm*, radiating muscles; *n*, nucleus; *mh*, muscles of nucleus; *g*, respiratory membrane; *b*, thickened margin of base of test; *pa*, pedicle of attachment.

Order III.—ASCIDIACEA.

Ascidiacea.

Fixed or free-swimming Simple or Compound Ascidians which in the adult are never provided with a tail and have no trace of a notochord. The free-swimming forms are colonies, the Simple Ascidians being always fixed. The test is permanent and well developed; as a rule it increases with the age of the individual. The branchial sac is large and well developed. Its walls are perforated by numerous slits (stigmata) opening into the peribranchial cavity, which communicates with the exterior by the atrial aperture. Many of the forms reproduce by gemmation, and in most of them the sexually-produced embryo develops into a tailed larva.

The *Ascidiacea* includes three groups—the Simple Ascidians, the Compound Ascidians, and the free-swimming colonial *Pyrosoma*.

Sub-order 1.—**Ascidiæ Simplices.**

Simple Ascidians.

Fixed Ascidians which are solitary and very rarely reproduce by gemmation; if colonies are formed, the members are not buried in a common investing mass, but each has a distinct test of its own. No strict line of demarcation can be drawn between the Simple and the Compound Ascidians, and one of the families of the former group, the *Clavelinidæ* (the Social Ascidians), forms a transition from the typical Simple forms, which never reproduce by gemmation, to the Compound forms, which always do (see p. 658 below). The *Ascidiæ Simplices* may be divided into the following families:

Family I.—CLAVELINIDÆ. Simple Ascidians which reproduce by gemmation to form small colonies in which each ascidiozooid has a distinct test, but all are connected by a common blood-system. Buds formed on stolons which are vascular outgrowths from the posterior end of the body, containing prolongations from the ectoderm, mesoderm, and endoderm of the ascidiozooid. Branchial sac not folded; internal longitudinal bars usually absent; stigmata straight; tentacles simple. This family contains three genera: *Ecteinascidia* (Herdman), with internal longitudinal bars in branchial sac; *Clavelina* (Savigny), with intestine extending behind branchial sac; and *Perophora* (Wiegmann), with intestine alongside branchial sac.

Family II.—ASCIDIIDÆ. Solitary fixed Ascidians with gelatinous test; branchial aperture usually eight-lobed, atrial aperture usually six-lobed. Branchial sac not folded; internal longitudinal bars usually present; stigmata straight or curved; tentacles simple. This family is divided into three sections:

Sub-family 1.—HYPOBYTHINÆ. Branchial sac with no internal longitudinal bars. One genus, *Hypobythius* (Moseley).

Sub-family 2.—ASCIDINÆ. Stigmata straight. Many genera, of which the following are the more important: *Ciona* (Fleming), dorsal languets present; *Ascidia* (Linnæus, =*Phallusia*, Savigny), dorsal lamina present (see Figs. 1 to 10); *Rhodosoma* (Ehrenberg), anterior part of test modified to form operculum; *Abyssascidia* (Herdman), intestine on right side of branchial sac.

Sub-family 3.—CORELLINÆ. Stigmata curved. Three genera: *Corella* (Alder and Hancock), test gelatinous, body sessile; *Corynascidia* (Herdman), test gelatinous, body pedunculated; *Chelyosoma* (Brod. and Sow.), test modified into horny plates.

Family III.—CYNTHIIDÆ. Solitary fixed Ascidians, usually with leathery test; branchial and atrial apertures usually both four-lobed. Branchial sac longitudinally folded; stigmata straight; tentacles simple or compound. This family is divided into three sections:

Sub-family 1.—STYELINÆ, not more than four folds on each side of branchial sac; tentacles simple. The more important genera are—*Styela* (Macleay), stigmata normal, and *Bathyoncus* (Herdman), stigmata absent or modified.

Sub-family 2.—CYNTHINÆ, more than eight folds in branchial sac; tentacles compound; body sessile. The chief genus is *Cynthia* (Savigny), with a large number of species.

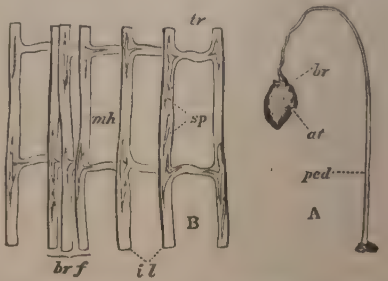

FIG. 18.—*Culeolus willemœsi*. A. Entire body, natural size. B. Part of branchial sac magnified. *at*, atrial aperture; *br*, branchial aperture; *ped*, peduncle; *br f*, slight fold of branchial sac; *i l*, internal longitudinal bar; *mh*, mesh; *sp*, calcareous spicules in vessels; *tr*, transverse vessels. (After Herdman, Challenger *Report*.)

Sub-family 3.—BOLTENINÆ, more than eight folds in branchial sac; tentacles compound; body pedunculated (Fig. 18, A). The chief genera are—*Boltenia* (Savigny), branchial aperture four-lobed, stigmata normal; and *Culeolus* (Herdman), branchial aperture with less than four lobes, stigmata absent or modified (Fig. 18, B). This last is a deep-sea genus discovered by the "Challenger" expedition (see **17**).

Family IV.—MOLGULIDÆ. Solitary Ascidians, sometimes not fixed; branchial aperture six-lobed, atrial four-lobed. Test usually incrusted with sand. Branchial sac longitudinally folded; stigmata more or less curved, usually arranged in spirals; tentacles compound. The chief genera are—*Molgula* (Forbes), with distinct folds in the branchial sac, and *Eugyra* (Ald. and Hanc.), with no distinct folds, but merely broad internal longitudinal bars in the branchial sac. In some of the *Molgulidæ* (genus *Anurella*, Lacaze-Duthiers, **20**) the embryo does not become converted into a tailed larva, the development being direct, without metamorphosis. The embryo when hatched assumes gradually the adult structure, and never shows the features characteristic of larval Ascidians, such as the urochord and the median sense-organs.

Sub-order 2.—**Ascidiæ Compositæ.**

Compound Ascidians.

Fixed Ascidians which reproduce by gemmation so as to form colonies in which the ascidiozooids are buried in a common investing mass and have no separate tests. This is probably a somewhat artificial assemblage formed of two or three groups of Ascidians which produce colonies in which the ascidiozooids are so intimately united that they possess a common test or investing mass. This is the only character which distinguishes them from the *Clavelinidæ*, but the property of reproducing by gemmation separates them from the rest of the *Ascidiæ Simplices*. The *Ascidiæ Compositæ* may be divided into the following families:

Family I.—DISTOMIDÆ. Ascidiozooids divided into two regions, thorax and abdomen; testes numerous; vas deferens not spirally coiled. The chief genera are—*Distoma* (Gaertner); *Distaplia* (Della Valle); *Colella* (Herdman), forming a pedunculated colony (see Fig. 19, A) in which the ascidiozooids develop incubatory pouches, connected with the peribranchial cavity, in which the embryos undergo their development (**17**); and *Chondrostachys* (Macdonald).

Family II.—CŒLOCORMIDÆ. Colony not fixed, having a large axial cavity with a terminal aperture. Branchial apertures five-lobed. This includes one species, *Cœlocormus huxleyi* (Herdman), which is a transition form between the ordinary Compound Ascidians (*e.g.*, *Distomidæ*) and the *Ascidiæ Salpiformes* (*Pyrosoma*).

Family III.—DIDEMNIDÆ. Colony usually thin and incrusting. Test containing stellate calcareous spicules. Testis single, large; vas deferens spirally coiled. The chief genera are—*Didemnum* (Savigny), in which the colony is thick and fleshy and there are only three rows of stigmata on each side of the branchial sac; and *Leptoclinum* (Milne-Edwards), in which the colony is thin and incrusting (Fig. 19, B) and there are four rows of stigmata on each side of the branchial sac.

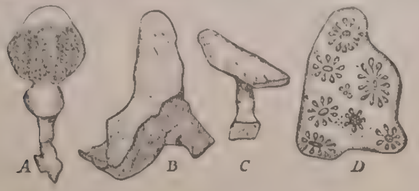

FIG. 19.—Colonies of *Ascidiæ Compositæ* (natural size). A. *Colella quoyi*. B. *Leptoclinum neglectum*. C. *Pharyngodictyon mirabile*. D. *Botryllus*, showing arrangement of ascidiozooids in circular systems each of which has a central common cloaca. (After Herdman, Challenger *Report*.)

Family IV.—DIPLOSOMIDÆ. Test reduced in amount, rarely containing spicules. Vas deferens not spirally coiled. In *Diplosoma* (Macdonald), the most important genus, the larva is gemmiparous.

Family V.—POLYCLINIDÆ. Ascidiozooids divided into three regions,—thorax, abdomen, and post-abdomen. Testes numerous; vas deferens not spirally coiled. The chief genera are—*Pharyngodictyon* (Herdman), with stigmata absent or modified, containing one species, *Ph. mirabile* (Fig. 19, C), the only Compound Ascidian known from a depth of 1000 fathoms; *Polyclinum* (Savigny), with a smooth-walled stomach; *Aplidium* (Savigny), with the stomach wall longitudinally folded; and *Amaroucium* (Milne-Edwards), in which the ascidiozooid has a long post-abdomen and a large atrial languet.

Family VI.—BOTRYLLIDÆ. Ascidiozooids having the intestine and reproductive organs alongside the branchial sac. Dorsal lamina present; internal longitudinal bars present in branchial sac. The chief genera are—*Botryllus* (Gaertn. and Pall.), with simple stellate systems (Fig. 19, D), and *Botrylloides* (Milne-Edwards), with elongated or ramified systems.

Family VII.—POLYSTYELIDÆ. Ascidiozooids not grouped in systems. Branchial and atrial apertures four-lobed. Branchial sac may be folded; internal longitudinal bars present. The chief genera are—*Thylacium* (Carus), with ascidiozooids projecting above general surface of colony; *Goodsiria* (Cunningham), with ascidiozooids completely imbedded in investing mass; and *Chorizocormus* (Herdman), with ascidiozooids united in little groups which are connected by stolons. The last genus contains one species, *Ch. reticulatus*, a transition form between the other *Polystyelidæ* and the *Styelinæ* amongst Simple Ascidians.

Reproduction by gemmation.

The methods of reproduction by gemmation differ in their details in the various groups of Compound Ascidians; but in all cases the process is essentially a giving off from the parent body of groups of cells representing the ectoderm, the mesoderm, and the endoderm, which develop into the corresponding layers of the bud. The first ascidiozooid of the colony produced by the tailed larva does not form sexual reproductive organs, but reproduces by gemmation so as to make a colony. Thus there is alternation of generations in the life-history. In the most completely formed colonies (*e.g.*, *Botryllus*) the ascidiozooids are arranged in groups (systems or cœnobii), and in each system are placed with their atrial apertures towards one another, and all communicating with a common cloacal cavity which opens to the exterior in the centre of the system (Fig. 19, D).

Sub-order 3.—**Ascidiæ Salpiformes.**

Ascidiæ Salpiformes.

Free-swimming pelagic colonies having the form of a hollow cylinder closed at one end. The ascidiozooids forming the colony are imbedded in the common test in such a manner that the branchial apertures open on the outer surface and the atrial apertures on the inner surface next to the central cavity of the colony. The ascidiozooids are produced by gemmation from a rudimentary larva (the cyathozooid) developed sexually.

Structure of *Pyrosoma*.

This sub-order includes a single family, the PYROSOMIDÆ, containing one well-marked genus, *Pyrosoma* (Péron), with several species. They are found swimming near the surface of the sea, chiefly in tropical latitudes, and are brilliantly phosphorescent. A fully developed *Pyrosoma* colony may be from an inch or two to upwards of four feet in length. The shape of the colony is seen in Fig. 20. It tapers slightly towards the closed end, which is rounded. The opening at the opposite end is reduced in size by the presence of a membranous prolongation of the common test (Fig. 20, B). The branchial apertures of the ascidiozooids are placed upon short papillæ projecting from the general surface, and most of the ascidiozooids have long conical processes of the test projecting outwards beyond their branchial apertures (Figs. 20, 21, and 22). There is only a single layer of ascidiozooids in the *Pyrosoma* colony, as all the fully developed ascidiozooids are placed with their antero-posterior axes at right angles to the surface and communicate by their atrial apertures with the central cavity of the colony (Fig. 21). Their dorsal surfaces are turned towards the open end of the colony. The more important points in the structure of the ascidiozooid of *Pyrosoma* are shown in Fig. 22. A circle of tentacles, of which one, placed ventrally (Fig. 22, *tn*), is larger than the rest, is found just inside the branchial aperture. From this point a wide cavity, with a few circularly-placed muscle bands running round its walls, leads back to the large branchial sac, which occupies the greater part of the body. The stigmata are elongated transversely and crossed by internal longitudinal bars. The dorsal lamina is represented by a series of eight languets (*l*). The nerve ganglion (on which is placed a small pigmented sense-organ), the subneural gland, the dorsal tubercle, the peripharyngeal bands, and the endostyle are placed in the usual positions. On each side of the anterior end of the branchial sac, close to the peri-pharyngeal bands, is a mass of

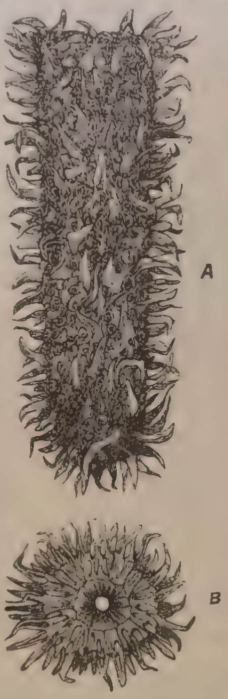

FIG. 20.—*Pyrosoma elegans*, natural size. A. Side view of entire colony. B. End view of open extremity. (Original.)

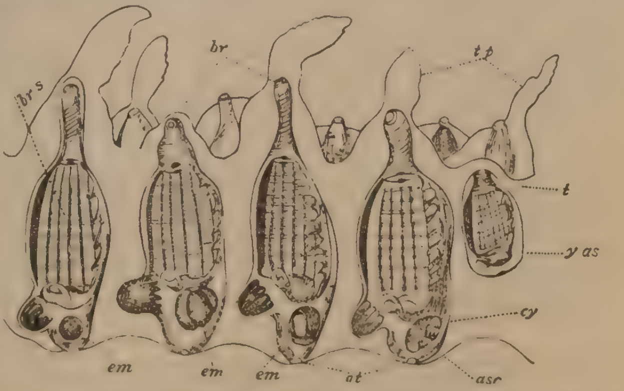

FIG. 21.—Part of a longitudinal section through wall of *Pyrosoma*, showing arrangement of ascidiozooids, magnified (partly after Savigny). *at*, atrial apertures; *br*, branchial apertures; *asc*, young ascidiozooid of a future colony produced by budding from *cy*, cyathozooid; *em*, embryos in various stages; *t*, test; *tp*, processes of test; *brs*, branchial sac; *yas*, young ascidiozooid.

rounded gland cells which are the source of the phosphorescence. The alimentary canal is placed posteriorly to the branchial sac, and the anus opens into a large peribranchial (or atrial) cavity, of which only the median posterior part is shown (*pbr*) in Fig. 22. The reproductive organs are developed in a diverticulum of the peribranchial cavity, and consist of a lobed testis and a single ovum at a time.

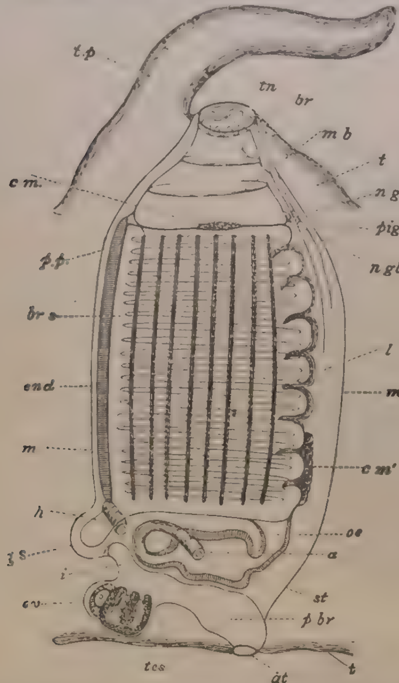

FIG. 22.—Mature ascidiozooid of *Pyrosoma*, from left side (partly after Keferstein). Lettering as before; *cm*, cellular mass, the seat of phosphorescence; *cm'*, posterior cellular mass; *gs*, gemmiparous stolon; *mb*, muscle band; *ngl*, subneural gland; *pig*, pigment spot on ganglion; *tp*, process of test.

Development of *Pyrosoma*.

The development takes place in a part of the peribranchial cavity (Fig. 21, *em*). The segmentation is meroblastic, and an elongated embryo is formed on the surface of a mass of yolk. The embryo, after the formation of an alimentary cavity, a tubular nervous system, and a pair of laterally placed atrial tubes, divides into an anterior and a posterior part. The anterior part then segments into four pieces, which afterwards develop into the first ascidiozooids of the colony, while the posterior part remains in a rudimentary condition, and was called by Huxley the "cyathozooid;" it eventually atrophies. As the four ascidiozooids increase in size, they grow round the cyathozooid and soon encircle it (Fig. 21, *asc* and *cy*). The cyathozooid absorbs the nourishing yolk upon which it lies, and distributes it to the ascidiozooids by means of a heart and system of vessels which have been meanwhile formed. When the cyathozooid atrophies and is absorbed, its original atrial aperture remains and deepens to become the central cavity of the young colony, which now consists of four ascidiozooids placed in a ring, around where the cyathozooid was, and enveloped in a common test. The colony gradually increases by the formation of buds from these four original ascidiozooids.

PHYLOGENY.

Phylogeny.

The accompanying diagram shows graphically the probable origin and course of evolution of the various groups of *Tunicata*, and therefore exhibits their relations to one another much more correctly than any system of linear classification can do. The ancestral *Proto-Tunicata* are here regarded[1] as an offshoot from the *Proto-Chordata*—the common ancestors of the *Tunicata* (*Urochorda*), *Amphioxus* (*Cephalochorda*), and the *Vertebrata*. The ancestral *Tunicata* were probably free-swimming forms, not very unlike the existing *Appendiculariidæ*, and are represented in the life-history of nearly all sections of the *Tunicata* by the tailed larval stage. The *Larvacea* are the first offshoot from the ancestral forms which gave rise to the two lines of descendants, the *Proto-Thaliacea* and the *Proto-Ascidiacea*. The *Proto-Thaliacea* then split into the ancestors of the existing *Cyclomyaria* and *Hemimyaria*. The *Proto-Ascidiacea* gave up their pelagic mode of life and became fixed. This ancestral process is repeated at the present day when the free-swimming larva of the Simple and Compound Ascidians becomes attached. The *Proto-Ascidiacea*, after the change, are probably most nearly represented by the existing genus *Clavelina*. They have given rise directly or indirectly to the various groups of Simple and Compound Ascidians and the *Pyrosomidæ*. These groups form two lines, which appear to have diverged close to the position of the family *Clavelinidæ*. The one line leads to the more typical Compound Ascidians, and includes the *Polyclinidæ*, *Distomidæ*, *Didemnidæ*, *Diplosomidæ*, *Cœlocormidæ*, and finally the *Ascidiæ Salpiformes*. The second line gave rise to the Simple Ascidians, and to the *Botryllidæ* and *Polystyelidæ*, which are, therefore, not closely allied to the other Compound Ascidians. The later *Proto-Ascidiacea* were probably colonial forms, and gemmation was retained by the *Clavelinidæ* and by the typical Compound Ascidians (*Distomidæ*, etc.) derived from them. The power of forming colonies by budding was lost, however, by the primitive Simple Ascidians, and must, therefore, have been regained independently by the ancestral forms of the *Botryllidæ* and the *Polystyelidæ*. If this is a correct interpretation of the course of evolution of the *Tunicata*, we arrive at the following important conclusions: (1) The *Tunicata*, as a whole, form a degenerate branch of the *Proto-Chordata*; (2) the *Ascidiæ Salpiformes* (*Pyrosoma*) are much more closely related to the typical Compound Ascidians than to the other pelagic *Tunicata*, viz., the *Larvacea* and the *Thaliacea*; and (3) the *Ascidiæ Compositæ* form a polyphyletic group, the sections of which have arisen at several distinct points from the ancestral Simple Ascidians.

---

[1] By Dohrn and others their point of origin is placed considerably further up on the stem of the *Chordata*, thus causing the *Tunicata* to be regarded as very degenerate *Vertebrata* (see 32).

TUNING FORK, a small bar of cast tool steel with tolerably defined edges, bent into a fork with two prongs. A handle of the same metal extending from the bend of the fork serves as a sound-post to transmit the vibrations of the fork to any resonance board or body convenient for reinforcing the sound. The fork is set in vibration by striking one of the prongs against any hard substance, by pressing the prongs together if the fork is a light one, or, if it is large, by drawing a double bass bow across one of the prongs. The larger forks are sometimes made with a worm upon the handle in order that they may be screwed into a resonance box, the dimensions of which should agree with the pitch of the fork. The ordinary use of a tuning fork is to serve as a pitch carrier or standard, for which it is particularly suited owing to the permanence with which it maintains the pitch to which it may be tuned. It is flattened by heat and sharpened by cold about 1 vibration in 20,000 for every degree Fahr., so that the exact pitch always depends upon the temperature. A tuning fork is tuned by filing the ends of the prongs or between them near the ends to make it sharper, or by filing between them near or at the bend to make it flatter. Less filing is required to flatten than to sharpen. It should be allowed to rest after tuning, on account of the disturbance of the molecular structure by the filing, and after a few days should be compared again with the pitch required, and corrected. The tuning fork is also of value in certain physical investigations, from the constancy of its rate of vibration. In England it is generally tuned to C in the treble clef, because organ-builders start their tuning from that note; in France it is tuned to A in the treble clef, which is the note of the third open string of the violin. The French diapason normal is tuned to A at 15° C. (= 59° Fahr.) and is fixed at 435 double vibrations in a second. The inventor of the tuning fork was John Shore, royal trumpeter in 1711, sergeant trumpeter at the entry of George I. in 1714, and lutanist to the chapel royal in 1715.

According to Chladni, whose analysis of the tuning fork has been generally accepted, it has two nodes or points of least vibration at the bend, with a ventral or vibrating loop between, by which its vibrations are transmitted to the handle. That this is not the case has been shown by Mr. W. F. Stanley.[1] The fundamental note appears to be an octave below the note which the ear recognizes as the pitch of the fork. Helmholtz, Tyndall, and others accept the latter as the fundamental, and Helmholtz expressly says that each prong may be regarded as an elastic rod fixed at one end.[2] The fork is really a bent elastic rod vibrating at both ends, with a node at the bend through which, and in the same way as with the bridge of any stringed instrument, the vibrations are conducted. As well as the second partial, the third and fourth are in large forks frequently distinguishable, but such partials above the octave are very weak. In addition to the lower harmonic partials it is generally easy to produce with a blow a very high inharmonic tinkle or ringing metallic note, that will continue to sound for some time without blending with the true note of the fork. The precise interval varies, but is usually two octaves and between a flat fifth and a major sixth above the recognized pitch of the fork. With ordinary tuning forks this tinkling note is to be found amongst the highest treble notes of the pianoforte. Theorists give other inharmonic proper tones in due ascending order; they are derived from calculation on the assumption that they proceed as the squares of the odd numbers, but are beyond practical verification owing to their extreme position in the scale of musical sounds and the variation of power in different ears to distinguish them.

The tuning fork was used by Scheibler (1777–1837) as the easiest means for correctly determining the pitch numbers of vibrations. To make a Scheibler tonometer, take a fork in which the octave can be easily heard and intercalate as many forks as, giving countable beats with each other, will fill up the octave. The addition of the whole number of beats and their fractions in the octave will be the vibrating number, in double vibrations per second, of the lower fork. In order to measure the fractions of vibrations accurately forks should be chosen that are audible for 40, or at least 20 seconds. For instance, 60 beats counted in 20 seconds would be 3 a second, and 65 in the same time 3.25. The forks should remain for three months after filing before their differences are finally determined, and the whole examination should be conducted in a known, uniform temperature. Scheibler considered four beats a second between two forks a good number for counting; but Mr. A. J. Ellis, who has used Scheibler's invention as a basis for an exhaustive historical statement of musical pitch[3] and as the novel and exact means for determining the non-harmonic musical scales of various nations, especially Eastern nations,[4] considers three beats a second the best counting number. This would increase the number of intermediate forks.

Attempts have been made to use tuning forks instead of strings for key-board instruments, the object being to obtain permanence of tuning with the soft, unexciting quality of tone furnished by the fork. The inventions of Clagget, London, 1788, of Riffelsen (the melodikon), Copenhagen, 1803, and of Schuster (the adiaphonon), Vienna, 1819, were of this nature. The latest adaptation of a key-board to tuning forks has been effected by Mr. Machell of Glasgow; it was shown at the Inventions Exhibition, South Kensington, London, 1885.

TUNIS, **Regency of**, formerly one of the Barbary states of north Africa, but since 1881 a dependency of France, whose resident-general exercises all real authority in the nominal dominions of the bey. Is bounded on the west by Algeria, on the north by the western basin of the Mediterranean, on the east from Cape Bon to the Gulf of Gabes (Ḳábis) by the eastern basin of the same sea, and on the southeast by the province of Tripoli. On the south the boundary is the Sahara and the frontier line is indefinite. The greatest breadth from east to west is about 150 miles; the length from north to south about 300 miles. The population does not exceed a million and a half.

Plate V.

Physical Features.—Tunis is formed by the prolongation towards the east of the two great mountain chains of Algeria (*q.v.*), and closely resembles that country in its physical features, products, and climate; see Africa, vol. i. pp. 237–8. The northern Algerian chain (the Little Atlas) is prolonged through Tunis to Rás Sídi 'Alí al-Makkí, the highest summits never attaining an altitude of 4000 feet. It forms a picturesque fertile, and well-watered region, with extensive cork woods in its western parts, and separated from the southern mountains by the valley (the ancient Zeugitana) of the Mejerda (the ancient Bagradas), the most important river of north Africa, which after a tortuous course of nearly 300 miles falls into the Gulf of Tunis at Porto Farina. The basin of the Mejerda, which is now traversed by the railway from Algiers to Tunis, is very fertile, and many important ruins testify to its prosperity in Roman times. The rich lacustrine deposits in the Dákhila, or plain of Bulla Regia, show that it was only in relatively recent times that its upper waters found a passage to the sea by cutting a deep gorge through the cretaceous barrier that shuts in this upland plain upon the east. The southern wall of the Mejerda valley and of the Gulf of Tunis is formed by a branch of the southern Algerian chain, connected with Jebel Aurás (Mount Aurès) by the plateau of Tebessa (Theveste) and running northeast to Cape Bon. Its highests summits (Zilk and Zaghwán) rise above 5000 feet. Another branch of the southern chain runs from the Sahara side of Mount Aurès southeast towards the head of the Lesser Syrtis or Gulf of Gabes. Between these two branches lies a mountainous plateau, whose waters descend eastward but do not reach the sea. Arrested by a line of hills running parallel to the coast, they form a chain of lakes and marshes, which for the most part dry up in summer. It is to this region of inland drainage (the ancient Byzacene) that the plain of Ḳairwan belongs. Its southern part from Sbeitla (Sobaiṭala) to the Syrtis is relatively sterile, and even in antiquity appears to have formed an exception to the general fertility of the country, which was one of the granaries of Rome. The upland district from Tebessa southward sinks into the desert by a step-like series of great plateaus, separated by rugged walls of variegated marls, sands, and alluvium, torn into fantastic shapes, and scored with deep ravines by streams which at some remote period of copious rainfall poured down into the Sahara. Farther east the plateaus disappear and the mountains rise like a rampart from the Sibákh (sing. *Sebkha*), or Saharian marshes and salt-flats. The depression to which the Sibákh belong terminates to the east in the Shott (Shaṭṭ) al-Jeríd, which is separated from the Lesser Syrtis only by a narrow isthmus; see SAHARA, vol. xxi. p. 158. Even the Sahara of Tunis abounds in fertile oases.

[4] "On Musical Scales," *ibid.*, 27th March and 30 October, 1885.

Climate.—The mean annual temperature at Súsa is 75° Fahr., the mean of the winter or rainy season 60° and of the hot season 97°. At Tunis the temperature rarely exceeds 90°, except with a wind from the Sahara. The prevailing winds from May to September are east and northeast and during the rest of the year northwest and east. A rainy season of about two months usually begins in January; the spring season of verdure is over in May; summer ends in October with the first rains. Violent winds are common at both equinoxes.

Flora and Fauna.—Both are generally the same as those of ALGERIA (*q.v.*). The lion and panther are almost extinct but the sportsman finds in abundance the wild boar, partridge, Carthage fowl, quail, and snipe. The African moufflon still exists in the southern mountains. Herds of buffaloes are found in the district of Mater. The stag occurs in the eastern districts. The camel, now so important, was hardly known here before the Roman sovereignty. Red mullet, tunny, and other fish abound around the coast; and fishing stations are numerous. The town of Bizerta and the Kerkenna Islands are mainly dependent on their fisheries. The coral and sponge fisheries, of which Sfax and the Island of Jerba (Djerba) are centres, are also considerable. Of noxious creatures may be named the scorpion, much more formidable than that of Algiers, a venomous tree snake (*Echis carinata*),[1] in the sandy lands between Kafṣa and Sfax, and a species of python called *taguerga*, which infests some parts of the southern mountains.

Cork and "zen" trees cover about 360,000 acres towards the Algerian frontier, and the pine and deciduous oak almost as large an area south of the Mejerda; but the country is much less wooded than in antiquity. The richness of the grain crops is still remarkable, in spite of imperfect cultivation. Olives and many excellent fruits are largely produced, and vineyards have been much extended since the French occupation. Esparto grass abounds in the uplands. The oases of the Jeríd are devoted to the date palm and produce the best dates known in the European market.

Minerals.—The mineral wealth of Tunis, like that of Algeria, is considerable, but it has been imperfectly explored. The iron mines of the northern mountains and the argentiferous lead mines of Al-Reṣáṣ near Tunis were worked in antiquity, as were also the marble quarries of Simittu (Chemtou), on the upper Mejerda, which are now in the hands of a Belgian company. The thermal springs of Hammám al-Anf on the Bay of Tunis are supposed to have healing virtues; they are now connected with the capital by rail.

Inhabitants.—The industrious Berbers (Kabyles), the oldest stock in the country, are less sharply marked off from the Arabs than in Algeria, but are distinguishable by their lighter complexion and often fair hair. They form a large part of the population in the northern and eastern mountains, and in the island of Jerba (Jirba). They are organized in tribes with purely democratic self-government, and laws of their own, which are not those of the Koran. The pastoral Arab nomads are descended from the second Arab invasion, which began in the 11th century (see below). They have little agriculture and are still as indolent and unruly as their ancestors. The Arabs of the towns are usually known as Moors; among them the Spanish Moors, descendants of the Andalusian refugees, form an exclusive and aristocratic class. The pure Turks and the Kuluglis (sons of Turkish fathers by Moorish women or slave girls) are no longer numerous. Of Europeans there are some 10,000 Italians, 8000 Maltese, and 4000 French (exclusive of the army). The Jews number some 50,000, of whom perhaps half are in the capital. The trade of the country is largely in their hands.

Towns.—For the capital Tunis, see below. Of the coast towns SFAX and SUSA have separate notices; Bizerta (Benzert), the ancient Hippo Zarytus, is the chief place on the north coast, with 5000 inhabitants. It stands on a canal connecting the sea with a lake which might easily be converted into a magnificent land-locked harbor. On the east coast are Hammamet (Ḥamámát), with 3700 inhabitants; Monastir, with 5600 inhabitants and a trade in cereals and oils; Mahdíya (Mehedia), with 6300 inhabitants, the fallen city of the Fátimites, which since the French occupation has begun to rise again, and has a new harbor; and Gabes (Ḳábis) on the Syrtis, a group of small villages, with an aggregate population of 14,000, the port of the shott country and a depôt of the esparto trade. Of the inland towns the holy city of KAIRWAN (*q.v.*) is the most remarkable. Its fine mosques are now open to visitors. Sbeitla (Lat. Sufetula), in the mountains southwest of Kairwan, is remarkable for its magnificent Roman remains, the triumphal arch of Constantine, and the three temples which form the *hieron*. The principal towns of the Mejerda basin are Bedja (Bája), the ancient Vaga, an important corn market, and higher up, near the border, the fortress of Kéf (Sicca Veneria), with 4000 inhabitants, boldly perched on the steep slope of a volcanic mountain.

Commerce.—The total imports of the regency in 1885 were valued at £1,098,047 [$5,336,508.42], of which about 27 per cent. were British goods, chiefly cotton fabrics. In 1884 the imports were valued at £1,157,182 [$5,623,904.52]. The most important export is olive oil, and after it come wheat, esparto grass, barley, sponges. The value of the total exports in 1884 was £745,554 [$3,623,392.44], and in 1885 £882,946 [$4,291,117.56]. In 1885 1035 vessels (71,133 tons) entered the port of Goletta, and the entries at other ports were 3033 (55,050 tons).

History.—The history of Tunis begins for us with the establishment of the Phœnician colonies; see vol. xviii. p. 819 PHŒNICIA and CARTHAGE. The Punic settlers Semitized the coast, but left the Berbers of the interior almost untouched. The Romans entered into the heritage of the Carthaginians and of the vassal kings of Numidia, and Punic speech and civilization gave way to Latin, a change which from the time of Cæsar was helped on by Italian colonization. Rich in corn, in herds, and in later times also in oil, and possessing valuable fisheries, mines, and quarries, the province of Africa, of which Tunis was the most important part, attained under the empire a prosperity to which Roman remains in all parts of the country still bear witness. Carthage was the second city of the Latin part of the empire, "after Rome the busiest and perhaps the most corrupt city of the West, and the chief centre of Latin culture and letters." In the early history of Latin Christianity Africa holds a more important place than Italy. It was here that Christian Latin literature took its rise, and to this province belong the names of Tertullian and Cyprian, of Arnobius and Lactantius, above all of Augustine. Lost to Rome by the invasion of the Vandals, who took Carthage in 439, the province was recovered by Belisarius a century later (533–4), and remained Roman to the Arab invasion, for which see vol. xvi. p. 570. The conqueror ‘Oḳba founded the city of Ḳairwán (*c.* 670), which was the residence of the governors of Africa under the Omayyads and thereafter the capital of the Aghlabite princes, the conquerors of Sicily, who ruled in merely nominal dependence on the ‘Abbásids (see vol. xvi. p. 611).

The Latin element in Africa and the Christian faith disappeared in a single generation; the Berbers of the mountains, who had never been Latinized and never really Christianized, accepted Islam without difficulty, but showed their stubborn nationality, not only in the character of their Mohammedanism, which has always been mixed up with the worship of living as well as dead saints (marabouts) and other peculiarities, but also in political movements. The empire of the Fátimites (see vol. xvi. p. 609) rested on Berber support, and from that time forth till the advent of the Turks the dynasties of north Africa were really native, even when they claimed descent from some illustrious Arab stock. When the seat of the Fátimite empire was removed to Egypt, the Zírites, a house of the Sanhaja Berbers, ruled as their lieutenants at Mahdíya, and about 1050 Mo‘izz the Zírite, in connection with a religious movement against the Shi‘ites, transferred his very nominal allegiance to the Abbasid caliphs. The Fátimites in revenge let loose upon Africa a vast horde of Bedouins from Upper Egypt (B. Hilál and Solaim), the ancestors of the modern nomads of Barbary. All Africa was ravaged by the invaders, who, though unable to found an empire or overthrow the settled government in the towns, forced the agricultural Berbers into the mountains, and, retaining from generation to generation their lawless and predatory habits, have ever since made order and prosperity almost impossible in the open parts of the country. The Zírite dynasty was finally extinguished by Roger I. of Sicily, who took Mahdíya in 1148 and established his authority over all the Tunisian coast. Even Moslem historians speak favorably of the Norman rule in Africa; but it was brought to an early end by the Almohade caliph ‘Abd al-Mu'min, who took Mahdíya in 1160. The Almohade empire soon began to decay, and in 1336 Abú Zakaríyá, prince of Tunis, was able to proclaim himself independent and found a dynasty, which subsisted till the advent of the Turks. The Hafsites (so called from Abú Ḥafṣ, the ancestor of Abú Zakaríyá, a Berber chieftain who had been one of the intimate disciples of the Almohade mahdi) assumed the title of Prince of the Faithful, a dignity which was acknowledged even at Mecca, when in the days of Mostanṣir, the second Hafsite, the fall of Baghdad left Islam without a titular head. In its best days the empire of the Hafsites extended from Tlemcen to Tripoli and they received homage from the Merinids of Fez; they held their own against repeated Frankish invasions, of which the most notable were that which cost St. Louis of France his life (1270) and that of the duke of Bourbon (1390), when English troops took part in the unsuccessful siege of Mahdíya. They adorned Tunis with mosques, schools, and other institutions, favored letters, and in general appear to have risen above the usual level of Moslem sovereigns. But their rule was troubled by continual wars and insurrections; the support of the Bedouin Arabs was imperfectly secured by pensions, which formed a heavy burden on the finances of the state;[1] and in later times the dynasty was weakened by family dissensions. Leo Africanus, writing early in the 16th century, gives a favorable picture of the "great city" of Tunis, which had a flourishing manufacture of fine cloth, a prosperous colony of Christian traders, and, including the suburbs, nine or ten thousand hearths; but he speaks also of the decay of once flourishing provincial towns, and especially of agriculture, the greater part of the open country lying waste for fear of the Arab marauders. Taxation was heavy, and the revenue very considerable: Don John of Austria in a report to Philip II. states that the land revenue alone under the last Hafsite was 375,935 ducats [$852,620.58], but of this a great part went in pensions to the Arabs.

---

[1] [Not a tree snake. See vol. xxii. pp. 209, 210.—AM. ED.]

The conquest of Algiers by the Turks gave a dangerous neighbor to Tunis, and after the death of Mohammed the Hafsite in 1525 a disputed succession supplied Khair al-Dín Barbarossa with a pretext for occupying the city in the name of the sultan of Constantinople. Al-Ḥasan, the son of Mohammed, sought help from the emperor, and was restored in 1535 as a Spanish vassal, by a force which Charles V. commanded in person, while Andrea Doria was admiral of the fleet. But the conquest was far from complete, and was never consolidated. The Spaniards remained at Goletta and made it a strong fortress; but the interior was a prey to anarchy and civil war, until in 1570 ‘Alí Pasha of Algiers utterly defeated Ḥámid, the son and successor of Ḥasan, and occupied Tunis. In 1573 the Turks again retreated on the approach of Don John, who had dreams of making himself king of Tunis; but this success was not followed up, and in the next year Sultan Selim II. sent a strong expedition, which drove the Spaniards from Tunis and Goletta, and reduced the country to a Turkish province. The civil administration was now placed under a pasha; but in a few years a military revolution transferred the supreme power to a dey elected by the janissaries, who formed the army of occupation. The government of the deys lasted till 1705, but was soon narrowed or overshadowed by the authority of the beys, whose proper function was to manage the tribes and collect tribute. From 1631 to 1702 the office of bey was hereditary in the descendants of Murád, a Corsican renegade, and their rivalry with the deys and internal dissensions kept the country in constant disorder. Ibrahím, the last of the deys (1702-1705), destroyed the house of Murád and absorbed the beyship in his own office; but, when he fell in battle with the Algerians, Ḥosain b. ‘Alí, the son of a Greek renegade, was proclaimed sovereign by the troops under the title of "bey," and, being a prince of energy and ability, was able to establish the hereditary sovereignty, which has lasted without change of dynasty to the present time.

Frequent wars with Algiers, which need not detain us, form the chief incidents in the internal history of Tunis under the beys. Under deys and beys alike Tunis was essentially a pirate state. Occasional acts of chastisement, of which the bombardment of Porto Farina by Blake in 1655 was the most notable, and repeated treaties, extorted by European powers, checked from time to time, but never put an end to, the habitual piracies, on which indeed the public revenue of Tunis was mainly dependent. The powers were generally less concerned for the captives than for the acquisition of trading privileges, and the beys took advantage of the commercial rivalry of England and France to play off the one power against the other. The release of all Christian slaves was not effected till after the bombardment of Algiers; and the definite abandonment of piracy may be dated from the presentation to the bey in 1819 of a collective note of the powers assembled at Aix-la-Chapelle. The Government had not elasticity enough to adapt itself to so profound a change in its ancient traditions; the finances became more and more hopelessly embarrassed, in spite of ruinous taxation; and attempts at European innovations in the court and army made matters only worse, so long as no attempt was made to improve the internal condition of the country. In the third quarter of the 19th century not more than a tenth part of the fertile land was under cultivation, and the yearly charge on the public debt exceeded the whole annual revenue. In these circumstances only the rivalry of the European powers that had interests in Tunis protracted from year to year the inevitable revolution. The French had long regarded the dominion of the bey as their natural inheritance, and in 1881, having got a grievance against the bey in a commercial transaction of the French African Society, with the execution of which he had interfered (the affair of the Enfida estate), a French force crossed the Algerian frontier under pretext of chastising the independent Kroumir or Khomair tribes in the northeast of the regency, and, quickly dropping the mask, advanced on the capital and compelled the bey to accept the French protectorate. The actual conquest of the country was not effected without a serious struggle with Moslem fanaticism; but all Tunis was brought completely under French jurisdiction and administration, supported by military posts at every important point. The power of the bey is null and his dignity merely nominal,—a fact acknowledged by Great Britain by the surrender in 1883 of Her Majesty's consular jurisdiction in the regency.

Literature.—Of Arabic sources accessible in translations, the geographical works of Ya‘ḳubí (*Descriptio al Magribi*, by De Goeje, Leyden, 1860), Al-Bakrí (*Descr. de l'Afrique septentr.*, by De Slane, Paris, 1859; Arabic text, *ibid.* 1857), and Edrísí (*Descr. de l'Afrique*, etc., by Dozy and De Goeje, Leyden, 1866) belong to the 10th, 11th, and 12th centuries respectively; the history of Ibn Khaldún (*Hist. des Berbères*, by De Slane, 4 vols., Algiers, 1852-56) includes the earlier Hafsites, that of Al-Kairawání (*Hist. de l'Afrique*, by Pellissier and Rémusat, Paris, 1845, in *Expl. Scient. de l'Algérie*, vol. vii.; Arabic text, Tunis, 1286 A.H.) deals especially with Tunis, and goes down to 1681. The geography of Tunis is treated by E. Pellissier (*Explor. Scient. de l'Algérie*, vol. xvi., Paris, 1853), C. Tissot (*Géog. Comparée de la Province Romaine d'Afrique*, vol. i., Paris, 1884), and Piesse (*Itinéraire de l'Algérie*, etc., new ed., Paris, 1887), and in Murray's *Handbook*, by Sir R. Playfair (1887), who has also published *Travels in the Footsteps of Bruce in Alg. and Tunis* (London, 1887). A French survey is in progress, and some of the maps are published. For the modern history, see Rousseau, *Annales Tunisiennes* (Algiers, 1864), and Broadley, *Tunis Past and Present* (Edinburgh, 1882); for the archæology, Davis, *Carthage and her Remains* (London, 1860), Guérin, *Voyage Archéologique* (1862), and D'Herisson, *Mission Archéol. en Tunisie* (Paris, 1881). The excellent description of Africa by Leo Africanus is in Ramusio and Purchas. Shaw's *Travels* (1738) may still be consulted. Of other books of travels Maltzan's *Reise* (Leipsic, 1870) deserves mention.

TUNIS, capital of the regency of the same name, in 36° 50′ N. lat. and 10° 12′ E. long., is situated on an isthmus between two salt lakes, a marshy sebkha to the southwest and the shallow Boḥeira to the northeast. The latter is twelve miles in circumference, and on the side opposite Tunis is connected with the Bay of Tunis at the port of Goletta (Ḥalḳ al-Wād) by a short canal. The old town, of which the walls have in great part disappeared, lies between two suburbs, the Ribáṭ al-Soweika on the north and the Ribáṭ Bab al-Jezíra on the south. These suburbs were surrounded by a wall in the beginning of the 19th century. Between the old town and the Marine Gate on the Boḥeira a European quarter, containing the palace of the resident, public offices, the provisional cathedral, and huge blocks of new houses in the French style, has sprung up. At the extreme west of the old town is the citadel, now used as barracks, whose lofty circuit includes the mosque built by Abú Zakaríyá the Hafsite in 1232. To the same century belongs the great mosque of the Olive Tree (Jámi‘ al-Zeitúna) in the centre of the town, with its many domes and spacious cloister, which possesses a library and serves as a college for some 450 students of Moslem learning. To the north near the walls of the old town rises the dome of the mosque named after Sídí Mahrez, a renowned saint of the 5th century of the Flight, whose tomb gives it a right of sanctuary for debtors. There are many other mosques and chapels, but all are closed against Christians. The palace of the bey, between the citadel and the mosque of the Olive Tree, is partly in bad French taste, but contains some rooms of the 18th century with admirable Moorish decoration in the delicate stucco arabesque work for which Tunis was formerly famous. The chief attraction of the old town lies in its bazaars, which retain their Oriental character unimpaired. Water is supplied to numerous fountains by an ancient aqueduct from Jebel Zaghwán, repaired at a cost of half a million sterling by the late Bey Mohammed al-Ṣádik. The principal educational establishments besides that of the great mosque are the Ṣádikíya college, founded in 1875 for gratuitous instruction in Arabic and European subjects, the college of St. Charles, conducted by priests and open to Christians and Moslems alike, and the normal school, founded in 1884 by the bey to train teachers in the French language and European ideas. The population of Tunis is about 125,000, of whom one-fifth are Jews and one-fifth Europeans, chiefly Maltese and Italians.

---

[1] In the 13th and 14th centuries the Hafsites also paid tribute to Sicily for the freedom of the sea and the right to import Sicilian corn,—a clear proof of the decline of Tunisian agriculture.

The environs of Tunis are admirable from the beautiful views they present; the finest prospects are from the hill on the southeast, which is crowned by a French fort, and from the Belveder on the north of the town (Jebel al-Túba), on which stands a very ancient fortress. Half-an-hour's drive west of the town is the decaying palace called the Bardo, a little town in itself, remarkable for the "lion court" and some apartments in the Moorish style. The port of Goletta, with 4000 inhabitants, is connected with Tunis by a railway 10 miles long. The older or southern part of the town next the canal has a fortress, now used as barracks, built by the Turks on the site of the Spanish fortress destroyed in 1574. The ruins of Carthage lie a few miles north of Goletta. The chief manufactures of Tunis are still textiles, as in the time of Leo Africanus. The manufacture of silk dates from the settlement of Moorish refugees from Spain about 1600. There are also tanneries, a tobacco factory, and some minor industries. The annual exports of grain, oil, stuffs, hides, and essences are valued at £720,000 [$3,499,200], and the imports, chiefly of cotton goods, at £560,000 [$2,721,600]. There are two French steamers weekly between Marseilles and Goletta, and the coast towns are served and connected with Malta both by French and Italian packets.

History.—Tunis was a Carthaginian city and is repeatedly mentioned in the history of the Punic wars. Strabo speaks of its hot baths and quarries. Under the Arabs it rose to importance, became the usual port for those going from Kairwan to Spain, and was one of the residences of the Aghlabites. In the 10th century it suffered severely, and was repeatedly pillaged in the wars of the Fátimites with Abú Yazíd and the Zenáta Berbers. For its later fortunes see above in the history of the country, of which since the accession of the Hafsites it has been the capital.

TUNNELLING. The process of making a more or less horizontal underground passage, or tunnel, without removing the top soil is known as tunnelling. In former times any long tube-like passage, however constructed, was called a tunnel. At the present day the word is sometimes popularly applied to an underground passage constructed by trenching down from the surface to build the arching and then refilling with the top soil; but a passage so constructed, although indistinguishable from a tunnel when completed, is more correctly termed a "covered way," and the operations "cutting and covering," instead of tunnelling. Making a small tunnel, afterwards to be converted into a larger one, is called "driving a heading," and in mining operations small tunnels are termed "galleries," "driftways," and "adits." If the underground passage is vertical it is a shaft; if the shaft is commenced at the surface the operations are known as "sinking," and it is called a "rising" if worked upwards from a previously constructed heading or gallery.

Tunnelling has been effected by natural forces to a far greater extent than by man. In limestone districts innumerable swallow-holes, or shafts, have been sunk by the rain water following joints and dissolving the rock, and from the bottom of these shafts tunnels have been excavated to the sides of hills in a manner strictly analogous to the ordinary method of executing a tunnel by sinking shafts at intervals and driving headings therefrom. Many rivers find thus a course underground. In Asia Minor one of the rivers on the route of the Mersina Railway extension pierces a hill by means of a natural tunnel, whilst a little south at Seleucia another river flows through a tunnel, 20 feet wide and 23 feet high, cut 1600 years ago through rock so hard that the chisel marks are still discernible. The Mammoth cave of Kentucky and the Peak caves of Derbyshire are examples of natural tunnelling. Mineral springs bring up vast quantities of matter in solution. It has been estimated that the Old Well Spring at Bath has discharged since the commencement of the 19th century solids equivalent to the excavation of a 6 feet by 3 feet heading 7 miles long; and yet the water is perfectly clear and the daily flow is only the 150th part of that pumped out of the great railway tunnel under the Severn. Tunnelling is also carried on to an enormous extent by the action of the sea. Where the Atlantic rollers break on the west coast of Ireland, on the seaboard of the western Highlands of Scotland, and elsewhere, numberless caves and tunnels have been formed in the cliffs, beside which artificial tunnelling operations appear insignificant. The most gigantic subaqueous demolition hitherto carried out by man was the blowing up in 1885 of Flood Rock, a mass about 9 acres in extent, near Long Island Sound, New York. To effect this gigantic work by a single instantaneous blast a shaft was sunk 64 feet below sea level, from the bottom of which four miles of tunnels or galleries were driven so as to completely honeycomb the rock. The roof rock ranged from 10 feet to 24 feet in thickness, and was supported by 467 pillars 15 feet square; 13,286 holes, averaging 9 feet in length and 3 inches in diameter, were drilled in the pillars and roof. About 80,000 cubic yards of rock were excavated in the galleries and 275,000 remained to be blasted away. The holes were charged with 110 tons of "rackarock," a more powerful explosive than gunpowder, which was fired by electricity, when the sea was lifted 100 feet over the whole area of the rock. Where natural forces effect analogous results, the holes are bored and the headings driven by the chemical and mechanical action of the rain and sea, and the explosive force is obtained by the expansive action of air locked up in the fissures of the rock and compressed to many tons per square foot by impact from the waves. Artificial breakwaters have often been thus tunnelled into by the sea, the compressed air blowing out the blocks and the waves carrying away the débris.

With so many examples of natural caves and tunnels in existence it is not to be wondered at that tunnelling was one of the earliest works undertaken by man, first for dwellings and tombs, then for quarrying and mining, and finally for water supply, drainage, and other requirements of civilization. A Theban king on ascending the throne began at once to drive the tunnel which was to form his final resting place, and persevered with the work until death. The tomb of Menptah at Thebes was driven at a slope for a distance of 350 feet into the hill, when a shaft was sunk and the tunnel projected a further length of about 300 feet, and enlarged into a chamber for the sarcophagus. Tunnelling on a large scale was also carried on at the rock temples of Nubia and of India, and the architectural features of the entrances to some of these temples might be studied with advantage by the designers of modern tunnel fronts. Petrie has traced the method of underground quarrying followed by the Egyptians opposite the Pyramids. Parallel galleries about 20 feet square were driven into the rock and cross galleries cut, so that a hall 300 to 400 feet wide was formed, with a roof supported by rows of pillars 20 feet square and 20 feet apart. Blocks of stone were removed by the workmen cutting grooves all round them, and, where the stone was not required for use, but merely had to be removed to form a gallery, the grooves were wide enough for a man to stand up in. Where granite, diorite, and other hard stone had to be cut, the work was done by tube drills and by saws supplied with corundum, or other hard gritty material, and water,—the drills leaving a core of rock exactly like that of the modern diamond drill. As instances of ancient tunnels through soft ground and requiring masonry arching, reference may be made to the vaulted drain under the southeast palace of Nimrúd and to the brick arched tunnel, 12 feet high and 15 feet wide, under the Euphrates. In Algeria, Switzerland, and wherever the Romans went, remains of tunnels for roads, drains, and water-supply are found. Pliny refers to the tunnel constructed for the drainage of Lake Fucino as the greatest public work of the time. It was by far the longest tunnel in the world, being more than 3½ miles in length, and was driven under Monte Salviano, which necessitated shafts no less than 400 feet in depth. Forty shafts and a number of "cuniculi" or inclined galleries were sunk, and the excavated material was drawn up in copper pails, of about ten gallons capacity, by windlasses. The tunnel was designed to be 10 feet high by 6 feet wide, but its actual cross section varied. It is stated that 30,000 laborers were occupied eleven years in its construction. With modern appliances such a tunnel could be driven from the two ends without intermediate shafts in eleven months.

No practical advance was made on the tunnelling methods of the Romans until gunpowder came into use. Old engravings of mining operations early in the 17th century show that excavation was still accomplished by pickaxes or hammer and chisel, and that wood fires were lighted at the ends of the headings to split and soften the rock in advance (see Fig. 1).

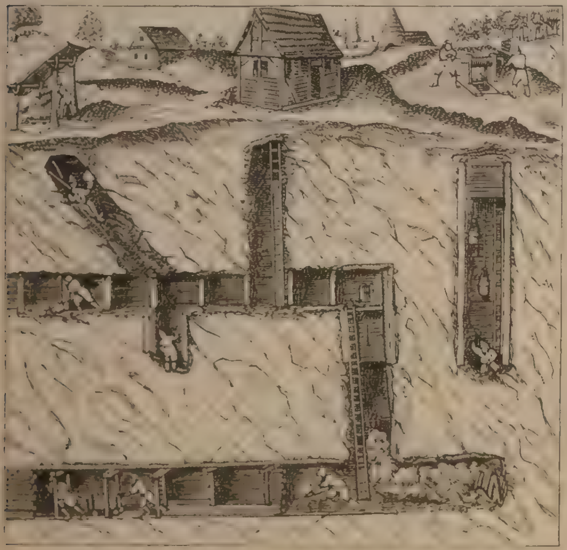

Fig. 1.—Method of mining, 1621. (From *De Re Metallica*, Basel, 1621.)

Crude methods of ventilation by shaking cloths in the headings and by placing inclined boards at the top of the shafts are also on record. In 1766 a tunnel 9 feet wide, 12 feet high, and 2880 yards long was commenced on the Grand Trunk Canal, England, and completed eleven years later; and this was followed by many others. On the introduction of railways tunnelling became one of the ordinary incidents of a contractor's work; probably upwards of 4000 railway tunnels have been executed.

Subaqueous Tunnelling.—In 1825 Brunel commenced and in 1843 completed the Thames tunnel, which was driven at points through liquid mud by the aid of a "shield" at a cost of about £1300 per lineal yard. It is now used by the East London Railway. In 1872 Chesborough began tunnelling under the Detroit river, between Canada and Michigan, U. S., but the work was abandoned owing to continued irruptions of water after some 600 yards of headings had been driven.

The most important subaqueous work yet accomplished—the Severn tunnel, 4⅓ miles in length—was commenced in 1873 and finished in 1886, Messrs. Hawkshaw, Son, Hayter, and Richardson being the engineers and Mr. T. A. Walker the contractor. The bed of the Severn is formed principally of marls, sandstones, and conglomerates in nearly horizontal strata, overlying highly inclined coal measures, shales, and sandstones, which are also exposed in the bed of the river. The tunnel is made almost wholly in the Trias and Coal measure formations, but for a short distance at its eastern end it passes through gravel. The lowest part of the line is below the "Shoots," where the depth is 60 feet at low water and 100 feet at high water, and the thickness of Pennant sandstone over the brickwork of the tunnel is 45 feet. Under the Salmon Pool, a depression in the bed of the river on the English side, there is a cover of only 30 feet of Trias marl. Much water was met with throughout. In 1879 the works were flooded for some months by a large land spring on the Welsh side of the river. The water which supplied the spring came from fissures in the carboniferous limestone, which was met with only at this place, and it is now conveyed by a side heading parallel to the tunnel to a shaft 29 feet in diameter, in which are fixed pumps of adequate power. On another occasion the works were flooded by water which burst through a hole in the river bed at the Salmon Pool. This hole, which was in the Trias marl and had an area of 16 feet by 10 feet, was subsequently filled with clay and the works were completed beneath it. The tunnel is for a double line of railway and is lined throughout with vitrified bricks set in Portland cement mortar. A heading was first driven entirely across the river to test the ground and subsequently another heading at a lower level. "Breakups" were made at intervals of two to five chains and the arching was carried on at each of these points. All parts of the excavation were timbered, and the greatest amount excavated in any one week was 6000 cubic yards. Owing to the inrush of water it was frequently necessary to completely roof the timbering with felt or corrugated iron before the bricklayers could commence the arching. The total amount of water raised at all the pumping stations is about 27,000,000 gallons in twenty-four hours; but the total pumping power provided is equal to 66,000,000 gallons in twenty-four hours. The ventilation is effected by a fan of the Guibal pattern, 40 feet in diameter and 12 feet wide, making forty-three revolutions and drawing 447,000 cubic feet of air per minute from the tunnel through an 18-feet shaft at Sudbrooke (Monmouth).

Another example of subaqueous tunnelling, second only in importance to the foregoing, is the Mersey tunnel, the length of which between the pumping shafts on each side of the river is 1 mile. From each shaft a drainage heading was driven through the red sandstone with a rising gradient towards the centre of the river. This heading was partly bored out by a Beaumont machine to a diameter of 7 feet 4 inches, and at a rate attaining occasionally 65 lineal yards per week. All of the tunnel excavation, amounting to 320,000 cubic yards, was got out by hand labor, since heavy blasting would have shaken the rock. The minimum cover between the top of the arch and the bed of the river is 30 feet. Pumping machinery is provided for 27,000,000 gallons per day, which is more than double the usual quantity of water; and ample ventilation is secured by two 30-feet diameter and two 40-feet diameter Guibal fans. Messrs. Brunlees and Fox were the engineers, and Messrs. Waddell the contractors for the works, which were opened in 1886, about 6 years after the commencement of operations.

Proposals for the construction of a tunnel about 30 miles in length to connect England and France have been brought forward periodically from the commencement of the 19th century, but nothing was done until 1881, when preliminary works of some importance were commenced by Sir Edward Watkin and the South-Eastern Railway Company. At the proposed point of crossing the deepest part of the channel is 210 feet, and, as the beds on the English side and those on the

French side, so far as relates to the gray chalk and chalk marl, are each 225 feet thick, it is assumed that those strata are continuous and that the tunnel would be driven through a water-tight material. Shafts have been sunk near Folkestone, and experimental headings have been driven 2000 yards under the sea, on the line of the tunnel. The heading, 7 feet in diameter, was cut by a Beaumont boring machine, having two arms with steel teeth, and driven by compressed air; the usual rate of progress was 15 lineal yards per day.

A partially constructed subaqueous tunnel now lies drowned under the Hudson river at New York. An attempt was made to drive a double tunnel through the mud and silt forming the river bed. In 1880, when about a hundred yards had been completed, the water burst in, and twenty men were drowned. Work was subsequently resumed on the following plan (see Fig. 2). A pilot tunnel, consisting of an iron tube of 6 feet 6 inches in diameter, was advanced from 30 to 40 feet ahead of the main tunnel, to form a firm support for the iron plates of the latter by means of radial screws. Compressed air, pumped into the tunnel at a pressure of about 20 ℔ per square inch, prevented the weight of silt and water from crushing the plating and flowing into the tunnel. The excavated silt was mixed with water and ejected by compressed air. Between the shafts the length of the proposed tunnel is 1 mile, and about one-eighth of the distance had been accomplished when the works were stopped for financial reasons.[1]

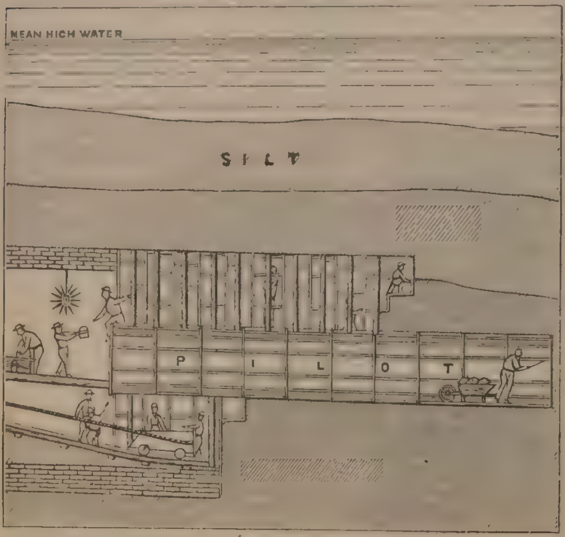

FIG. 2.—Hudson river tunnel—method of work.

Small subaqueous tunnels have been driven through clay without difficulty under Lakes Michigan and Erie, and elsewhere in America. In England a heading was driven nearly across the Thames in 1807, and eighty years later two 10 feet 6 inch iron-lined tunnels were constructed under the river close to the foundation of London Bridge by Mr. Greathead, with the aid of a simple annular shield advanced by six hydraulic presses. Where open gravel or water has to be tunnelled through a diaphragm must be fitted to the shield. Mallet proposed in 1858 to carry in this way a tubular tunnel across the English Channel. Various plans have been suggested for the removal of the soil in advance of the shield. Mr. Greathead would effect it by the circulation of a closed current of water, carrying the stuff through the shield from front to back; and an American plan provides for forcing it bodily out of the way by a plough-shaped shield, aided by jets of water at a very high pressure.

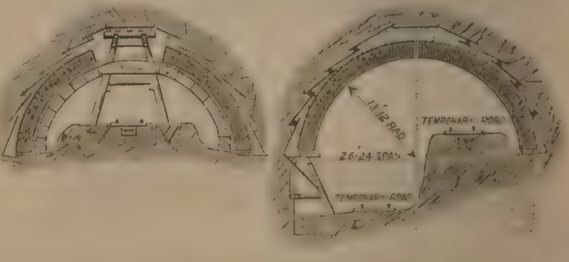
Tunnelling through Mountains.—Where a great thickness of rock overlies a tunnel, it is necessary to do the work wholly from the two ends, without intermediate shafts. The problem resolves itself into devising the most expeditious way of excavating and removing the rock, and there are none of the uncertainties and difficulties which make subaqueous tunnelling of so high an interest. Experience has led to great advances in speed and economy, as will be seen from the following particulars of the three tunnels through the Alps, the longest yet constructed:

Tunnel.	Length.	Progress per day.	Cost.
	Miles.	Lineal Yards.	Per Lineal Yard.
Mont Cenis......	7½	2.57	£226 [$1098.36]
St. Gotthard.....	9¼	6.01	143 [$694.98]
Arlberg............	6⅓	9.07	108 [$524.88]

In 1857 the first blast was fired in connection with the Mont Cenis works; in 1861 machine drilling was introduced; and in 1871 the tunnel was opened for traffic. With the exception of about 300 yards the tunnel is lined throughout with brick or stone. Little interest now attaches to the method of tunnelling adopted at Mont Cenis, as it is in several respects obsolete. During the first four years of hand labor the average progress was not more than 9 inches per day on each side of the Alps; but with compressed-air rock-drills the rate towards the end was five times greater.

In 1872 the St. Gotthard tunnel was commenced and in 1881 the first locomotive ran through it. Mechanical drills were used from the commencement. Tunnelling was carried on by driving in advance a top heading about 8 feet square, then enlarging this sideways, and finally sinking the excavation to invert level (see Figs. 3 and 4). Air for working the rock-drills was compressed to seven atmospheres by turbines of about 2000 horsepower. Six to eight Ferroux drills, making about 180 blows a minute, were mounted on a carriage and pushed up to the point of attack. From thirteen to eighteen holes were drilled by the machine and its sixteen attendants to depths of from 2′ 7″ to 4′ 3″ in three to five hours, and the work of charging with dynamite, firing, and clearing away was then done by twenty-two men in three to four hours. The charge per hole averaged 1¾ ℔, and after firing a strong current of compressed air was directed over the face of the excavation. Four sets of holes were under favorable circumstances drilled in twenty-four hours, which rendered a progress of 13 feet per day in such rock as gneiss attainable in each heading.

The driving of the Arlberg tunnel was commenced in 1880 and the work was completed in little more than three years. The main heading was driven along the bottom of the tunnel and shafts were opened up 25 to 70 yards apart, from which smaller headings were driven right and left. The tunnel was enlarged to its full section at different points simultaneously in lengths of 8 yards, the excavation of each occupying about 20 days, and the masonry 14 days. Ferroux percussion air drills and Brandt rotary hydraulic drills were used, and the performance of the latter was especially satisfactory. After each blast a fine spray of water was injected, which assisted the ventilation materially. In the St. Gotthard tunnel the discharge of the air drills was relied on for ventilation. In the Arlberg tunnel over 8000 cubic feet of air per minute were thrown in by ventilators. In a long tunnel the quick transport of materials is of equal importance with rapid drilling and blasting. In the Arlberg, to keep pace with the miners, 900 tons of excavated material had to be removed, and 350 tons of masonry to be introduced, daily at each end of the tunnel, which necessitated the transit of 450 wagons. This traffic was carried on over a length of 3½ miles on a single track of 27-inch gauge with two sidings. When the locomotives ran into the tunnel the fires were damped down, and, as the pressure in the boiler was fifteen atmospheres



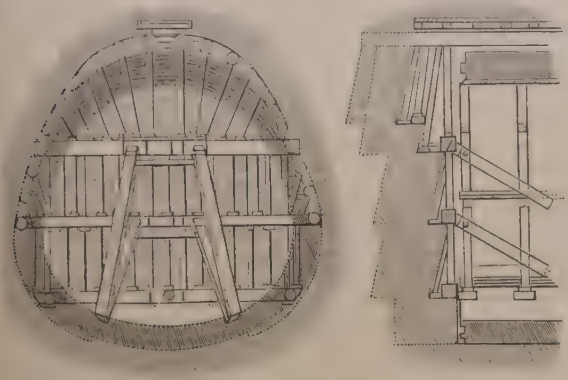
FIGS. 3 and 4.—Method of excavation in St. Gotthard tunnel.

---

[1] [Work on this tunnel was resumed in June, 1887.—AM. ED.]

the stored-up heat in the water furnished the necessary power. The cost per lineal yard varied according to the thickness of masonry lining and the distance from the mouth of the tunnel. For the first 1000 yards from the entrance the prices per lineal yard were £11, 8s. [$55.40] for the lower heading; £7, 12s. [$36.94] for the upper one; £30, 10s. [$148.23] for the unlined tunnel; £45 [$218.70] for the tunnel with a thin lining of masonry; and £124, 5s. [$603.85] with a lining 3 feet thick at the arch, 4 feet at the sides, and 2 feet 8 inches at the invert.

Long Tunnels.—The new Croton aqueduct tunnel from Croton dam to the reservoir in New York is worthy of note both for its great length and the rapid progress made with it. The distance is 33¼ miles and practically the whole is tunnelled through rock. Shafts were sunk about 1½ miles apart and headings driven each way. Ingersoll drills were chiefly used, and the rate of advance with the headings was in 1886 1¼ miles per month. The old Croton aqueduct was 7 feet 8 inches wide by 8 feet 5 inches high; the new one is 13 feet 7 inches in width and height.



FIGS. 5 and 6.—Great Northern Railway tunnel. Method of tunnelling under the Metropolitan cattle market, London.

Tunnelling in Towns.—Where tunnels have to be carried through soft soil and in proximity to valuable buildings special precautions have to be taken to avoid settlement. The important Metropolitan tunnels constructed by Sir John Fowler have already been described under RAILWAY (vol. xx. pp. 241–42). Another successful example of such work is the tunnel driven in 1886 by Mr. Johnson, the Great Northern Company's engineer, under the Metropolitan cattle market. Where clear of buildings the tunnel was executed in 12-feet lengths measured from the finished brickwork, the excavation extending another 5 feet. The face of the excavation was carried out in four sections, the first between the head trees and the first sill was formed with a rake of 1 in 4½, the second and third with a rake of 1 in 6, and the fourth was vertical, the whole face being close boarded (see Figs. 5 and 6). The arch and side walls were eight rings and the invert six rings thick. A 12-feet length was completed in 12 to 14 days, and the subsidence in the ground was about 3½ inches. Under buildings and roads the tunnel was executed in 6-feet lengths. The crown bars, 15 inches in diameter, alternating six and seven in number, were built in with solid brickwork in cement and hard wood wedging. The skeleton centres for the arching were supported by props notched into the ribs and provided with wedges for tightening up. A 6-feet length was built in 6 days, and the surface subsidence, consequent upon the impossibility of exactly fitting the poling boards to the clay, was only from 1 inch to 1¾ inches. Several heavy buildings were tunnelled under without any structural damage arising.

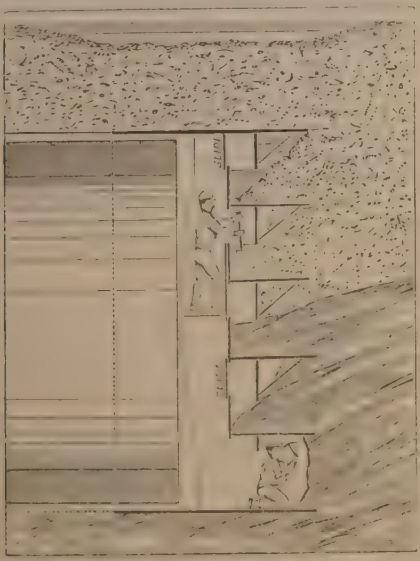


FIG. 7.—Mr. B. Baker's pneumatic shield.

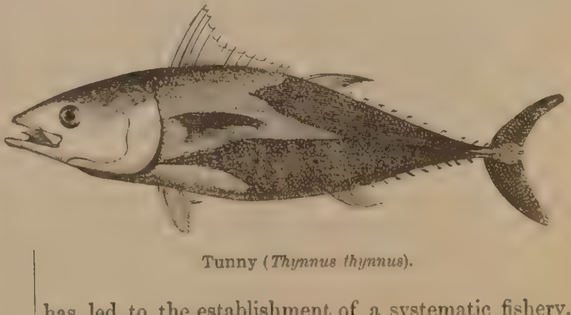
Where open ballast and running sand heavily charged with water are met with a tunnel cannot be driven on the ordinary system without seriously endangering adjoining buildings. To meet such cases, and also to provide a safe means of tunnelling under dock basins, canals, and rivers, the pneumatic shield (see Fig. 7) was designed by Mr. Benjamin Baker. The shield is supported against external pressure by vertical girders about 6 feet apart. Horizontal shelves of steel plates with cutting edges are spaced about 4 feet apart, and the face of the shield is closed by vertical plates and slides; the arrangement is such that any slide can be opened to admit of the ballast or sand being excavated, whilst the compressed air filling the tunnel prevents the influx of water during the process. Where hard water-tight clay is encountered, sections of the shield plates are unbolted to admit miners. When sufficient material has been excavated the shield is advanced by hydraulic pressure and the brick arching built.

See AQUEDUCT and RAILWAY; also H. S. Drinker's *Tunnelling*, New York, 1878, (a most important work); and *Proc. Inst. Civ. Eng.*, art. "Tunnels." (B. B.)

TUNNY

TUNNY (*Thynnus thynnus*), one of the largest fishes of the family of Mackerels, belongs to the genus of which the Bonito (*Th. pelamys*) and the Albacores (*Th. albacora*, *Th. alalonga*, etc.) are equally well-known members. From the latter the tunny is distinguished by its much shorter pectoral fins, which reach backwards only to, or nearly to, the end of the first dorsal fin. It possesses nine short finlets behind the dorsal and eight behind the anal fin. Its color is dark bluish above, and grayish, tinged and spotted with silvery, below. The tunny is a pelagic fish, but periodically approaches the shore, wandering in large shoals, at least in the Mediterranean, within well-ascertained areas along the coast. The causes by which its wanderings are regulated in the Atlantic Ocean are much less understood; it not unfrequently appears in small companies or singly in the English Channel and in the German Ocean, probably in pursuit of the shoals of pilchards and herrings on which it feeds. The regularity of its appearance on certain parts of the coasts of the Mediterranean has led to the establishment of a systematic fishery, which has been carried on from the time of the Phœnicians to the present day. Immense numbers of tunnies were caught on the Spanish coast and in the Sea of Marmora, where, however, this industry has much declined. The Sardinian tunnies were considered to be of superior excellence. The greatest number is now caught on the north coast of Sicily, the fisheries of this



Tunny (*Thynnus thynnus*).

island supplying most of the preserved tunny which is exported to other parts of the world. In ancient times the fish were preserved in salt, and that coming from Sardinia, which was especially esteemed by the Romans, was known as *Salsamentum sardicum*. At present preference is given to tunny preserved in oil. Many of the fishes, especially the smaller ones, are consumed fresh. The tunny occurs also in the South Pacific; but several other species seem to take its place in the Indo-Pacific Ocean. It is one of the largest fishes, attaining to a length of ten feet and to a weight of more than a thousand pounds.[1]

On the tunny fisheries of ancient and modern times, see Cuvier and Valenciennes, *Hist. Nat. des Poissons* (vol. viii. pp. 71–92).

TUNSTALL, a market town of Staffordshire, England, is situated on a branch line of the London and North-Western Railway and on the Trent and Mersey Canal, 4 miles northwest of Stoke and 168 northwest of London. Among the public buildings are the market (1858), town hall (1884), old court-house (now used as a free library and reading room), and board schools (1880). The chief manufactures are those peculiar to the Potteries district; there are also large iron-works (coal and iron being obtained in the neighborhood), and brick and tile works. The town is chiefly the growth of the 19th century, and in 1811 numbered only 1677 inhabitants. In 1885 it was included for parliamentary purposes in the borough of Newcastle-under-Lyme. It is governed by a local board of twenty-four members. The population of the urban sanitary district (area 690 acres) was 13,540 in 1871, and 14,244 in 1881.

TURANIAN. This word means etymologically no more than "not Iranian," and in this sense the word Turan was used by Sasanian monarchs to cover those parts of their realm that did not belong to Iran. The application of the word to denote the Ural-Altaic family of languages is extremely unfortunate and seems to be falling out of use. See PHILOLOGY, vol. xviii. pp. 792–93.

TURBINE. See HYDROMECHANICS, vol. xii. p. 555.

TURBOT,[2] the largest and best known of a genus of flat fishes, *Rhombus*, which bears the appropriate systematic name of *Rh. maximus*. The turbot has great width of body, and is scaleless, but is covered with conical bony tubercles. The eyes are on the left side of the body, the lower being slightly in advance of the upper; the mouth is large and armed with teeth of uniformly minute size. The turbot is found all round the coast of Europe (except in the extreme north), preferring a flat sandy bottom with from 10 to 50 fathoms of water. The broad banks off the Dutch coast are a favorite resort. It is a voracious fish, and feeds on other fish, crustaceans, and mollusks. It seems to constantly change its abode, wandering northward during the summer, and going into deeper water in the cold season. Some thirty years ago it was estimated that the Dutch supplied turbot to the London market to the value of £80,000 [$388,800] a year. At present (1887) the value of turbot annually sold in London cannot be ascertained; but it must be several times that amount, and is principally earned by English line-fishermen and trawlers. Although the turbot abounds off the west coast of Ireland, the fishing is not carried on with the same energy and success as in the English Channel and German Ocean. The turbot is also common, though not abundant, in the Mediterranean, and is replaced in the Black Sea by an allied species with much larger bony tubercles (*Rh. maoticus*). Both species grow to a large size, being usually sold at from 5 to 10 ℔; but the common turbot is stated to attain to a weight of 30 ℔. Both from its size and the excellent flavor of its flesh it ranks next after the codfish among British sea-fishes.

TURENNE, HENRI DE LA TOUR D'AUVERGNE, VICOMTE DE (1611–1675), a famous French general of the 17th century, was the second son of Henri, Duc de Bouillon, by Elizabeth, daughter of William I., prince of Orange, and was born at Sedan on 11th September, 1611. He was carefully educated in the strictest doctrines of the reformed religion, and at the age of thirteen was sent to learn war from his uncles Maurice and Henry of Nassau, in the campaigns of these princes against the Spaniards. In 1626 he received a commission as captain of infantry in the service of Holland, and by 1630 had shown such military capacity that Richelieu invited him back to France and appointed him colonel of a regiment. He was present at the relief of Casale, and on 21st June, 1635, was made a maréchal de camp for his services at the siege of La Motte in Lorraine under De la Force. In that year he took command of a division in the army under Cardinal La Valette in the defence of Mainz, and, when the cardinal's army had to fall back on Metz from want of provisions, Turenne commanded the rear-guard, covering the retreat with admirable skill. In 1636 he was present under La Valette at the siege of Saverne, where he was wounded, and in the campaign in Franche Comté; in 1637 he served under the same commander in Flanders, took Landrecies, and drove back the cardinal infant from Maubeuge. In 1638 he served under Bernhard of Saxe-Weimar at the siege of Breisach, and in the following year was transferred to the army of D'Harcourt in Italy. It was at this epoch that he established his fame as a general. In November, 1639, he covered the retreat of the army, and fought a famous engagement, known as the battle of the "route de Quiers"; in 1640 he saved Casale, and insisted upon not abandoning the siege of Turin, which town surrendered on 24th September; in 1641 he took Coni, Ceva, and Mondovi; and on 11th March, 1642, he was promoted to the rank of lieutenant-general. After he had served for a short time in Roussillon, he was appointed by Richelieu in 1643 to the command of the army in Italy, under Thomas of Savoy, although his brother, the Duc de Bouillon, had just before been arrested as an accomplice in the conspiracy of Cinq Mars. Mazarin did not exhibit quite so much confidence in Turenne, and in December, 1643, removed him from Italy, sending him to collect the remains of Bernhard of Saxe-Weimar's army and form them once more into an organized force; but he softened the transference by creating Turenne a marshal of France on 16th May, 1644.[3]

Turenne's four campaigns in Germany, which largely contributed to the peace of Westphalia, have always been regarded as models in the art of war. In June, 1644, he crossed the Rhine at Breisach, and was marching against the Comte de Mercy, the Imperialist general, who was at Freiburg, when he was superseded by the Duc d'Enghien, better known by his later title of the Prince de Condé. D'Enghien, after fighting the three days' battle of Freiburg, left the army again to Turenne, who took Philippsburg and Mainz, and then went into winter quarters. In May, 1645, Turenne was surprised by Mercy at Marienthal and defeated; but he skilfully concentrated the remains of his army and retreated into Hesse, where he was soon joined by D'Enghien. The two marshals, having reorganized their army, marched against Mercy and totally defeated him at Nördlingen on 3d August, 1645, when Mercy was killed. D'Enghien again left the army to Turenne, who in conjunction with the Swedish army under Wrangel overran Franconia and Swabia, taking all the fortresses there in 1646. In 1647 he conducted a still more masterly campaign, and after beating the Bavarians and Imperialists in two engagements he and the Swedes occupied Bavaria, and drove the old duke out of his dominions.

---

[1] [*Orcynus thynnus*, the so-called American tunny or great horse mackerel, called also the albicore, is found along the Atlantic coast from Nova Scotia to New Jersey during the summer months. It attains a length of from 9 to 15 feet and yields about 20 gallons of oil.—AM. ED.

[2] The word "turbot" is of great antiquity, perhaps of Celtic origin; it is preserved in French in the same form as in English, and is composed of two words, of which the second is identical with the "but" in holibut and with the German "Butte," which signifies flat fish. The German name for the turbot is "Steinbutte."

[3] [This title had been conferred upon him 16th May, 1643. See TURENNE in Nouvelle Biographie Générale.—AM. ED.]

When the troubles of the Fronde (see FRANCE, vol. ix. p. 504, and MAZARIN) broke out, Turenne, who was in command of the veteran troops of Bernhard of Saxe-Weimar in Alsace, hesitated which side to take, till the Duchesse de LONGUEVILLE (*q.v.*), with whom he fell violently in love, persuaded him to side with the parlement. But his troops refused to follow him, and he had to fly with her to Flanders. He there took a command in the Spanish army under Don Estevan Gomar, and, when trying to raise the siege of Réthel, was utterly defeated by Du Plessis-Praslin. But in 1652 he defeated Condé at Gien, and nearly annihilated his army in the battle of the Faubourg St. Antoine. When the troubles of the Fronde were over, Turenne marched upon the frontier, and in several campaigns defeated the Spaniards over and over again, by these victories paving the way for the peace of the Pyrenees (1659), the natural complement of the peace of Westphalia. In these campaigns he had once more to fight against Condé, general-in-chief of the armies of Spain, and in 1654 he showed his superiority by raising the siege of Arras and driving the Spaniards from their lines. In 1656 Condé, assisted by Don John of Austria, won an exactly similar victory and relieved Valenciennes, which Turenne was besieging. The prolonged contest between the two was decided in 1658 by Turenne's victory of the Dunes, in which Cromwell's contingent of 6000 soldiers took part.

Louis XIV. now began to rule in reality, and one of his first acts was to create Turenne in 1660 marshal-general of the armies of France. Seven years later Turenne occupied French Flanders and took all the fortresses in that province, though the king was nominally in command of the army,—an exploit equalled in the following year by Condé's rapid occupation of Franche Comté. It was in 1668 that Turenne made his notorious change of faith. Born of Calvinist parents and educated a Protestant, he had in compliance with the tenets of his religion refused to marry one of Richelieu's nieces in 1639, and had eventually married a daughter of the Protestant marshal de la Force. But it can hardly be believed that he was converted at the age of fifty-seven from religious convictions. In 1672 the second great European war broke out, brought about by the ambition of Louis XIV. Turenne once more took command of the army, which the king accompanied, and speedily occupied the greater part of Holland, which, however, they were forced to evacuate owing to the Dutch cutting their dykes. In the following year Turenne marched into Westphalia to oppose the imperialist forces, and, though his army was small compared to that of Montecuculi, the imperialist general, he managed to make head against both him and the elector of Brandenburg. In 1673 he was compelled to act on the defensive; but in 1674 in spite of his inferiority of numbers he boldly resumed the aggressive. Crossing the Rhine at Philippsburg in June, and marching rapidly to Sinsheim, he defeated the imperialist general Caprara and the duke of Lorraine. He then retired for a time, but in December of the same year he made a sudden rush into the enemy's winter quarters and utterly routed the elector of Brandenburg, who was then general of the imperialists, at Colmar. Between the battle of Sinsheim and the dash at Colmar, Turenne, under orders from Louvois, committed the acts which are the greatest blot upon his fame by devastating the Palatinate. After the rout of Colmar, and the defeat of Türkheim which followed it, he laid waste the greater part of Alsace, as a defensive measure against another advance of the imperialists. He then advanced into the heart of Germany, and again met Montecuculi, who had succeeded the elector of Brandenburg as general-in-chief. The two generals manœuvred for four months in much the same way as Wellington and Marmont marched and countermarched before the battle of Salamanca; at last, on 27th July, 1675, their field of battle was chosen, and, as Turenne was directing the position of a battery, he was struck by a cannon ball and killed on the spot. The news of his death was received with universal sorrow; Fléchier, Mascaron, Saint-Évremond, and Lamoignon wrote *éloges* of him; and Madame de Sevigné describes the consternation caused by his sudden loss. His body was taken to St. Dénis, and buried with the kings of France. Even the extreme revolutionists of 1793 respected it, and, when the bones of the sovereigns were thrown to the winds, the remains of Turenne were preserved at the museum of natural history until 23d September, 1800, when they were removed by order of Bonaparte to the church of the Invalides at Paris, where they still rest.

Turenne's fame rests on his military achievements; as a man he was not more distinguished for his virtues than the duke of Marlborough, whom in many respects he resembled. He had indeed the calmness of all philosophic, cold-minded temperaments, but few other praiseworthy qualities. As a politician he holds no high place. (H. M. S.)

TURGAI [or TOORGAI], a Russian province in Central Asia, formerly a part of the Kirghiz steppe, and now embodied in the governor-generalship of the Steppes, is bounded by Uralsk and Orenburg on the W. and N., by Akmolinsk on the E., and by Syr-Daria and the Sea of Aral on the S. This extensive and irregularly-shaped territory, which has an area (176,800 square miles) as large as that of Caucasia and Transcaucasia taken together, belongs to the Aral-Caspian depression. It has, however, the Mugojar Hills on its western border and includes a part of the southern Urals; and from Akmolinsk it is separated by a range of hills which runs between the two chief rivers of the Kirghiz steppe—the Turgai and the Sary su. In the north it includes the low belt of undulating land which stretches from the Mugojar Hills towards the north-east and separates the rivers belonging to the Aral basin from those which flow towards the Arctic Ocean, and beyond this range it embraces the upper Toboł. The remainder is steppe land, sloping gently towards the Sea of Aral. The Mugojar Hills consist of an undulating plateau nearly 1000 feet in height, built up of Permian and Cretaceous deposits, and deeply grooved by rivers. They are not the independent chain which our maps make them out to be[1]: they merely continue the Urals towards the south, and are connected with the Ust Urt plateau by a range of hills which was formerly an island of the Aral-Caspian Sea. Their northern extremity joins the undulating plateau (400 to 600 feet), built up of sandstones and marls, which separates the tributaries of the Toboł from those of the Ural, and falls by a range of steep crags—probably an old shore-line of the Aral basin—towards the steppes. The steppe land of Turgai is only some 300 feet above the sea-level, and is dotted with lakes, of which the Tchołgardenghiz, which receives the Turgai and its tributary the Irghiz, is the largest. The Turgai was, at a recent epoch, a large river flowing into the Sea of Aral and receiving an entensive system of tributaries, which are now lost in the sands before joining it. Remains of aquatic plants buried in the soil of the steppe, and shells of *Mytilus* and *Cardium*, both still found in the Sea of Aral, show that during the Glacial period this region was covered by the waters of the Aral-Caspian Sea.

---

[1] See P. S. Nazaroff, in "Recherches Zoologiques dans les Steppes des Kirghizes," in *Bull. Soc. des Natur. de Moscow*, 1886, No. 4.

The climate of Turgai is exceedingly dry and continental. Orsk, a town of Orenburg, on its northwestern border, has a January as cold as that of the west coast of Nova Zembla (—4° Fahr.), while in July it is as hot as July in Morocco (73°); the corresponding figures for Irghiz, in the centre of the province, are 7° and 77°. At Irghiz and Orsk the annual rainfall is somewhat under 10 and 12 inches respectively (3 inches in summer). The west winds are desiccated before they reach the Turgai steppes, and the northeast winds, which in winter bring cold, dry snows from Siberia, raise in summer formidable clouds of sand. A climate so dry is of course incompatible with a vigorous forest growth. There is some timber on the southern Urals, the Mugojar Hills, and the waterparting of the Toboł; elsewhere trees are rare,—only shrubs, such as the wild cherry (*Cerasus Chamæcerasus*) and the dwarf almond (*Amygdalus nana*) growing on the hilly slopes, while the rich black-earth soil of the steppe is chiefly covered with feather grass (*Stipa pennata*), the well-known ornament of the south Russian steppes. In spring the grass vegetation is luxuriant, and geese and cranes are attracted in vast numbers by the fields of the Kirghiz from the depth of the steppe. The jerboa (*Dipus jaculus*) and the marmot (*Spermophilus rufescens*) are characteristic of the fauna of the region; another species of marmot (*Arctomys bobac*) and the *Canis corsac* are common; and the saiga antelope of Central Asia is occasionally met with. Further south the black earth disappears and with it the feather grass, its place being taken by its congener, *Stipa capillata*. Trees disappear, and among the bushes along the banks of the rivers willows and the pseudo-acacia or Siberian pea tree (*Caragana microphyla*) are most prevalent. In the middle parts of the province the clayey soil is completely clothed with wormwood (*Artemisia fragrans* and *A. monogyna*), with a few grassy plants on the banks of the rivers and lakes (*Lasiagrostis splendens, Alhagi camelorum* and *A. kirghizorum, Obione portulacoides, Halimodendrum argenteum*); while large areas consist of shifting sands, salt clays clothed with a rich carpet of various *Salsolaceæ*, and dried beds of old lakes. Such lakes as still exist, notwithstanding the rapid desiccation now going on, are surrounded by rush thickets,—the retreat of wild boars. Turgai is thus the borderland between the flora of Europe and that of Central Asia.

In 1882 the population of Turgai was estimated at 323,110, all nomad Kirghiz, with the exception of some 3600 who are settled in four villages officially described as towns. Agriculture is in its earliest stage of development; but some 100,000 quarters [800,000 bushels] of corn are raised in the southwest by the Kirghiz, who sell some of it in Orenburg. Cattle-breeding is the chief occupation, and within the province there are some 800,000 horses, 335,000 cattle, about 200,000 camels, and more than two million sheep. But the want of fodder in spring occasions violent murrains, which sometimes result in actual famine among the Kirghiz. Endeavors have recently been made to induce the people to make communal stores of hay, but the 300,000 cwts. yearly collected in this way are insufficient. The Kirghiz of the southern parts go in winter to the better sheltered parts of Syr-Daria, while in the summer some 30,000 *kibitkas* (felt tents) of nomads come from the neighboring provinces to graze their cattle on the grassy steppes of Turgai. Some 30,000 cwts. of salt are annually got from the lakes. The four settlements of the province are Turgai, chief town and seat of the provincial administration, with less than 400 inhabitants, and the "district towns" of Irghiz (920), Ak-tube (400), and Karabutak (300) the last two being more or less fortified. Several merchants in these carry on trade with the Kirghiz, exchanging manufactured goods for wool and skins, which are sent to the frontier settlements of Orenburg. There is a brisk caravan traffic through Turgai.

TURGOT. Anne Robert Jacques Turgot, Marquis de l'Aulne (1727–1781), French statesman and economist, was born at Paris, 10th May, 1727. He was the third son of Michel Étienne Turgot and of Madeleine Françoise Martineau. His family, which was ancient and noble, is said to have been originally Scottish, but had long been settled in Normandy. His ancestors early abandoned the sword for the robe. Both his father and grandfather had been in the civil service of the state: his father was "prévôt des marchands" at Paris, and won a high reputation as a magistrate and administrator. Turgot in his childhood was timid, and showed in company an absent and embarrassed air, from which he never afterwards entirely freed himself, and which in later life was sometimes unjustly attributed to hauteur. His mother, through excessive or injudicious efforts to correct these faults, appears to have aggravated them. He obtained his early education at the Collége Louis-le-Grand, and was afterwards a student of the Collége du Plessis. He then entered the seminary of St. Sulpice, and thence passed to the Sorbonne with the view of taking his license in theology. But he decided finally in 1751 not to follow the ecclesiastical profession. His opinions were inconsistent with that calling, and he said "he could not consent to wear a mask all his life." He showed at this time an enthusiastic love of literature and powers of memory which are described as "prodigious," as well as a penetrating intellect and a sound judgment. We have the testimony of the Abbé Morellet, who was then his intimate acquaintance and constant companion, to the singular purity, the simplicity, modesty, and frank gayety which characterized him.

As prior of the Sorbonne (an honorary office conferred annually on some distinguished student) he wrote and delivered publicly in 1750 two remarkable pieces,—one *On the Benefits which the Christian Religion has conferred on Mankind*, the other *On the Historical Progress of the Human Mind.* Having chosen the law as his profession, he was appointed in 1752 "conseiller substitut du procureur général," and afterwards "conseiller au parlement." The controversy arising from the refusal of the sacraments to the Jansenists by the archbishop of Paris being then agitated between the parlement and the clergy, Turgot wrote (1753) *Letters to a Vicar-General on Toleration* and a pamphlet entitled *Le Conciliateur*, in favor of religious liberty and against the interference of the temporal power in theological disputes. In 1753 he became "maître des requêtes." He discharged his professional duties with scrupulous purity and conscientious industry. He continued at the same time his studies in ancient and modern literature (including English and German), mathematics, astronomy, chemistry, and natural history, and frequented the salons of Madame de Graffigny (authoress of (*Les Lettres Péruviennes*), Madame Geoffrin, and Madame du Deffand. Whilst he enjoyed the acquaintance and society of D'Alembert, Baron d'Holbach, Raynal, Marmontel, Morellet, Galiani, Helvétius, and other notabilities of the time, he maintained his intellectual independence and refused to connect himself with any party or political group. About this time he also entered into relations with Quesnay and Gournay—the principal members of the physiocrats. He was attracted to them by the similarity of their sentiments on social questions and their opinions on economic policy to those which he himself entertained. Turgot accompanied Gournay in 1755 and 1756 in his official tours of inspection as intendant of commerce, and on Gournay's death in 1759 he wrote his *Éloge.* He then made a short visit to eastern France and a part of Switzerland. When he arrived at Geneva he went to see Voltaire at Les Délices, and formed with him what proved to be a lasting friendship. He contributed about this period several articles to the *Encyclopédie.* In 1761 the controller-general Bertin appointed him intendant of the *généralité* of Limoges. In that district the mass of the people were sunk in poverty and barbarism; the corvées for the construction of roads and the transport of military equipages were oppressive; the country was depopulated by the requisitions for the militia; the taxation was excessive and unfairly distributed; the state of the roads was wretched; and the general condition of agriculture was deplorable. Turgot's administration of the district lasted for thirteen years, and was marked by a steady pursuit of the public good, and a firm resistance to inertia, prejudice, and corruption. In particular he strongly maintained the cause of the industrious poor, and insisted on a more equitable assessment of the public charges which pressed unduly upon them. With nobly disinterested spirit he refused to be transferred to other *généralités* in which the salary was higher and the administration easier. Rising above the common prejudices of the *philosophes*, he sought the co-operation of the clergy, both to inform him of everything relating to the circumstances of the people which it was desirable for him to know, and to explain to their flocks the nature and objects of the measures he proposed to put in operation; and he acknowledges that he found in them earnest and active auxiliaries. But he was not seconded as he ought to have been by the central government, and had often to remonstrate with the Abbé Terray, minister of finance. During the scarcity of 1770 and 1771, which was particularly severe in Limousin, he devoted himself with untiring assiduity to the relief of the distressed, and, when he had exhausted such public funds as were available, incurred for the same object a personal debt of more than 20,000 livres [$3700]. Shortly after the accession of Louis XVI. Turgot was appointed by Maurepas (19th July, 1774) minister of marine, and in that capacity began at once to initiate important reforms and to conceive far-reaching projects. But he filled the post only for five weeks, being then (21st August) promoted to the ministry of finance. In his new office he addressed to the young king a declaration of the principles by which he intended to be guided: "No bankruptcy, no increase of taxation, and no borrowing." Economy and wise management were to be his only resources. Fearing the opposition he must encounter, he appealed to Louis to support him. By a decree of the 13th September, 1774, he re-established free trade in grain within the kingdom, which had been suspended by Terray, and authorized the importation of supplies from abroad; the traffic in other alimentary substances was also relieved of many impediments, and various monopolies and exclusive privileges were abolished; the *octroi* taxation was reformed, public works promoted, and improvements in agriculture encouraged. Some of these measures were made the pretext for disturbances, known as *la guerre des farines*, which Turgot always suspected the Prince de Conti of having fomented. The riots had to be suppressed by armed force, and the energetic action of the minister against them was made a ground of attack by his enemies. The parlement had been weakly recalled by Louis from the exile to which in the preceding reign Maupeou had condemned it. It now constituted itself the organ of the resistance of menaced interests to the measures of Turgot, who would gladly have abolished it, providing in its place better political securities and courts of justice on a new plan. In January, 1776, he presented to the king a memoir proposing, amongst other things, the abolition of the corvée, to be replaced by a territorial tax, from which the privileged classes were not to be exempt, and the suppression of the *jurandes* (exclusive trade corporations). The edicts for these purposes were submitted to Miromesnil, keeper of the seals, a secret enemy of Turgot, who, spurred on by Maurepas, wrote a memoir against them, and opposed them in the king's council. The courtiers, the nobility, the clergy, and the leading members of the industrial corporations now combined against the minister, and were joined by a large part of the common people, who did not understand his policy. The Count de Provence, afterwards Louis XVIII., wrote a pamphlet, entitled *The Dream of M. de Maurepas*, against Turgot. The parlement refused to register the decrees; but the king held a *lit de justice*, which Voltaire proposed to call a *lit de bienfaisance*, and compelled the registration. This forced submission only aggravated the rancor of Turgot's enemies, and the king had not the firmness to sustain his minister against the coalition. A vile conspiracy having poisoned Louis's mind against him, he addressed to the king an eloquent letter in which he pointed out the grave perils impending over the throne and the state, and warned Louis that princes who are tempted to give themselves up to the direction of courtiers should remember the fate of Charles I. The minister received his dismissal on the 12th of May, 1776. He had been in office only twenty months, of which he had lost six in repressing sedition, and for seven more had been confined to his bed by the gout; but he had done during his tenure an extraordinary amount of work. Voltaire, however, nobly avenged Turgot on his enemies in his *Épître à un Homme*. The fallen minister devoted his remaining years to his favorite studies, especially to physical science and the ancient poets; he enjoyed the society of Lavoisier, D'Alembert, Condorcet, Bossut, Rochon, and Rouelle, and attended the meetings of the Academy of Inscriptions, of which he was elected vice-director in 1777. He also corresponded with Price and Franklin, and, if we may believe Condorcet, with Adam Smith, whose acquaintance he had made at Paris in 1766.[1] Turgot died at Paris on 18th March, 1781.

Turgot's official career is forever memorable in the history of social politics. Never did a public man give himself to the service of the community with more earnest and unselfish devotion. He made it his object to convince before commanding, in order that his aims might be better understood and his directions more surely obeyed; and, in issuing any instruction, making any decision, or advising any legislative act, he stated fully, by way of preamble, the grounds on which he proceeded. In the documents which he prepared on these occasions we have a body of valuable materials on administrative and economic questions; some of them contain the substance of chapters in the *Wealth of Nations*. When he became minister, the finances were in what seemed a desperate condition, and the general state of affairs justified the prediction of Louis XV.—"après moi le déluge." Turgot framed a vast plan of reform, at once administrative and economic, as the only hope for the salvation of the state. He speaks of his system of measures as intended for "the regulation of the kingdom," thus showing that he contemplated nothing less than a pacific revolution. But the first condition of success in such an effort was wanting, namely, the entire confidence and unfaltering support of the king, and the energetic exercise of the royal power in carrying out a policy of thorough reform against all adverse influences.[2] Turgot's struggle, though it failed from causes independent of himself, cannot be regarded without profound sympathy and admiration. Nor was it without a large measure of immediate success. Whilst he scrupulously observed all the pecuniary obligations of the state, he greatly diminished the crushing deficit which he found on his accession to office, and re-established the public credit in such a degree that the Dutch bankers offered him a loan of sixty millions of livres at less than 5 per cent. His financial and other plans, of course, fell with him, and his most important measures were annulled; but his policy and his writings exercised a lasting influence, and many of his projects were realized by the Revolution. Turgot is altogether one of the most massive and imposing figures of the 18th century. His whole character and public action are marked by an air of austere grandeur. Single-mindedness and veracity were of the very essence of his nature. Absolutely unbiased by selfish ends, he lived only for France, for truth, and for his duty. Believing intensely in a definite system of social and economic principles, which he had early formed by independent study and reflection, he was prepared to carry them out with dauntless determination, and with a lofty contempt for the interested or prejudiced opposition they were sure to encounter. He has been accused of a doctrinaire rigidity, and it is possible that, as a practical man, he wanted flexibility; yet he was often willing, not indeed to disguise his convictions, but to postpone the realization of his plans. In his public acts he always showed a lively concern for the poor and the suffering; in private life he was humane and benevolent; in his relations with his friends, amiable and affectionate. Malesherbes, the only other minister of his time who was worthy to be his colleague, said of him that "he had the head of Bacon and the heart of L'Hôpital," and, on the moral side at least, this was no exaggerated estimate.

---

[1] Dugald Stewart, however, cannot find any evidence of a correspondence between Turgot and Smith. It has also been said that during this period Turgot corresponded with Hume. But little more than three months intervened between his dismissal and the death of Hume (25th August, 1776), and there appears to be no trace of letters having passed between them in this interval. They had corresponded, but at a much earlier date; see Burton's *Life of Hume*, ii. 352, 381.

[2] Some have thought that the cardinal error in Turgot's policy lay in his not having convoked the states-general; that would, however, have been simply to open the flood-gates.

Possessed of a many-sided culture, Turgot wrote on a great variety of subjects—philosophic, scientific, and literary—though political economy is the branch of knowledge with which his name must always be most closely associated. Already in 1749, whilst a student at St. Sulpice, he addressed to his friend, Abbé de Cicé, afterwards bishop of Auxerre, a *Letter on Paper Money*, in which he asserted, in opposition to the views of Law and his followers, doctrines similar to those now accepted by all competent authorities. In one of his discourses at the Sorbonne, in 1750, moving into the higher regions of the philosophy of society, he makes a remarkable attempt to work out the pregnant conception, already enunciated by Pascal, of the continuity of the intellectual movement of our race, thus preparing the way for Condorcet's *Esquisse*, and ultimately for the sociology of Comte. In 1753 he translated, under the title of *Questions Importantes sur le Commerce*, a tract of Dr. Josiah Tucker on the expediency of naturalizing foreigners. He contributed to the *Encyclopédie* the articles *Étymologie, Existence, Expansibilité, Fondations*, and *Foires et Marchés*. The first of these contains much that is just as well as interesting, though in the time of Turgot the subject could not be treated on genuinely scientific bases. In the second he undertakes a refutation of the Berkeleian theory. The third contains some ingenious suggestions in practical physics. The article on foundations maintains the right of the Government to dispose of them for the public good, suppressing them if hurtful, and directing the funds to more useful objects; the policy advocated in it was afterwards carried into effect by the constituent assembly. In the paper on fairs and markets he argues that these are institutions adapted only for an immature state of commercial relations, and that more good would be done by liberating trade from the legislative fetters which everywhere impeded it than by bestowing special privileges or other encouragements on particular localities as centres of exchange. In the *Éloge* of Gournay he combines with his tribute to the memory of his friend a vindication of the principle of industrial freedom, which that friend had condensed in the oft-repeated maxim, "Laissez faire, laissez passer." To the period of Turgot's intendance belong his unfinished *Valeurs et Monnaies*, intended to form an article in the *Dictionnaire de Commerce* of Morellet; his *Letters* (to the Abbé Terray) *on the Freedom of the Corn-Trade*; his memoir *Sur les Prêts d'Argent*, in which he insists on the necessity of leaving free the interest on loans; and that on the principles which should direct legislation respecting mines and quarries, as well as the work on which his reputation as a systematic economist mainly rests, namely, his *Réflexions sur la Formation et la Distribution des Richesses*. This treatise was written for two Chinese youths who had been sent over by the Jesuit missionaries to study in France. The work was first published in 1766 in the *Éphémérides du Citoyen*, edited by Dupont de Nemours, and speedily passed through four editions. It gives in brief compass a luminous statement of some of the most important principles relating to the economic constitution of societies—the division of labor, the origin and use of money, the nature of capital and the different modes of its employment, the necessary rise of capitalist chiefs of industry, the legitimacy of interest on loans, and the impossibility of arbitrarily fixing the rate of that interest. It unfortunately contains, along with many truths, the erroneous doctrines of the physiocrats on the exclusive productiveness of agriculture and on the consequent propriety of imposing taxes only on the land of a country. This book was erroneously represented by Condorcet as "the germ of the *Wealth of Nations*," and has been spoken of by others as "anticipating some of the leading principles" of Smith. The truth is, most of what it contains had either been fully set forth by the earlier economists or was familiar to Quesnay and his group. It is, in fact, not a work of research but of exposition, and, regarded in this light, has real originality and may justly be pronounced a masterpiece.

Fuller information on the life, administrative labors, and writings of Turgot will be found in the following works: Dupont de Nemours, *Notes et Mémoires sur la Vie, l'Administration, et les Ouvrages de Turgot*, 1782, and enlarged in his edition of Turgot's works mentioned below; Condorcet, *Vie de Turgot*, 1786; A. Batbie, *Turgot, Philosophe, Économiste, Administrateur*, 1861; J. Tissot, *Turgot, sa Vie, son Administration, ses Ouvrages* (a *mémoire couronné*), 1862; A. Neymarck, *Turgot et ses Doctrines*, 1885. The last-named contains the most complete treatment of the subject. See also an *Éloge* by Dupuy (1782) in the *Mémoires de l'Académie des Inscriptions et Belles-Lettres*, vol. xlv.; L. de Lavergne, *Les Économistes Français au Dix-Huitième Siècle*, 1870, and Mr. John Morley's article in his *Critical Miscellanies*, 2d series, 1877. A collected edition of Turgot's writings was published for the first time by Dupont in 9 vols. (Paris, 1808–11); the most complete and in every respect best edition is that contained in the *Collection des Principaux Economistes* of Coquelin and Guillaumin, 2 vols., 1844, with a biographical notice by Eugène Daire. An English translation of *The Formation and Distribution of Wealth* was published in London in 1793, and was reprinted in 1859, in Lord Overstone's *Select Collection of Scarce and Valuable Economical Tracts*, edited by J. R. M'Culloch.

TURIN, a city of northern Italy formerly the capital of Piedmont and the Sardinian states and now the chief town of a province in the compartimento of Piedmont, is situated in 45° 4′ 8″ N. lat. and 7° 48′ 22″ E. long. in the alluvial valley of the Po, just above the confluence of the Dora Riparia. By rail it is 54 miles from the Mount Cenis tunnel. The communal palace stands 788 feet above the sea. The Monte dei Cappuccini in the neighborhood reaches 922 and La Superga 2405 feet. As viewed from the east the city stands out boldly against the Alps. Taken as a whole Turin may be described as a very modern city, with broad and regular streets, and large squares and public gardens. The cathedral of St. John the Baptist is a cruciform Renaissance building dating from the close of the 15th century. The site was first occupied by a church erected, it is said, by the Lombard duke Agilulf (7th century). Behind the high altar of the cathedral (from which it is separated by a glass screen) is the chapel of the Sudario or Sidone, built (1657–1694) by Guarini as a royal burial-place. The "sudario" from which it takes its name is asserted to be the shroud in which Joseph of Arimathea wrapped the body of Jesus. La Beata Vergine della Consolata, another of Guarini's works, has a tower which originally belonged to the church of St. Andrew, founded by the monk Bruning in 1014, and attracts attention by Vincenzo Vela's beautiful kneeling statues of Queen Maria Teresa and Queen Maria Adelaide, as well as by the image of the Madonna, which has the credit of having warded of the cholera in 1835. Other churches of some note are San Felippo Neri (1672–1772), the dome of which fell in just as it was approaching completion under the hands of Guarini, and La Gran Madre de Dio, erected to commemorate the return of the royal family in 1814. Of the secular buildings the more interesting are the Madama palace, first erected by William of Montferrat in the close of the 13th century, and the extensive royal palace begun in the 17th century. The university, founded in 1400 by Lodovico di Acaja, has faculties of jurisprudence, medicine and surgery, literature and philosophy, and mathematical, physical, and natural sciences. The number of students enrolled was 2132 in 1886. About 1876 the old university buildings erected in 1713 by the Genoese architect Ricca began to prove too small for their purpose ; and at the present time (1887) new buildings, fitted more especially for the medical and scientific departments are being erected. The area of the botanical gardens has also been extended and the observatory enlarged. The medical school derives advantage from the number of important hospitals in the city. The royal lunatic asylum can accommodate 980 patients. Turin has a prison on the cell system (672 cells) and a female penitentiary for 300 besides two houses of correction. The academy of sciences was founded in 1757. It occupies a building erected in 1687 by Guarini as a Jesuit college. The museum of antiquities and the picture gallery, of which it has the custody, are both of high interest—the former for the local antiquities of Piedmont and Sardinia (notably from Industria) and for the Egyptian treasures collected by Donati and Drovetti, and the latter for its Van Dycks. There is a museum of zoology and mineralogy in the royal palace (another of Guarini's buildings), and the Castello palace contains the royal armory (a collection made by Charles Albert in 1833) and the royal library with its rich manuscript collection and its 20,000 drawings, among which are sketches by Raphael, Michelangelo, and Da Vinci. The civic museum has a great variety of artistic and literary curiosities, among them a remarkable collection of autographs and the Lombard missal (1490). The Jewish synagogue, a striking and conspicuous building, erected in 1863 by Alessandro Antonelli, was purchased by the municipality in 1879 for a Renaissance museum. Other public institutions are the Albertine academy of the fine arts, the geographical society, and the Alpine club.

The industries of Turin and its suburbs give employment to 17,936 persons (13,305 men, 4631 women). Spinning-mills, weaving-factories, "vesta" factories (De Medici), breweries, and iron-works are among the more extensive establishments. The commercial relations of the city are very extensive. It is the seat of the central offices of the North Italian Railway ; and the central station is one of the most imposing buildings of its class in the country. The mean annual temperature at Turin (1866–84) is 53° Fahr. (Jan. 36°, July 74°), with a maximum of 96° and a minimum of 4.1°. Mists are frequent in the winter mornings, and to a less degree in autumn. Snow seldom falls in any great quantity, and on an average only on 7 days per annum. The rainfall, distributed over 100 days, reaches 32 inches—December being 1.6 and April 4.3. Water of good quality is brought to the city from a distance of 15 miles. The population of Turin was only about 4200 in 1377 and 9000 in 1580; but by 1702 it was returned as 43,866. In 1848 it had risen to 136,849, and in 1861 to 204,715. In spite of the changes caused by the removal of the capital, first to Florence and then to Rome, the census of 1881 showed 233,124 inhabitants (commune 252,832).

Turin, *Augusta Taurinorum*, took its name from the Taurini or Taurisci, an ancient Ligurian people. The town is first alluded to (but not distinctly by name) in the year 218 B.C., when it was captured by Hannibal after a three days' siege, being at that time a place of great strength. A colony of Roman veterans was introduced into the city, possibly after the battle of Philippi, or at any rate after the battle of Actium. It was assigned to the Stellatine tribe. Of Roman architecture scarcely any trace remains even in the oldest parts of Turin, but the arrangement of the streets of the old town recalls the alignments of the Roman military settlement. The Palazzo delle due Torri, often designated the Porta Palatina, is probably part of a building of the 8th century. Turin continued to be a place of importance and military strength under numerous vicissitudes, till at length it was made the chief town of Piedmont by Amadeus, first duke of Savoy. Under Emmanuel Philibert it became the usual residence of the ducal family, and in 1515 the bishopric was raised to metropolitan rank by Leo X. Between 1536 and 1562 Turin was occupied by the French, and in 1630 it lost 8000 of its citizens by the plague. The French were masters once more from 1640 to 1706, and again from 1798 till 1814, when the Sardinian states were restored to the house of Savoy. Between 1859 and 1865 Turin was the capital of united Italy. Among the many men of mark born in Turin it is enough to mention Lagrange, Gioberti, Cesare Balbo, Cavour, Marochetti the sculptor, D'Azeglio, and Sommellier.

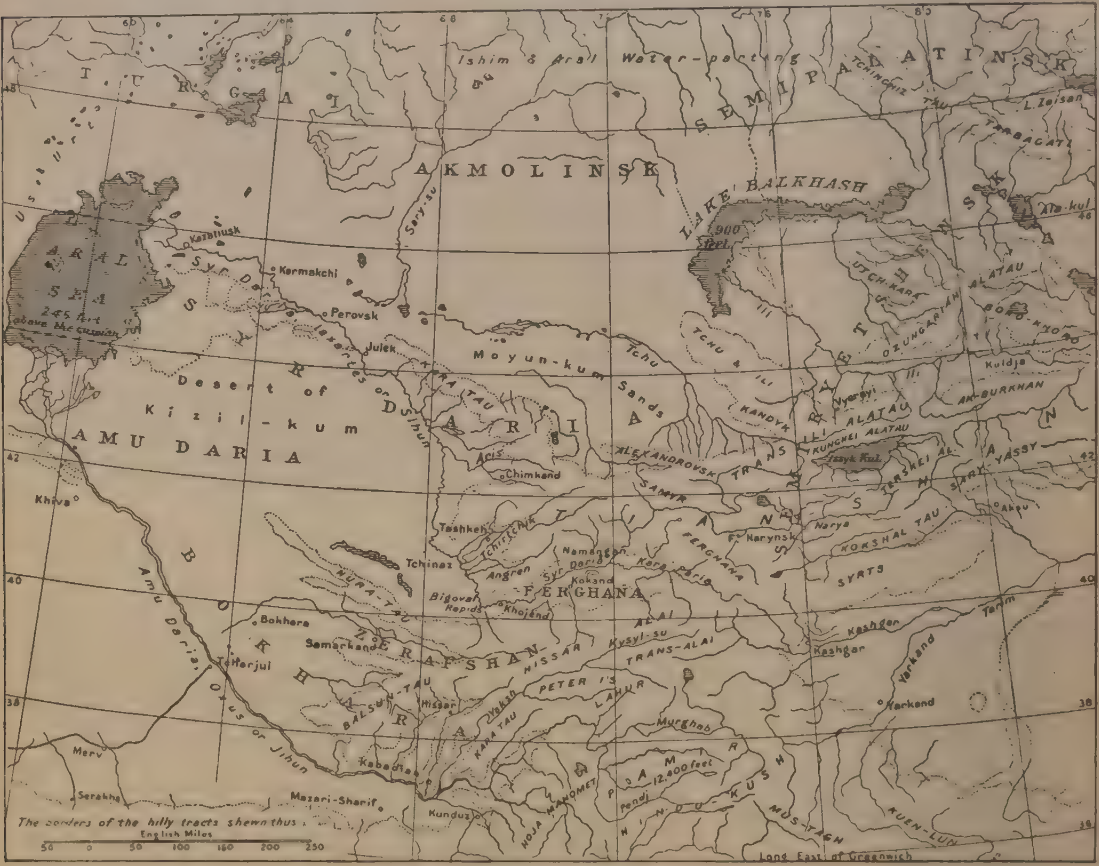
TURKESTAN.

Meaning of term Central Asia.

THE terms "Turkestan" and "Central Asia" are often used indiscriminately to describe the whole of the immense territory to the east of the Caspian, comprised between Siberia on the north and Khorasan (Persia), Afghanistan, and Tibet on the south, or to designate separate, sometimes arbitrarily determined, parts of the same region. In the beginning of the 19th century the whole of the territory just named, with its great variety of altitudes, climate, inhabitants—these last differing as much in their history as in their present characteristics—was comprised under the vague denomination of High Tartary, or High or Interior Asia. After the appearance of Humboldt's first draft of *Asie Centrale* in 1831, the term "Central Asia" came into favor. But Humboldt's limits of Central Asia were too mathematical (from 39½° to 49½° N. lat.), and were further unsatisfactory because influenced by his erroneous conception of the mountains of Central Asia, which he supposed to run either along parallels or along meridians. Richthofen made an attempt to limit the sense of the term, proposing to apply it only to that region—embracing the Tarim drainage area and the Gobi—which has no outlet either towards the ocean or to the Sea of Aral and Lake Balkash (Balkhash) and which constitutes the Hang-hai of the Chinese and the supposed bed of the Tertiary Asiatic Mediterranean. But this terminology, besides the drawback of including within Central Asia the steppes of the Gobi as far east as Transbaikalia and the Great Khingan, notwithstanding the broad differences by which they are distinguished from the drainage area of the Tarim, was open to another objection, which has been pointed out in M. Mushketoff's *Turkestan*. It excluded from Central Asia Turkestan proper, which nevertheless has had the same recent geological history as the Tarim region, and therefore has so many features in common with it as regards soil, climate, flora, fauna, population, and even civil history. On the other hand, if Central or Interior Asia were to include West Turkestan, and its limits to be determined by those of the drainage-areas which have no outlet to the ocean, the basins of the Volga and Ural,—that is, territories purely European in character,—would have to be comprised under the same denomination. The fact is that in Asia, as so often elsewhere, hydrographical considerations alone furnish no sound basis for geographical delimitations, and that these last must result from a complicated variety of considerations, chiefly orographical, inasmuch as orographical are indicative of other physical characters, such as geology, climate, flora, fauna, and so on. Such were the views of Ritter and Humboldt, and we are now brought back to their conceptions, but corrected into accordance with improved knowledge of the Asiatic continent. The name Central Asia can still be used with great advantage to designate that immense portion of the continent to the east of the Caspian and the Ust-Urt plateau which is limited on the north by the important climatic and geo-botanic boundary of the Irtish and Aral water-parting and the Great or Ektagh Altai, on the east by the eastern Gobi, and on the south by the northern border of the Khor plateau (Altyn-Tagh and Kuen-Lun), the Hindu-Kush, and the Kopet-Dagh. Extensive as it is, this territory has its own climatic and geo-botanic features; it forms a distinct part of the continent, when the orography of Asia is broadly viewed; and its inhabitants have a number of common characteristics resulting directly from the physical features of the territory. But this immense area must be subdivided; and its subdivisions become apparent as soon as the orographical features are grasped.

Great Asiatic plateaus.

Two great plateaus constitute the two backbones, as it were, of the orographical structure of Asia,—that of eastern Asia, an immense triangle stretching northeastwards, having the Himalayas for its base and the peninsula of the Tchuktchis for its apex; and that of western Asia, which extends at right angles to the above, from the lower Indus to the Black Sea. The Hindu-Kush connects these two massive swellings, both continents of the oldest formation in Asia. Both are fringed on their northern edges by lofty chains of mountains. The Tian-Shan, the Altai, the Sayan, and the Vitim Mountains rise in a long succession on the borders of the former, while a series of chains, which might be described under the general name of Kopet-Dagh, continued into the Transcaucasian chains, rise on the northeastern edge of the western plateau.



Map of East and West Turkestan.[1]

West Turkestan.

An immense trapezoidal depression occupies the angle on the west where the great plateaus meet, and this depression is West Turkestan. Its southeastern limits are the Hindu-Kush and the Tian-Shan; on its southwestern edge it has the Iranian plateau; and its northwest and northeast boundaries correspond with the edge of the Ust-Urt and the Irtish and Aral water-parting, which separates it from Siberia. The Trapezium is 1100 miles long from southwest to northeast, and 900 miles wide from southeast to northwest. It thus includes, not only the depression at the junction of the two plateaus, but also the girdle of alpine tracts which fringes them, and in whose deep and sheltered valleys the Turkish and partly Iranian population of Turkestan find a fertile soil and plenty of water for their fields, while their herds graze on the rich alpine meadows in the very heart of the Tian-Shan. Not orographically only but also in respect of its recent geological past, its climate, flora, fauna, and inhabitants, this region forms a geographical domain by itself, quite distinct from the steppes of southeastern Russia, the prairies of Siberia, and the two great plateaus by which it is inclosed; and, although it is easily subdivided into two parts—the dry lowlands of the Transcaspian depression and the plains and highlands of Turkestan proper—it presents one geographical whole when contrasted with the surrounding regions. Some doubt may arise as to the propriety of including in it the plateau of Pamir; but its flora and fauna are so closely connected with those of the Tian-Shan that, although better treated as a separate sub-region, like the Transcaspian Turcoman steppes, it cannot be separated from the above. For the orographer, the "Roof of the World" is merely a succession of the wide *syrts* or alpine plateaus that are characteristic of the Tian-Shan. Most of this territory has within recent years been annexed to the Russian empire. Bokhara, with its vassal khanates in the gorges of the Pamir slopes, and Khiva, although they are still described as independent, are in reality rapidly becoming dependencies of Russia, and the railway from the Caspian, which is about to connect Merv with Samarkand, will complete the annexation of Bokhara. West Turkestan, therefore, is often called Russian Turkestan, as distinguished from Chinese or East Turkestan.

---

[1] See also the following maps: HIMALAYA, vol. xi. Pl. XVI.; SIBERIA, vol. xxii. Pl. I.; and TIBET, Pl. IV. above.

East Turkestan.

This second great region of Central Asia also has well-defined limits. A glance at any recent map shows that there is in the great eastern plateau a depression bordered by the deep slopes of the Pamir (Humboldt's Bolor) on the W., the border-ridges of Tibet (Kuen-Lun and Ałtyn-Tagh) on the S., the eastern Tian-Shan on the N., and the western Gobi on the E.[1] Although we call it a depression, because it is much lower than the surrounding plateaus, it is itself a plateau, ranging from 3000 to 4000 feet above sea-level. This depression—the Hang-hai of the Chinese, which, during the later Tertiary and earlier Quaternary period, was covered by a sea, of which a very small survival still exists in Lob-Nor—is now drained by the Tarim. Its deserts, in which human settlements are now very rare, though formerly the population was much denser, have been described under a variety of names (Little Bokhara, Alty-shar or Jity-shar, Kashgariä, and so on); but the name of East Turkestan has prevailed, and there is no reason for abandoning it, provided it is not confounded with DZUNGARIA (*q.v.*) in the north and the great Desert of Gobi in the east. Dzungaria is a deep trench leading from the lowlands to the central plateau, and has special physical features and a history of its own. The Mongolian Gobi, on the other hand, owing to its position on the lower terrace of the plateau of eastern Asia, must be regarded as a separate unity. In fact, it appears to be more closely connected with the plateau of the Selenga on the north and that of Ordos on the south than with East Turkestan; and it, too, has its own physical features, its own inhabitants, and its own history.

The expression Central Asia thus includes the following countries. (A) West Turkestan, comprising the Tian-Shan highlands, the Balkash plains, and the Aral-Caspian lowlands, politically divided into Russian Turkestan (the general-governorship of Turkestan and the Aral-Caspian slope of Turgai and Akmolinsk), the Chinese oasis of Kulja (Kuldja), the Transcaspian region, Khiva, Bokhara and its vassal khanates, and parts of Afghan Turkestan. (B) East Turkestan, comprising the Tarim region as far east as Lob-Nor. (C) Dzungaria, limited on the northeast by the Tarbagatai, Altai-Nauru, Irdyn-ula, and Artsa-bogdo Mountains.

WEST TURKESTAN.

General physical features.

As comprised within the above limits, West Turkestan has an area of nearly 1,680,000 square miles, and a population of nearly 8,500,000.[2] It presents a very great variety of aspects, including the lonely plateau of Pamir, in height second only to that of Tibet; the immense complex of alpine tracts described under the general name of Tian-Shan (three times as long as the Alps of Europe), which lift their snow-clad peaks four and nearly five miles above the sea, and feed huge glaciers, while their deep valleys and gorges partake of almost every variety of climate and vegetation; rich prairies and still wider lowlands descending below the level of the ocean; and deserts where the winds, burning hot or icy, but always dry, have free scope to modify the surface, which is bare of vegetation.

Highland region.

Nevertheless West Turkestan is sharply divided into two parts,—the highlands in the southeast and the plains and deserts in the northwest. The former cover an area nearly 1000 miles long by 270 broad, of which the northern parts are described under the general name of Tian-Shan (properly, T'han-Shañ). Their distinctive feature is that, like the highlands of Siberia, they constitute a high border-ridge, running W.S.W. to E.N.E. on the edge of the great plateau of eastern Asia. This plateau is fringed on its outer side by a complex of short ranges, which mostly run parallel to the border-ridges and send off a series of isolated chains, due to a later system of upheaval, through the plains and steppes in a northwestern direction. Down to the middle of the 19th century these highlands were almost absolutely unknown, and the orography of Central Asia as shown on our maps was quite hypothetical. Numerous surveys by Russian and British explorers have, however, recently disclosed the real structure of those regions; and it has now become possible to discriminate the leading features of the orographical conformation of the country. The Hindu-Kush, with its snow-clad summits of 18,000 and 20,000 feet, limits the highlands of Turkestan to the southeast. It appears now to be settled that this ridge runs from northeast to southwest, as far at least as the latitude of Cabul, and possibly still farther south; and the last Russian surveys of the Pamir show that it extends northeast as far as Tash-Kurgan (37° 45′ N. lat., 75° E. long.). At the foot of its northwestern slope it has the plateau of Pamir—the "Roof of the World,"—with an area of about 37,000 square miles. A series of chains, gently sloping and dome-shaped, rising 4000 or 5000 feet above the level of the plateau, traverse it from southwest to northeast, with a remarkable parallelism, dividing it into a series of broad parallel flat-bottomed grooves or valleys, which do not sink below 10,000, and sometimes 14,000 feet above sea-level. Thus the features of the lower plateaus of northeastern Asia reappear here on a greater scale, having the same characters and the same direction in the plaitings of the earth's crust.

Pamir plateau.

Nearly 150 miles to the northwest of the Hindu-Kush lies the northwestern border of the Pamir, fringed by the lofty Trans-Ałai Mountains. Their crest, covered with snow, rises nearly 4 miles above the sea (Kaufmann Peak 23,000 feet); but the traveller approaching them from the south would hardly guess their height, because their southern slope towards the wildernesses of the plateau, themselves 13,000 feet high, is very gentle. The great elevation of the border-chain is only realized when it is seen from the Ałai valley on the north, where its steep and deeply furrowed sides tower up like a dark wall, from 11,000 to 14,000 feet high, above the high and broad valley of the Kizil-su. The geological structure of the Ałai valley must not be inferred from its orographical features, otherwise we should describe it as longitudinal. It is watered by the Kizil-su, which flows towards the west southwest and joins the Amu-Daria under the name of Vaksh (or Wakhsh). On the north it has the lofty Ałai-Tagh range, also partially snow-clad. On our best maps the Trans-Ałai Mountains are figured as an isolated range, some 120 miles in length; and it cannot yet be affirmed with certainty which chains of the Tian-Shan, possessing the same border-ridge characters, ought to be considered as its continuations. Further research is needed to determine whether it is continued southwest by the Darvaz, or Lahor, Mountains, where the group of lofty Sel-tau peaks feed the extensive Fedtchenko glacier, or by the Hoja-Mahomet chain on the left bank of the Amu-Daria.[3] Thus the real northwestern limits of the Pamir are still unsettled. As for the northeastern continuations of the Trans-Ałai, the present writer is inclined to trace them, not in the Kokshał-tau, but in the Terskei Ala-tau and the high mountains of Sary-yassy, where the Khan-Tengri lifts its snow-clad granitic cap 24,000 feet above the sea, and is surrounded by numerous vast glaciers (Semenoff's and Mushketoff's Muz-art). It would thus separate, broadly speaking, the drainage area of the Tarim from those of Lake Balkash and the Sea of Aral. Thus the border-ridge of the Central Asian plateau would have a length of more than 1000 miles from the Amu to Kulja, and the valleys of the upper Naryn and Tekkes would therefore be homologous with that of the Ałai.

---

[1] In the map (issued October, 1887) embodying the results of Prjevalsky's fourth journey, East Turkestan is plainly demarcated from the Gobi. This last falls by a steep slope towards the Tarim depression, which narrows to the east of Lob-Nor and terminates about Añ-si, some 4800 feet above sea-level.

[2] Separate portions of it are described under AFGHANISTAN, BOKHARA, KHIVA, OXUS, SYR-DARIA, SEMIPALATINSK, SEMIRYETCHENSK, TRANSCASPIAN REGION, ZERAFSHAN.

[3] See G Grum-Grzimailo, in *Izvestia* of Russ. Geog. Soc., vol. xxii., 1886.

Alpine tracts.

A girdle of alpine tracts, from 150 to 180 miles in width, which fringes the outer edge of the Pamir plateau, consists of shorter chains running parallel to the border ridge and ranging from 11,000 to 17,000 and 20,000 feet in altitude. They are separated by deep valleys, mostly with three separate foldings of Azoic rocks. Some of these ranges are covered with perennial snow and feed great glaciers, among which Schurovsky and Fedtchenko glaciers around the lofty Kok-su group are especially worthy of mention. These subsidiary chains all belong to the oldest system of upheavals, which have had a northeast direction, and which at four different places are modified by more modern ones having a northwestern direction. In lat. 47° N. the orographical structure becomes more complicated, the alpine region being pierced by the broad Dzungarian trench, which leads from the lowlands of the Irtish to the heights of the Central Asian plateau. A high ridge—the Tarbagatai—continued in the Tchinghiz (Jinghiz) and Karkaralinsk Mountains, branches off northwestwards, separating Turkestan from Siberia. Further east the Tian-Shan is continued on our maps in an eastern direction; but our knowledge of it still remains very imperfect.[1]

Lacustrine basins of Tian-Shan.

A series of deep depressions,—Balkh, Ferghana, Issyk-kul, and Kulja,—sinking to low levels amidst the Tian-Shan highlands follow one another in a northeast direction. That of Issyk-kul is occupied by the lake of the same name (5000 feet above the sea), while the second and fourth, now desiccated, are lacustrine basins. A great number of smaller lacustrine basins, mostly filled with Tertiary conglomerates, occur higher up in the mountains. For the orographer and the geologist they are homologous with those of the Altai and east Siberia (Bukhtarma, Us, Irkut, Barguzin, and others). The rivers that issued from the high alps had to pierce many parallel ridges in order to reach the plains, and they frequently expanded into wide lakes before cleaving through the chains of mountains the narrow and deep transverse gorges by which they descended to the lower terraces.

Lowland plains.

Like the highlands of Siberia, those of Turkestan are fringed by a girdle of plains, having an altitude of from 1000 to 1500 feet, and these again are skirted by an immense lowland area reaching only 400, 300, and 150 feet, or even sinking below the level of the ocean. These plains and lowlands cover nearly 650,000 square miles. Some geographers divide them into two portions,—the higher plains of the Balkash (the Ala-kul and Balkash drainage areas) and the Aral-Caspian depression, which occupies nearly two-thirds of the whole and has been ably described by M. Mushketoff under the appropriate name of Turanian basin,—the Kara-tau Mountains being considered as the dividing line between the two. The Balkash plains, more than 1000 feet above the sea, and covered with clay, with a girdle of loess at their foot, are well watered by the Ili and other feeders of Lake Balkash (see SEMIRYETCHENSK) and on their rich prairies are the homes of numerous Kirghiz. In the southwest the clayey soil becomes saline. There is the Famine steppe (Bek-pak-dała), while in the Ak-kum steppe, which surrounds Lake Kara-kul, large areas are covered with sands, partly shifting. A gulf of clayey plains penetrates up the Ili into the interior of the mountains, and its thick layers of loess form the Kulja oasis. Another gulf, penetrating much more deeply into the highlands up the trench occupied by Lakes Ebi-Nor and Ayar, and joining the trench of the upper Irtish, leads by an imperceptible gradient up to the plateau of Central Asia. It is known as the "Dzungarian Gate," and a gate it has been since the dawn of history for whole nations of nomads who have migrated from the rapidly desiccating plateau down to the grassy prairies of Siberia and Russia. The plains and lowlands of the Turanian basin are subdivided by a line drawn from northeast to southwest along a slight range of hills running from the sources of the Ishim towards the southeast corner of the Caspian (Bujnurd and Elburz edge of Khorasan). This low range, which most probably separated the lowlands of the Aral-Caspian region (submerged during the Post-Pliocene period) from the higher plains which had emerged by the end of the Tertiary period, now divides the Transcaspian steppes from the somewhat different higher plains (see TRANSCASPIAN REGION). In the Turanian basin the contrast between desert and oasis is much stronger than in the Balkash region. Fertile soil, or rather soil which can be rendered fertile by irrigation, is limited to a narrow terrace of loess along the foot of the mountains (see SYR-DARIA), and is surrounded by barren deserts. Even where the loess spreads over terraces at some distance from the mountains, as in the southeast Transcaspian region, it can be cultivated only when irrigated. The dryness of the climate is excessive: rain falls only where the hills cause the clouds to condense, the soil elsewhere being moistened only occasionally by a few showers. Two rivers only—the Syr and the Amu—succeed in crossing the desert and reaching the Sea of Aral. But their former tributaries no longer run their full course: the glacier-fed Zerafshan dries up amidst the gardens of Bokhara soon after emerging from the highlands; and the Tejeñ, the Murghab, and the Andkho lose themselves amidst the fields of the Turcomans. The only tributaries which the Amu retains are those which have the whole of their course in the highlands. In the north such formerly important tributaries of the Syr-Daria as the Tchu, with its subtributary the Sary-su, now dry up some hundreds of miles distant from the main stream. The arid desert absorbs every drop of running water which reaches its borders.

Desiccation of West Turkestan.

The whole area is now undergoing geological changes on a vast scale. Rivers have changed their courses, and lakes their outlines. Far away from their present shores the geologist finds indubitable traces of the recent presence of the lakes in the shells they have left amidst the sands. Traces of former rivers and channels, which were the main arteries of prosperous regions within the period of written history, have now disappeared. Of the highly developed civilizations which grew up and flourished in Bactriana, Bokhara, and Samarkand the last traces are now undergoing rapid obliteration with the desiccation of the rivers and lakes. The great "Blue Sea" of Central Asia, the Sea of Aral, which at a recent epoch (Post-Glacial) extended southwest to Sary-kamysh, and the shells of which are found north and east of its present shores from 50 to 200 feet above its present level (162 feet above the ocean, and 245 above the Caspian), now occupies but a small portion of its former extent. It covers a shallow depression, some 23,000 square miles in area, which is drying up with astonishing rapidity, so that the process of desiccation can be shown on surveys separated only by intervals of ten years; large parts of it, like Gulf Aibughir, have dried up since the Russians took possession of its shores. Steamers regularly ply on its waters and ascend both its tributaries. The whole country is dotted with lakes, which are rapidly disappearing under the hot winds of the deserts; and the clayey *takyrs* of the steppes give evidence of thousands of lakes which have quite recently ceased to exist, leaving beds of clay kept wet by the condensed moisture of winter and the few rain-showers of early spring.

---

[1] The present writer is inclined to consider the "Eastern Tian-Shan" of our maps, which runs east-southeast to Bagratch-kul, as a separate chain belonging to the more modern system of northwestern upheavals, meeting at its eastern extremity a chain which trends towards the northeast.

Geology.

Like the highlands of eastern Asia, those of Turkestan are mostly built up of Azoic gneisses and metamorphic slates, resting upon granites, syenites, old orthoclase porphyries, and the like. These upheavals date from the remotest geological ages; and since the Primary epoch a triangular continent having its apex turned towards the northeast, as Africa and America have theirs pointing southward, rose in the middle of what now constitutes Asia. It is only in the outer foldings of the highlands that Primary fossiliferous deposits are found,—Devonian, Carboniferous, and Permo-Carbonic. Within that period the principal valleys were excavated, and their lower parts have been filled up subsequently with Jurassic, Cretaceous, and Tertiary deposits. One of the most striking instances of this is the very thick Cretaceous and Tertiary deposits which cover the bottom of the valley of the Vaksh (right tributary of the Amu) and are continued for about 300 miles to the northeast, as far as the Alai valley,—probably along the edge of the Pamir plateau. The deposits of the Secondary period have not maintained their horizontal position. While upheavals having a northeastern strike continued to take place after the Carboniferous epoch,[1] another series of upheavals, having a northwestern strike, and occasioned by the expansion of diabases, dolerites, melaphyres, and andesites, occurred later, subsequently at least to the close of the Tertiary period, if not also before it, dislocating former chains and raising rocks to the highest levels by the addition of new upheavals to the older ones. Throughout the Triassic and Jurassic periods nearly all Turkestan remained a continent indented by gulfs and lagoons of the south European Triassic and Jurassic sea. Immense fresh-water lakes, in which were deposited layers of plants (now yielding coal), filled up the depressions of the country. Cretaceous and Tertiary deposits occur extensively along the edge of the highlands. Upper and Middle Cretaceous, containing phosphates, gypsum, naphtha, sulphur, and alum, attain thicknesses of 2000 and 5000 feet in Hissar. Representatives of all the Tertiary formations are met with in Turkestan; but, while in the highlands the strata are coast-deposits, they assume an open-sea character in the lowlands, and their rich fossil fauna furnishes evidence of the gradual shallowing of that sea, until at last, after the Sarmathian period, it became a closed Mediterranean. During the Post-Pliocene period this sea broke up into several parts, united by narrow straits. The connection of Lake Balkash with the Sea of Aral can hardly be doubted; but this portion of the great sea was the first to be divided. While the Sea of Aral remained in connection with the Caspian, the desiccation of the Lake Balkash basin, and its break-up into smaller separate basins, were already going on. The Quaternary epoch is represented by vast morainic deposits in the valleys of the Tian-Shan. About Khan-Tengri glaciers descended to a level of 6800 feet above the sea,[2] and discharged into the wide open valleys or *syrts*. It is most probable that, when allowance has been made for the obliteration of glacial markings, and the region has been better explored, it will appear that the glaciation of Turkestan was on a scale at least as vast as that of the Himalayas. In the lowlands the Aral-Caspian deposits, which it is difficult to separate sharply from the later Tertiary, cover the whole of the area. They contain shells of mollusks now inhabiting the Sea of Aral, and in their petrographical features are exactly like those of the lower Volga. The limits of the Post-Pliocene Aral-Caspian sea have not yet been fully traced. It extended some 200 miles north and more than 90 miles east of the present Aral shores. A narrow strait connected it with Lake Balkash. The Ust-Urt plateau and the Mugojar Mountains (see TURGAI) prevented it from spreading northwestward, and a narrow channel connected it along the Uzboi (see p. 544 *supra*) with the Caspian, which sent a broad gulf to the east, spread up to Volga, and was connected by the Manytch with the Black Sea basin. Great interest, geological and historical, thus attaches to the recent changes undergone by this basin; but much still remains to be done before the numerous questions arising in connection with it can be settled. Since the theory of geological cataclysms was abandoned, and that of slow modifications of the crust of the earth accepted, new data have been obtained in the Aral-Caspian region to show that the rate of modification after the close of the Glacial period, although still very slow, was faster than had been supposed from the evidence of similar changes now going on in Europe and America. The effects produced by desiccating agencies are beyond all comparison more powerful than those which result from the earthquakes that are so frequent in Turkestan. All along the base of the highlands, from Khojend to Vyernyi, earthquakes are frequent;[3] but, however destructive of life, their effects lie beyond the scope of our observational methods.

Climate.

The climate of West Turkestan is exceedingly dry and continental. Although the country is comprised within the latitudes of Sicily and Lyons, it has a south Norwegian January and a Persian summer. Temperatures of more than 100° Fahr. in the shade are common, and the heat is rendered still more unbearable by the reflection from a soil destitute of vegetation. The winter is for the most part so cold that the average temperature of January is below the freezing point, and even reaches 0° Fahr. Snow falls for several months on the lower Syr-Daria, and, were it not blown away by the winds, sledge-communication would be possible. This river is frozen for an average of 123 days every year in its lower parts, and nearly 100 days at Perovsk. At Tashkend there is snow during two months and temperatures of —10° Fahr. have been measured. In 1876, on 24th October, almond-trees, vines, and cotton crops were buried under a heavy snowfall. To the south of Khojend the winter becomes more clement. Absence of rain is the distinctive feature of the climate. Although it rains and snows heavily on the mountains, only 11 inches of rain and snow fall throughout the year at Tashkend, at the base of the highlands; and the steppes of the lower Amu have less than 3 inches. A few showers are all that fall from the almost invariably cloudless sky above the Transcaspian steppes. The following table will illustrate the climate of Turkestan:

	Latitude.	Height in feet.	Average temperature.			Rain in inches.
			Year.	January.	July.	
Akmolinsk	51° 12′	1020	28.8°	0.0°	69.2°	9.2
Semipalatinsk	50° 24′	590	27.0°	–0.7°	72.5°	7.7
Irghiz	48° 37′	360	21.8°	3.4°	76.2°	6.1
Kazalinsk	45° 45′	160	45.5°	10.6°	78.0°	7.9
Alexandrovsk	44° 33′	—30	51.2°	25.0°	78.0°	...
Kulja	43° 51′	2100	48.7°	14.4°	76.5°	...
Nukus	42° 27′	215	53.0°	19·4°	79.6°	2.9
Petro-Alexandrovsk	41° 28′	325	55.0°	...	...	2.4
Tashkend	41° 19′	1480	58.3°	29.0°	77.5°	11.3
Krasnovodsk	40° 00′	—70	59.8°	36.3°	83.2°	...
Yarkand (East Tur...)	38° 21′	4120	54.2°	21.2°	81.7°	...

Fauna.

The fauna of Turkestan belongs to the great zoo-geographical domain of northern Asia, and is only differentiated by the presence of species which have disappeared from the peripheric parts of the Old World and now find a refuge in the remotest regions of the uninhabited plateau. From the great Palæarctic region it is distinguished by the presence of Himalayan species. The distinctive animal of the Pamir plateau is the magnificent *Ovis poli* (conjectured to be the ancestor of our common sheep), mentioned by Marco Polo and rediscovered by Syevertsoff. It breeds by thousands on the Pamir, climbing the highest ridges, which it prefers to the valleys. The region to which it is confined has the shape of an ellipse, with its longer axis running southwest to northeast. The animal is rare on the upper Naryn, and never penetrates to the west of Sel-su. In the alpine tracts of the Tian-Shan, on the borders of the Pamir, their horns and skulls are frequently met with, but there the place of the species is now taken by *Ovis karelini*. The wild horse, which occurred in Poland a few centuries ago, has been discovered by Prejevalsky in the highlands of Dzungaria and described as *Equus prjevalskii* by Polyakoff. The wild camel inhabits the lonely plateaus south of the Ala-Shan; but no description of it has been published. The other mammals of Turkestan are mostly those which are met with elsewhere in north Asia. The large light-colored Himalayan bear (*Ursus isabellinus*) has its home on the Pamir, and the smaller strong, white-clawed *Leuconyx* up to the highest levels on the Tian-Shan. Antelopes, *Lepus lehmanni*, *Lagomys rutilus*, various species of *Arvicolæ*, and the Himalayan long-tailed marmot (*Arctomys caudatus*), the most characteristic inhabitant of the alpine meadows, are the only mammals of the Pamir proper. In the alpine region are found the badger (*Meles taxus*), the ermine (*Putorius ermineus*) and six other *Mustelidæ*, the wild dog (*Canis alpinus*), the common and the black-eared fox (*C. melanotis*), while the corsac fox (*C. corsac*) is met with only on the plains. Two species of lynx, the cheetah (*Felis jubata*), *Felis manul*, and *Felis irbis*, this last extending westwards as far as the Persian Gulf and eastwards as far as the river Amur, must be added to the above. The tiger is met with only on the lower Amu-Daria, except when it wanders to the alpine region in pursuit of the maral deer (*Cervus maral*). The jackal is characteristic of the steppes; it banishes the wolves and foxes. Hares are represented by several species, *Lepus lehmanni* being the most characteristic. Both the common and the long-tailed marmot (*A. baibacinus* and *A. caudatus*) are found at the foot of the mountains, as also four species of *Spermophilus*, three of voles, two of the mouse, and three of the hamster. The *Meriones* (four species) and the jerboa (five species) are only met with in the steppe region. Of ruminants, besides the sheep (*O. poli*, *O. karelini*, *O. nigrimontana*, *O. heinsii*), we find one mufflon (*Musimon vignei*), formerly known only in the Himalayas, the Chinese antelope (*Antilope subgutturosa*) and the saiga antelope in the steppes, the Siberian ibex and another goat, the yak, the zebu or Indian ox, the common ox, the camel, and the dromedary. The wild boar is common in the reed thickets along the rivers and lakes, where it stays during the winter, migrating to the highlands in summer. The hedgehog and porcupine are common in the plains.

---

[1] Mushketoff's *Turkestan* (pp. 35, 681) seems to justify this conclusion

[2] See I. Ignatieff, in *Izvestia* of Russ. Geogr. Soc., vol. xxiii., 1887.

[3] For a list of them, see *Izvestia* of Russ. Geogr. Soc., vol. xxiii., 1887; also Orloff, in *Mem. of Kazan Naturalists*, 1873, iii.

It would be impossible to describe in a few words the avifauna. No fewer than 385 species are recorded, most of them being middle-European and Mediterranean. A large number were formerly known only in the Himalayas, or in Persia, while others have their origin in east Asia. The commonest are mostly European acquaintances. As for the very rich insect fauna, of which full descriptions are now accessible, it is worthy of note that among the *Lepidoptera* of the Pamir there is an interesting mixture of Tian-Shan with Himalayan species. M. Grum-Grzimailo found on the Pamir the *Colias nastes*, a species characteristic of Labrador and Lapland; like the alpine plants which bear witness to a Glacial period flora in the Himalayas, this butterfly is a survival of the Glacial period fauna of the Pamir.[1]

Flora.

As a whole the flora of Turkestan belongs to that of Central Asia, which was formerly continued by geobotanists as far west as the steppes of Russia, but which must now be considered as a separate region subdivided into two,—the Central Asian proper and that of the Gobi. It has its own habitus, notwithstanding the number of species it has in common with Siberia and southeast Russia on the one hand and with the Himalayas on the other, and this habitus is due to the dryness of the climate and the consequent changes undergone by the soil. Towards the end of the Glacial period the Tian-Shan Mountains had a flora very like that of northern Caucasus, combining the characters of the floras of the European Alps and the Altai, while the prairies had a flora very much like that of the south Russian steppes. During the Stone Age the human inhabitants lived in forests of maple, white beech, and apple trees. But the gradual desiccation of the country resulted in the immigration from the Central Asian plateau of such species as could adapt themselves to the dry climate and soil, in the disappearance of European and Altaic species from all drier parts of the region, in the survival of steppe species, and in the adaptation of many of the existing species to the needs of an arid and extreme climate and a saline soil.[2] At present the flora of Turkestan has a variety of characters, depending on the various physical aspects of the separate regions, the Pamir vegetation and that of the Aral-Caspian steppes constituting two types with numberless intermediate gradations.

There is no arboreal vegetation on the Pamir, except a few willows and tamarisks along the rivers. Mountain and valley alike are covered with soft carpets of grass, various species of *Festuca* predominating almost to the exclusion of all others. In the immediate vicinity of water the *ryang* (*Carex physoides*) grows, and a few patches are covered with *Allium*. To these may be added a few *Ranunculaceæ*, some *Myosotis*, low *Scabiosæ*, the common *Taraxacum*, one species of *Chamomilla*, and a few *Leguminosæ*. In the north and west the *Stipa* of the Russian steppes supersedes *Festuca* and affords splendid pasture for the herds of the Kara-Kirghiz. In the gorges and on the better-watered slopes of the mountains the herbaceous vegetation becomes decidedly rich. Besides the above-named there are many other *Gramineæ*, such as the beautiful *Lasiagrostis splendens*, and whole seas of *Scabiosæ*. *Eremurus*, of a variety of colors and 6 to 7 feet in height, forms thickets along with the tall *Scorodosma fœtida*. The northern slopes of the Altai chain are richer in trees. Up to 12,000 feet full-grown specimens occur of the *artcha* (*Juniperus pseudo-Sabina*), characteristic of the whole northern slopes of the Turkestan highlands, the poplar, a very few birches (*B. Sogdiana*), and a rich underwood of shrubs familiar in European gardens, such as *Rhododendron chrysanthum*, *Sorbus aucuparia* (rowan), *Berberis heteropoda* (berberry), *Lonicera Tatarica* (honeysuckle), and *Cratægus* (hawthorn). Farther east and north comes the Turkestan pine (*Picea Schrenkiana*), while at lower levels there grow numerous willows, black and white poplars, tamarisk, large Celtis, as well as shrubs of *Elæagnus* (wild olive), *Hippophae rhamnoides* (sallow thorn), *Rubus fruticosus* (blackberry), *Prunus spinosa* (blackthorn), and *P. Armeniaca* (apricot). The characteristic poplar, *Populus diversifolia*, which does not seem to have found yet the shape of leaves best suited to the climate, and therefore produces them in most striking variety, and the dwarf *Acer Lobelii*—very different, however, from the European maple—also occur.

The above applies to most of the highlands of the Tian-Shan. The drier southern slopes are quite devoid of arboreal vegetation. On the northern slopes, at the higher levels, only the *Juniperus pseudo-Sabina* grows on the mountains, and rich meadow grasses cover the *syrts*. Lower down, at about 7500 to 8000 feet the conifer zone begins, characterized by the *Picea Schrenkiana*, which furnishes the inhabitants with timber and fuel. Of course the artcha and a few other deciduous trees also occur. The richest zone is that which comes next, extending downwards to 5000 and 4500 feet. There woods of birch, several species of poplar, the maple (*Acer Semenovii*), and a rich underwood spread over the mountain slopes. Orchards of apple and apricot surround the villages. The meadows are covered with a rich vegetation,—numberless bright *Pæoniæ*, variegated *Scabiosæ*, large *Convolvulaceæ*, all kinds of *Campanulæ*, dark-colored *Eremurus*, splendid *Umbelliferæ*, yellow-flowered *Gallium*, a mass of *Rosaceæ*, *Altheæ*, *Glycyrrhizæ*, high-stemmed *Scorodosma fœtida*, and tall *Gramineæ*. But, as soon as the soil loses its fertile humus, it produces only a few of *Phlomis*, *Alhagi camelorum*, *Psammæ*, *Salsolaceæ*, *Artemisiæ*, *Peganum*, and some poppies and *Chamomillæ*, but only in the spring. The invading steppe plants appear everywhere in patches in the Turkestan meadows. Very often—almost invariably on the drier southern slopes of the mountains—the steppe vegetation climbs up to the level of the alpine. Nowhere, perhaps, is the effect of various soils—loess, clay, salt clay, and sand—upon vegetation better observable than in the recently-emerged and arid regions of Turkestan.

The "culture" or "apricot" zone is followed by the prairie belt, in which black-earth plants (*Stipa* and the like) struggle for existence against invading Central Asian forms. And then come the lowlands and deserts with their moving sandy *barkhans*, *shors*, and *takyrs* (see TRANSCASPIAN REGION). Two species of poplar (*P. pruinosa* and *P. diversifolia*), *Elæagnus angustifolia*, the ash, and a few willows grow along the rivers. Large areas are wholly destitute of vegetation, and after crossing 100 miles of such a desert the traveller will occasionally come upon a forest of *saksaul* (*Anabasis Ammodendron*). Contorted stems, sometimes of considerable thickness, very hard, and covered with a gray cracked bark, rise out of the sand, bearing green plumes of thin branches, with small grayish leaves and pink fruit. Sometimes the tree is a mere knot peeping above the sand with a crown of thin branches. But even these fantastic growths are rapidly being destroyed by the Kirghiz herdsmen, who use them for fuel.[1] In spring, however, the steppe assumes quite another aspect, being covered, except where the sands are shifting, with a rich vegetation. Persian species penetrate into Bokhara and the region of the upper Amu.

Vegetable products.

As already stated (p. 675), the climate of Turkestan varies considerably from north to south. In Akmolinsk and Semiryetchensk most of the kinds of corn which characterize Middle Russia are grown. South of the Tchu and the Syr-Daria gardening is a considerable industry; and, although rye and wheat continue to be the chief crops, the culture of the apple, and especially of the apricot (*uryuk*), acquires importance. Attempts are also made to cultivate the vine. The inhabitants of the neighborhood of Tashkend and Samarkand, as well as those of the much more northern but better sheltered Kulja oasis, add the cultivation of the almond, pomegranate, and fig. Vines are grown and cotton planted in those districts. Finally, about Khojend and in Ferghana, where the climate is milder still, the vine and the pistachio tree cover the hills, while agriculture and horticulture have reached a high degree of perfection. Successful attempts are now being made to grow the tea-plant in the Transcaspian region.

Agriculture.

The arable land, being limited to the irrigated terraces of loess already spoken of, occupies less than a fiftieth of the whole area of West Turkestan, even when the Transcaspian deserts are left out of account. The remainder is nearly equally divided between pasture land and desert (sandy steppe and barren mountains). Owing to a very equitable distribution of irrigation water in accordance with Moslem law, agriculture and gardening have reached a high stage of development in the oases. Two crops are usually taken every year.[2] Wheat, barley, millet, pease, lentils, rice, sorghum, lucerne, and cotton are the chief agricultural products. Carrots, melons, vegetable marrows, and onions are extensively grown. Rye and oats are cultivated in Kazalinsk and Kopal. Corn is exported. Owing to the irrigation, total failure of crops and consequent famines are unknown, unless among the Kirghiz shepherds. The kitchen gardens of the Mohammedans are, as a rule, admirably kept. Potatoes are grown only by the Russians. The cultivation of cotton is rapidly extending (32,000 acres in 1886), as also is sericulture, which is chiefly carried on in Ferghana, whence silk cocoons are an important item of export. Cattle-breeding is extensively pursued, and in Russian Turkestan alone recent estimates show 400,000 camels, 1,600,000 horses, 1,200,000 cattle, and 11,000,000 sheep. This last figure, however, is but a very rough estimate,—the flocks on the Kirghiz steppe being so large that the proprietors themselves do not know their exact numbers. Murrains are of frequent occurrence; a recent one resulted in a terrible famine among the Kirghiz. Live cattle, hides, wool, camel-hair, tallow, felt, and leather are exported to a considerable extent.

Minerals.

The mineral wealth of Turkestan is considerable. Traces of auriferous sands have been discovered at many places, but the percentage of gold is too poor to make the working remunerative. Silver, lead, and iron ores occur at several places; but the want of fuel is an obstacle to their exploitation. The vast coal-beds of Kulja and several inferior ones in Turkestan are not yet seriously worked, the total yearly output being only some 120,000 cwts. The naphtha wells of Ferghana and the layers of graphite about Sairam-Nor are also neglected. There are abundant deposits of gypsum, alum, kaolin, marble, and similar materials. Notwithstanding the salt springs of Ferghana and Syr-Daria, the salt lakes of the region, and the rock-salt strata of the Alexandrovsk Mountains, salt is imported.

Industry and trade.

Turkestan has no manufacturing industry carried on by means of machinery, except a few distilleries and two establishments for dressing raw cotton. But there is a great variety of artisan work, which, however, has been for some time declining and now stands at a rather low level.[3] Trade is very actively carried on. Its importance may be judged by the fact that in 1876 27,900 camels were used for the transport of wares to Tashkend. This town and Bokhara are the chief commercial centres, the principal articles of export to Russia, *via* Orenburg and Semipalatinsk, being raw cotton and silk, cattle and their products, while manufactured wares are imported in return. There is also an import and export trade to and from Urumtchi and China, *via* Kulja and Ak-su.

Ethnography.

Turkestan has been the theatre of so many migrations and conquests that its present population could not fail to be very mixed. Both Aryans and Mongols (especially the Ural-Altaic branch) have their representatives there, the former settled for the most part, the latter chiefly nomad. The Ural-Altaians, or Turanians, are numerically the predominant element, and consist of Turcomans, Kirghiz, Uzbegs, and Sarts. The Turcomans inhabit chiefly that part of Turkestan which is now known as the Transcaspian Region (*q.v.*). They number less than one million. The Kara-Kalpaks ("Black Bonnets") may number about 50,000 in Turkestan, and some 300,000 in the Russian empire altogether. Very little is known of their history. They are supposed to be but recent immigrants to Syr-Daria, having come from the former Bulgarian empire on the middle Volga. Their language and habits are the same as those of the Kirghiz; but for the last century and a half they have had some acquaintance with agriculture. Their pacific temper exposed them to the raids of the Kirghiz, who compelled them first to settle in Dzungaria, then to change their dwellings several times, and ultimately (in 1742) to recognize the sovereignty of Russia. Even since that time they have been driven by the persecutions of their old enemies to cross the Aral-Caspian steppes and seek refuge near Astrakhan. The real masters of the steppes and highlands of Turkestan are the Kirghiz, of whom there are two branches,—the Kazak (Cossack) Kirghiz and the Kara (Black) Kirghiz or Burut (see Kirghiz). The Uzbegs, who played a predominant political part in Turkestan before the Russian conquest, are of Turco-Tartar origin and speak a pure Jagatai dialect; but they are mixed to a great extent with Persians, Kirghiz, and Mongols. They are subdivided into clans and lead a semi-nomadic life, preserving most of the attractive features of their Turkish congeners—especially their honesty and independence. When settled they are mostly designated as Sarts—a name which has reference more to manner of life than to anthropological classification, although a much stronger admixture of Iranian blood is evident in the Sarts, who also speak Persian at Khojend and Samarkand. Tarantchi or Taranji ("laborer" in Chinese) is the name given to those Sarts who were settled in the Kulja region by the Chinese Government after the rising of 1758. They constitute about two-fifths of the population of Kulja. After defeating the Dzungañs in the year 1865, they took the political power in Kulja into their own hands, offering shelter to the Kirghiz who made inroads on the Russian dominions. This was made a pretext for the annexation of Kulja by Russia in 1871; but it has been since restored to China. The origin of the Dzungañs is somewhat problematical. They number nearly 20,000, and inhabit the valley of the Ili in Kulja and partly are settled in Russian Turkestan. They are Mohammedans, but have adopted Chinese manners of life. The Mongolian branch is represented in Turkestan by Kalmucks and Torgoutes (Torgod) in the northeast and in Kulja, where they are mixed with Solons, Sibos, and Chinese. The Aryan Tajak (see Tajak), the aborigines of the fertile parts of Turkestan, were subdued by the Turco-Mongolian invaders and partly compelled to emigrate to the mountains, where they are now known as Galtchas. They constitute the intellectual element of the country and are the principal owners of the irrigated land,—the Uzbegs being their laborers,—merchants, and mollahs or priests. They are Sunnite Mussulmans. The other representatives of Aryan race in Turkestan are a few Persians, mostly liberated slaves; Indians, who carry on trade and usury in the cities; a few Gypsies; and the Russians. Among these last two distinct elements must be noticed,—the Cossacks who are settled on the borders of the Kirghiz steppe and have assumed many Kirghiz features,[4] and the peasant-settlers who are beginning to colonize the valley of the Ili and to spread farther south. Exclusive of the military the Russians number about 75,000, nearly two-thirds being in Semiryetchensk (Cossacks and peasants).

Cities.

Turkestan has no lack of populous cities, which, notwithstanding recent vicissitudes, continue to be important for their trade, while several others are widely famous for the part they have played in history. Khokand,[5] Marghilan, Namangan, and Andijan in Ferghana; Tashkend and Khojend in Syr-Daria; Samarkand in Zerafshan; Bokhara and Khiva in the independent khanates have each from 30,000 to 100,000 inhabitants.

Populous cities adorned with fine monuments of Arabian architecture, numerous ruins of cities decayed, grand irrigation canals now lying dry, and written monuments of Arabian literature testify to a time when civilization in Turkestan stood at a much higher level than at present. This period was during the first centuries after its conversion to Islam. Now all is in decay. The beautiful mosques and madrasas are dilapidated; no astronomers watch the sky from the tops of their minarets; and the scholars of the madrasas waste their time on the most deplorably puerile scholasticism. The inspiration of early belief has disappeared; the ruling motive of the mollahs (priests) is the thirst for personal enrichment, and the people no longer follow the khojas (see p. 680 below). The agricultural laborer has preserved the uprightness, diligence, and sobriety which characterize the Turkish peasant in Asia as well as in Europe; but the richer inhabitants of the cities are grossly sensual. Centuries of wars, followed by massacres and cruel vengeance, an unceasing civil strife between parties disputing for supremacy in the name of religion, conspiracies, appeals to foreigners, and endless intrigues have hastened the decay of Mohammedan civilization in the khanates of Turkestan and paved the way for Russian conquest.

[5] Each of these towns in small capitals is described in a separate article.

General condition of the country.

Effects of Russian influence.

It remains, however, an open question whether the Russians will be able to bring new vigor to the country and awaken intellectual life. They have failed to do so in eastern Russia, at Kazan, and elsewhere, where both civilizations—the European and the Asiatic—remain as thoroughly estranged from one another as they were three centuries ago. This estrangement is not merely religious, but social and economical. The followers of Islam, whose common law and religion know only of a temporary possession of the land, which belongs wholly to the Prophet, cannot accept the principles of unlimited property in land which European civilization has borrowed from Roman law; to do so would put an end to all public irrigation works, and to the system by which water is used according to each family's needs, and so would be fatal to agriculture. When taking possession of Turkestan, the Russians began to grant deeds establishing property rights over land in accordance with Roman law. But a study of the Mohammedan system soon put an end to so erroneous a policy, and Mussulman law is still respected. The Russians have abolished slavery in Turkestan; and their rule has put an end to the interminable intestine struggles, which had weakened and desolated the whole region. The barbarous tortures and executions which rendered Khiva notorious in the East are no longer heard of; and the continual appeals of the khojas for "holy" war against their rivals find no response. But the Russian rule has imposed many new taxes, in return for which Turkestan only gets troops of Russian merchants and officials, who, instead of becoming the exponents of what is best in European civilization, too often accept the worst features of the depraved Mussulman civilization of the higher classes of the country. New tribunals and new justices of the peace are about to be introduced (1887); schools are being diligently spread; but the wants of the natives are set behind those of the children of the Russian officials and merchants and the supposed necessities of Russification. A consulting hospital for Mohammedan women has recently been opened by women graduates in medicine at Tashkend.

EAST TURKESTAN.

Boundaries.

As already stated, by this name we designate that vast depression in the great plateau of eastern Asia which lies between the Tian-Shan Mountains in the northwest; the steep slopes of the Pamir and of the Tibet plateau, bordered by the Kuen-Lun, in the southwest and south; the Ałtyn-Tagh in the southeast as far as Lake Lob-Nor; and in the northeast the still imperfectly known mountains which run east-southeast from the Tian-Shan, having the Bagratch-kul on their northern slope.[1] Farther east the Kuruk-Tagh and the steep slope of the Gashuñ Gobi separate east Turkestan from the higher Terrace of the plateau, so that about Lob-Nor the Tarim depression is narrowed to a width of about 100 miles; and on the 98th meridian, at Lake Tchin-shen-ho, the steep edge of the Gobi meets the spurs of the Nan-Shañ Mountains.[2] This region has been and still is designated by a variety of names, such as the Tangut Plain, West Gobi (a most inappropriate name, as already pointed out by Ritter), Altyshar or Jity-shar (the land of six or seven cities), Little Bokharia, Kashgaria, and so on. In its physical features it forms a connecting link between the Chinese territories and the Aral-Caspian depression. It covers about 465,000 square miles, but has hardly more than 1,000,000 inhabitants.

Physical features.

Although lying at a high altitude (Kashgar 4000 feet and Yarkand 4120 feet), it has the character of a depression in comparison, not only with the mountains, but also with the lofty plateaus which surround it,—Tibet, Pamir, and the Tian-Shan *syrts*. It has a general slope towards the east, and its lowest portions (formerly occupied by a great lacustrine basin) are only 2600 feet above the sea.[3] At its northeast edge, *i.e.*, at the foot of the remotest offshoots of the Tian-Shan, M. Prjevalsky measured an altitude of only 2600 feet. Its average altitude ranges from 3100 to 3700 feet, increasing to 4200 at its outer rim. No mountains or hills diversify its surface, which is that of a high plain. All the mountains which enclose it rise to considerable heights, far above the snow line. The steep slopes of the Pamir culminate in Tagharma Peak (25,360 feet). In the north the snowclad Kokshał-tau and Kirghiznyn Ala-tau form a series of uninterrupted chains, which reach a height of 24,000 feet in the Khan-Tengri and have at their southern base the broad and high alpine plateaus, or *syrts*, of which the Yułduz, dotted with lakes, has acquired historical fame as the meeting-place of the armies of Timur before his Dzungarian march. On the southern borders of East Turkestan, in the Kuen-Lun and Karakorum Mountains, is the Dapsang—one of the highest peaks of the globe; and farther east the Ałtyn-Tagh and the Nan-Shañ (with Humboldt and Ritter ranges), which are among the highest mountains of Asia, separate it from the lofty Chaidam or Tsaidam plateau.[4] East Turkestan is thus secluded by high mountains and plateaus from the rest of the continent. Even the few passes which lead to it climb to altitudes of 14,000 feet. It is open only towards the east, where it is connected with the Gobi depression. Its position as the highway from China to West Turkestan and the Dzungarian empire has made it known, though only very imperfectly until lately, through Chinese documents, the narratives of the journeys of Buddhist missionaries, and the travels of Marco Polo, Rubruquis, and a few Jesuits. From a remote antiquity it was crossed by caravans going from China to Lake Balkash, Ferghana, and the Oxus. The route, after crossing the Gobi, proceeded either to the Dzungarian Gate, or, *via* Kashgar, to the high passes of Terek-Davan and Muz-art, which led to Ferghana and Issyk-kul. Both passes have a wide renown in Central Asia, the latter especially, on account of its difficulties, one of which is a huge glacier, which has to be ascended with the help of the ice axe.

Passes.

River Tarim.

One river only, the Tarim—now lost in the marshes of Lob-Nor—and its tributaries, water this region. It is formed by the confluence of several rivers flowing from the semicircle of mountains which fence in East Turkestan on the south, west, and north. The Kashgar-Daria rises under the name of Kizil-su on the Ałai. The Yarkand-Daria has its origin in a high valley between the Kuen-Lun and Karakorum Mountains, at the base of Dapsang, from several streams, such as the auriferous Zerafshan, which is fed by the glaciers of the Karakorum pass; after piercing the Kuen-Lun, it enters the plain, where its waters are soon diverted to the fields and gardens of the Yarkand oasis. The Khotan-

[3] Barometrically observed, the possible error being about 300 feet.

[4] Prjevalsky, *Reisen in Tibet und am oberen Laufe des Gelben Flusses*, Jena, 1884.

Daria rises farther east in the same valley, and also pierces the Kuen-Lun, its two branches—the Kara-kash and Urung-kash—being renowned for their "black" and "white" jade. This river only reaches the Tarim during the summer. The Tian-Shan Mountains contain the sources of several feeders of the Tarim; but some of them no longer reach the main stream. The Kizil-Kunghei disappears after having watered Utch-Turfan (Uj-Turfan); the Ak-su meets the Khotan-Daria at its junction with the Tarim; but the Baidu-gol and the Kutcha are lost in Lakes Baba-kul and Sary-kamysh. From the Yulduz plateau comes the Haidu-gol, which flows past Kara-Shar and enters the Bagratch-kul Lake, whence it issues under the name of Kontcha-Daria, and, crossing the east of East Turkestan from north to south, joins the marshes of Lob-Nor; thus the long-doubted connection between these two lakes—the northern and the southern—really exists. The Tarim is navigable for steamers from the confluence of the Yarkand and Khotan rivers all the way to Lob-Nor.[1] These rivers, however, do not bring life to the immense deserts, the aspect of which recalls partly the Aral-Caspian depression and partly the Mongolian Gobi. Their undulating surface is covered with a gravelly soil, out of which all the finer particles have been winnowed by the wind, and it resounds under the hoofs of the passing hordes; grass covers it only in the beginning of spring. Here and there occur clayey deposits with an efflorescence of salt, which is hard in summer but impassable after rains. Then come immense areas of loose sand, which is raised in clouds by storms of wind, and the hills of which, moving on like waves, invade the cultivated fields that have been conquered by laborious effort from the desert. The features with which the traveller in the Sahara, or on the plateau of eastern Iran about Lake Zareh (Hamun) is familiar, are here reproduced on the same large scale. The Takla-makan desert north of Khotan covers 93,000 square miles—an area exceeding that of Great Britain. As one approaches Lob-Nor, and thus touches upon territory that has emerged at a still more recent epoch, the desert becomes still drearier and still less passable on account of the shifting sands. Lob-Nor now consists of two basins; but the largest of them, although it has an area four times as large as that of the Lake of Geneva, can hardly be called a lake, since its greatest depth is less than 20 feet, while reeds rise 20 feet above the thin film of water and extend far beyond its shores. In fact the whole of the region, notwithstanding its considerable altitude above the ocean, has but recently emerged from under water. During the later portion of the Tertiary period it was covered with an immense Mediterranean sea, and even during the Post-Pliocene period was occupied by a lake. But, as we see on a smaller scale in Finland and Sweden, where the higher lacustrine depressions are more advanced in the process of desiccation than those situated at lower levels, so in Central Asia the more elevated Tarim region is more advanced in its desiccation than the Balkash basin, and this latter again is in a more advanced stage of the same process than the Aral Caspian depression. The desiccation of East Turkestan must have gone on, however, within historical times at a much more rapid rate than geologists seem prepared to admit. East Turkestan has not always been the desert it now is. Many cities, in which Greek and Byzantine coins have been found, lie buried beneath the sands, and in one of these Buddhist statues have been discovered. Indeed it is very probable that the great migration of the first centuries of our era resulted from the necessity of abandoning East Turkestan.

Deserts.

Climate.

The climate is severe: a cold winter follows a burning summer. A few showers slightly moisten the surface in spring; but the summer and autumn are rainless. The air is continually charged with dust, and often with sand.

Flora.

The vegetation of the interior of East Turkestan is very poor, being the same as that of the steppes of West Turkestan. On the sandy hills are some tamarisks and *Elæagnus*, rapidly being used up as fuel; along the rivers are copses of poplars, which have difficulty in maintaining themselves, because no humus gathers in their shade, the dry leaves being blown away by the storms and scattered as dust over the desert; and, finally, along the old beds of rivers and lakes grow dense and rank beds of reeds, where the wild boar has his habitat. Immense areas are covered with *Salsolaceæ*, and the gravelly ground is clothed in spring with a rich carpet of grass. The oases possess all the plants which are cultivated in West Turkestan,—the mulberry, walnut, pear, apple, apricot, olive, and vine. Cotton, rice, maize, millet, and wheat are grown; and Middendorff's[2] remark, that on the edge of the desert we find the best cultivated fields and the richest gardens, is still more applicable to the oases of East than to those of West Turkestan. But outside the oases desolation reigns. Wind freely modifies the surface, carrying away the finest particles of the gravelly soil, breaking down the *barkhans* as soon as man has destroyed the vegetation which grew on them, and lifting the sand into the air and whirling it along in columns of the most fantastic shapes.

Fauna.

As a rule, the mammals are not numerous, and the fauna closely resembles that of the Tian-Shan. It seems to be owing to the loneliness of its deserts that East Turkestan has preserved the wild ancestors of our domestic animals. Besides the wild ass (*Equus hemionus*), Prjevalsky discovered in the Dzungarian steppes the wild horse—the real ancestor of our domestic horse—and on the plateau of Tsaidam the wild camel and the wild yak.[3]

Industries and minerals.

Raw cotton and silk are exported to a considerable amount; but of manufactured cottons only a rough *mata* is sent to Semiryetchensk for the Kirghiz. Some silk wares, carpets, and silk "grain" are exported from Khotan, leather-ware from Yarkand, polished and copper ware from Ak-su, and small iron ware from Kutcha. Stock-breeding is of paramount importance, and cattle, asses, camels, and sheep are reared in considerable numbers. Mineral resources are not wanting, but the mining industry is in a primitive condition. Gold is obtained from alluvial deposits at Kiria, coal at Kashgar, jade in Khotan, and sulphur and saltpetre at Utch-Turfan.

Oases.

It is only along the base of the mountains, where there is a fringe of loess, and where streams bring the necessary moisture, that human settlements have sprung up, or rather maintained themselves until now. The series of oases skirts the base of the Tian-Shan and the Kuen-Lun. Kashgar stands at the apex of the angle made by those two ranges, while Yanghi-hissar, Yarkand, Khotan, and Kiria lie along the Kuen-Lun, and Utch-Turfan, Ak-su, Bai, Kutcha, Kurla, Kara-shar, and Turfan along the Tian-Shan. Many miles of desert separate these oases from each other; and their population could be, and has been, much greater than it is, for there is no lack of water in the streams which rise beneath the snow covering of the mountains. The various oases, which are named after their chief towns, have always been nearly independent of each other. Still, in the course of their much disturbed history, Khotan, Yarkand, Kashgar, and Ak-su, one after another acquired a kind of supremacy over the rest. At present Yarkand and Kashgar are the most important. The city of Yarkand has nearly 60,000 inhabitants; it is surrounded by walls, and has a separate fort, Yanghi-hissar; ruins of old settlements are scattered around. Its Chinese merchants carry on an active trade, and the Turkish population are breeders of cattle on an extensive scale. Wheat, barley, rice, beans, sorghum, mulberries, and a variety of fruit trees are grown in the gardens. KASHGAR (*q.v.*), surrounded by a series of populous villages, is the chief commercial centre, owing to its position on the highway to Lake Issyk-kul. It is surrounded by forts, one standing at the confluence of the Kashgar and Yarkand rivers. KHOTAN (*q.v.*) or Iltchi (also Yu-thian), a very populous city under the Han dynasty of China (206 B.C.–1 A.D.), has much declined of late. It is renowned for its gold mines, and especially for its jade and its musk. Copper kettles, carpets, some silk, and felt ware are manufactured. Sanju (7000 houses), Kilian, Pialma, Guma, Kargałyk, and Posgan, on the slopes of the Kuen-Lun between Yarkand and Khotan, are the richest parts of the region. Naya, Kiria, Tchira, all on small rivers flowing from the Kuen-Lun, continue the line of oases towards the east, terminating in Tchertcheñ, which now consists of but a few score of houses. The oases at the base of the Tian-Shan are Utch-Turfan (Ust-Turfan), Ak-su (formerly the capital of Sairam), Bai, Kutcha with Shah-yar, Bugur, Kurła, Karashar, and Turfan. Their inhabitants grow corn to a considerable amount, and keep numerous herds of cattle and flocks of sheep. The chief exports are wool, fowls, and the horns of the maral deer. On the lower Tarim, where a few settlements, supported chiefly by fishing, continue to struggle against the encroaching desert, the ruins of formerly populous towns testify that the region was not always the dreary waste it now is.

---

[1] At the confluence the Tarim has at low water a depth of 3 to 5 feet and a width of 190 yards; towards Lob-Nor the depth increases to 14 feet (Prjevalsky, in *Izvestia* of Russ. Geog. Soc., 1887).

[2] *Op. cit.*

[3] Prjevalsky, *Reisen in Tibet*, etc.; and Wilkins (naturalist of M. Kuropatkin's expedition) in the Russian periodical *Priroda*, 1887, No. 3.

Population.

The population is mixed, Aryans and Turanians being thoroughly intermingled. On the slopes of the Pamir, about Sary-kol, there is a purely Aryan population of Persian Galtchas. Kirghiz and Kara-Kirghiz inhabit the slopes of the Tian-Shan. Kalmucks occur in the northeast; and in the central parts the population consists of Turkish Sarts and Uzbegs and of Persian Tajak,—the Mongolian element increasing towards the northeast. The language is Turkish, like that spoken in West Turkestan, with several varieties of *patois* and a considerable addition of Chinese words. As a rule, the inhabitants of East Turkestan have an air of poverty. There are no rich mosques in their towns, such as those of Samarkand and Bokhara; the houses are of unbaked brick and poorly furnished. The dress is that customary in West Turkestan. But the habits of the people differ to some extent and the women enjoy greater liberty than in other Mohammedan countries: they go into the streets unveiled; free marriages, contracted for short terms, are not unfrequent. As a rule, the position of women is more independent—a feature noticed even by the earliest travellers in the country.

The aggregate population of East Turkestan, estimated between 575,000 and 1,500,000 in 1825, is now (1887) hardly more than 1,000,000. Kuropatkin estimates it at 1,200,000, Forsyth at 600,000. The population of the chief towns may be stated approximately as follows—Yarkand, 60,000; Kashgar, 50,000; Khotan, 40,000; Sanju, 35,000; Ak-su, 20,000; Kiria, 15,000; Yanghi-hissar, 10,000; Kargałyk, 10,000; Kurła, 6000.

History.

It appears very probable that at the dawn of history East Turkestan was inhabited by an Aryan population, the ancestors of the present Slavonic and Teutonic races, and that a civilization not inferior to that of Bactriana had already developed at that time in the region of the Tarim.[1] Our knowledge, however, of the history of the region is very fragmentary until about the beginning of the Christian era. When the Huns (Hiong-nu) occupied west and east Mongolia in 177 B.C., they drove before them the Yue-chi (Yutes, Yetes, or Ghetes), who divided into two hordes, one of which invaded the valley of the Indus, while the other met the Sacæ in East Turkestan and drove them over the Tian-Shan into the valley of the Ili. Thus by the beginning of our era the Tarim region had a mixed population of Aryans and Ural-Altaians, some being settled agriculturists and others nomads. There were also several independent cities, of which Khotan was the most important. One portion of the Aryans emigrated and settled in what is now Wakhan (on the Pamir plateau), the present language of which seems very old, dating anterior to the separation of the Vedic and Zend languages. In the 1st century the Chinese extended their rule westwards over East Turkestan as far as Kashgar. But their dominion seems to have been merely nominal, for it was soon shaken off. By the end of the 5th century the western parts fell under the sway of the "White Huns" or Ephthalites, while the eastern parts were under Tangut (Thygun) dominion. The Chinese, however, still retained the region about Lob-Nor. Buddhism penetrated into the country at an early date; but in East Turkestan there were also followers of Zoroastrianism, of Nestorian Christianity, and even of Manichæism. An active trade was carried on by means of numerous caravans. The civilization and political organization of the country were dominated by the Chinese, but were also influenced to some extent by Græco-Bactrian civilization. Buddhism spread rapidly in the southwest, and the study of Pali became widely diffused. Our information as to the state of the country from the 2d century to the first half of the 7th is slight, and is chiefly derived from the *Journeys* of the Buddhist pilgrim Fa-hien in 399, Song-yun in 518, and Hwen-t'sang in 629. By this time Buddhism had reached its culminating point: in Khotan there were 100 monasteries and 5000 monks, and the Indian sacred literature was widely diffused; but already there were tokens of its decay. Even then the eastern parts of the Tarim basin seem to have been growing less and less populous. To the east of Khotan cities which were prosperous when visited by Song-yun had a century later fallen into ruins, while their inhabitants had migrated westwards. Legend has it that all the inhabitants of Go-lao-lo-tsia were buried in a sandstorm, and this seems to be but a poetical way of representing a phenomenon which was steadily going on in East Turkestan.

Little is known about these regions during the 7th, 8th, and 9th centuries. In the 7th century the Tibetan king, Srong-btsan, with the help of the western Turks, subjugated the western part of the Tarim basin. During the following century the Mohammedans under Kotaiba, after several excursions into West Turkestan, took Samarkand, Ferghana, Tashkend, and Khokand (712–713), and invaded East Turkestan, penetrating as far as Turfan and China. The Chinese supremacy was not shaken by these invasions. But, on the outbreak of internal disturbances in China, the Tibetans took possession of the western provinces of China, and intercepted the communications of the Chinese with Kashgaria, so that they had to send their troops through the lands of the Hui-khe (Hoei-ke, or Hoei-hu). In 790 the Tibetans were masters of East Turkestan; but their rule was never strong, and towards the 9th century we find the country under the Hoi-he. Who these people were is somewhat uncertain. According to Chinese documents, they came from the Selenga; but most Orientalists identify them with the Uigurs. In the opinion of M. Grigorieff, whom we follow in this sketch,[2] the Turks who succeeded the Chinese in the western parts of East Turkestan were the Karluk Turks, who extended farther southwest up to Kashmir, while the northeastern parts of the Tarim region were subdued by the Uigurs. Soon Mongolian hordes, the Kara-Kitais, entered East Turkestan (11th century), and then penetrated into West Turkestan, Khiva falling under their dominion. During the following century Jenghiz Khan overran China, Turkestan, India, Persia, Russia, and Hungary; Kashgaria fell under his rule in 1220, though not without strenuous resistance followed by massacres. The Mongolian rule was, however, not very heavy, the Mongols merely exacting tribute. In fact, Kashgaria flourished under them, and the fanaticism of Islam was considerably abated. Women again acquired greater independence, and the religious toleration then established permitted Christianity and Buddhism to spread freely. This state of affairs lasted until the 14th century, when Tughlak Timur, who extended his dominions to the Kuen-Lun, accepted Islam. He transferred his capital from Ak-su to Kashgar, and had a summer residence on the banks of Issyk-kul. His son reigned at Samarkand, but was overthrown by Timur-lang (see TIMUR), and the reign of the great conqueror was a fertile source of suffering to the region. To put an end to the attacks of the wild Tian-Shan tribes, he undertook in 1389 his renowned march to Dzungaria, which was devastated; East Turkestan also suffered severely.

The re-introduction of Islam was of no benefit to the Tarim region. In the 14th and 15th centuries Bokhara and Samarkand became centres of Moslem scholarship, and sent great numbers of their learned doctors to Kashgaria. Rubruquis, who visited East Turkestan in 1254, Marco Polo between 1271 and 1275, and Hoïs in 1680, all bore witness to great religious tolerance; but this entirely disappeared with the invasion of the Bokharian mollahs. They created in East Turkestan the power of the *khojas*, who afterwards fomented the many intestine wars waged between the rival factions of the White and Black Mountaineers. In the 17th century a powerful Kalmuck confederation arose in Dzungaria, and extended its sway over the Ili and Issyk-kul basins, having its capital on the Ili. To this power or to the Kirghiz the "Whites" and "Blacks" alternately appealed in their struggles, in which Yarkand supported the latter and Kashgar the former. These struggles paved the way for a Chinese invasion, which was supported by the White khojas of Kashgar. The Chinese entered Dzungaria in 1758, and there perpetrated a terrible massacre, the victims being estimated at one million. The Kalmucks fled and Dzungaria became a Chinese province, with a military colonization of Sibos, Solons, Dahurs, Chinese criminals, and Moslem Dzungars. The Chinese next re-conquered East Turkestan, marking their progress by massacres and transporting 12,500 partisans of independence to the Ili valley. Hereupon the dissentient khojas fled to Khokand and there gathered armies of malcontents and fanatic followers of Islam. Several times they succeeded in overthrowing the Chinese rule—in 1825, in 1830, and in 1847—but their successes were never permanent. After the "rebellion of the seven khojas" in 1847 nearly 20,000 families from Kashgar, Yarkand, and Ak-su fled to West Turkestan through the Terek-Davan pass, many of them perishing on the way. In 1857 another insurrection broke out; but a few months later the Chinese again took Kashgar (for the details see KASHGAR). In the course of the Dzungarian outbreak of 1864 the Chinese were again expelled; and Yakub Beg became master of Kashgar in 1872. But five years later he had again to sustain war with China, in which he was defeated, and East Turkestan once more became a Chinese province.

---

[1] Such is the conclusion reached by Lassen (*Indische Alterthumskunde*), and supported by M. Grigorieff (Ritter's *Asien* in Russ. transl.; Addenda to "East Turkestan," in Russian). In connection with the objection based upon the sub-boreal character of the regions which were the cradle of the Aryans, as proved by the so-called palæontology of the Aryan languages, it may be observed that by the end of the Glacial, and during the earlier Lacustrine (Post-Glacial) period, the vegetation of Turkestan and of Central Asia was quite different from what it is now. It was Siberian or north European. The researches by M. Krasnoff (see above, p. 675) as to the characters of the former flora of the Tian-Shan, and the changes it has undergone in consequence of the extremely rapid desiccation of Central Asia, must be carefully borne in mind in all speculations founded upon the testimony of language as to the original home of the Aryans.

[2] See Ritter's *Asien*, "East Turkestan" (Russ. trans.), ii. 282; also Kuropatkin's *Kashgaria*.

Bibliography.—The literature on Turkestan has of late years become very voluminous, especially in the form of papers scattered through the periodicals published by the European Geographical Societies and other scientific bodies. The reader is referred to the following works as fitted to facilitate research. Vols. vi. and vii. of Elisée Reclus's *Géographie Universelle* contain maps showing the routes of the chief explorers. Prof. Mushketoff's *Turkestan* (in Russian, vol. i. 1886) contains an excellent critical analysis of all explorations of Turkestan and works thereupon, and the information they contain with regard to the physical geography and geology of West Turkestan. Prof. Grigorieff's addenda to Ritter's *Asien* embody the whole of the older and more modern researches into the geography and history of East Turkestan down to 1873. *Amu and Uzboi* (Saratoff, 1879), by the chief of the Amu-Daria expedition, and Bogdanoff's *Review of Expeditions and Explorations in the Aral-Caspian Region from* 1720 *to* 1874 (St. Petersburg, 1875) are most useful works. Prof. Lenz's paper "Ueber den früheren Lauf des Amu Daria," in *Mem. Acad. Sc. St. Petersburg*, discusses valuable information borrowed from ancient sources. Mezhoff's *Turkestanskiy Sbornik* is a catalogue of the Central-Asian library at Tashkend, and his annual "Index" contains full classified lists of Russian geographical literature. Of works of a general character, with descriptions of both regions (apart from travels), the following, arranged in chronological order, are worthy of mention: Semenoff's "Tian-Shan," being vol. i. of Ritter's *Asien* (Russ. transl., 1856); Grigorieff's "East Turkestan," forming two vols. of Ritter's *Asien* (Russ. transl., 1869 and 1873); Syevertsoff's "Vertical and Horizontal Distribution of *Mammalia* in Turkestan," in *Izvestia Lub. Est.* of Moscow, 1873; Wenjukoff's *Die Russisch-Asiatischen Grenzlande* (trans. from Russian by Krahmer, Leipsic, 1874); Hellwald's *Centralasien*, 1875; Petzholdt's *Umschau im Russ. Turk.*, 1877; Kuropatkin's *Kashgaria*, 1879 (partially translated into French); Kostenko's *Turkestanskiy Krai*, 3 vols., 1880, very copious translations from which are embodied in Lansdell's *Central Asia*, but unhappily too intimately combined with less useful information; Schlagintweit's *Reisen in Indien und Hochasien*, vol. iii., East Turkestan; Prjevalsky's three journeys to Central Asia (the first two translated into English; all three in German); Olga Fedtchenko's *Album of Views of Russ. Turk.*, 1885; Nalivkin's *History of the Khanate of Kokand* (in Russ.), Kazan, 1885; Vambéry's *Das Türkenvolk*, 1885; Roskoschny's *Afghanistan u. angrenz. Länder* (for Afghan Turk.); and Mushketoff's *Turkestan*, vol. i. (in Russian), 1886.

(P. A. K.)

TURKEY.

PART I.—HISTORY.

Er-Ṭoghrul.

ʻOsmán.

SOMEWHERE about the second decade of the 13th century the little Turkish tribe which in due course was to found the Ottoman empire fled before the Mongols from its original home in Central Asia, and, passing through Persia, entered Armenia, under the leadership of Suleymán Sháh, its hereditary chief. His son, Er-Ṭoghrul, who succeeded him as head of the tribe, when wandering about the country with his warriors came one day upon two armies engaged in a furious battle. Er-Ṭoghrul at once rode to the assistance of the weaker party, who were on the point of giving way, but who through the timely aid thus rendered not only regained what they had lost but totally defeated their enemies. The army thus saved from destruction proved to be that of ʻAlá-ud-Dín, the Seljúḳ sultan of Asia Minor, and their adversaries to be a horde of marauding Mongols. By way of recompense for this service ʻAlá-ud-Dín granted to Er-Ṭoghrul a tract of land on the Byzantine frontier, including the towns of Sugut and Eski Shehr. ʻOsmán, the son of Er-Ṭoghrul and the prince from whom the race derives its name of ʻOsmánli (see TURKS, p. 703 below), corrupted by Europeans into Ottoman, was born in Sugut in 1258 (A.H. 656). While still young ʻOsmán won from the Greeks Ḳaraja Ḥiṣár (Karahissar) and some other towns, on which account he received from his suzerain, the Seljúḳ sultan of Konya (Konieh), the title of beg or prince, along with the drum and the horsetail standard, the symbols of princely rank.

Early Turkish principalities.

In 1300 (699) the Seljúḳ empire (see SELJUKS) fell to pieces under the onslaught of the Mongols, who were, however, powerless to replace it by any government of their own. Thereupon ten separate Turkish dynasties arose from its ruins: that of Ḳarasi sprang up in ancient Mysia, the houses of Ṣaru Khan and Aydin in Lydia, of Mentesha in Caria, of Tekka in Lycia and Pamphylia, of Ḥamíd in Pisidia and Isauria, of Ḳaraman in Lycaonia, of Kermiyan in Phrygia, of Kizil Aḥmedli in Paphlagonia, and of ʻOsmán in Phrygia Epictetus. These principalities were all eventually merged in that of the ʻOsmánlis, once the least among them, and the inhabitants assumed the name of Ottoman. Hence by far the greater portion of the people called Ottomans owe their name to a series of political events. On the collapse of the Seljúḳ power the Greeks retained hardly any possessions in Asia except Bithynia and Trebizond. Armenia was abandoned for a time to roving Tatar or Turkman tribes, till some sixty or seventy years later one or two petty local dynasties sprang up and founded short-lived states.

Founding of Ottoman power.

The year 1301 (700), in which ʻOsmán, who shortly before had succeeded his father, first coined money and caused the khuṭba, or public prayer for the reigning monarch, to be read in his name—the two prerogatives of an independent sovereign in the East—may be regarded as the birth-year of the Ottoman empire; and it was about this time that his followers and subjects began to call themselves ʻOsmánlis, or, as we might render it, ʻOsmanites. Having thoroughly established his authority in his capital of Yeni Shehr, ʻOsmán began to wrest from the Greeks many of the neighboring towns and strongholds, among others Ayina Göl and Ḳoyun Ḥiṣári, routing before the last named a large Byzantine army. He then turned his attention to the administration of his state, and such was the feeling of security he succeeded in establishing that large numbers of people from the surrounding districts flocked into his dominions and became his subjects. After six years of peace several of the Byzantine castellans of the neighborhood, instigated by the governor of Brusa (Broussa), made a simultaneous attack upon the Ottomans, but ʻOsmán totally defeated them and sent in pursuit Ḳara ʻAlí Alp, who took possession of all their domains. Gházán, the khan of the Mongols, who had entered into an alliance with the emperor of Constantinople, sent to all the Turkish princes an arrogantly worded message forbidding them to do any hurt to the Byzantine territories. To show how light he held this menace, ʻOsmán assembled an army forthwith, marched to Nicæa and thence to the Bosphorus, laying waste the country as he went and taking possession of a number of towns and villages. Michael, called by the Turkish historians Kösa Míkhál or Michael Scantbeard, the governor of one of these, embraced Islám and became one of the most trusted officers of 'Osmán and of his son and successor Orkhan. The descendants of this Michael were the hereditary commanders of the aḳinjis, a corps of light cavalry who played a great part in the early Ottoman wars. The first service on which Michael was employed was to destroy, along with Orkhan, a Mongol horde that had taken and pillaged the Ottoman town of Ḳaraja Ḥiṣár. Meanwhile 'Abd-ur-Raḥmán and Aḳcha Ḳoja, two of 'Osmán's generals, were adding to the Ottoman dominions in the north, capturing several towns and laying siege to the city of Nicæa. The Ottoman chiefs next resolved to acquire Brusa, the natural capital of these parts. So they built around it a series of towers, in which they placed garrisons, with the view of intercepting communications and eventually starving the city into submission. At length, in 1326 (726), after a desultory siege of eight years, the keys were, through the intervention of Míkhál, handed over to Orkhan, who was in command of the Ottomans, and the townspeople were allowed to ransom themselves for 30,000 sequins [about $68,040]. Very soon after this 'Osmán died, aged seventy, at Sugut, whence his remains were carried for burial to Brusa. 'Osmán was distinguished for piety and generosity as well as for equity and courage. He cared nothing for amassing wealth, and on his death his personal effects were found to consist of two or three suits of clothes, a few weapons, some horses, and a flock of sheep. And so high was his reputation for justice that, we are told, many of the Asiatic subjects of the Cæsars fled to him for that protection which their own rulers would not or could not give them.

Orkhan.

Orkhan, who succeeded his father 'Osmán, continued the war against the Greeks, taking from them Nicomedia, Nicæa, and many of the towns which they still retained in Asia. Hitherto the Ottomans had not interfered with the other Turkish states; but now Orkhan, granting a short respite to the Byzantines, took advantage of a dispute regarding the succession to the throne of Ḳarasi, entered that principality, and annexed it to his own dominions. To his son Suleymán the Ottomans owe their first establishment in Europe: one night that prince, accompanied by a few companions, crossed the Hellespont on a raft and surprised the town of Galipoli (Gallipoli). The next day he brought over a number of Turkish troops, with whose assistance he possessed himself of many of the neighboring towns and villages; but his career was cut short by a fatal fall from his horse when out hunting. Orkhan did not long survive his son, grief at whose untimely end is said to have hastened his own death, in 1359 (761). This monarch is celebrated for the number of mosques, colleges, and other public institutions that he founded. During his reign the Ottoman army was thoroughly organized, and a body of regular paid soldiers was raised, which formed the nucleus of the military power of the state, though the old irregular militia was still called out whenever a campaign was to be undertaken. The famous corps of the janissaries (Turkish *yeni cheri*, *i.e.*, "new troop") was instituted at this time. It consisted of the children of Christian subjects, who were educated as Mussulmans and brought up to a military life.

Murád I.

Having taken the city of Angora from certain territorial lords who, incited by the prince of Ḳaraman, had attacked the Ottoman dominions, Murád I., the son and successor of Orkhan, found himself free to extend his possessions across the Hellespont. He forthwith passed over into Europe, where he and his generals soon reduced almost all Roumelia, capturing Adrianople, Philippopolis, and many other places of importance. These successes alarmed the Christian princes, who determined to make a vigorous effort to drive the Turks back into Asia. The kings of Bosnia, Hungary, and Servia accordingly marched with a large army upon Adrianople, but were surprised during the night and completely defeated by an inferior Turkish force. Some time after this victory Murád returned to Asia, where he celebrated the wedding of his son Báyezíd with the daughter of the prince of Kermiyán, a large portion of whose territory was made over to the 'Osmánli monarch as the dower of the bride. Next year, when Murád set out to inspect his new possessions, he met the prince of Ḥamíd, whom he constrained to sell all his dominions. The Ḳaraman prince, ever the jealous rival of the Ottoman, now stirred up some of the Turkman tribes to ravage his enemy's land; but Murád was beforehand with him, and, entering his country, defeated him and annexed the district of Aḳ-Shehr to his own kingdom. The Bosnian and Bulgarian princes having allied themselves against the sultan, the Turkish commander in Europe invaded Bulgaria, which was speedily subdued and added to the Ottoman possessions. Murád next entered Servia and advanced to the plain of Kosovo, where he found awaiting him the levies of Servia, Bosnia, Hungary, Albania, and Walachia. The Turks, though far inferior in number to their adversaries, gained a complete victory, 1389 (791), but it was purchased with their sovereign's life. After the battle Murád was riding over the field with some of his people, when a wounded Servian, who was lying among the slain, sprang up and stabbed him so that he died almost immediately afterwards. In consequence of this battle Servia became subject to the Turk.

Battle of Kosovo.

Báyezíd I.

Báyezíd I., surnamed Yildirim, "Thunderbolt," on account of the fury of his attack and the rapidity of his movements, received the oath of fealty on the battlefield of Kosovo. He did much to secure the position of the Ottomans, in Europe, taking many of the towns which still remained to the Christians in Roumelia. In Asia he annexed the remaining Turkish principalities, and pushed his conquests as far as Cæsarea and Sívás. The Christians made another great effort to free themselves from their Eastern foes: whilst Báyezíd was absent in Asia, the king of Hungary led a powerful army, in the ranks of which were many knights of France and Germany, into the Ottoman dominions and laid siege to Nicopolis. Báyezíd sped to the rescue, and inflicted an overwhelming defeat on the Christians. He next turned his attention to Constantinople, the reduction and annexation of which he had long meditated, when he was summoned to meet Tímúr, the Tatar conqueror, who had invaded his Asiatic dominions and taken Sívás. The Ottoman and Tatar hosts encountered each other outside Angora, and there the former sustained their first disastrous overthrow, Báyezíd being taken prisoner and his army practically annihilated. Next year, 1403 (805), he died in captivity; the story of his having been imprisoned in an iron cage is not confirmed by the Turkish historians, and is most probably fictitious. After this victory Tímúr overran the Ottoman territories in Asia, taking and sacking Brusa, Nicæa, and many other cities. With a view to the complete annihilation of the 'Osmánli power, he restored the independence of the Turkish principalities which Báyezíd had annexed, and placed them under the rule of their former emírs.

Muḥammed I.

On the withdrawal of Tímúr from Asia Minor the four surviving sons of Báyezíd fought for what was left of their father's kingdom; after ten years of civil war success finally rested with Muḥammed, who alone of the four is reckoned among the Ottoman sovereigns. The attention of the new sultan, whom his people called Chelebi Muḥammed or Muḥammed the Debonair, was turned rather to the restoration of his father's empire than to the conquest of neighboring countries. In Europe he lived on amicable terms with the Byzantine emperor, and the Christian kings further north did not venture to make any serious attack upon him. But in Asia he had to contend with many enemies, the most formidable of whom was the emír of Ķaraman, who, having been defeated and made prisoner, was generously pardoned and restored to liberty. Another difficulty with which Muḥammed had to deal was a strange religious outbreak: a vast number of fanatic dervishes, headed by an apostate Jew and a Turkish adventurer of low birth, rose in revolt, and were only dispersed after several bloody battles. This sultan, who was much beloved by his subjects and is spoken of with praise by the Byzantine historians, was stricken with apoplexy while riding in Adrianople, and died almost immediately in the thirty-third year of his age, 1421 (824).

Murád II.

The first care of his son and successor Murád II. was to rid himself of a pretender to the throne who, aided by the Greek emperor, had made a descent upon the Asiatic shore of the Dardanelles. This adventurer was soon defeated and pursued to Adrianople, where he was taken and hanged. In revenge for the assistance rendered to his enemy, the sultan invested Constantinople, but he was compelled to relinquish the siege in order to subdue a revolt headed by his brother, which had broken out in Asia. Murád again annexed all the Turkish principalities which had been restored by Tímúr, except those of Ķizil Aḥmedli and Ķaraman, which did not finally become incorporated with the empire till the time of Muḥammed II. The Turks were now called upon to face the most formidable Christian enemy they had yet encountered, namely Hunyady, the illegitimate son of Sigismund, king of Hungary. This famous general, after having inflicted several severe though not very important defeats upon his adversaries, invaded European Turkey with a large army of Hungarians, Poles, Servians, Bosnians, Walachians, and Frankish crusaders, the last-named being under the command of Cardinal Julian. The Ottoman army was utterly routed, Sophia taken, and the chain of the Balkans forced; and Murád was compelled to sign a treaty for ten years, by which he resigned all claims to Servia and gave over Walachia to Hungary. Weary of the cares of state, and thinking that peace was, for a time at least, secured, Murád abdicated in favor of his young son Muḥammed and sought a quiet retreat in the town of Magnesia. But he was not allowed to enjoy repose for long: the Christian princes, incited by Cardinal Julian and in direct violation of the treaty, assembled their forces, and, under Hunyady as commander-in-chief, without declaring war, entered the Turkish dominions and took many of the Ottoman strongholds in Bulgaria. When the news reached Murád he resumed the imperial power, put himself at the head of his troops, and advanced to meet the invaders, who had just captured Varna. Outside that town a great battle was fought, in which a copy of the violated treaty, raised high upon a lance, formed one of the standards of the Ottomans. The conflict, which was long and bloody, resulted in the total overthrow of the Christians, the Polish king, Ladislaus, and Cardinal Julian being among the slain, 1444 (848). Murád again abdicated and sought the retirement of Magnesia; but once again he had to take up the reins of government. This time the janissaries and sipáhís, accustomed to the firm rule of the victor of Varna, had refused obedience to the young Muḥammed. The sultan remained at the head of the state until his death, which occurred in 1451 (855).

Muḥammed II.

Fall of Constantinople.

Muḥammed II., who now ascended the throne for the third time, determined to accomplish the long-cherished design of his house, and make Constantinople the capital of the 'Osmánli empire. He easily found a pretext for declaring war against Constantine Palæologus and in the spring of 1453 (857) led an immense army to beleaguer the city. His troops covered the ground before the landward walls between the Sea of Marmora and the Golden Horn; but he found that even his monster cannon could do but little against the massive fortifications. At length he resolved to assail the city from its weakest side, that facing the Golden Horn. But the Greeks, having foreseen the likelihood of an attack from this quarter, had thrown a great chain across the entrance to the harbor, thereby blocking the passage against the hostile ships. The Ottomans, however, constructed a road of planks, five miles long, across the piece of ground between the Bosphorus, where their own fleet lay, and the upper part of the Golden Horn. Along this road they hauled a number of their galleys, with sails set to receive the aid of the favoring wind, and launched them safely in the harbor, whence they cannonaded with more effect the weaker defences of the city. This compelled the Greek emperor to withdraw a portion of his little garrison from the point where the more serious attack was being made, to repair the destruction wrought in this new quarter. At dawn on May 29th the Ottomans advanced to storm the city. The Christians offered a desperate resistance, but in vain. The emperor died fighting in the forefront of the battle, and at noon Muḥammed rode in triumph into his new capital and went straight to the cathedral of St. Sophia; there, before the high altar, where the preceding night Constantine had received the Holy Sacrament, he prostrated himself in the Moslem act of worship. The capture of Constantinople is not the only exploit to which Muḥammed owes his surname of Fátiḥ, or the Conqueror: he also reduced Servia and Bosnia, overthrew and annexed the Greek empire of Trebizond and the Turkish principality of Ķaraman, acquired the suzerainty of the Crimea, and won many of the islands of the Greek Archipelago from the Venetians and Genoese. But before Belgrade, which he had besieged as the first step to an attack upon the northern kingdoms, he suffered a serious defeat, being driven wounded from the field by Hunyady and John Capistran, with the loss of 300 cannon and 25,000 men. Rhodes, whither an Ottoman force was despatched, was the scene of another failure: here the Knights of St. John gallantly and successfully withstood their Muhammedan foes, and compelled them to retire from the island. In Albania a long and, for a time, successful resistance was offered to the Turkish arms by the famous George Castriot, the Iskender Beg of the Turks. This chieftain had been in his youth in the service of Murád II., and was by him appointed governor of his native Albania, whereupon he revolted and tried to restore the independence of his country. Among the favorite designs of Muḥammed were the subjugation of Italy and the establishment of the Mussulman dominion in the capital of Western Christendom. A Turkish army crossed the Adriatic and stormed the city of Otranto; but its further progress was stopped, and forever, by the death of the Conqueror, which occurred a few months later, in 1481 (886). The Muhammedan soldiers besieged in Otranto, being unsupported from Turkey, were, after a long and brave defence, forced to surrender.

Báyezíd II.

Báyezíd II. was hardly seated on the throne before he was called upon to face a formidable revolt raised by his younger brother Jem. This youthful pretender, who was both talented and high-spirited, was, after a number of adventures, finally compelled to fly the country. He sought the protection of the Knights of St. John at Rhodes, who, however, retained him a prisoner, and made an arrangement with Báyezíd whereby they received from that monarch a yearly sum of 45,000 ducats as the price of the compulsory detention of his brother. After thirteen years of captivity the unfortunate prince was murdered by Pope Alexander VI. (Borgia), who, it is said, received 300,000 ducats from the sultan as the reward of his crime. Though frequently compelled to engage in defensive wars, Báyezíd was of a peace-loving and unambitious disposition, and a few towns in the Morea were all the additions made to the empire while he was on the throne. It was during his reign, however, that the Ottoman fleet began to be formidable to Christendom, the desperate battle off Sapienza, won by Kemál Re'ís against the Venetians, being the first of the Turkish naval victories over the Mediterranean powers. Báyezíd, whose pacific habits had alienated the sympathies of the janissaries, was in 1512 (918) forced by these dreaded guards to abdicate in favor of Selím, the youngest of his three sons. This prince had already been in open revolt against his father; but his determined and warlike character had won for him the esteem of the Turkish prætorians. Báyezíd's health, which had long been failing, gave way under this blow; and the old sultan died three days after his deposition, at a little village on the way to Demitoka, whither he was going to end his life in retirement.

Selím I.

Conquest of Egypt, Syria, and the Hejáz.

Selím I. was personally the greatest of the Ottoman monarchs: his unflinching courage and tireless vigor were not more remarkable than his political sagacity and his literary and poetic talents; but so merciless was he that he has always been known in Turkish history as Yawuz Selím or Selím the Grim. Happily for Europe he turned his attention to the neighboring Muhammedan states and left the Christian powers in peace. Having caused both his brothers to be put to death, he marched against Persia, the king of which country had given refuge to the family of one of the hapless Turkish princes. The quarrel between them was further embittered by religious hatred: the sháh of Persia was the pillar of the Shí‘ites, as the Ottoman sultan was of the Sunnites. Selím in his fanatical zeal had ordered a massacre of his Shí‘ite subjects, in which forty-five thousand persons suffered death. The sháh was eager to avenge the slaughter of his co-religionists. The janissaries showed signs of insubordination upon the march, but Selím resolutely maintained order and reduced them to submission. At length they came upon the Persian host drawn out on the plain of Chaldiran, where a great battle was fought, which ended in the rout of the Persians and left the way to Tabríz, the residence of the Persian king, open to the sultan. Thither Selím proceeded; but eight days later he set out on his homeward march. The battle of Chaldiran brought no addition of importance to the empire; but the districts of Diyár-Bekr (Diarbekr) and Kurdistán, through which the army had passed on the way to Persia, were completely subdued and annexed to the Ottoman dominions. Selím's next important campaign was against the Memlúks of Egypt. This body of Eastern chivalry offered a most gallant resistance to the ‘Osmánlis; but, possessing no artillery, which they disdained as unbecoming men of valor, they were defeated in a series of engagements, and Selím and his army entered Cairo as conquerors in 1517 (923). The results of this war were momentous and far-reaching: the Ottoman empire was greatly increased by the addition of Egypt, Syria, and the Hejáz, of all of which the Memlúks had been lords; the caliphate of Islám was won for the house of ‘Osmán, Selím constraining the representative of the old ‘Abbásid family, who resided, a purely spiritual prince, at Cairo, to make over to him and his heirs the rights and privileges of the successors of the Prophet. The sultan at the same time acquired from him the sacred banner and other relics of the founder of Islám, which had been handed down to the Arabian prince from his fathers, and which are now preserved in the seraglio at Constantinople. On his return Selím set himself to strengthen and improve his fleet, doubtless with a view to the conquest of Rhodes. He died, however, in 1520 (926), before his extensive preparations were completed. This sultan reigned only eight years, but in that short time he almost doubled the extent of the Ottoman empire.

Suleymán I.

Conquest of Rhodes.

Suleymán I., who succeeded his father Selím as sultan, had not been long on the throne before he found himself involved in a war with the king of Hungary. He marched northwards with a powerful army and wrested from the enemy several places of importance, including the strongly fortified city of Belgrade. Having left a large garrison in this city, which was regarded as the key to the Christian lands north of the Danube, the sultan returned to Constantinople, where he continued his father's work of creating a strong and efficient Ottoman fleet. When all was ready Suleymán set out for Rhodes, determined to wipe away the disgrace of his ancestor's second failure, as he had done that of his first. The conquest of Egypt had moreover, rendered the possession of Rhodes necessary to the Turks, as the passage between Constantinople and their new acquisition could never be safe so long as that island remained in hostile hands. The Knights of St. John met the attack in a manner worthy of their illustrious order; but the overwhelming force of the Ottomans and the hopelessness of any relief compelled them to accept the sultan's terms. These were highly honorable to the defenders, who were permitted to retire unmolested, while Suleymán pledged himself to respect the Christian religion in the island, which now, 1522 (929), became his. Four years after the conquest of Rhodes the sultan again invaded Hungary, where in the renowned battle of Mohacz he annihilated the army of the Magyars and slew their king. Thence he marched along the Danube to Buda-Pesth, which opened its gates to him, and there he rested a little while before starting on his homeward way. The disturbed state of Asia Minor hastened Suleymán's departure; but in three years (1529) he was back at Buda, ostensibly as the ally of Zapolya, an Hungarian who claimed the throne left vacant by Louis, who fell at Mohacz. Ferdinand of Austria had opposed the claim of Zapolya, who thereon had applied to the sultan for aid, which that monarch was most willing to accord. The troops of Ferdinand being driven from Buda, Suleymán, accompanied by his protégé, advanced upon Vienna. On 27th September, 1529, the vast Turkish host, under the personal command of one of the greatest of the family of ‘Osmán, laid siege to the capital of the German empire, and on the 14th of the following month, after a most desperate assault carried on for four days, the invaders were compelled to retire, leaving the city in the possession of its heroic defenders. The torrent of Turkish military might had now reached its northern limit: once again it vainly swept round the walls of Vienna, but further it never went. Suleymán next directed his arms against Persia, from which country he won a large portion of Armenia and ‘Irák as well as Baghdád, the old capital of the ‘Abbásid caliphs. In 1542 he was again in Hungary, having been appealed to by the widow of Zapolya on behalf of her infant son against the pretensions of Ferdinand. Suleymán promised to place the child upon the throne when he should be of a proper age; in the meantime he treated Hungary as an Ottoman province, dividing it into sanjaks or military districts, and garrisoning Buda and other important cities with Turkish troops. Six years later a truce for five years was concluded between the sultan and Ferdinand, whereby almost all Hungary and Transylvania were made over to the former, who was also to receive a yearly present, or more correctly tribute, of thirty thousand ducats. The Turks, now at the zenith of their power, were the terror of all around them. The achievements of the

Annexation of Algiers and Tripoli.

Ottoman navy during the reign of Suleymán were hardly, if at all, less remarkable than those of the army. Khayr-ud-Dín, the Barbarossa of the Europeans, won Algiers for Turkey, and held the Mediterranean against the fleets of Spain and Italy; Torghud added Tripoli to the empire; and Piyála routed the galleys of Genoa, Florence, Naples, and Malta off the isle of Jerba. But fortune did not always smile upon the crescent. In 1565 (973) Suleymán sustained the second great check he was destined to encounter. The Turks once more measured swords with the Knights of St. John and drove them from Malta,[1] which had been given to the order by Charles V. on its expulsion from Rhodes. A powerful Turkish army and fleet, commanded by officers of renown, were accordingly despatched to win Malta for the Ottoman crown; but so valiantly was it defended that the Turks were forced to withdraw with a loss of twenty-five thousand men. Suleymán died in harness. In 1566 (974), when seventy-six years of age, he entered Hungary for the last time, summoned thither to aid his vassal, young Sigismund Zapolya. Sziget, a place which had foiled the Turks on previous occasions, was the first object of attack. Count Zrinyi, the governor, determined to resist to the last, so the Ottomans found themselves compelled to undertake the siege of this comparatively unimportant town. There on the night of 4th September the great sultan died, and a few hours later Count Zrinyi and his brave companions perished amid the smoking ruins of the fortress they had most nobly held. Under Suleymán I., whom European historians call the Magnificent, but whom his own people style Ḳánúní or the Lawgiver, the Turkish empire attained the summit of its power and glory. The two great disasters, at Vienna and Malta, were eclipsed by the number and brilliancy of the sultan's victories, by which large and important additions were made to the empire in Europe, Asia and Africa.

Selim II.

Selím II., the unworthy son and successor of the Magnificent Suleymán, was the first Ottoman monarch who shrank from leading his army in person. He was a man of mean and ignoble character, whose sole pleasure seems to have consisted in the indulgence of his degraded tastes and vicious appetites. The first conflict between the Turks and the Russians occurred in his reign. In view of a threatened war with Persia, the grand vizier Ṣokolli conceived the idea of uniting the rivers Don and Volga by a canal, by means of which an Ottoman fleet could be sent into the Caspian. But in order to carry out this scheme it was necessary that the town of Astrakhan should be in the hands of the Turks. A considerable force was accordingly despatched from Constantinople to take possession of that city; but the Russian army which Ivan the Terrible sent to its relief drove back the Turks and their Tatar allies from before the walls, 1569 (977). Cyprus was the next object of attack. This island, which belonged to Venice, was assailed and taken, though not without heavy loss, at a time of peace between the republic and the Porte, 1570–71 (978). The Christian powers of the Mediterranean were roused and alarmed by this act of treachery, and a maritime league was formed through the efforts of Pope Pius V., with Spain, Venice, and Malta for its most important members. On 7th October, 1571, the Christian fleet, under the command of Don John of Austria, encountered the Ottoman ships, led by the galley of the ḳapudan pasha, Mu‘ezzin-záda ‘Alí, just outside the Gulf of Lepanto. A furious conflict ensued, which resulted in the utter defeat of the Turks, their admiral being killed and their fleet almost annihilated. This famous fight, although it brought little immediate material advantage to the victors, was of the highest moral value to them; for it broke the spell of Barbarossa, and showed that the Ottoman was no longer invincible on the seas. The only other event of importance during this reign was the final conquest of Tunis for Turkey by Ḳilij ‘Alí, who won it from the Spaniards in 1574 (982). Selím II. died miserably the same year.

Murád III.

Murád III., who now succeeded to the Ottoman throne, was no improvement upon his father; he ruled in name only, all real power being in the hands of worthless favorites. As a natural consequence the empire began rapidly to decay; corruption infected all ranks of official society, the sultan himself selling his favors for bribes; while the other great curse of old Turkey, military insubordination, showed itself in a more threatening aspect than ever. The janissaries mutinied on several occasions, and each time compelled the weak Murád to accede to their demand. Notwithstanding this wretched state of affairs, some extensive and important, though not permanent, additions were made to the empire. These, consisting of Azerbijan and Georgia—the latter had been in alliance with Persia—were the result of a campaign against the last-named country, the internal condition of which was then even worse than that of Turkey. Transylvania, Moldavia, and Walachia rose in revolt, encouraged by the war which broke out in 1593 between Turkey and Austria. In 1594 hostilities with Persia were resumed; and early in the following year Murád died, leaving the empire to his eldest son, Muḥammed III.

Muḥammed III.

Things had been going very badly in the war with Austria, when in June, 1596, the grand vizier and the muftí, joining their voices with that of Sa‘d-ud-Dín the historian, prevailed upon the new sultan, whose character resembled only too closely that of his father, to place himself at the head of the Ottoman army which was about to march into Hungary. Four months later Muḥammed met the imperialists under the archduke Maximilian, and the Transylvanians led by Prince Sigismund, on the marshy plain of Keresztes, where a battle lasting three days took place. Although at one time things looked so hopeless for the Turks that the sultan would have fled but for the entreaties and remonstrances of Sa‘d-ud-Dín, the ‘Osmánlis gained a complete and decisive victory. But nothing came of it; for Muḥammed, instead of following up his success, hastened back to Constantinople to receive the congratulations of his courtiers and to resume his indolent and voluptuous life. Nothing else worthy of note occurred during his inglorious reign. He died in 1603 (1012).

Muḥammed III. was the last heir to the Ottoman throne who was entrusted with the government of a province during his father's lifetime; henceforth all the sons of the sultan were kept secluded in a pavilion called the Ḳafes or cage in the seraglio gardens. This new system, which was necessarily very prejudicial to the character of the future rulers, had its origin in the same dread of rivals that caused a sultan in those times to put all his brothers to death immediately on his accession.

Aḥmed I.

The reign of Aḥmed I. is not marked by any event of importance. The peace of Sitavorok (Zsitvatorok) between Turkey and Austria, 1606 (1015), made no change of any moment in the territorial possessions of either power, but is interesting as being the first treaty in which an Ottoman sultan condescended to meet a Christian prince on a footing of equality. Hitherto the Turkish monarchs had affected to grant merely short truces to their European enemies. But this peace was to be permanent; the annual payment or tribute of thirty thousand ducats [about $68.040] by Austria was to be discontinued; and the ambassadors sent from the Porte were now to be officials of rank, and not, as formerly, menials of the palace or camp.

[1] [Suleymán's arms never drove the Knights from Malta, but in 1551 they surrendered Tripoli to Dragut. For accurate particulars see vol. xxi. p. 183.—Am. Ed.]

Muṣṭafa I.

Aḥmed died in 1617 (1026) and was succeeded by his brother Muṣṭafa I. Up till this time the succession had been regularly from father to son; but, as Muṣṭafa's life had been spared by his brother on his accession, that prince now ascended the throne in preference to 'Osmán, the eldest son of Aḥmed I. This arose from the peculiar nature of the Turkish law of succession, which gives the throne to the eldest male relative of the deceased sovereign. Muṣṭafa was, however, imbecile; so after a reign of three months he was deposed, and his nephew 'Osmán, though only fourteen years of age, seated on the throne in his stead.

'Osmán II.

An unsuccessful war with Persia, which had been going on for some time, was now brought to an end by a treaty which restored to the sháh all the territories conquered since the days of Selím II. In 1621 the sultan led his troops against Poland, partially with the view of weakening the janissaries, whom he justly regarded as the most deadly enemies of his empire. This expedition was not attended by any important results, neither Turks nor Poles gaining a decisive advantage. On his return 'Osmán formed another plan for freeing himself from his tyrannical soldiery: he gave out that he was going to make the pilgrimage to Mecca, but his real intention was to proceed only as far as Damascus, there place himself at the head of an Asiatic army, and march against the janissaries and sipáhís in Constantinople. But the janissaries heard of this design and rose in revolt. Incited by a vizier whom 'Osmán had deposed, they seized their sovereign and dragged him to the state prison of the Seven Towers, where shortly afterwards he was foully murdered by the traitor minister, 1622 (1031).

The wretched Muṣṭafa was again raised to the throne, only to be deposed fifteen months afterwards in favor of Murád, the eldest surviving brother of 'Osmán.

Murád IV.

In Murád IV., who succeeded to the supreme power in 1623 (1032), when a child of eleven years, Turkey had once more a sultan of the old 'Osmánli type. Since the death of Suleymán the empire had been cursed with a succession of *rois fainéants*, under whom it had rapidly fallen to decay. The vigor and courage of the new sultan stayed it for awhile upon its downward course, and restored to it something of its bygone glory. While still quite young, Murád had been compelled by the mutinous janissaries to deliver into their cruel hands his favorite vizier, Ḥáfiz Pasha. This embittered him against that corps, and, when soon afterwards the soldiers began openly to discuss his deposition, Murád swiftly and suddenly cut off the ringleaders and all others whom he suspected of disloyalty; this struck fear into the hearts of the disaffected soldiers, who, finding themselves without any to organize or direct them, returned to their allegiance. Murád next turned his attention to checking the intolerable corruption and abuses which pervaded every department of the state. He had but one simple though terribly drastic method of reform,—the execution of every official whom he even suspected of any malpractice. Having restored some sort of order in his capital, Murád marched against Persia and recaptured the city and district of Erivan. In 1638 (1048) he undertook a second and more important campaign against the same power. His object was the recovery of Baghdád, which had been taken by the sháh's troops some sixteen years before. The Persians resisted long and gallantly, but at length the Turks carried the city by storm, when Murád disgraced himself by the slaughter of a vast number of the inhabitants. By the peace which followed Turkey restored Erivan to Persia, but retained Baghdád, which has been in its hands ever since. Murád on his return entered Constantinople in triumph. This sultan died in 1640 (1049); his death is said to have been hastened by habits of intemperance, which he had contracted towards the close of his life.

Ibráhím.

Ibráhím, the brother of the late sultan, now mounted the Ottoman throne. He was another of those wretched princes who gave themselves up to the indulgence of their own follies and vices without bestowing a thought upon the welfare of their people or the prosperity of their country. All the evils that had been curbed for a time by the stern hand of Murád broke out afresh and in worse form than before. The sultan himself was the most venal of the venal. Shut up in the seraglio, he thought of nothing but the gratification of his own and his favorites' caprices; gem-encrusted coaches and pleasure-boats, and carpets and hangings of richest sable for his rooms, were among the objects for which he plundered his people and sold every office to the highest bidder. This went on for eight years, till at length his subjects, weary of his exactions and tyranny, deposed him, and made his son Muḥammed, then only seven years of age, sultan in his room. The only events of note that occurred during Ibráhím's tenure of power are the capture of Azoff from the Cossacks and the occupation of Crete. This island, which was then in the hands of Venice, was soon overrun, but it was not till well on in the next reign, after a siege of twenty years, that the Ottomans succeeded in taking Candia the capital.

Muḥammed IV.

The minority of Muḥammed IV., who became sultan in 1648 (1058), was marked by all the troubles and evils that might have been anticipated, until the grand vizierate was conferred on Köprili Muḥammed in 1656 (1067). This statesman, who was seventy years old when he entered upon the duties of prime minister of Turkey, was the founder of an illustrious family of viziers, whose integrity and strength of character did much to counteract the pernicious influence of degenerate sultans and to prop up for a season the declining empire. Old Köprili accepted the office of grand vizier only upon condition of receiving absolute power; this he employed much in the same way as Murád IV. had done when he set about the work of reform: he executed every one who fell under his suspicion. He died in 1661 (1072), leaving the vizierate to his son Fázil Aḥmed. Aḥmed was, like his father, a man of great ability, and happily for Turkey he enjoyed the complete confidence of the young sultan, who cared for nothing but the chase, whence he is called in the Ottoman histories Avji Muḥammed or Muḥammed the Huntsman. Before long Aḥmed was called on to lead the Turkish army against Austria. He took Neuhäusel and several places of little importance; but near the convent of St. Gotthard (on the Raab) he was completely defeated in 1664 (1075) by a smaller Christian force under Montecuculi. A truce for twenty years on the basis of the treaty of Sitavorok was the result of this battle; the Ottomans, however, retained Neuhäusel. Aḥmed next appeared in arms in Crete, for the purpose of bringing to a close the siege of Candia, which had been going on ever since 1648; but it was not till other three years had passed that the brave garrison opened the gates to the grand vizier, in 1669 (1079). The sultan himself was induced to head the next campaign, which was undertaken on behalf of the Cossacks of the Ukraine, who had craved the protection of the Porte against Poland. The Turks took the cities of Kamenetz and Lemberg, whereupon King Michael sued for peace, 1672 (1083), and promised to make over Podolia and the Ukraine to Turkey and to pay an annual tribute of 220,000 ducats [about $498,960]. The sultan accepted these terms and returned home in triumph; but the Poles refused to be bound by them, and under the command of Sobieski they attacked and defeated the troops of Aḥmed Pasha. The war lasted till 1676, when it was brought to an end by the treaty of Zurawno, which left the sultan in possession of Podolia and almost all

Siege of Vienna.

the Ukraine. Three days after this peace was signed Aḥmed Pasha died. Few men have done more to ruin their country than Ḳara Musṭafa, who succeeded Aḥmed in the grand vizierate. His pet scheme was the conquest of Germany and the establishment of a great Turkish province between the Danube and the Rhine, with himself as nominal viceroy but virtual sovereign. He accordingly marched with an enormous army, probably not far off half a million strong, against Vienna. In the summer of 1683 (1094) this mighty host appeared before the walls of the Austrian capital. For an account of the siege, see vol. xix. p. 307 *sq.* A few weeks after his discomfiture Ḳara Musṭafa was executed at Belgrade by the sultan's orders. Venice and Russia now declared war against Turkey; misfortune followed misfortune; city after city was rent away from the empire; the Austrians were in possession of almost the whole of Hungary, the Italians of almost all the Morea. At length a severe defeat at Mohacz, where Suleymán had triumphed years before, exhausted the patience of the soldiery, and Muḥammed IV. was deposed in 1687 (1099).

Suleymán II.

The first year of the reign of Suleymán II., who succeeded his brother, was marked by a serious mutiny of the janissaries of the capital, who, aided by the dregs of the population, created a reign of terror in Constantinople, during which they pillaged the palaces of the principal officers of the government and murdered the grand vizier, along with many of the members of his household. The Austrians, under Charles of Lorraine, Louis of Baden, and Prince Eugene, were carrying all before them in the north: Erlau, Belgrade, and Stuhlweissenburg fell into their hands; and by the end of 1689 the Ottomans had lost almost all their former possessions beyond the Danube. Meanwhile the Venetian leader, Morosini, was equally successful in the Morea, completing the conquest of that province, which he added to the dominions of St. Mark. When matters had come to this pass, the sultan summoned an extraordinary meeting of the divan to consult on the measures to be taken to meet the danger threatening on every hand. By the unanimous advice of his ministers, Suleymán appointed to the grand vizierate Köprili-záda Musṭafa, another son of old Köprili Muḥammed. This statesman, who had been trained in the duties of office under his father and brother, worthily upheld the high name of his house. He gave up the whole of his gold and silver plate to be coined into money wherewith to pay the troops; he sought out the best men to fill positions of trust and responsibility in the army and navy; and he exercised and encouraged a wise and just policy of toleration towards the Christian subjects of the sultan. Such was the confidence which his high character and illustrious connection inspired that large numbers of volunteers hastened to join the Turkish hosts; and in a very few weeks from the time when he took command of the army Musṭafa had driven the Austrians out of Servia, and Belgrade once more received a garrison of Ottoman troops. Musṭafa returned in triumph to Constantinople, where, early in the summer of 1691 (1102), Suleymán II. died, and was succeeded on the throne by his brother Aḥmed II.

Aḥmed II.

The most important event which occurred during the brief and disastrous reign of this monarch was the defeat and death at Slankamen (Szlankament) of Köprili-záda Musṭafa, who in August, 1691, advanced from Belgrade to attack the Austrians under Louis of Baden. The unfortunate result of the battle was in great measure owing to the rashness of the vizier, who, in opposition to the advice of the oldest and most experienced of his officers, refused to await behind the lines the attack of the enemy. The Ottomans fought with desperate courage; but the day was decided against them by the death of Musṭafa, who was shot while cutting his way through the Christian ranks. Aḥmed II. reigned for four years, during which the hapless empire, besides continuing to suffer defeat at the hands of foreign foes, was visited with the curses of pestilence and domestic insurrection.

Musṭafa II.

On the death of Aḥmed II. in the year 1695 (1106) Musṭafa II., son of Muḥammed IV., was girt with the sword of 'Osmán. The new sultan, aware of the pitiful condition to which the empire had sunk, in part, at least, through the negligence and indifference of his predecessors, resolved to restore the old Ottoman usages, and placed himself at the head of his armies. His first campaign was altogether successful: he recaptured several important fortresses and totally defeated a great Austrian army. During the following winter he worked hard to repair the finances and bring the forces of the empire into a higher state of efficiency; and, when he set out in the spring against the Austrians, fortune continued to smile upon his banners. He defeated the duke of Saxe, raised the siege of Temesvar, and strengthened the garrisons of those fortresses which Turkey still held in Hungary. But in the next year, 1697, all was changed: Prince Eugene was at the head of the Austrians, and on the banks of the Theiss, near Zenta, the Turks sustained an overwhelming defeat, which compelled the sultan to retreat to Temesvar. Thence he returned to Constantinople, and never again led an army against the enemy. Recourse was once more had to the house of Köprili, and Amuja-záda Ḥuseyn, a nephew of old Köprili Muḥammed, was promoted to the grand vizierate. Ḥuseyn raised fresh troops; but he saw that what was really needful was peace, and this he succeeded in bringing about. At Carlowitz on 26th January, 1699, a peace was arranged, through the intervention of England and Holland, between Turkey on the one hand and Austria, Venice, Russia, and Poland on the other. The basis of the treaty, agreed to with certain modifications, was that each power should retain the territories in its possession at the time of opening negotiations. This arrangement left Austria in possession of Transylvania and almost all Hungary and Slavonia; Venice remained mistress of its conquests in Dalmatia and the Morea; Poland received Podolia; and Russia, which under Peter the Great was only now becoming conscious of its strength, retained Azoff, which it had wrested from Turkey three years before. Ḥuseyn Pasha took advantage of the restoration of peace to check the disorders which had sprung up in various parts of the empire, and to endeavor to effect much-needed reforms in many departments of the state. But unfortunately his efforts were thwarted by others less disinterested than himself; and, brokenhearted by the calamities of his country, he retired from office three years after the peace of Carlowitz, and very shortly afterwards died. Musṭafa II. very soon followed the example of his minister, and abdicated in 1703 (1115) in favor of his brother Aḥmed III.

Peace of Carlowitz.

Aḥmed III.

Although the peace of the empire was often broken during his reign, Aḥmed III. was not of a warlike disposition, and all the representations and entreaties of Charles XII. of Sweden, who after the disaster of Pultowa had taken refuge in Turkey, failed to induce him to reopen hostilities with the czar. In 1710 Nu'mán Pasha, son of Amuja-záda Ḥuseyn, and the last of the Köprili family, was appointed grand vizier. Though able and tolerant he was so much addicted to interfering in the business of his subordinates that he became the object of general dislike, and was dismissed from his office after holding it for fourteen months. The menacing preparations of Russia in the south had more influence with the Porte than the prayers of the Swedish king, and in 1711 the new grand vizier, Baltaji Muḥammed, marched into Moldavia to meet the forces of Peter the Great, who had formed an entrenched camp near the village of Hush, on the right bank of the Pruth. Here the

Treaty of Passarowitz.

vizier blockaded him, and after two days' severe fighting compelled him to surrender with all his army. By the treaty which followed the czar pledged himself, among other things, to restore the fortress of Azoff and all its dependencies to the sultan, and to grant the king of Sweden a free and safe passage to his own country through the Muscovite dominions. The lenity of Balṭaji Muḥammed in not destroying the czar and his army when they were within his grasp caused such discontent at Constantinople that he was dismissed from the vizierate, which was conferred on 'Alí Pasha, known as Dámád 'Alí or 'Alí the Son-in-Law, from the circumstance of his having married a daughter of the sultan. This vizier distinguished himself by winning back from Venice the whole of the Morea in a single campaign (1715). His next venture, a war against Austria, undertaken in the following year, had a very different issue, he himself being slain and his army routed in a great battle at Peterwardein. Next year Prince Eugene, the conqueror of Dámád 'Alí, laid siege to Belgrade, which he forced to capitulate after driving off a large army sent by the Turks to its relief. These events led to the peace of Passarowitz in 1718, by which Austria acquired that portion of Hungary which had remained in the possession of Turkey, as well as extensive territories in Servia and Walachia. The grand vizier Ibráhím, another son-in-law of the sultan, who was at the head of affairs from 1718 to 1730, contrived to secure for the empire an unusually long respite from internal disorders; but the sultan's love of costly pomp and splendor and the luxurious magnificence of his court rendered him so unpopular that, in consequence of a riot in the autumn of 1730 (1143), he voluntarily abdicated the throne, and his nephew Maḥmúd I. became pádisháh in his stead.

(E. J. W. G.)

History from 1718.

Maḥmúd I.

Wars with Russia.

With the treaty of Passarowitz the Venetian republic disappears from the scene of Turkish warfare. Russia gradually becomes a more formidable enemy than Austria; and the subject Christian races imperceptibly enter on the first stages of national consolidation and revival. After the long and resultless war with Persia hostilities again broke out with Russia in 1736. Marshal Münnich stormed the lines of Perekop and devastated the Crimea; but he was unable to maintain his army there and retreated with greatly diminished forces. Azoff was taken by General Lascy; and in the following year Otchakoff fell into the hands of Münnich, while the Crimea was again invaded and ravaged. Austria now joined Russia, and the Porte had to sustain a war in Servia and Bosnia as well as on the coasts of the Black Sea. The double combat was carried on with very different results. While the Russians won victory after victory, and finally penetrated into the heart of Moldavia, the Austrians were defeated and driven across the Danube. On their advancing from Belgrade in the summer of 1739 they were defeated with great loss at Krotzka, and compelled to sue for peace. The treaty of Belgrade, which was signed on 1st September, 1739, restored to the Porte Belgrade and Orsova, with the portions of Servia, Bosnia, and Walachia which it had ceded to Austria at the peace of Passarowitz. Russia, unable to continue the war with a victorious Turkish army ready to fall upon its flank, had to conclude peace on very moderate terms. It received Azoff, but under a stipulation that the fortifications should be razed, and that no Russian vessels of war should be kept either on the Black Sea or on the Sea of Azoff. The peace was the last advantageous one made by the Porte without allies; and the succeeding thirty years were on the whole a period of respite from misfortune.

Musṭafa III.

Conquest of Crimea by Russia.

After this followed the wars with the empress Catherine, before whose genius and resources it seemed as if Turkey must inevitably sink into nothingness. The first contest was provoked by the armed intervention of the empress in Polish affairs and her well-known intrigues with rebellious subjects of the Porte. War was rashly declared by Musṭafa III. in October, 1768. In 1769 the Russians entered Moldavia and captured the fortress of Choczin (Chotim); in the following year their armies made good the conquest of Moldavia and Walachia, while a fleet from the Baltic entered the Greek Archipelago and landed troops in the Morea. The Greeks of the Morea rose in insurrection; they were, however, overpowered, and the small Russian force withdrew, leaving the Greeks to the vengeance of their conquerors. At sea the Turks suffered a severe defeat near Chios, and their fleet was subsequently blockaded and set on fire in the Bay of Tchesme, the principal officers in the Russian navy being Englishmen. Assistance was, moreover, given by the Russians to Ali Bey, a Mameluke chieftain who was in rebellion against the Porte in Egypt, and to Tahir, a sheikh who had made himself independent at Acre. In 1771 the Russians invaded and conquered the Crimea. Austria now took alarm, and signed a convention with the Porte preparatory to armed intervention. But the partition of Poland reunited the three neighboring Christian powers and prevented a general war. An armistice was agreed upon between Russia and the Porte, and negotiations followed. These were broken off in 1773. The Russians crossed the Danube, and, though unsuccessful in their attempts upon Silistria and Varna, so completely defeated the Turkish forces in the field that on 21st July, 1774, the Porte concluded peace at Kutchuk-Kainardji under conditions more unfavorable than those which it had rejected in the previous year. The Tartar territory of the Crimea, with Kuban and the adjoining districts, was made into an independent state, Russia retaining Azoff, Kertch, and Kinburn. Moldavia and Walachia were restored, but on the condition that, as occasion might require, the Russian minister at Constantinople might remonstrate in their favor. Russia, in fact, was given a species of protectorate over these provinces. Permission was given to Russia to erect a church in Constantinople, and the following engagement was made: "The Porte promises to protect the Christian religion and its churches; and it also allows the court of Russia to make upon all occasions representations as well in favor of the new church at Constantinople as on behalf of its ministers, promising to take such representations into consideration." Out of this clause arose the claim of Russia to the right of protection over all the Christian subjects of the Porte, though the specific right of intervention was clearly attached only to a single church and its ministers. By other clauses in the treaty the obligations restraining Russia from making fortifications and placing ships of war on the Black Sea were annulled. It received the right of free navigation for its merchant ships on all Turkish waters, and the right of placing consuls at all Turkish ports. These last two conditions were of great historical importance through their effect upon Greece. The consuls appointed were usually Greek traders, and permission to carry the Russian flag was indiscriminately given to Greek vessels. Hence there followed that great development of Greek commerce, and of the Greek merchant navy, which in half a century made the insurgent Greeks more than a match for the Turks at sea.

The stipulation that the Crimea and adjoining districts should be made into an independent state was of course not intended by Russia to be anything more than a veil for annexation; and in 1783 Catherine united this territory to her dominions. She had now definitely formed the plan of extinguishing Turkish sovereignty in Europe and placing her younger grandson on the throne of a restored Greek kingdom. The boy was named Constantine; his whole education was Greek and such as to fit him for the throne of Constan-

War with Russia and Austria.

tinople. Joseph II. of Austria threw himself eagerly into the plan for a partition of the Ottoman empire, and in 1788 followed Russia into war. While the Russians besieged Otchakoff, Joseph invaded Bosnia; but he was unsuccessful and retired ingloriously into Hungary. Otchakoff was stormed by Suwaroff on 16th December, 1788. In the following year the Turkish armies were overthrown by Suwaroff in Moldavia and by the Austrian Laudon on the south of the Danube. The fate of the Ottoman empire seemed to tremble in the balance; it was, however, saved by the convulsions into which Joseph's reckless autocracy had thrown his own dominions, and by the triple alliance of England, Prussia, and Holland, now formed by Pitt for the preservation of the balance of power in Europe. Joseph died in 1790; his successor Leopold II. entered into negotiations, and concluded peace at Sistova in August, 1791, relinquishing all his conquests except a small district in Croatia. Catherine continued the war alone. Ismail was captured by Suwaroff with fearful slaughter, and the Russian armies pushed on south of the Danube. Pitt, with the triple alliance, attempted to impose his mediation on the empress Catherine, and to induce her to restore all her conquests. She refused, and both Prussia and England armed for war; but public opinion declared so strongly against the minister in England that it was impossible for him to pursue his plan. Catherine nevertheless found it in her interest to terminate the war with the Porte. Poland claimed her immediate attention; and, adjourning to a more convenient season her designs upon Constantinople, she concluded the treaty of Jassy in January, 1792, by which she added to her empire Otchakoff, with the seaboard as far as the Dniester. The protectorate of Russia over Tiflis and Kartalinia was recognized.

Affairs in Egypt and Syria.

Catherine's successor Paul (1796–1801) made it his business to reverse his mother's policy by abandoning the attack on Turkey. Bonaparte's invasion of Egypt and the destruction of the French fleet by Nelson at the battle of the Nile led the Porte to join the second coalition against France. Bonaparte, invading Syria, was checked and turned back at Acre, where Jezzar Pasha was assisted in his strenuous defence by an English squadron under Sir Sidney Smith. A Turkish army was meanwhile transported from Rhodes to the Egyptian coast. This army was destroyed by Bonaparte on his return to Egypt at the battle of Aboukir on 25th July, 1799, after which Bonaparte set sail for France, leaving the Egyptian command to Kléber. Kléber, cut off from all communication with France and threatened by superior Turkish forces, entered into a convention at El Arish for the evacuation of Egypt. This convention, however, was annulled by Lord Keith, the English admiral, and Kléber replied by giving battle to the Turks and defeating them at Heliopolis on 20th March, 1800. Egypt was finally wrested from the French by the English expedition under Abercromby, and restored to the sultan. The Ionian Islands, which France had taken from Venice at the time of the treaty of Campo Formio, were conquered by a combined Russian and Turkish force, and were established as a republic, at first under the joint protectorate of Russia and the Porte, afterwards under the sole protectorate of Russia. The former Venetian ports on the mainland of Epirus and Albania were given up to Turkey. Somewhat later, under pressure from St. Petersburg, the sultan undertook not to remove the hospodars, or governors, of Walachia and Moldavia without consulting Russia, and to allow no Turks except merchants and traders to enter those territories.

Internal condition of empire.

On the restoration of peace France reassumed its ancient position as the friend and ally of the Porte. The sultan now on the throne was Selím III. (1789–1807). Though the results of the war of the second coalition had been favorable to Turkey, the Ottoman empire was in a most perilous condition. Everywhere the provincial governors were making themselves independent of the sultan's authority; a new fanatical sect, the Wahhabees, had arisen in Arabia and seized upon the holy places; the janissaries were rebellious and more formidable to their sovereign than to a foreign enemy; and the Christian races were beginning to aspire to independence. It had seemed for a while as if the first to rise against the Porte would be the Greeks, among whom the revolutionary influences of 1789 and the songs of the poet Rhegas, put to death by the Turks in 1798, stirred deep feelings of hatred against their oppressors. Circumstances, however, postponed the Greek revolt and accelerated that of the Servians. In the country immediately south of the Danube the sultan's authority was defied by the janissaries settled about Belgrade and by Passwan Oglu, ruler of Widdin in Bulgaria. The pasha of Servia, hard pressed by these rebels, called upon the rayas to take up arms in defence of the sultan. They did so, and in 1804 the janissaries answered by a series of massacres in the Servian villages. The Servians now rose as a nation against the janissaries. Kara George became their chief, and in combination with the pasha of Bosnia, acting under the sultan's orders, exterminated the janissaries or drove them out of the country. Victorious over one oppressor, the Servians refused to submit to another. They carried on the war against the sultan himself, and at the suggestion of Russia sent envoys to Constantinople demanding that for the future the fortresses of Servia should be garrisoned only by Servian troops.

Servian revolt.

Difficulties of Selim III.'s reign.

When the third European coalition against France was in course of formation Russian and French influences were in rivalry at Constantinople. The victories of Napoleon in 1805 gave him the ascendency, and his envoy prevailed upon the sultan to dismiss, without consulting Russia, the hospodars of Walachia and Moldavia, who were considered to be agents of the court of St. Petersburg. This was a breach of the engagement made by the sultan in 1802, and it was followed by the entry of Russian troops into the principalities. England, as the ally of Russia, sent a fleet under Admiral Duckworth through the Dardanelles to threaten Constantinople. While the admiral wasted time in negotiation, the French ambassador, General Sebastiani, taught the Turks how to fortify their capital. The English admiral found that he could do nothing, and repassed the Dardanelles, suffering some loss on the passage. The war on the Danube was not carried on with much vigor on either side. Alexander was occupied with the struggle against Napoleon on the Vistula; Selím III. was face to face with mutiny in Constantinople, having brought upon himself the bitter hatred of the janissaries by attempting to form them into a body of troops drilled and disciplined after the methods of modern armies. While the military art in Europe had been progressing for centuries, Turkey had made no other changes in its military system than those which belonged to general decay. Its troops were a mere horde, capable indeed of a vigorous assault and of a stubborn defence, but utterly untrained in exercises and manœuvres, and almost ignorant of the meaning of discipline. Selím was a reformer in government and administration as well as in military affairs. He broke from the traditions of his palace, and began a new epoch in Turkish history; but the influences opposed to him were too strong, and a mutiny of the janissaries in Constantinople deprived him of his crown. He was allowed to live, but as a prisoner, while the puppet of the janissaries, Mustafa IV., was placed on the throne (May, 1807).

A few weeks after this event the treaty of Tilsit ended the war between France and Russia, and provided for the nominal mediation of Napoleon between Russia and the Porte. A truce followed between the armies on the Danube. Among the Turkish generals

Bairaktar.

Maḥmúd II.

who had understood the necessity of Selím's reforms, and who were prepared to support him against the janissaries, was Bairaktar, commander at Rustchuk. As soon as the truce gave him freedom of action, Bairaktar marched upon Constantinople. Leading his troops against the palace, he demanded the restoration of Selím. As the palace gates were closed, Bairaktar ordered an assault; but at the moment when his troops were entering Selím was put to death. Besides Muṣṭafa there was only one member of the house of Osman remaining, his brother Maḥmúd, who concealed himself in the furnace of a bath until the palace was in the hands of Bairaktar's soldiers. He was then placed on the throne (July, 1808). For a while Bairaktar governed as grand vizier. He was rash enough, however, to dismiss part of his own soldiers from Constantinople. The janissaries attacked him in his palace. A tower in which he defended himself was blown up, and after a battle in the streets of Constantinople between the janissaries and the remainder of Bairaktar's troops, during which the dethroned sultan Muṣṭafa was put to death, the janissaries remained conquerors, and Maḥmúd was forced to submit to their demands. The innovations of the late reign were abolished, and for a while Maḥmúd seemed content to reign as servant of the reaction.

Peace of Bucharest.

It is well known that plans for the partition of the Ottoman empire occupied Napoleon and Alexander at Tilsit. Austria, though unwilling to see Russia aggrandized, was prepared in the last resort to combine with the dismembering powers, if all attempts to prevent the execution of the plan by diplomatic means should fail. But after a few years the alliance declined and a war between France and Russia was seen to be inevitable. Meanwhile the conflict on the Danube had been resumed, and the Servians were still in arms. The Russians had advanced into Bulgaria and captured Silistria. England, which had made peace with Turkey in 1809, sought to reconcile the belligerents, in order that the czar might be free to employ his whole force against Napoleon. In May, 1812, a treaty was signed at Bucharest, by which Bessarabia was ceded to Russia, the river Pruth becoming the boundary of the two empires. The Porte in this treaty promised to grant an amnesty to the Servians, to leave to them the management of their internal affairs, and to impose upon them only moderate taxes. These promises, however, were neither accepted by the Servians as a sufficient concession, nor were they observed by the Porte. The Servians continued to fight, and ultimately secured their autonomy about 1817 without help from Russia.

Maḥmúd's rule.

Ali Pasha of Janina.

Greek revolt.

Maḥmúd II. (1808–1839) was the only sultan of modern times who possessed the qualities of a great ruler. Brought up in the seclusion of the seraglio till the age of twenty-three, when he was suddenly placed on the throne, it is surprising that he should have shown the power, the resolution, and the intelligence which marked his government. The difficulties of his reign were enormous. He belonged to an epoch when the Ottoman empire might fairly be considered as in actual dissolution. This he to some extent arrested, and the reforms which he effected, partial and imperfect as they were, have prolonged the existence of the Turkish state to our own day. The first and most obvious internal danger to be met was the insubordination of the provincial pashas. Against these rebellious servants Maḥmúd waged a persistent and unwearying war, now employing them against one another, now crushing them by his own armed force. One of the most formidable was Ali Pasha of Janina, who had made himself master of Albania and part of Greece. When Maḥmúd in 1820 threw his armies upon this chieftain, the outbreak of hostilities in Epirus was the signal for the insurrection of Greece. While Hypsilanti, grandson of a hospodar of Moldavia who had been put to death by the Porte, raised the standard of revolt in Moldavia, asserting that Russia had promised the Christians its support, the Greeks of the Morea rose and exterminated the Turkish population among them. Hypsilanti was soon crushed; and the rising in the Morea was answered by massacres of the Greeks in the principal cities of the empire, and by the execution of Gregory, patriarch of Constantinople, the head of the Greek Church. These deeds of violence excited the utmost indignation in Russia. A despatch was sent to Constantinople, calling upon the Porte to restore the churches which had been destroyed, to guarantee the inviolability of Christian worship in the future, and to discriminate in its punishments between the innocent and the guilty. These demands were presented as an ultimatum by the Russian ambassador, who, not receiving an answer within the time allowed, quitted Constantinople (27th July, 1821). The influence of Austria and England, however, restrained the emperor Alexander from declaring war, and the Greeks were left to sustain their combat by themselves. As long as Ali Pasha was unsubdued, the only forces which the sultan could employ against the Greeks were irregular bands of volunteers. It was by one of these hordes that the fearful massacres of Chios, in the spring of 1822, were perpetrated. In that same spring, however, the overthrow and death of Ali set free the regular troops. Two armies of considerable strength now moved southwards from Thessaly, with the object of reducing the country north of the Gulf of Corinth and then uniting to conquer the Morea. The western army, commanded by Omer Brionis, was checked by the Suliotes, and subsequently beaten back by the defenders of Missolonghi. The eastern army, after advancing under the command of Dramali into the Morea, was compelled to retreat. But the passes in its rear had been seized by the Greeks; on all sides the enemy closed in upon it; and it was only through the disorders of the Greeks themselves that Dramali's force escaped annihilation. Of those who survived the encounter most perished by sickness and famine in the neighborhood of Corinth. Nor was the fortune of the Ottomans better at sea. The destruction of their admiral's vessel with all its crew by the fire-ship of the Greek captain, Kanaris, caused such terror that all further attempts to reduce the islands were abandoned, and the fleet returned to the Dardanelles.

Mehemet Ali's assistance to Turkey.

After an interval of ineffective land warfare, the sultan determined to call upon Mehemet Ali, pasha of Egypt, for assistance. Mehemet had risen to power in the disturbed period that followed the expulsion of the French from Egypt. He had a more powerful fleet than that of his sovereign, and an army disciplined after the European system. In calling upon his powerful vassal for help the sultan must have been aware of the dangers which his aggrandizement would involve. Mehemet eagerly responded to Maḥmúd's call; and his son Ibráhím, in command of a powerful armament, set sail in the spring of 1824 from Alexandria against Crete. This island was rapidly conquered, and Ibráhím, after failing in some combined operations against Samos, crossed over to the Morea. Here he marched across the peninsula, carrying all before him. Nauplia alone maintained its defence, while the Egyptian sent out his harrying columns, slaughtering and devastating in every direction. From the Morea Ibráhím was summoned to assist the Turks, who had been for nine months unsuccessfully engaged in a second siege of Missolonghi. Ibráhím began his siege operations in the beginning of 1826; but it was not for three months more that Missolonghi fell. The tide of Ottoman conquest moved on eastwards, and the acropolis of Athens capitulated in the following year. But the defence of Missolonghi had lasted long enough to bring the powers of Europe into the field. On the death of the emperor Alexander at the end of 1825, Canning sent the duke of Wellington to St. Petersburg to negotiate conditions of joint diplomatic action on the part of England and Russia. A protocol signed at St. Petersburg on 4th April, 1826, fixed the conditions on which the mediation of Great Britain was to be tendered to the Porte. Greece was to remain tributary to the sultan, but to be governed by its own elected authorities and to be independent in its commercial relations. The surviving Turkish population was to be removed from Greece; all property belonging to Turks, whether on the continent or the islands, was to be purchased by the Greeks. This protocol was developed into the treaty of London between England, Russia, and France, signed in July, 1827, by which the three powers bound themselves to put an end to the conflict in the East. In pursuance of this treaty the mediation of the powers was offered to the Porte, and an armistice demanded. It was contemptuously refused. The united fleets of the powers consequently appeared before Navarino, where Ibráhím was assembling his forces for an expedition against Hydra.

Battle of Navarino.

After a vain attempt at negotiation, they entered the harbor and fought the battle of Navarino, on 20th October, 1827, in which the Turco-Egyptian fleet was totally destroyed. Canning had just died; his successors could only speak of Navarino as an "untoward event" and withdraw from further interference, leaving Russia and the Porte face to face. After a proclamation by the sultan calling the Mohammedans to arms, war was declared by Russia in April, 1828. The moment was singularly favorable for Russia, for Maḥmúd had, little more than a year before, exterminated the janissaries.

Suppression of janissaries.

After bringing over soldiers from Asia to make him secure of victory in the event of a conflict, he had called upon the janissaries to contribute a certain number of men to the regiments about to be formed on the European pattern. The janissaries refused and raised the standard of rebellion. Maḥmúd opened fire on them with cannon, and the slaughter did not cease until the last of them had perished. The great difficulty in the way of a military reorganization was thus removed, and the newly-modelled regiments were raised to about 40,000 men.

War with Russia.

Small as the army was with which he had to meet the Russian invasion in 1828, the campaign of that year was honorable to the Turkish arms. Though Varna fell into the hands of the Russians, Silistria and Shumla were successfully defended, and the Russians, after suffering great losses, were compelled to withdraw to winter quarters on the Danube. In the following year they advanced through Bulgaria, defeated the Turks at Kulevtcha, and, after the surrender of Silistria, crossed the Balkans under the command of Diebitsch. They reached Adrianople, which immediately capitulated. Diebitsch, concealing the real weakness of his force, sent out detachments towards the Euxine and the Ægean, while the centre of his army marched on Constantinople. Had the sultan known the insignificant number of his enemy, he might safely have defied him. But the wildest exaggerations were current in the capital; Kars and Erzeroum had fallen into the hands of Paskiewitch, commander of the czar's forces in Asia; and in Constantinople the friends of the slaughtered janissaries threatened revolt. Maḥmúd listened to the advocates of peace, and on 14th September hostilities were brought to a close by the treaty of Adrianople.

Treaty of Adrianople.

This treaty gave Russia the ports of Anapa and Poti on the eastern coast of the Black Sea; but its most important clauses were those which confirmed and extended the protectorate of the czar over the Danubian principalities. The office of hospodar, hitherto tenable for seven years, was now made an appointment for life, and the sultan undertook to permit no interference on the part of neighboring pashas with these provinces. No fortified point was to be retained by the Turks on the left bank of the Danube; no Mussulman was to reside or hold property within the principalities. The Bosphorus and the Dardanelles were declared free and open to the merchant ships of all nations. The Porte further gave its adherence to the treaty of London relating to Greece, and accepted the act entered into by the allied powers for regulating the Greek frontier. An indemnity in money was declared to be owing to Russia, and by leaving the amount to be fixed by subsequent agreement Russia retained in its own hands the most powerful means of enforcing its influence at Constantinople. The suzerainty over Greece, which the powers had at first agreed to leave to the sultan, was by common consent abandoned, and Greece became an independent kingdom.

At the close of eight years of warfare Maḥmúd's southernmost provinces were even more completely severed from the empire than Servia and the Danubian principalities.

Conflict with Mehemet Ali.

It was in vain that he had borne the humiliation of calling upon his vassal, Mehemet Ali, for help, and Mehemet's reward had now to be paid. Crete was offered to him; this, however, was far from satisfying his ambition, and in November, 1831, he threw an army under Ibráhím into Palestine and began the conquest of Syria. The sultan now declared Mehemet and his son to be rebels, and despatched an army against them. The first encounter took place in the valley of the Orontes. The Turks were put to the rout, and retired into Cilicia. Ibráhím following gained a second victory at the pass of Beylan, and, after crossing Mount Taurus, destroyed the last army of the sultan at Konieh, on 21st December, 1832. In this extremity Maḥmúd looked for help to the European powers, and Russia at once tendered its aid. At the request of the sultan a Russian fleet appeared before Constantinople. The French ambassador thereupon threatened to quit the capital; and finally, under French mediation, terms of peace were signed with Ibráhím at Kutaya (April, 1833), the sultan making over to his vassal, not only the whole of Syria, but also the province of Adana between Mount Taurus and the Mediterranean.

Alliance with Russia.

Scarcely had this treaty been concluded when Russian influence again won the ascendency at Constantinople, and a treaty of alliance between Turkey and Russia was signed at the palace of Unkiar Skelessi, which in fact reduced Turkey to the condition of a vassal state. The form of the treaty was skilfully framed to disguise the relation of dependence which it created and the right of intervention in the internal affairs of the Ottoman empire which it gave to Russia. Each power pledged itself to render assistance to the other not only against the attack of an external enemy but wherever its peace and security might be endangered. Another article declared that, in order to diminish the burdens of the Porte, the czar would not demand the material help to which the treaty entitled him, but that in lieu thereof the Porte undertook, whenever Russia should be at war, to close the Dardanelles to the war-ships of all nations. The control of the Dardanelles was thus transferred from Turkey to Russia, and the entrance to the Black Sea converted into a Russian fortified outpost. In this treaty, brilliant as it appeared, Russia had gone too far. The Western powers declared that they would not recognize it, and the most strenuous and systematic efforts were henceforth made both by France and England to diminish Russian influence in the East. France, anxious to gain in Egypt a counterpoise to England's naval power in the Mediterranean, made itself the patron and ally of Mehemet Ali. England adhered to the cause of the sultan, and on many occasions showed its hostility to Mehemet. Thus the two Western powers, though both in antagonism to Russia, were directly in conflict with one another in their Eastern policy. Mahmúd in the meantime was steadily preparing to renew the war with his rival. He obtained the services of Moltke and other Prussian officers in organizing his army, and, after a successful campaign against the rebellious tribes of Kurdistan, assembled his troops in the spring of 1839 on the upper Euphrates, and marched against Ibráhím. In the operations which followed the advice of the European officers was persistently disregarded by the pasha in command; and on 24th June the Turkish army was annihilated by Ibráhím at Nisib. To complete the ruin of the empire, the Turkish admiral, Achmet Fewzi, sailed into the port of Alexandria and handed over his fleet to Mehemet Ali. The sultan did not live to hear of the overthrow of his hopes. He died in the same week in which the battle of Nisib was fought, leaving the throne to his son 'Abd-ul-Mejíd (1839–1861).

Renewal of war with Mehemet.

Action of England and France.

The very suddenness of these disasters contributed ultimately to the preservation of the Ottoman empire, inasmuch as it compelled the powers of Europe to take action. The French and English fleets appeared in the Dardanelles. The czar saw that it was impossible to maintain the treaty of Unkiar Skelessi, and this treaty was tacitly abandoned. Russia now addressed itself to the task of widening the existing differences between France and England. France insisted on far more favorable conditions for Mehemet Ali than England would allow, demanding that Egypt and all Syria should be given to him in hereditary dominion, with no further obligation towards the sultan than the payment of an annual tribute. Russia and the other powers took part with England, and ultimately, without asking the sanction of France, the four powers signed a treaty pledging themselves to enforce upon Mehemet the terms proposed by England, which practically reduced him to the position of an ordinary pasha in Palestine, while leaving him the hereditary government of Egypt. On the publication of this treaty Thiers, the French minister prepared for war. He was, however, dismissed by Louis Philippe, and his successor, Guizot, accepted the situation. As Mehemet Ali refused to give up his conquests, an Anglo-Austrian naval squadron was sent to co-operate with a Turkish force in attacking the coast-towns of Syria. Acre was captured and Ibráhím, assailed by the mountain tribes of the interior, was forced to retire to Egypt. A convention made between Mehemet and Sir Charles Napier, who had appeared at Alexandria with part of the fleet, formed the basis of the ultimate settlement, by which Mehemet, after formal submission to the sultan, was recognized as hereditary governor of Egypt. Russia now united with the other powers in a declaration that the ancient rule of the Ottoman empire, forbidding the passage of the Dardanelles to the war-ships of all nations, except when the Porte should itself be at war, was accepted by Europe at large.

Reforms of 'Abd-ul-Mejíd.

The young sultan entered on his reign nominally as an independent sovereign, but really under the protection of the European powers. His minister, Reshid Pasha, who had gained in an unusual degree the confidence of Western statesmen, understood the necessity of bringing the Turkish system of government more into harmony with the ideas of the civilized world. An edict, known as the *Hatti-sherif of Gulhane*, announced the speedy establishment of institutions "which should insure to all subjects of the sultan perfect security for their lives, their honor, and their property, a regular method of collecting the taxes, and an equally regular method of recruiting the army and fixing duration of service." Scarcely had this edict been published when Reshid was driven from power by a palace intrigue. His reforming efforts, like those of Mahmúd, were not wholly ineffective; yet little was realized in comparison with what was promised and what was needed. The Turkish Government was soon discredited, and the intervention of Europe required by conflicts between the Christian and Mohammedan tribes in the Lebanon, resulting in massacres of the former. After the convulsions of 1848 the sultan incurred the enmity of the autocratic courts by refusing to give up Kossuth and other exiles who had taken refuge within his dominions. The suppression of the national Hungarian Government by Russia in 1849 had heightened in the emperor Nicholas the sense of his own power. He now looked forward to the speedy extinction of Turkey, and in 1853 proposed to the British ambassador, Sir H. Seymour, a plan for the division of "the sick man's" inheritance as soon as he should expire. Disputes between France and Russia relating to the rights of the Latin and Greek Churches in certain sacred places were made the occasion for the assertion of a formal claim on the part of the czar to a protectorate over all Christians in Turkey belonging to the Greek Church. This claim not being acknowledged by the Porte, a Russian army entered the Danubian principalities. After ineffective negotiations war was declared by the sultan on 4th October, 1853. Hostilities commenced in Walachia, and the Turkish fleet was attacked and destroyed at Sinope. England and France allied themselves with the Porte, and landed an army at Varna in the spring of the following year. Silistria was successfully defended by the Turks; and, on the occupation of the Danubian principalities by Austria, the allies took up the offensive and transferred their forces to the Crimea. The siege of Sebastopol followed, ending in its capture in September, 1855. Meanwhile Russian and Turkish forces were opposed in Asia. Kars maintained a gallant defence, but succumbed to famine two months after the fall of Sebastopol. The peace of Paris followed, in which Russia ceded to Turkey the portion of Bessarabia adjacent to the mouth of the Danube. The Black Sea was neutralized, Russia and the Porte alike engaging to keep no war-ships and to maintain no arsenals there. The exclusive protectorate of Russia over the Danubian principalities was abolished, and the autonomy of these provinces, as well as of Servia, placed under the guarantee of all the powers. The Porte published a firman, the *Hatti-Humaiun*, professing to abolish "every distinction making any class of the subjects of the empire inferior to any other class on account of their religion, language, and race," and establishing complete equality between Christians and Mohammedans; the powers in return declared the Porte admitted to the advantages of the public law and concert of Europe. The absurd stipulation was added that no right should thereby accrue to the powers to interfere either collectively or separately in the relations of the sultan with his subjects.

Crimean War.

Internal disorders.

The Crimean War gave to part of the Balkan population twenty years more of national development under the slackened grasp of the Porte; and by extinguishing the friendship of Austria and Russia it rendered the liberation of Italy possible. But each direct proviso of the treaty of Paris seemed made only to be mocked by events. Scarcely a year passed without some disturbance among the Christian subjects of the sultan, in which the interference of the powers invariably followed in one form or another. A new series of massacres in the Lebanon in 1860 caused France to land a force in Syria. Walachia and Moldavia formed themselves into a single state under the name of Roumania, to which the house of Hohenzollern soon afterwards gave a sovereign. Bosnia and Montenegro took up arms. Servia got rid of its Turkish garrisons. Crete fought long for its independence, and seemed for a moment likely to be united to Greece under the auspices of the powers; but it was ultimately abandoned to its Turkish masters. The overthrow of France in the war of 1870 and the consequent isolation of England led Russia to declare the provision of the treaty of Paris which excluded its ships of war and its arsenals from the Black Sea to be no longer in force. To save appearances, the British Government demanded that the matter should be referred to a European conference, where Russia's will was duly ratified.

War with Russia.

Treaties of San Stefano and Berlin.

Bulgarian question.

A few years later the horizon of eastern Europe visibly darkened with the coming storm. Russian influences were no doubt at work; but the development of national feeling which had so powerfully affected every other part of Europe during the 19th century could not remain without effect among the Christian races of the Balkan peninsula. In 1875 Bosnia and Herzegovina revolted. In the meantime the government of ‘Abd-ul-‘Azíz (1861–1876) had become worse and worse. The state was bankrupt. Ignatieff, the Russian ambassador, gained complete ascendency in the palace, and frustrated every attempt on the part of the better Turkish statesmen to check the torrent of misrule. His creature, Mahmúd Pasha, maintained his place in spite of universal contempt, until a conspiracy was formed at Constantinople, which cost the sultan his throne (30th May, 1876) and a few days later his life. His imbecile successor, Murád V., gave place after a reign of three months to ‘Abd-ul-Ḥamíd II. The Bosnian insurrection had already extended to Bulgaria, and the slaughter of the Turkish inhabitants in certain villages had been avenged by massacres of the most fearful character. Servia and Montenegro took up arms. The resources of European diplomacy were exhausted in fruitless attempts to gain from the Porte some real securities for better government, and in April, 1877, Russia declared war. The neutrality of Austria had been secured by a secret agreement permitting that country to occupy Bosnia and Herzegovina, if Russia should extend its influence beyond the Balkans. The Bulgarian massacres had excited such horror and indignation in England that Lord Beaconsfield was forced to remain neutral. The ministry contented itself with stating that England would not permit Egypt to be the scene of hostilities, nor acquiesce in any prolonged occupation of Constantinople by Russian troops. Turkey was thus left without an ally. The Russians entered Bulgaria in June; and, while Rustchuk was besieged, their advanced guard under Gourko hurried across the Balkans. Meanwhile Osman Pasha, coming from Widdin, occupied and fortified Plevna on the Russian line of march. Against his redoubts the Russians, ill commanded, threw themselves in vain, and Gourko was compelled to fall back on the Shipka Pass. But in December the capture of Plevna, in which Roumanian troops co-operated, set free the invading army, and the march on Constantinople was resumed. The Balkans were passed in mid-winter; Adrianople was occupied; and the Turkish armies were captured or annihilated. The Russians now pressed forward to the very suburbs of Constantinople, and on 3d March, 1878, peace was concluded at San Stefano. In Asia the Russians had captured Kars and were besieging Erzeroum. The treaty of San Stefano ceded to Russia the portion of Bessarabia taken from it in 1856, together with the Dobrudja,[1] and also Kars, Batoum, and the adjoining territory in Asia. It recognized the independence of Servia, Montenegro, and Roumania, and largely extended the territory of the first two. Bulgaria was constituted an autonomous state, though tributary to the Porte, and was defined so as to extend to the Ægean Sea and to include the greater part of the country between the Balkans and the coast. Crete, Thessaly, and Epirus were to receive the necessary reforms at the hands of a European commission. To this treaty Great Britain refused to give its assent, and vigorous preparations were made for war. The fleet was at the Dardanelles, and Indian troops were brought to Malta. Russia could no longer count on the neutrality of Austria. Under these circumstances the court of St. Petersburg consented to submit the treaty to a European congress, which, after a secret agreement had been made between Russia and England on the principal points of difference, assembled at Berlin. The treaty of San Stefano received various modifications, the principal being a reduction of the territory included in Bulgaria and the division of that state into two parts. Bulgaria north of the Balkans was constituted an autonomous principality; Bulgaria south of the Balkans was made into a province, with the title of Eastern Roumelia, subject to the authority of the sultan, but with a Christian governor and an autonomous administration. Austria received Bosnia and Herzegovina. The territory ceded to Servia and Montenegro by the treaty of San Stefano, as well as that ceded to Russia in Asia, was somewhat diminished. The Porte was advised to make some cession of territory to Greece, and the line of frontier subsequently recommended gave to Greece Janina as well as Thessaly. The usual promises of organic reform were made by Turkey. By a separate convention England undertook the defence of Asiatic Turkey and received Cyprus. The organization of Eastern Roumelia was duly taken in hand by a European commission and brought to a favorable conclusion; but it was not until a naval demonstration had been made by England that the final cession of Dulcigno to the Montenegrins was effected, and that Thessaly, without Epirus,[2] was given up to Greece. Alexander of Battenberg became prince of Bulgaria. By a popular movement in 1885 Bulgaria and Eastern Roumelia were united into a single state. This revolution occasioned the utmost displeasure at St. Petersburg; and under Russian influence Prince Alexander was kidnapped and forced to abdicate. The Porte offered no armed resistance to the union. (C. A. F.)

Literature.—The best work on Ottoman history is Von Hammer's *Geschichte des Osmanischen Reiches* (Buda-Pesth, 1834–35), which covers the period between 1300 and 1774. The author availed himself of the writings of the Turkish annalists as well as of those of his European predecessors; and all later Western historians of the empire have borrowed directly or indirectly from his volumes. This valuable work has been translated into French by Hellert, *Histoire de l'Empire Ottoman* (Paris, 1835–41). The best English work is Creasy's *History of the Ottoman Turks* (London, 1854–56); it is compiled for the most part from Von Hammer. Prince Cantemir of Moldavia's *History of the Growth and Decay of the Othman Empire* (London, 1734) contains many interesting particulars, but is not always trustworthy. The best Turkish authorities for the period 1300–1730 are—Sa'd-ud-Dín, *Táj-ut-Teváríkh* (1300–1520); Pechevi, *Táríkh, i.e.,* "History" (1520–1631); Na'ímá, *Táríkh* (1591-1659); Ráshid, *Táríkh* (1661-1722); and Chelebi-záda, *Táríkh* (1722-28). For the later period, see Zinkeisen, *Geschichte des Osmanischen Reiches*, 7 vols. (Hamburg and Gotha, 1840–63); Finlay, *Greece under Othoman Dominatium* (Edinburgh, 1856); Kanitz, *Donau-Bulgarien* (Leipsic, 1875–79); Prokesch-Osten, *Geschichte des Abfalls der Griechen* (Stuttgart, 1867); Finlay, *Greek Revolution* (Edinburgh, 1861); Bourchier's Codrington; H. von Moltke, *Russisch-Türkische Feldzug* (1828–29) (2d ed., Berlin, 1877); H. von Moltke, *Briefe über Zustände in der Turkei* (1835–39) (3d ed., Berlin, 1877); Prokesch-Osten, *Mehmed Ali* (Vienna, 1877); Rosen, *Geschichte der Türkei* (1826–56) (2 vols., Leipsic, 1866–67); Kinglake, *Invasion of the Crimea* (6 vols., new ed., Edinburgh, 1875–80); Eichmann, *Reformen des Osmanischen Reiches* (Berlin, 1858); V. Baker, *War in Bulgaria* (2 vols., London, 1879); W. Müller, *Russisch-Türkischer Krieg* (Stuttgart, 1878). For the diplomatic history, see *Aus Metternich's Papieren* (Vienna, 1880–84); Wellington, *Despatches* (new ser., London, 1867-71); Gentz, *Dépêches Inédites* (3 vols., Paris, 1876–77); Sir H. Bulwer, *Palmerston* (2 vols., London, 1871); Guizot, *Mémoires* (Paris, 1858–67); Sir F. Hertslet, *British and Foreign State Papers* (London, 1819, and still in progress). and *Map of Europe by Treaty* (1875); *Parliamentary History;* and *Papers Presented to Parliament.*

PART II.—GEOGRAPHY AND STATISTICS.

Plate VI.

Turkey, or the Ottoman empire (*Osmanli Vilaieti*), embraces extensive territories in southeastern Europe, western Asia, and northern Africa, grouped mainly round the eastern waters of the Mediterranean, and along both sides of the Red Sea, the west coast of the Persian Gulf, and the southern and western shores of the Black Sea. These territories form an aggregate of provinces and states, some under the direct control of the sultan, some enjoying a large share of political autonomy, some practically independent, either administered by foreign powers or ruled by hereditary vassals or tributary princes. The present (1887) extent of the Ottoman empire is about 1,692,150 square miles, and its population 42,346,000.

EUROPEAN TURKEY.

Boundaries.

Since the Russo-Turkish War of 1878 (see above), the extremely irregular frontiers of European Turkey are conterminous with Greece in the south, and in the north with Montenegro, Austria, Servia, and Roumania, being separated from the last country partly by the Danube, partly by a conventional line drawn from Silistria on that river to Mangalia on the Black Sea. By the Berlin congress Roumania and Servia, hitherto vassal states, were made absolutely independent kingdoms, Roumania at the same time receiving the district of Dobrudja between the lower Danube and the Black Sea, and Servia those of Nish and Leskovatz about the upper Morava river. Montenegro was also recognized as an independent principality, with an increase of territory, which gave it a sea-frontier limited southwards by the river Boyana, and including the Albanian ports of Dulcigno and Antivari on the Adriatic. The Greco-Turkish frontier was also shifted north, Greece obtaining most of Thessaly and a strip of Epirus (south Albania), so that since 1881 the border line runs from near Mount Olympus on the Gulf of Saloniki (40° N. lat.) west to the Pindus range, thence southwest to the Gulf of Arta on the Ionian Sea. A still more serious step was taken towards disintegration by the withdrawal of Bulgaria and Eastern Roumelia from the immediate jurisdiction of the Sublime Porte. The former was constituted a tributary principality, with representative institutions, and Eastern Roumelia was erected into an autonomous province, both under the guarantee of the European powers. But in 1885 the latter province declared for union with Bulgaria, and since then these two territories have practically formed one state administered from Sophia, Europe assenting and Turkey consenting (imperial firman of 6th April, 1886), on the retrocession to Turkey of the Moslem districts of Kirjali and the Rhodope. In the year 1878 Austria occupied and assumed the civil administration of the northwestern provinces of Bosnia and Herzegovina, besides taking military possession of the contiguous strategical district of Novi-Bazar. The direct possessions of the sultan have thus been reduced in Europe to a strip of territory stretching continuously across the Balkan Peninsula from the Bosphorus to the Adriatic (29° 10′ to 19° 20′ E. long.), and lying in the east mainly between 40° and 42° and in the west between 39° and 43° N. lat. It corresponds roughly to ancient Thrace, Macedonia with Chalcidice, Epirus, and a large part of Illyria, constituting the present administrative divisions of Stambul (Constantinople, including a small strip of the opposite Asiatic coast), Edirneh (Adrianople), Saloniki with Kosovo (Macedonia), Janina (parts of Epirus and Thessaly), Shkodra (Scutari or upper Albania). To these must be added the Turkish islands in the Ægean usually reckoned to Europe, that is, Thasos, Samothrace, Imbros, and, in the extreme south, Crete or Candia, with estimated (1887) areas and populations as under:

Area and population.

Provinces.	Area in Square Miles.	Population.
Constantinople	1,100	1,200,000
Adrianople	12,800	580,000
Saloniki and Kosovo	32,000	1,900,000
Janina	14,000	1,440,000
Scutari	13,000	890,000
Candia and other islands	3,800	290,000
Immediate possessions	76,700	5,720,000
Bulgaria, tributary principality	24,300	2,008,000
East Roumelia, autonomous province	14,000	975,000
Bosnia, Herzegovina, and Novi-Bazar, occupied by Austria	23,570	1,504,000
Total European Turkey since 1878	138,570	10,207,000
Dobrudja, ceded to Roumania	4,200	150,000
Nish and Leskovatz, ceded to Servia	4,250	367,000
Dulcigno, etc., ceded to Montenegro	2,000	116,000
Parts of Thessaly and Epirus, ceded to Greece	2,000	100,000(?)
Total European Turkey before 1878	151,020	10,940,000

Physical geography.

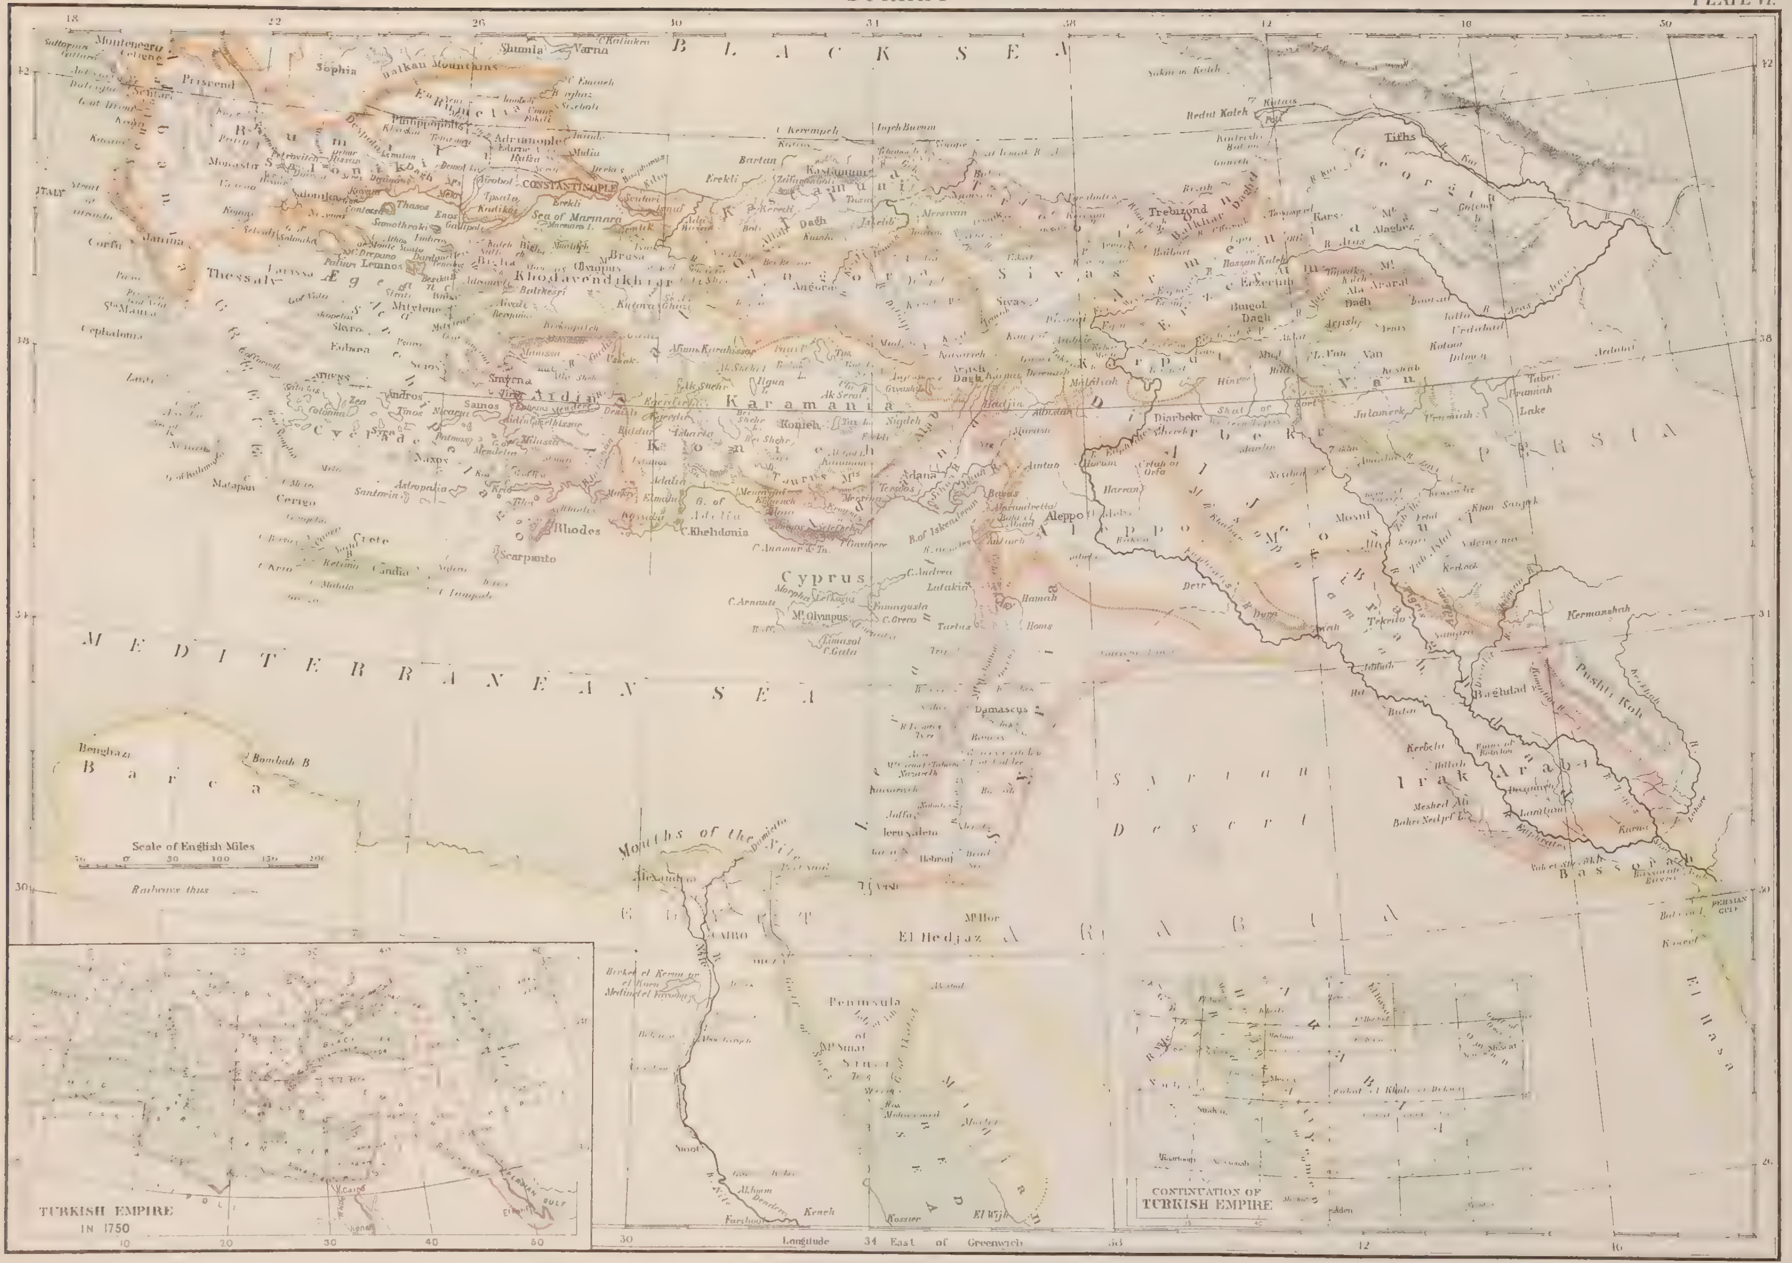
For detailed accounts of the physical features, climate, fauna, and flora of these regions, the reader is referred to the articles ALBANIA, BOSNIA, BULGARIA, CONSTANTINOPLE, EPIRUS, HERZEGOVINA, MACEDONIA, and THRACE. Here it will suffice to remark in a general way that the territory still directly administered from Stambul comprises one of the most favored regions of the temperate zone. The extensive igneous and metamorphic system of the Great Balkans and Rhodope (Despoto-Dagh), culminating in the Rilo Dagh (9000 feet), interspersed in the Pindus range farther west by Permian formations of unknown age, and succeeded in the extreme east (both sides of the Bosphorus) by Lower Devonian sandstones and some more recent volcanic rocks, is pierced by the four rich alluvial valleys of the Maritza, Kara-su or "Blackwater," Struma (Strymon), and Vardar. These rivers, flowing in nearly parallel southeasterly courses to the Ægean, collect most of the drainage of Roumelia, as Thrace and Macedonia are commonly called by the Turks. The whole region thus enjoys a somewhat southerly aspect, sheltered from the north by the lofty crests of the Rilo Dagh and northern Pindus, and in every way admirably suited for the cultivation of most cereals, as well as of cotton, tobacco, madder, the mulberry, the vine, and fruits. Here maize yields such a bountiful harvest that, although originally introduced from America, it has long been regarded as indigenous, and for the Italians is simply the Turkish corn ("gran turco") in a pre-eminent sense. The inhabitants also, Greeks intermingled with Turks in the east, with Bulgarians in the west, are intelligent and industrious, noted for their skill in the manufacture of carpets and other woven goods, of saddlery, arms, and jewellery.

ASIATIC TURKEY.

Boundaries.

The mainstay of the Ottoman dynasty is the Asiatic portion of the empire, where the Mohammedan religion is absolutely predominant, and where the naturally vigorous and robust Turki race forms in Asia Minor a compact mass of many millions, far outnumbering any other single ethnical element and probably equalling all taken collectively. Here, also, with the unimportant exception of the islands of Samos and Cyprus and the somewhat privileged district of Lebanon, all the Turkish possessions constitute vilayets directly controlled by the Porte. They comprise the geograpically distinct regions of the Anatolian plateau (Asia Minor), the Armenian and Kurdish highlands, the Mesopotamian lowlands, the hilly and partly mountainous territory of Syria and Palestine, and the coastlands of west and northeast Arabia. The changes caused by the Russo-Turkish War of 1878 were

TURKEY



ENCYCLOPÆDIA BRITANNICA, NINTH EDITION

the cession to Persia of the little district of Kotur on the eastern frontier and to Russia of the districts of Kars and Batoum on the northeast frontier, while to England were conceded the military occupation and administration of Cyprus. Asiatic Turkey is conterminous on the east with Russia and Persia; in the southwest it encloses on the west, north, and northeast the independent part of Arabia. Towards Egypt the frontier is a conventional line drawn from Akabah at the head of the Gulf of Akabah northwestwards to the little port of El Arish on the Mediterranean. Elsewhere Asiatic Turkey enjoys the advantage of a sea frontage, being washed in the northwest and west by the Euxine, Ægean, and Mediterranean, in the southwest by the Red Sea, and in the southeast by the Persian Gulf.

Area and population.

The above enumerated five natural divisions of Asiatic Turkey are divided for administrative purposes into about twenty vilayets, which, however, have been and still are subject to considerable fluctuations. The subjoined grouping, with areas and populations, is based mainly on data lately communicated confidentially to the British Government by Mr. Redhouse. His estimates of population have been strikingly confirmed by the official returns that have for the first time just been made for certain provinces in Asia Minor and the Armenian highlands. Thus the census of the Trebizond vilayet, completed in 1886, gave a total of 1,010,000 which differs only by 7000 from Mr. Redhouse's estimate for 1878 (1,017,000). So also the just completed (1887) census for the Erzeroum vilayet gives 583,000, or 998,000 including the territory ceded to Russia in 1878, which is 45,000 higher than Mr. Redhouse's estimate.

Natural Divisions.	Provinces.	Area in Square Miles.	Population.
Asia Minor	Broussa with Biga and Ismid	32,000	1,900,000
	Aidin (Smyrna)	23,000	1,610,000
	Kastamuni	21,000	1,260,000
	Angora	27,000	860,000
	Konieh	39,000	1,280,000
	Adana	16,000	470,000
	Sivas with Janik	26,000	1,770,000
Armenia and Kurdistan	Trebizond	12,000	1,010,000
	Erzeroum and Van	40,000	583,000 1,000,000
	Diarbekr with Aziz	38,000	560,000
Mesopotamia	Baghdad	100,000	4,750,000
	Basra with El-Hasa	31,000	1,085,000
Syria and Palestine	Aleppo	46,000	1,450,000
	Damascus Lebanon Jerusalem	35,000	1,560,000 450,000 390,000
Arabia	Hejaz Yemen	200,000 (?)	720,000 830,000
	Archipelago	1,700	525,000
	Samos	210	41,000
	Cyprus	3,670	235,000
	Total Asiatic Turkey	691,580	24,339,000

Physical features.

Detailed descriptions of Asiatic Turkey will be found under the separate articles ARABIA, ARMENIA, ASIA MINOR, KURDISTAN, MESOPOTAMIA, PALESTINE, and SYRIA. Of these natural divisions Asia Minor or Anatolia is by far the most important for extent, population, and natural resources. It constitutes an elevated and fertile plateau enclosed by irregular mountain ranges, which in the Taurus and Antitaurus on the south and east rise to from 7000 to 10,000 feet, culminating in the volcanic Erjish-Dagh, or Argæus, nearly 12,000 feet high. The plateau, which has a mean altitude of some 3000 feet, is depressed in the centre, where the Tuz-gol (Tatta Palus) and several other lacustrine basins have at present no outflow, but which appear to have formerly drained through the Sakaria (Sangarius) northwards to the Euxine. In the same direction, and in curiously parallel curves, flow the more easterly Kizil-Irmak (Halys) and Yeshil-Irmak (Iris), which carry off most of the surface waters of the plateau. The western rivers—Granicus, Xanthus (Scamander), Hermus, Simois, Meander—although renowned in song and history, are comparatively insignificant coast-streams, rushing from the escarpment of the plateau down to their fjord-like estuaries in the Ægean. None of the rivers are navigable to any distance from their mouths, and in the absence of good means of communication the very rich resources of the plateau in minerals and agricultural produce have hitherto been little developed. Owing to the different elevations and varied aspects of the land towards the Euxine, Ægean, and Mediterranean, the climate is exceedingly diversified, presenting all the transitions from intense summer heat along most of the seaboard to severe winters on the lofty tablelands of the interior, which are exposed to biting winds from the Russian steppes. Anatolia has an endless variety of natural products, from the hardy boxwood of Lazistan (Trebizond vilayet) to the subtropical figs and grapes of the western coast-lands. On the plateau thrives the famous breed of Angora goats, whose soft, silky fleece (mohair) forms a staple export.

Of far less economic importance are the Armenian uplands, forming a rugged plateau of limited extent, above which rise many lofty peaks, culminating in the tower-crested Ararat (16,916 feet), the converging point of three empires. The long and terribly severe winters, intolerably hot short summers, and generally poor soil of Armenia present a marked contrast to the far more temperate climate, rich upland valleys, and densely wooded slopes of the more southern Kurdistan highlands. But these advantages are counterbalanced by the generally inaccessible nature of the country, the want of good highways, and especially the lawless character of its inhabitants, who have undergone little social change since the days of their wild Karduchi forefathers. In the heart of this savage region lies the magnificent basin of Lake Van, which, like Tuz-gol and the more easterly Urmiya, has no present outflow, but formerly, no doubt, discharged to the Tigris valley.

In the Van district lie the sources of most of the head streams of the TIGRIS (*q.v.*) and EUPHRATES (*q.v.*), which have created the vast and fertile alluvial plains of Mesopotamia. This latter region, the seat of the ancient Accadian and Assyrian and the more recent Moslem cultures, forms a continuous plain from the escarpments of the Kurdistan highlands to the Persian Gulf, broken only in the north by the Sinjar Hills, and capable of yielding magnificent crops wherever water is available. But under Osmanli rule the splendid system of irrigation works, dating from the dawn of history, has fallen into decay: the lower Euphrates now overflows its banks and converts much of the region above and below Kurnah, at the confluence of the two great arteries, into malarious marshlands. Hence the populous cities and innumerable villages formerly dotted over the Babylonian plains have been succeeded by the scattered hamlets of the Montefik and other amphibious Arab tribes.

This lowland region is separated by the more elevated Syrian desert or steppe from the much smaller and less productive provinces of Syria and Palestine. Here the main physical features are at once simple and yet striking. The narrow, hilly region disposed north and south between the Mediterranean and the desert, and stretching for over 400 miles between Anatolia and the Sinai Peninsula, culminates towards the centre in the parallel Libanus and Antilibanus (10,000 to 11,000 feet), enclosing between them the fertile depression of the Beká' (Cœle-Syria). The stupendous ruins of Baalbek, standing at the highest point of this depression in 30° N. lat., mark the parting line between the northern and southern watersheds of the region. Northwards flows the El-'Aṣi (Orontes), southwards the Líṭâni (Leontes), both through the Beká' in moderately sloping beds to the Mediterranean. For further particulars, see the articles LEBANON, JORDAN, PALESTINE. In the Lebanon the Christian Maronite communities enjoy a measure of self-government under the guarantee of France, while their pagan neighbors and hereditary foes, the Druses, are gradually withdrawing to the hilly Hauran district beyond Jordan.

Turkey's Arabian possessions comprise, besides El-Hasa on the Persian Gulf, the low-lying, hot, and insalubrious Tehama and the southwestern highlands (vilayets of Hejaz and Yemen) stretching continuously along the east side of the Red Sea, and including the two holy cities of Mecca and Medina. These are held by military occupation, probably at a loss to the imperial exchequer, and certainly against the wishes of the inhabitants. But these drawbacks are supposed to be more than compensated by the political prestige derived from the possession of the Holy Land of Islam.

AFRICAN TERRITORIES.

Area and population.

Since the abandonment of eastern or Egyptian Soudan in 1884, consequent on the revolt of the Mahdi, and the occupation of Tunis by the French in 1881, Turkey in Africa has been reduced to the two territories of Egypt and Tripolitana with Barca and Fezzan, jointly occupying the northeast corner of the continent. Of these Tripolitana alone is directly administered, constituting the pashalik or vilayet of Tripoli. Egypt, whose southern frontier was temporarily fixed in January, 1887, at the station of Akashe above Wady Halfa, near the second cataract in Lower Nubia (22° N. lat.), has formed a practically independent principality under the dynasty of Mehemet Ali since 1841, subject only to an annual tribute of £695,000 [$3,377,700] to the Porte. The areas and populations of Turkey in Africa were estimated as follows in 1887:

	Area in Sq. Miles.	Population.
Tripoli, with Barca and Fezzan, a vilayet	485,000	1,000,000
Egypt, tributary principality	374,000	6,800,000
Total Turkey in Africa	862,000	7,800,000

The Empire.

Adminis-tration.

Turkey is essentially a theocratic absolute monarchy, being subject in principle to the direct personal control of the sultan, who is himself at once a temporal autocrat and the recognized caliph, that is, "successor" of the Prophet, and consequently the spiritual head of the Moslem world (see MOHAMMEDANISM). But, although the attempt made in 1876 to introduce representative institutions proved abortive, this theoretical absolutism is nevertheless tempered not only by traditional usage, local privilege, the juridical and spiritual precepts of the Koran and its *'ulemá* interpreters, and the privy council, but also by the growing force of public opinion and the direct or indirect pressure of the European powers. The 'ulemá[1] form a powerful corporation, whose head, the *sheikhu 'l-Islám*, ranks as a state functionary scarcely second to the grand vizier, or prime minister. Owing to their intensely conservative and fanatical spirit, the 'ulemá have always been determined opponents of progress, and are at present one of the greatest obstacles to reform in a political system where the spiritual and temporal functions are inextricably interwoven. Besides these expounders of Koranic doctrine, the sovereign is to some extent bound also by the *Multeka*, a legal code based on the traditional sayings of Mohammed and the recorded decisions of his successors, having the force of precedents.

The grand vizier (*sadr-azam*), who is nominated by the sultan, presides ex-officio over the privy council (*mejliss-i-khass*), which, besides the sheikhu 'l-Islám, comprises the ministers of home and foreign affairs, war, finance, marine, trade, public works, justice, public instruction, and worship, with the president of the council of state and the grand master of artillery. For administrative purposes the immediate possessions of the sultan are divided into vilayets (provinces), which are again subdivided into sanjaks or mutessariks (arrondissements), these into kazas (cantons), and the kazas into nahiés (parishes or communes). A vali or governor-general, nominated by the sultan, stands at the head of the vilayet, and on him are directly dependent the pashas, effendis, beys, and other administrators of the minor divisions. All these officials unite in their own persons the judicial and executive functions, and all alike are as a rule thoroughly corrupt, venal in the dispensation of justice, oppressors of the subject, embezzlers of the public revenues, altogether absorbed in amassing wealth during their mostly brief and precarious tenure of office.[2] Foreigners settled in the country are especially protected from exactions by the so-called "capitulations" in virtue of which they are exempt from the jurisdiction of the local courts and amenable for trial to tribunals presided over by their respective consuls. Cases between foreigners of different nationalities are heard in the court of the defendant, and between foreigners and Turkish subjects in the local courts, at which a consular dragoman attends to see that the trial is conducted according to law.

Commerce.

The trade returns for the last few years show that the country is slowly recovering from the disastrous consequences of the Russo-Turkish War. For the four years 1882-86 the exports from and imports to Turkey were valued as under:

	Exports.[3]	Imports.		Exports.[3]	Imports.
1882-83	£10,900,000	£17,000,000	1884-85	£11,326,000	£18,263,000
1883-84	9,550,000	17,350,000	1885-86	10,690,000	17,702,000

The share of the chief foreign states in these exchanges is shown in the subjoined table[4] for the years 1884-85 and 1885-86:

	Imports from		Exports to	
	1884-85.	1885-86.	1884-85.	1885-86.
Great Britain	£8,304,000	£7,755,000	£3,923,000	£4,031,000
France	2,225,000	2,050,000	4,083,000	3,296,000
Austria	3.800,000	3,468,000	1,113,000	1,001,000
Russia	1,204,000	1,556,000	366,000	841,000
Italy	563,000	536,000	339,000	327,000
Greece	395,000	318,000	500,000	437,000
United States	275,000	166,000	63,000	107,000
Persia	553,000	482,000	7,990	7,450
Roumania	228,000	565,000	88,000	96,000
Belgium	254,000	261,000	2,525	9,486

The chief staples of the export trade are raisins (£1,370,000 [$6,658,200] in 1884-85), wheat (£900,000 [$4,374,000]), cotton (£700,000 [$3,402,000]), opium (£500,000 [$2,430,000]), olive oil (£450,000 [$2,187,000]), valonia (£450,000 [$2,187,000]), barley (£332,000 [$1,713,520]), figs (£200,000 [$972,000]), sesame (£196,000 [$952,560]), maize (£194,000 [$942,840]), pulse (£185,000 [$899,100]), nuts (£184,000 [$894,240]), mohair (£145,000 [$704,700]), wool (£140,000 [$680,400]), dates (£115,000 [$558,900]); and of the import trade cotton and cotton stuffs (£4,350,000 [$17,141,000] in 1883-84), cereals and flour (£1,350,000 [$6,561,000]), sugar (£1,150,000 [$5,589,000]), draperies, hosiery, etc. (£735,000 [$3,572,100]), woollen stuffs (£650,000 [$3,159,000]), coffee (£535,000 [$2,600,100]), metals (£516,000 [$2,517,760]), ironmongery (£475,000 [$2,308,500]), dyes (£450,000 [$2,187,000]), silk and silk stuffs (£400,000 [$1,944,000]), petroleum (£375,000 [$1,822,500]), hides and skins (£255,000 [$1,239,300]), live stock (£236,000 [$1,146,960]), chemicals (£167,000 [$811,620]), coal (£135,000 [$656,100]).

In the next table are given the principal seaports of the empire with their imports, exports, and shipping for 1886:

	Exports.	Imports.	Vessels entered.	Tonnage
Alexandria	£11,710,000	£9,417,000	1249	1,020,000
Constantinople	......	......	9072	5,195,000
Smyrna	4,331,000	2,706,000	1645	1,363,000
Saloniki	1,362,000	1,660,000	5440	574,000
Iskanderoon and Tripoli	1,022,000	1,670,000	626	351,000
Samsun, with Ordu and Unieh	806,000	787,000	473	455,000
Trebizond and Kirasun	715,000	1,904,000	6063	478,000
Beyrut, with Akka and Haifa	602,000	995,000	4009	618,000
Kavala	457,000	201,000	778	115,000
Crete (six ports)	385,000	633,000	3760	491,000
Dédéagatch	298,000	169,000	......	.....
Tripoli (Africa)	231,000	310,000	501	272,000
Burgas	222,000	281,000	1371	115,000
Gallipoli and Rodosto	212,000	185,000	......	....
Suez	172,000	709,000	712	1,109,000
Benghazi	121,000	111,000	261	54,000
Jaffa	120,000	240,000	1000	459,000
Jeddah	119,000	?	1040	317,000

Exclusive of coasting craft, the mercantile fleet of Turkey in 1885 consisted of 14 steamers of 11,000 tons and 400 sailing vessels of 65,000 tons.

Agriculture.

All branches of the foreign trade, together with most of the local traffic and the banking business, are almost exclusively in the hands of Greeks, Armenians, Jews, and foreigners. The Turks and other Mohammedans are engaged nearly altogether in agricultural and pastoral pursuits. But the land, especially in Anatolia, is gradually passing from its Moslem owners into the possession of Christian mortgagees. Scarcely any accurate agricultural returns are available, except for one or two districts. In the Erzeroum vilayet in 1886[1] the live-stock stood as under,—sheep 1,485,000, goats 645,000, oxen 470,000, buffaloes 48,000, horses 61,000, asses 42,000, mules 5000; beehives numbered 80,000. The chief agricultural produce for the same year was—wheat 16,690,000 bushels, barley 13,297,000 bushels, beans 46,250 cwts, melons 17,000 cwts., mulberries 10,000 cwts., other fruits 40,000 cwts. In the same year of the 12,000 square miles constituting the Trebizond vilayet 2100 were under cultivation, 1860 uncultivated, 2520 woodland, and 5520 highland pasturage, the annual yield being about 2,300,000 cwts. of cereals, 1,000,000 cwts. of nuts, fruits, vegetables, etc., and 500,000 cwts. of fodder; whilst of live-stock there were 300,000 sheep and goats, 150,000 horses, 25,000 mules and asses, 60,000 oxen.[2]

---

[1] See SUNNITES, vol. xxii. p. 694.

[2] Major-General F. T. Haig, who travelled through the heart of Yemen in the winter of 1886-87, thus speaks of the administration in that almost exclusively Moslem province: "The fiscal system of the Turks, if it were really carried into effect, would be by no means bad; but like every other department of the government it is ruined by the utter corruption that prevails in every branch of the administration from top to bottom. No more eloquent expounders of the evils and hopelessness of their whole system are to be found than the Turks themselves, as I found from conversation with two or three of their own officials" (*Proc. R. Geog. Soc.*, August, 1887, p. 487). Mr. G. P. Devey also, consul at Erzeroum, reports that in a part of that province the sheep-tax for 1885 was collected three times over: "On the first occasion the real number had been underestimated, and the collector therefore came again, and, finding that such was the case, made the villagers pay the whole sum of 14,000 piastres [$613.87] (9000 [$394.63] had been levied on the previous occasion), instead of the difference, on the ground that they had cheated the Government in not declaring their whole stock. A third time a collector visited the caza, and, when the villagers could produce no receipt that the tax had been paid (for none had been given), a third time the full sum was taken" (*Cons. Rep.*, July, 1887, p. 3).

[3] Exclusive of tobacco, which for fiscal reasons is not included in the general trade returns, but the export of which amounted to £11,500,000 [$55,890,000] in value for 1884-85, and nearly £11,000,000 [$53,460,000] for 1885-86.

[4] Consul-General Fawcett's *Report* for July, 1887, p. 31.

Finance.

Previous to 1880 Turkey was commonly regarded as practically bankrupt. But since then a considerable improvement has been effected. Trustworthy data are still wanting; but a careful estimate gave the gross revenue and expenditure of 1884 at £T16,313,000 [$71,369,375] and £T16,223,000 [$70,975,625] respectively, the expenditure including over £T4,000,000 [$17,500,000] available for state creditors. The public debt stood at £106,437,000 [$517,283,820] in 1882. The sultan is reported to draw a sum of from £1,000,000 [$4,860,000] to £2,000,000 [$9,720,000] annually from the public revenues for the support of the seraglio or imperial household of over five thousand persons.

Army.

Until 1886 the military service, compulsory on all Moslems over 18 years of age, was kept up by 45,000 annual recruits drawn by ballot; but in November of that year universal conscription of the whole able-bodied male population was decreed. By this measure the army, hitherto reckoned at about 160,000 men, with a war strength of from 450,000 to 500,000, will be probably raised to a permanent footing of 1,000,000 effectives under the flag and in the reserves. These will continue to be grouped in the three categories of the nizam or regulars in active service, the redif or first reserve, and the mustahfiz or second reserve. There is to be a considerable increase of cavalry, all conscripts being allowed to join that branch of the service who have the means of providing themselves with mounts and equipment. For military purposes the empire is divided into seven divisions, with headquarters at Constantinople, Adrianople, Monastir, Erzingian, Baghdad, Damascus, and Sanaa, all except Sanaa (for Yemen) hitherto furnishing an army corps for the nizam and two for the redif.

Navy.

The navy at the beginning of 1887 comprised 15 large and several smaller ironclads (monitors, gun-boats, etc.), a number of mostly old-fashioned steamers, and 14 torpedo boats, and was manned by 30,000 sailors and 10,000 marines (nominal strength), raised by conscription or voluntary enlistment and serving for 12 years in the active and reserve classes.

Education.

Public instruction is much more widely diffused throughout the empire than is commonly supposed. This is due partly to the Christian communities, notably the Maronites and others in Syria, the Anatolian and Roumelian Greeks, and the Armenians of the eastern provinces and of Constantinople. Education is practically limited amongst the Mohammedans to reading and writing and the study of the Koran. But amongst the Christians, especially the Armenians, the Greeks of Smyrna, and the Syrians of Beyrut, it embraces a considerable range of subjects, such as classical Hellenic, Armenian, and Syriac, as well as modern French, Italian, and English, modern history, geography, and medicine. Large sums are freely contributed for the establishment and support of good schools, and the cause of national education is seldom forgotten in the legacies of patriotic Anatolian Greeks. Even the Turks are bestirring themselves in this respect, and great progress has been made during the last twenty years in the Erzeroum vilayet.[3] In 1886 that province contained 1216 schools and 163 madrasas (colleges), with a total attendance of 25,680, including 1504 girls. Elsewhere few official statistics are available.

Communication.

Besides administrative and financial reforms, one of the most pressing needs is improved means of communication. In Trebizond the route from the coast at Unieh through Niksar to Sivas has recently been completed to the limits of the vilayet. But the works on the more important road from Kirasun to Karahissar for the silver and lead mines at Lijessy are still suspended, owing to disputes between the contiguous provincial administrations. Many of the great historic highways are also much out of repair. At the end of 1885 only 1250 miles of railway were completed in the empire, of which 903 were in Europe and 347 in Asia. The chief lines are those connecting the capital with Adrianople (210 miles), Adrianople with Saremby (152), Saloniki with Uskub (150), Zenica with Brod (118), Uskub with Mitrovitza (75), and Kulleli with Dégéagatch (70) in Europe, and, in Asia, Scutari with Ismid (40), Smyrna with Ala-Shehr (130), and Smyrna with Denizli (170). By imperial decree (August, 1887) a contract was granted to an English syndicate for the extension of the Ismid line and the construction of a system of Asiatic railways to extend to Baghdad within the space of ten years.

The telegraph system is much more developed, comprising (1885) 14,620 miles, with 26,100 miles of wire and 470 stations. The yearly average of letters and packages of all sorts sent through the 710 post-offices scarcely exceeds 2,600,000. Most of the foreign postal service is conducted through the British, Austrian, German, French, and Russian privileged post-offices.

For the ethnography of the Turks, see TURKS.

(A. H. K.)

PART III.—LITERATURE.

In all literary matters the Ottoman Turks have shown themselves a singularly uninventive people, the two great schools, the old and the new, into which we may divide their literature, being closely modelled, the one after the classics of Persia, the other after those of modern Europe, and more especially of France. The old or Persian school flourished from the foundation of the empire down to about 1830, and still continues to drag on a feeble existence, though it is now out of fashion and cultivated by none of the leading men of letters. These belong to the new or European school, which sprang up some fifty or sixty years ago, and which, in spite of the bitter opposition of the partisans of the old Oriental system, has succeeded, partly through its own inherent superiority and partly through the talents and courage of its supporters, in expelling its rival from the position of undisputed authority which it had occupied for upwards of five hundred years. For the present purpose it will be convenient to divide the old school into three periods, which may be termed respectively the pre-classical, the classical, and the post-classical. Of these the first extends from the early days of the empire to the accession of Suleymán I., 1301–1520 (700–926); the second from that event to the accession of Maḥmúd I., 1520–1730 (926–1143); and the third from that date to the accession of ‘Abd-ul-‘Azíz, 1730–1861 (1143–1277).

Old school.

General character of Ottoman literature.

The works of the old school in all its periods are entirely Persian in tone, sentiment, and form. We find in them the same beauties and the same defects that we observe in the productions of the Iranian authors. The formal elegance and conventional grace, alike of thought and of expression, so characteristic of Persian classical literature, pervade the works of the best Ottoman writers, and they are likewise imbued, though in a less degree, with that spirit of mysticism which runs through so much of the poetry of Írán. But the Ottomans did not stop here: in their romantic poems they chose as subjects the favorite themes of their Persian masters, such as Leylí and Mejnún, Khusrev and Shírín, Yúsuf and Zuleykhá, and so on; they constantly allude to Persian heroes whose stories occur in the *Sháh-Náma* and other storehouses of Iranian legendary lore; and they wrote their poems in Persian metres and in Persian forms. The mesneví, the ḳasída, and the ghazel, all of them, so far at least as the Ottomans are concerned, Persian,—were the favorite verse-forms of the old poets. A mesneví is a poem written in rhyming couplets, and is usually narrative in subject. The ḳasída and the ghazel are both monorhythmic; the first as a rule celebrates the praises of some great man, while the second discourses of the joys and woes of love. Why Persian rather than Arabian or any other literature became the model of Ottoman writers is explained by the early history of the race (see TURKS). Some two centuries before the arrival of the Turks in Asia Minor the Seljúḳs, then a mere horde of savages, had overrun Persia, where they settled and adopted the civilization of the people they had subdued. Thus Persian became the language of their court and Government, and when by and by they pushed their conquests into Asia Minor, and founded there the Seljúḳ empire of Rúm, they carried with them their Persian culture, and diffused it among the peoples newly brought under their sway. It was the descendants of those Persianized Seljúḳs whom the early Ottomans found ruling in Asia Minor on their arrival there. What had happened to the Seljúḳs two centuries before happened to the Ottomans now: the less civilized race adopted the culture of the more civilized; and, as the Seljúḳ empire fell to pieces and the Ottoman came gradually to occupy its place, the sons of men who had called themselves Seljúḳs began thenceforth to look upon themselves as Ottomans. Hence the vast majority of the people whom we are accustomed to think of as Ottomans are so only by adoption, being really the descendants of Seljúḳs or Seljúḳian subjects, who had derived from Persia whatever they possessed of civilization or of literary taste. An extraordinary love of precedent, the result apparently of conscious want of original power, was sufficient to keep their writers loyal to their early guide for centuries, till at length the allegiance, though not the fashion of it, has been changed in our own days, and Paris has replaced Shíráz as the shrine towards which the Ottoman scholar turns. While conspicuously lacking in creative genius, the Ottomans have always shown themselves possessed of receptive and assimilative powers to a remarkable degree, the result being that the number of their writers both in prose and verse is enormous. Of course only a few of the most prominent, either through the intrinsic merit of their work or through the influence they have had in guiding or shaping that of their contemporaries, can be mentioned in a brief review like the present. It ought to be premised that the poetry of the old school is greatly superior to the prose.

Pre-classical period.

Ottoman literature may be said to open with a few mystic lines, the work of Sultán Veled, son of Mauláná Jelál-ud-Dín, the author of the great Persian poem the *Mathnawí*. Sultán Veled flourished during the reign of ‘Osmán I., though he did not reside in the territory under the rule of that prince. Another mystic poet of this early time was ‘Áshiḳ Pasha, who left a long poem in rhyming couplets, which is called, inappropriately enough, his *Díván*. The nocturnal expedition across the Hellespont by which Suleymán, the son of Orkhan, won Galipoli and therewith a foothold in Europe for his race, was shared in and celebrated in verse by a Turkish noble or chieftain named Ghází Fázil. Sheykhí of Kermiyán, a contemporary of Muḥammed I. and Murád II., wrote a lengthy and still esteemed mesneví on the ancient Persian romance of Khusrev and Shírín; and about the same time Yaziji-oghlu gave to the world a long versified history of the Prophet, the *Muḥammedíya*. The writers mentioned above are the most important previous to the capture of Constantinople: but there is little literature of real merit prior to that event. The most notable prose work of this period is an old collection of stories, the *History of the Forty Vezirs*, said to have been compiled by a certain Sheykh-záda and dedicated to Murád II. A few years after Constantinople passed into the hands of the Ottomans, some ghazels, the work of the contemporary Tatar prince, Mír ‘Alí Shír, who under the *nom de plume* of Neváyí wrote much that shows true talent and poetic feeling, found their way to the Ottoman capital, where they were seen and copied by Aḥmed Pasha, one of the viziers of Muḥammed II. The poems of this statesman, though possessing little merit of their own, being for the most part mere translations from Neváyí, form one of the landmarks in the history of Ottoman literature. They set the fashion of ghazel-writing; and their appearance was the signal for a more regular cultivation of poetry and a greater attention to literary style and to refinement of language. In Sinán Pasha, another minister of Muḥammed the Conqueror, Ottoman prose found its first exponent of ability; he left a religious treatise entitled *Tazarru‘át* (Supplications), which, notwithstanding a too lavish employment of the resources of Persian rhetoric, is as remarkable for its clear and lucid style as for the beauty of many of the thoughts it contains. The most noteworthy writers of the Conqueror's reign are, after Aḥmed and Sinán, the two lyric poets Nejátí and Zátí, whose verses show a considerable improvement upon those of Aḥmed Pasha, the romantic poets Jemálí and Hamdí, and the poetesses Zeyneb and Mihrí. Like most of his house, Muḥammed II. was fond of poetry and patronized men of letters. He himself tried versification, and some of his lines which have come down to us appear quite equal to the average work of his contemporaries. Twenty-one out of the thirty-four sovereigns who have occupied the throne of ‘Osmán have left verses, and among these Selím I. stands out, not merely as the greatest ruler, warrior, and statesman, but also as the most gifted and most original poet. His work is unhappily for the greater part in the Persian language; the excellence of what he has done in Turkish makes us regret that he did so little. The most prominent man of letters under Selím I. was the legist Kemál Pasha-záda, frequently called Ibn-Kemál, who distinguished himself in both prose and verse. He left a romantic poem on the loves of Yúsuf and Zuleykhá, and a work entitled *Nigáristán*, which is modelled both in style and matter on the *Gulistán* of Sa‘dí. His contemporary, Mesíḥí, whose beautiful verses on spring are perhaps better known in Europe than any other Turkish poem, deserves a passing mention.

Classical period.

With the accession of Selím's son, Suleymán I., the classical period begins. Hitherto all Ottoman writing, even the most highly finished, had been somewhat rude and uncouth; but now a marked improvement becomes visible alike in the manner and the matter, and authors of greater ability begin to make their appearance. Fuzúlí, one of the four great poets of the old school, seems to have been a native of Baghdád or its neighborhood, and probably became an Ottoman subject when Suleymán took possession of the old capital of the caliphs. His language, which is very peculiar, seems to be a sort of mixture of the Ottoman and Ázerbiján dialects of Turkish, and was most probably that of the Persian Turks of those days. Fuzúlí showed far more originality than any of his predecessors; for, although his work is naturally Persian in form and in general character, it is far from being a mere echo from Shíráz or Ispahán. He struck out a new line for himself, and was indebted for his inspiration to no previous writer, whether Turk or Persian. An intense and passionate ardor breathes in his verses, and forms one of the most remarkable as well as one of the most attractive characteristics of his style; for, while few even among Turkish poets are more artificial than he, few seem to write with greater earnestness and sincerity. His influence upon his successors has scarcely been as far-reaching as might have been expected,—a circumstance which is perhaps in some measure owing to the unfamiliar dialect in which he wrote. Besides his *Díván*, he left a beautiful mesneví on the story of Leylí and Mejnún, as well as some prose works little inferior to his poetry. Báḳí of Constantinople, though far from rivalling his contemporary Fuzúlí, wrote much good poetry, including one piece of great excellence, an elegy on Suleymán I. The Ottomans have as a rule been particularly successful with elegies; this one by Báḳí has never been surpassed. Rúhi, Lámi‘í, Nev‘í, the janissary Yahya Beg, the muftí Ebú-Su‘úd, and Selím II. all won deserved distinction as poets. During the reign of Aḥmed I. arose the second of the great poets of the old Ottoman school, Nef‘í of Erzerúm, who owes his pre-eminence to the brilliance of his ḳasídas. But Nef‘í could revile as well as praise, and such was the bitterness of some of his satires that certain influential personages who came under his lash induced Murád IV. to permit his execution. Nef‘í, who, like Fuzúlí, formed a style of his own, had many to imitate him, of whom Ṣabrí Shákir, a contemporary, was the most successful. Ná’ilí, Jevrí, and Fehím need not detain us; but Nábí, who flourished under Ibráhím and Muḥammed IV., calls for a little more attention. This prolific author copied, and so imported into Ottoman literature, a didactic style of ghazel-writing which was then being introduced in Persia by the poet Ṣá’ib; but so closely did the pupil follow in the footsteps of his master that it is not always easy to know that his lines are intended to be Turkish. A number of poets, of whom Seyyid Vehbí, Rághib Pasha, Rahmí of the Crimea, Kelím, and Sámí are the most notable, took Nábí for their model. Of these, Sámí is remarkable for the art with which he constructed his ghazels. Among the writers of this time who did not copy Nábí are Sábit, Rásikh, and Ṭálib, each of whom endeavored, with no great success, to open up a new path for himself. We now reach the reign of Aḥmed III., during which flourished Nedím, the greatest of all the poets of the old school. Little appears to be known about his life further than that he resided at Constantinople and was alive in the year 1727 (A.H. 1140). Nedím stands quite alone: he copied no one, and no one has attempted to copy him. There is in his poetry a joyousness and sprightliness which at once distinguish it from the work of any other Turkish author. His ghazels, which are written with great elegance and finish, contain many graceful and original ideas, and the words he makes use of are always chosen with a view to harmony and cadence. His ḳasídas are almost equal to his ghazels; for, while they rival those of Nef‘í in brilliancy, they surpass them in beauty of diction, and are not so artificial and dependent on fantastic and far-fetched conceits. The classical period comes to an end with Nedím; its brightest time is that which falls between the rise of Nef‘í and the death of Nedím, or, more roughly, that extending from the accession of Aḥmed I., 1603 (1012), to the deposition of Aḥmed III., 1730 (1143).

We will now glance at the prose writers of this period. Under the name of *Humáyún Náma* (Imperial Book) ‘Alí Chelebi made a highly esteemed translation of the well-

Classical prose writers.

known Persian classic *Anvár-i Suheylí*, dedicating it to Suleymán I. Sa'd-ud-Dín, the preceptor of Murád III., wrote a valuable history of the empire from the earliest times to the death of Selím I. This work, the *Táj-ut-Teváríkh* (Crown of Chronicles), is reckoned, on acount of its ornate yet clear style, one of the masterpieces of the old school, and forms the first of an unbroken series of annals which are written, especially the later among them, with great minuteness and detail. Of Sa'd-ud-Dín's successors in the office of imperial historiographer the most remarkable for literary power is Na'ímá. His work, which extends from 1591 (1000) to 1659 (1070), contrasts strongly with that of the earlier historian, being written with great directness and lucidity, combined with much vigor and picturesqueness. Evliyá, who died during the reign of Muḥammed IV., is noted for the record which he has left of his travels in different countries. About this time Ṭash-köpri-záda began and 'Aṭá-ulláh continued a celebrated biography of the legists and sheykhs who had flourished under the Ottoman monarchs. Ḥájí Khalífa (see vol. xi. p. 337), frequently termed Kátib Chelebi, was one of the most famous men of letters whom Turkey has produced. He died in 1658 (1068), having written a great number of learned works on history, biography, chronology, geography, and other subjects. The Persianizing tendency of this school reached its highest point in the productions of Veysí, who left a *Life* of the Prophet, and of Nergisí, a miscellaneous writer of prose and verse. Such is the intentional obscurity in many of the compositions of these two authors that every sentence becomes a puzzle, over which even a scholarly Ottoman must pause before he can be sure he has found its true meaning. The first printing press in Turkey was established by an Hungarian who had assumed the name of Ibráhím, and in 1728 (1141) appeared the first book printed in that country; it was Vanḳuli's Turkish translation of Jevherí's Arabic dictionary.

Post-classical period.

Coming now to the post-classical period, we find among poets worthy of mention Belígh, Nevres, Ḥishmet, and Sunbuli-záda Vehbí, each of whom wrote in a style peculiar to himself. Three poets of note—Pertev, Neshet, and Sheykh Ghálib—flourished under Selím III. The last-named is the fourth great poet of the old school. *Ḥusn u 'Ashḳ* (Beauty and Love), as his great poem is called, is an allegorical romance full of tenderness and imaginative power. Ghálib's style is as original as that of Fuzúlí, Nef'í, or Nedím. The most distinguished of the prose writers of this period are perhaps Ráshid, the imperial historiographer, 'Áṣim, who translated into Turkish two great lexicons, the Arabic *Ḳámús* and the Persian *Burhán-i Ḳáṭi'*, and Káni, the only humorous writer of merit belonging to the old school.

Transition period.

When we reach the reign of Maḥmúd II., the great transition period of Ottoman history, during which the civilization of the West began to struggle in earnest with that of the East, we find the change which was coming over all things Turkish affecting literature along with the rest, and preparing the way for the appearance of the new school. The chief poets of the transition are Fázil Bey, Wáṣif, notable for his not altogether unhappy attempt to write verses in the spoken language of the capital, 'Izzet Molla, Pertev Pasha, 'Ákif Pasha, and the poetesses Fitnet and Leylá. In the works of all of these, although we occasionally discern a hint of the new style, the old Persian manner is still supreme.

Modern school.

More intimate relations with western Europe and a pretty general study of the French language and literature, together with the steady progress of the reforming tendency fairly started under Maḥmúd II., have resulted in the birth of the new or modern school, whose objects are truth and simplicity. In the political writings of Reshíd and 'Ákif Pashas we have the first clear note of change; but the man to whom more than to any other the new departure owes its success is Shinásí Efendi, who employed it for poetry as well as for prose. The European style, on its introduction, encountered the most violent opposition, but now it alone is used by living authors of repute. If any of these does write a pamphlet in the old manner, it is merely as a *tour de force*, or to prove to some faithful but clamorous partisan of the Persian style that it is not, as he supposes, lack of ability which causes the modern author to adopt the simpler and more natural fashion of the West. The whole tone, sentiment, and form of Ottoman literature have been revolutionized by the new school; varieties of poetry hitherto unknown have been adopted from Europe; an altogther new branch of literature, the drama, has arisen; while the sciences are now treated and seriously studied after the system of the West. Among writers of this school who have won distinction are Ziyá Pasha, Jevdet Pasha, the statesman and historian, Ekrem Bey, the author of a beautiful series of miscellaneous poems, *Zemzema*, Ḥámid Bey, who holds the first place among Ottoman dramatists, and Kemál Bey, the leader of the modern school and one of the most illustrious men of letters whom his country has produced. He has written with conspicuous success in almost every branch of literature,—history, romance, ethics, poetry, and the drama.

For the Turkish language, see p. 703 below.

There is no work in existence which gives a satisfactory account of Ottoman literature. Von Hammer-Purgstall's *Geschichte der Osmanischen Dichtkunst* (Pesth, 1836) is not always trustworthy and leaves much to be desired in many ways. Other works on the poetry are *La Muse Ottomane*, by Servan de Sugny (Paris, 1853); *On the History, System, and Varieties of Turkish Poetry*, by Redhouse (London, 1878); *Ottoman Poems*, by Gibb (London, 1882). Of translations we have Báḳí's *Divan*, by Hammer (Vienna, 1825); the *Travels of Evliyá*, by Hammer (London, 1834); *Rose und Nachtigall* (a poem of Fazlí, a mediocre writer of the time of Suleymán I.), Turkish and German, by Hammer (Pesth); *Les Conseils de Nabi Efendi*, by Pavet de Courteille (Paris, 1857); *The History of the Forty Vezirs*, by Gibb (London, 1886). An interesting and valuable sketch of Ottoman poetry is given by Kemál Bey in a series of aricles in the Turkish literary journal *Mejmú' a-i Ebu-z-Ziyá*. (E. J. W. G.)

TURKEY, an abbreviation for TURKEY-COCK or TURKEY HEN as the case may be, a well-known large domestic gallinaceous bird. How it came by this name has long been a matter of discussion, for it is certain that this valuable animal was introduced to Europe from the New World, and in its introduction had nothing to do with Turkey or with Turks, even in the old and extended sense in which that term was applied to all Mahometans. But it is almost as unquestionable that the name was originally applied to the bird which we know as the GUINEA-FOWL (*q.v.*), and there is no doubt that some authors in the 16th and 17th centuries curiously confounded these two species. As both birds became more common and better known, the distinction was gradually perceived, and the name "Turkey" clave to that from the New World—possibly because of its repeated call-note—to be syllabled *turk*, *turk*, *turk*, whereby it may be almost said to have named itself (*cf.* *Notes and Queries*, ser. 6, iii. pp. 23, 369). But even Linnæus could not clear himself of the confusion, and unhappily misapplied the name *Meleagris*, undeniably belonging to the Guinea-Fowl, as the generic term for what we now know as the Turkey, adding thereto as its specific designation the word *gallopavo*, taken from the *Gallopavo* of Gesner, who, though not wholly free from error, was less mistaken than some of his contemporaries and even successors.[1]

The Turkey, so far as we know, was first described by Oviedo in his *Sumario de la Natural Historia de las Indias*[2] (cap. xxxvi.), said to have been published in 1527. He, not unnaturally, includes both Curassows and Turkeys in one category, calling both "Pavos" (Peafowls); but he carefully distinguishes between them, pointing out among other things that the latter make a wheel (*hacen la rueda*) of their tail, though this was not so grand or so beautiful as that of the Spanish "Pavo," and he gives a faithful though short description of the Turkey. The chief point of interest in his account is that he speaks of the species having been already taken from New Spain (Mexico) to the islands and to Castilla del Oro (Darien), where it bred in a domestic state among the Christians. Much labor has been given by various naturalists to ascertain the date of its introduction to Europe, to which we can at present only make an approximate attempt;[1] but after all that has been written it is plain that evidence concurs to show that the bird was established in Europe by 1530—a very short time to have elapsed since it became known to the Spaniards, which could hardly have been before 1518, when Mexico was discovered. The possibility that it had been brought to England by Cabot or some of his successors earlier in the century is not to be overlooked, and reasons will presently be assigned for supposing that one of the breeds of English Turkeys may have had a northern origin;[2] but the often quoted distich first given in Baker's *Chronicle* (p. 298), asserting that Turkeys came into England in the same year—and that year by reputation 1524—as carps, pickerels, and other commodities, is wholly untrustworthy, for we know that both these fishes lived in the country long before, if, indeed, they were not indigenous to it. The earliest documentary evidence of its existence in England is a "constitution" set forth by Cranmer in 1541, which Hearne first printed (Leland's *Collectanea*, ed. 2, vi. p. 38). This names "Turkey-cocke" as one of "the greater fowles" of which an ecclesiastic was to have "but one in a dishe," and its association with the Crane and Swan precludes the likelihood of any confusion with the Guinea-Fowl. Moreover the comparatively low price of the two Turkeys and four Turkey-chicks served at a feast of the serjeants-at-law in 1555 (Dugdale, *Origines*, p. 135) points to their having become by that time abundant, and indeed by 1573 Tusser bears witness to the part they had already begun to play in "Christmas husbandlie fare." In 1555 both sexes were characteristically figured by Belon (*Oyseaux*, p. 249), as was the cock by Gesner in the same year, and these are the earliest representations of the bird known to exist.

---

[1] The French *Coq* and *Poule d'Inde* (whence *Dindon*) involve no contradiction, looking to the general idea of what India then was. One of the earliest German names for the bird, *Kalekuttisch Hün* (whence the Scandinavian *Kalkon*), must have arisen through some mistake at present inexplicable: but this does not refer, as is generally supposed, to Calcutta, but to Calicut on the Malabar coast (*cf.* *Notes and Queries*, ser. 6, x. p. 185).

[2] Purchas (*Pilgrimes*, iii. p. 995) in 1625 quoted both from this and from the same author's *Hystoria General*, said to have been published a few years later. Oviedo's earlier work is only known to the present writer by the reprint of 1852.

There is no need to describe here a bird so familiar and in these days so widely distributed. As a denizen of our poultry-yards (see POULTRY, vol. xix. p. 666-67) there are at least two distinct breeds, though crosses between them are much commoner than purely-bred examples of either. That known as the Norfolk breed is the taller of the two, and is said to be the more hardy. Its plumage is almost entirely black, with very little lustre, but the feathers of the tail and some of those of the back have a brownish tip. The chicks also are black, with occasionally white patches on the head. The other breed, called the Cambridgeshire, is much more variegated in color, and some parts of the plumage have a bright metallic gloss, while the chicks are generally mottled with brownish gray. White, pied, and buff Turkeys are also often seen, and if care be taken they are commonly found to "breed true." Occasionally Turkeys, the cocks especially, occur with a top-knot of feathers, and one of them was figured by Albin in 1738. It has been suggested with some appearance of probability that the Norfolk breed may be descended from the northern form, *Meleagris gallopavo* or *americana*, while the Cambridgeshire breed may spring from the southern form, the *M. mexicana* of Gould (*Proc. Zool. Society*, 1856, p. 61), which indeed it very much resembles, especially in having its tail-coverts and quills tipped with white or light ochreous,—points that recent North-American ornithologists rely upon as distinctive of this form. If this supposition be true, there would be reason to believe in the double introduction of the bird into England at least, as already hinted, but positive information is almost wholly wanting.[3] The northern form of wild Turkey, whose habits have been described in much detail by all the chief writers on North-American birds, is now extinct in the settled parts of Canada and the eastern States of the Union, where it was once so numerous; and in Mexico the southern form, which would seem to have been never abundant since the conquest, has been for many years rare. Further to the south, on the borders of Guatemala and British Honduras, there exists a perfectly distinct species, *M. ocellata*, whose plumage almost vies with that of a Peacock in splendor, while the bare skin which covers the head is of a deep blue studded with orange caruncles (*Proc. Zool. Society*, 1861, pl. xl.).

The genus *Meleagris* is considered to enter into the Family *Phasianidæ*, in which it forms a Subfamily *Meleagrinæ*, peculiar to North and Central America. The fossil remains of three species have been described by Prof. Marsh—one from the Miocene of Colorado, and two, one much taller and the other smaller than the existing species, from the Post-Pliocene of New Jersey. Both the last had proportionally long and slender legs. (A. N.)

TURKS. The use of the name "Turks" has never been limited in a clear and definite way from the time of the Byzantine authors to the present day. To the former, as also to the Arabs, it has a collective sense like Scythians or Huns;[4] at the present day we are wont to restrict the name to the Osmanli Turks, though they themselves refuse to be called Turks, having, as they hold, ceased to be such in becoming imbued with Arabo-Persian culture. On the other hand, when we speak of Uigurs and Tatars, we mean tribes who style themselves Turks and really are such. It is only by the aid of historical and linguistical evidence that we can determine the true limits of the Turkish name.

Origin.

Ethnological affinities.

The national Turkish traditions, preserved by the Persian historians Rashīd ed-Dīn and Jowaini from Uigurian books which are now lost, point to the region watered by the river Selenga and its affluents, the Orkhon and the Tugila, as the primitive seat of the Turkish people. Rashīd ed-Dīn combines this tradition with that of the Mohammedan descendants of Oghuz, who, in accordance with Moslem traditions, derive the whole Turkish stock from Japhet, the son of Noah, or more accurately from Turk, the son of the former (Yafiz-oglan), and pretend that he pitched his tents in the vicinity of Lake Issyk-kul (in Semiryetchensk). But, though Turkish tribes did wander so far to the west, and even farther, in remote antiquity, it seems pretty certain that the Uigurian tradition has preserved the memory of the true origin of the race, that Turks and Mongols were originally different stems of a single people, and that these two members of the URAL-ALTAIC (*q.v.*) family were more closely related to each other than to any other member of the same family (Finno-Ugrians, Samoyedes, Tungus-manchus). The evidence for this rests, not on the ethnological system of Rashīd ed-Dīn, though it affords a secondary argument, but on the indubitable affinity of the Mongolian and Turkish languages and the similarity of the ethnological characters of the two races. Here, of course, we do not argue from the Osmanlis, who have lost all their original race-characters and have become "Caucasians" of the best time, but rather, for instance, from the Kirghiz, who are considered as the typical Turks of the present day, and are described by Ujfalvy as being midway between the Mongol and the Caucasian. We must now turn our attention to the wanderings of the Turks and their subsequent fate,—a rather difficult task, owing to the want of accurate information. The only truly historical records are to be found in the Chinese chronicles and encyclopædias,[5] where, however, the Turkish proper names appear in such distorted forms as to be unrecognizable; yet, till the 6th century of our era, no other accounts are available.

The Hiong-nu.

It is generally admitted that the first Turkish people mentioned by the Chinese are the Hiong-nu, who, wandering to the west, occupied the country south of the Altai Mountains and expelled

---

[1] The bibliography of the Turkey is so large that there is here no room to name the various works that might be cited. Recent research has failed to add anything of importance to what has been said on this point by Buffon (*Oiseaux*, ii. pp. 132-162), Pennant (*Arctic Zoology*, pp. 291-300),—an admirable summary,—and Broderip (*Zoological Recreations*, pp. 120-137)—not that all their statements can be wholly accepted. Barrington's essay (*Miscellanies*, pp. 127-151), to prove that the bird was known before the discovery of America and was transported thither, is an ingenious piece of special pleading which his friend Pennant did him the real kindness of ignoring.

[2] In 1672 Josselyn (*New England's Rarities*, p. 9) speaks of the settlers bringing up "great store of the wild kind" of Turkeys, "which remain about their houses as tame as ours in England." The bird was evidently plentiful down to the very seaboard of Massachusetts, and it is not likely to have been domesticated by the Indian tribes there, as, according to Hernandez, it seems to have been by the Mexicans. It was probably easy to take alive, and, as we know, capable of enduring the voyage to England.

[3] The results of a comparison of the skulls of wild and domesticated Turkeys are given by Dr. Shufeldt in *Journ. of Comp. Medicine and Surgery*, July, 1887.

[4] Constantine Porphyrogenitus calls the Magyars Turks, even in contradistinction to the truly Turkish Petchenegs.

[5] Translated in the well-known works of Deguignes, Visdelou, etc.; for a French translation by Stanisl. Julien of the accounts of the Pien-i-tien, referring to the Tu-kiu, see *Journ. Asiat.*, 1864, p. 325 *sq.*

The Tu-kiu.

(about 177 B.C.) the former occupants of those regions, the Yue-chi,[1] Kan goi, and Usun (U-ssun),—tribes of unknown nationality, but possibly also Turks.[2] The Hiong-nu were identified by Deguignes with the Huns, this denomination being used in a political or collective sense, and including, besides the Huns proper, the Ephthalites or White Huns, Avars, Bulgars, Magyars, Khazars, and Petchenegs, who are styled by several scholars Hunnic or Scythian peoples,—a term of no scientific value whatever, as the main body of these peoples consisted really of Mongol-Turks or Finno-Ugrians. As, however, separate articles have been devoted to most of these ethnical names, we abstain from further details, as also from discussion of the question of the Turkish origin of the Magyars and the Khazars, though that of the former seems to us as improbable as that of the latter is certain.[3] Be this as it may, the Hiong-nu are, so to speak, proto-Turks, and the history of the Turks proper begins with the Tu-kiu, the Chinese equivalent of the word Turk. Originally a division of the Hiong-nu, almost extirpated by wars, but miraculously saved from complete destruction, the Tu-kiu settled south of the Kin-shan (Altai?) Mountains, and were miners and iron-smelters in the service of the Juen-Juen[4] ("les Tartares Geou-gen" of Deguignes). About 552 A.D., however, they conquered their former masters and founded a mighty empire under princes who took the title of Ili khan. In these Tu-kiu Deguignes recognized the Turks who entered into friendly relations with Byzantium, and to whom Justin II. sent two ambassadors,—Zemarchus (568) and Valentinus (575). The narratives of these ambassadors are preserved in the fragments of Menander Protector; and (comparing the variations of the corrupt text with the record of Tabarī) from him we learn that at the first date the reigning prince was Sinjibulus (Arabic Sinjibu.[5]) From the Greek and the Arabo-Persian accounts it seems that Sinjibu put an end to the empire of the Ephthalites or Haitāls in those regions. He shared the conquered country with Khosrau I., the Oxus becoming the frontier between Irān and Turān. The memory of the empire of Sinjibu and of its political strength has been preserved by the Arabic authors Ibn Khordādbeh and Mas'udī, who inform us that the Turkish tribe of the Karluks, settled in the provinces of Ferghāna and Shāsh (Tashkend), were of old the mightiest of all the Turks, and that their sovereign, the khakān of khakāns, was obeyed by all the neighboring princes. To them they reckon the mythical Afrāsiāb and the historical Shāwa.[6] It is uncertain at what epoch the empire of the Karluks came to an end; but the Chinese assert that about 650 they reduced the inhabitants of the Ili and Jaxartes territory, though they were unable to protect them afterwards against the inroads of the Arabs under Kotaiba b. Moslim (706–714). The latter defeated the armies sent to their aid under Kurbogha Noyon, a sister's son of the Chinese emperor.[7] It is also doubtful if the so-called Afrāsiāb kings or Ilekkhans, who reigned in the 10th century at Kāshgar and Balāsāghun and conquered (999) the dominions of the Samanids in Transoxiana, belonged to the Karluks, as is supposed by Grigorieff and Lerch, or to the Uigurs, as others think.

The Uigurs.

The name Uigurs is very common during the Mongolian period, and Rashīd ed-Dīn and others use it (by an anachronism) in speaking of remote antiquity, though it is wholly unknown to the Arabic geographers, and, as Vambéry has shown, to the Uigurs themselves,—nay, even impossible in the old Turkish language, in which the form would be Utkur. The name Ugur, Ogur, or Ogor of Byzantine authors is really different; but Grigorieff has recognized the name in the corrupt Arabic form of Tagazgaz, which must be read Toguz-Ugur,[8] the "Nine Ugurs," to distinguish them from another division of the same tribe, the On-Ugur or "Ten Ugurs." In the time of Ibn Khordādbeh and Mas'udī these Turks had gained the supremacy amongst their brethren, and had their residence at Kushān, which has been identified with the Kiao-chang of the Chinese. According to their accounts, the Kiao-chang form the southern division of the Hui-khe (Hoei-ke of Deguignes), and were settled before the Christian era south and east of the Tian-shan up to the Pamir plateau and the Kuen-Lun. The Arabic authors make them adherents of Manichæism; but as the original Turkish Shamanism has developed into a dualistic system, this statement may rest on a partial misapprehension. It seems, however, certain that Buddhism reached these Turks on its way towards China, for we know that this religion spread in the 2d century B.C. throughout the adjacent kingdom of Bactria, and was still flourishing when Hwen-T'sang visited (7th century) those regions. Thus we can understand why the old Ural-Altaic religion bears a Sanskrit name. The northern division of the Hui-khe, which remained unknown to the Arabs, wandered from the Selenga region to the sources of the Yenisei, vanquished the Tu-kiu (745), and founded an empire from the Selenga to Lake Balkash, till they were overthrown (841) by the Ha-kas (identified with the Kirghiz). These northern Uigurs are called by the Chinese Kao-che, Chi-le, Di-li, and Te-le. The history of the southern branch is unknown, for the chronological data of Rashīd ed-Dīn and Abu-'l-Ghāzi are contradictory and useless, though their statements that the prince bore the title of Idi-kut and submitted to the Mongols have full historical weight. That the Uigurs rose during the Mongolian epoch to a certain supremacy by higher culture is attested by Rashid ed-Dīn and Jowaini, who often mention Uigurian books.

The Petchenegs.

The Petchenegs (Gr. Πατζινακαι, Πατζινακιται; Magyar *Besenyö*; Lat. *Bisseni*) were of old, as Constantine Porphyrogenitus tells us, settled about the lower Ural and Volga, but were driven thence (894–899) by the Ghuzz (Ouzoi). A part of them returned afterwards to their ancient abode, but the great majority wandered westward and settled on both sides of the Dnieper, driving the Hungarians before them to the Carpathians. Here they annoyed the neighboring peoples by their raids, and engaged readily in the Russian expeditions against the Greek empire, till the policy of the Byzantine court incorporated large numbers of them with its own armies, sometimes with fatal result, as was experienced by Romanus Diogenes, when these auxiliaries passed to the camp of his antagonist Alp Arslān. At the period of the first crusade the Christian armies met with them on their march through Servia and Bulgaria; but the Petchenegs are not mentioned after the 13th century. The learning of Orientalists has discovered faint traces of the language once spoken by them in the Turkish dialect of the Bosnians.[1]

[1] Comp. PERSIA, vol. xviii. pp. 659–60, 651–52.

[2] Radloff, for instance, thinks that the name U-ssun, and perhaps remnants of the people denoted by it, survive in the present Uisuns, a division of the Great Horde of the Kirghiz. At the time of Alexander the Great's expeditions against the Scythians beyond the Jaxartes, we find in that region certain traces of the Turkish language in names of places and persons (cp. vol. xviii. p. 599, note 4). It is therefore certain that long before the age of the Hiong-nu Turkish tribes had spread to the borders of the Jaxartes, and even along the northern coast of the Caspian to the rivers Ural and Volga. But the ethnical denominations of antiquity—Scythians, Parthians, Massagetæ, Sacæ, etc.—do not convey to our mind clear ethnical distinctions, so that the true nationality of these peoples has been much debated. Neither are the pre-Semitic culture of Babylonia and the supposed "Turanian" origin of the Accads facts of such character that from them we can infer the presence of Turks in these regions in remote antiquity.

[3] On the Petchenegs see below.

[4] From their Chinese name it may be inferred that the Juen-Juen were a Mongolian people, in which case the Avars, who are supposed to have been a division of them, were also Mongols.
